### ABSTRACT

Entrepreneurship training and education programs are increasingly undertaken by not only educational institutions but also by state and national government units. An evaluation of the effectiveness of such programs would be useful in improving the quality and success of these programs. With this point of view this study involves an assessment of the performance of the entrepreneurship program undertaken in the Mayagüez region by the AAFET unit of the government of Puerto Rico (AAFET is an acronym of the Spanish title which in English stands for “Administration for Training Future Entrepreneurs and Workers”). The Mayagüez region program which covers the western part of Puerto Rico is one of three regional programs covering the island of Puerto Rico.

This investigation involves the identification of the number and type of entrepreneurs initiated in this program, their survival rate, the performance and problems facing the ones that are continuing to operate. Information and data about the firms is collected using both telephone and personal interviews of the owners of these enterprises. A well designed set of questions are used to conduct telephone interviews of the entrepreneurs initiated under this program to obtain relevant information about the performance of the enterprise. This is followed by selecting a random sample of 23 enterprises from this program and conducting personal interviews to obtain in depth information and data.

Analysis of the data and other information is used to draw conclusions about the performance of these enterprises and the effectiveness of the AAFET program. An assessment of these enterprises contribution to employment and economic output is also made. Recommendations to improve the training program and methods to provide continuing assistance to ongoing enterprises developed under this program to become successful are developed. The study looks into the possibility of extending the recommendations developed here to the other two regional centers of Puerto Rico.

### INTRODUCTION

It is now generally recognized that a country's economy and economic growth are strongly influenced by the dynamism of their entrepreneurial environment. Reynolds et al (1999) present a consolidated conceptual model that includes both general national, and entrepreneurial framework conditions developed in a GEM (Global Entrepreneurship Monitor) report. The model indicates how a country's entrepreneurial capacity contributes to its economic growth. In the 2001 GEM Executive report Zacharakis et al identify two categories within the total entrepreneurial activity (TEA) within a country. The two categories are identified as:

I) Opportunity Entrepreneurship and II) Necessity Entrepreneurship. Opportunity entrepreneurs are those that start a business to take advantage of a business opportunity. They have an innovative idea and want to explore it and take advantage of an opportunity in the market place. Candidates in this category tend to be educated and are employed or employable. On the other hand those that have no better choice for work or have to find alternate means to survive and support themselves are necessity entrepreneurs. Here entrepreneurship is motivated by need.

Schumpeter (1947, 1949) describes the entrepreneur as creating disequilibrium in order to profit from it. He sees the function of the entrepreneur as one to revolutionize patterns of production by exploiting an invention or innovation. However it is not easy to teach an individual to invent a creation that will cause an economic disequilibrium. In contrast to the entrepreneur as essentially an innovator Kirzner (1973, 1982) argues that an entrepreneur might simply identify an opportunity for profit rather than create one. Hence the Kirznerian entrepreneur can benefit from general education and managerial training. This paper describes and analyzes attempts to train young people to become entrepreneurs in the Kirznerian sense. They can also be considered as necessity entrepreneurs, as described by Zacharais et al.

## **THE AAFET PROGRAM**

In an effort to provide education, training to young people between the ages of 18 to 29 the PR government created a "Service Organization of PR" in August of 1990. The operational component of the department of human resources of PR reorganized the work of the "Service Organization of PR" and in 1999 changed its name to AAFET, an acronym for its Spanish title "Administración para el Adiestramiento de Futuros Empresarios y Trabajadores" (Administration to Train the Future Entrepreneurs and Workers).

The AAFET program consists of three distinct components of activities namely: 1) Vocational Technical Program, 2) Job Corps Program and 3) Economic Development Program. The vocational technical program is based in 13 vocational institutes, the Job Corps program is conducted in 3 Job Corps centers, and the economic development program is divided into three regions. The activity of interest in the present investigation is the Economic Development Program of the western region.

### **Western Region of Puerto Rico**

Puerto Rico, an island lying between the Caribbean sea and the Atlantic ocean (18° 15'N, 61° 30' W) is made up of a total area of 8,959 sq. km. land and 145 sq. km. water (Approximately 180 km East-West and 50 km. North-South) with a population of 3.8 million. The western region considered in this study represents the entire west coast and extends inland approximately 50 km. It consists of 14 cities mostly along the coast line which is nearly flat while the interior of the island is extremely hilly. The population of the western region is approximately 576,874. Mayagüez which represents the principal city in the west is the fifth largest city in P.R. with a population of 98,434. The number of business establishments in the western region as determined in a study (2002) under the P.R. Commerce Department add up to 24,414.

## **Economic Development Program**

The Economic Development Program is made up of the micro enterprise sub program and the entrepreneurial development program of the Work Investment Act (WIA). The micro enterprise sub program is funded and supported by the PR Government while the Entrepreneurial Development Program is supported by the U.S. federal government.

The state program and the WIA program are designed to provide training and education to young people to start a business and manage its operation. While both programs give basically the same training material there are some distinct differences in the approaches taken by each of these with respect to the topics covered in the training, the distribution of materials and the duration of the program.

The state program takes a very direct approach to educate and orient the students. It goes directly to train participants in the basics of business functional areas of accounting, finance marketing, and personnel management. The fire department, health department, and the administration of rules and permits (ARPE) agencies visit them during their training period to educate them about the different permit requirements to start a business in Puerto Rico. This program extends over a period of 3 months.

The WIA program includes all the aspects of the state program. In addition the program puts more emphasis to develop and improve the self esteem and motivation of the participants, and help them with their personal issues as much as possible. The program dedicates more time to their training to help and guide the participants to develop their business proposal. The program is more people oriented, focusing on the development of the individual so they will be more receptive, ready, and open to the training materials. This program extends over a period of 5 months and is thus 2 months longer than the state program.

The two programs in their training cover the basics of starting and managing an enterprise. The areas covered include the following topics:

- Strategies of planning and managing a small business.
- Preparing job description, staffing & managing employees.
- Assessing the market and competition.
- Promotion, Publicity & Public Relations.
- Identifying customers & creative sales.
- Revenues, costs and cash flows.
- Budgets and accounting records.
- Regulations, Permits and Agencies.

These topics are covered in a set of manuals along with a series of exercise. During the training program the students discuss cases relating to the different topics, and complete the exercises. They prepare questionnaires, make market analysis presentations, practice sales techniques, and prepare budgets and cash flows.

At the end of the AAFET and WIA programs the participants are expected to have familiarized with the essential aspects of starting a business and operating it. They hand in a portfolio containing materials and projects they have completed in each of the courses. Following this the students develop a business plan of a business they want to start and submit it for approval and funding support. The staff of AAFET and WIA evaluate the plans and recommend those that are considered acceptable for financial support. The AAFET program participants whose business plans are successful receive a sum of \$900 to start their business. The successful WIA program participants receive a sum of \$1,100 for their startup.

## **INVESTIGATION**

The current investigation is based on a study of a sample of 63 enterprises initiated through the AAFET and WIA programs of the western region. The sample was drawn from a list of 205 enterprise listing provided by the Mayagüez center. This list of 205 is derived from the total number of enterprises initiated in the AAFET and WIA programs over the years 1990 to 2003. The two programs together initiate about 100 startups each year. Thus the total population of enterprises initiated over this period in the western region is approximately 1,300. Information for 40 in the sample of 63 of these enterprises was obtained using telephone interviews and the remaining 23 involved personal visits & interviews. A questionnaire designed for both of these interviews was used to collect the following information about these enterprises:

- Is the enterprise continuing its operation in 2005 or is it out of business.
- The start up date of the operating business.
- The number of employees when it started and the number now.
- Performance of the business operation during the first year and its performance now.
- Expectations of its continuing operation and growth in the future.
- Current sales volume.
- Major problems facing the business.
- Nature of assistance and needs of the entrepreneur and the enterprise.

The information generated from these interviews involves both qualitative & quantitative data. The analysis of the information is as follows. (Summary data obtained from the interviews is given at the end of the paper in tables)

### **Survival**

Of the 40 enterprises whose telephone numbers were available 13 were successfully contacted while 12 did not respond even after several attempts (4-5), and 15 were out of service. The 22 personal visits resulted in 12 enterprises being out of business and 10 were continuing in their operation. The results show:

Sample size  $n = 63$

Successfully continuing operation in 2005: 23

Enterprises no longer in operation: 40

Survival rate of enterprises in the sample over the period (2003-2005) of 2 years: 36.5%

### **Years in business**

The surviving enterprises range in their length of operation from 2 to 18 years with a mean of 6.9 years. Since 50% of these businesses are more than 4 years in operation their chances of continuing survival are good.

Table 1

### **Sales revenues**

In spite of this length of business operation a substantial number (48%) of these enterprises have gross revenues of \$35,000 or less. Only 22% of these enterprises have gross revenues exceeding \$100,000. Sales revenues of these enterprises range from a yearly low of \$5,200 to a high of \$600,000. The median sales volume of the sample is \$44,200. (The median value is used to describe the central tendency of the sample sales volume since there are some extreme values. Extreme values in a sample affect the mean as a measure of its central tendency.)

These enterprises can be group into three categories:

- |   |     |
|---|-----|
| 1. Enterprises with sales revenues less than \$35,000           | 48% |
| 2. Enterprises with sales revenues between \$35,00 to \$105,000 | 30% |
| 3. Enterprises with sales revenues greater than \$105,000       | 22% |

Table 2

Table 3

### **Employment**

Most of the enterprises namely 70% have just 1 employee. The remaining 30% have 2 or more. The average number of employees at the start of these businesses was 2.1 while the average now in 2005 is 3.8 employees per business. Even so a few of these business 13% have substantially fewer employees now than when they started. These businesses find that it is not easy to find good reliable workers and monitor their performance.

Table 4

Table 5

### **Business status**

While 52% of the enterprises felt that their business is in good or very good condition, all of them indicate that they will continue to operate in the next year or many more years. In terms of the future almost 50% of them expect to grow rapidly or moderately.

Table 6

### **Problems facing the enterprises**

Some of the problems identified by the respondents are as follows:

A large number of enterprises (48%) indicated that the major problem they faced; in continuing their business operations or to expand their operation, was in obtaining commercial loans. Often they had to seek personal loans and even in these situations they received little help from the regional offices and they found the process to be very time consuming.

The next major problem appears to be obtaining proper facilities with necessary utilities. A total of (39%) said they faced the problem of finding a proper location. Other problems identified relate to marketing to identify customers (13%). Finding appropriate employees who are dependable, honest and hard working was a problem faced by 17% of the businesses.

### **CONCLUSIONS AND RECOMMENDATIONS**

A major problem of the present study has been the difficulty of obtaining adequate and proper data and information. The list of enterprises contained only 20% of the businesses with telephone numbers. Further there is lack of information concerning the relation between the list of 205 enterprises and the approximate 1,300 total start ups. It was difficult to design a random sample; the sample drawn in this study is a convenience sample and thus limits inferential analysis.

A one sample runs test was made to evaluate the randomness of the convenience sample used in this study. The runs test is used to determine whether the order or sequence of observations in a sample is random. The null hypothesis is: The items in the sample are generated randomly. The critical values of R (number of runs) are 5 for the lower tail and 17 for the upper tail of the distribution. When the observed value of R falls between 5 and 17, the decision is to not reject the null hypothesis. Here the value of R was 14, the decision is to not reject the null hypothesis. Not enough evidence is provided to declare that the data are not random.

Even considering the sample as random we can only draw inferences about the 205 enterprises and will not be able to make any reliable statistical inferences about the population of 1,300 enterprises initiated by the Mayagüez region. (Efforts to determine the nature of the list of 205 from the 1,300 startups is currently being made).

Using the sample information as a pilot study we can draw some conclusions and make recommendations to improve the AAFET and WIA programs.

In a paper on "Entrepreneurship education and training in Canada: a critical assessment" Ibrahim and Soufami (2002) find that the small and medium size enterprises suffer from a considerably high failure rate that is largely attributed to the lack of management skills & planning which can be improved by providing training and education in the business areas. They

go on to develop a conceptual framework for entrepreneurship training which could be adopted in improving the training of AAFET & WIA participants.

In order to ensure the success of even a micro enterprise potential candidates approved for receiving financial support from the state or federal government need to exhibit to some extent entrepreneurial traits associated with successful entrepreneurs; traits such as need for achievement, independence, control, and willingness to accept reasonable risk in view of the uncertainty in the marketplace with respect to many aspects of operation of an enterprise. In the context of providing management skills ensure that potential entrepreneurs in their educational and training programs acquire the skills of developing strategy, financial planning, and cash flow management, marketing to enhancing sales, and networking to establish contacts in the business community and the government agencies.

Another major problem of the AAFET and WIA programs is the limited follow up of the enterprises initiated through their training and financing activities. Lack of personnel has resulted in limited information about the first year performance of these enterprises and (little or) no information in their succeeding years. In order to evaluate the success of this program it is extremely important that a mechanism be set up where by the following activities can be undertaken.

- A planned number of contacts by Mayagüez region personnel during the 1<sup>st</sup>, 2<sup>nd</sup> and 3<sup>rd</sup> years of operation of the business enterprises. They could undertake 12 visits the first year, 6 the second year and 3 the third year to collect basic information about the business operation and their problems.
- Schedule a seminar every 3 months inviting all the enterprises in each region and provide information and solutions to deal with some of the common problems faced by many of the businesses and identified during the visits by the personnel.
- Revise the curriculum to provide training and practices to learn proper book keeping and accounting procedures.

**Table 1: Years of Business Operation**

| # of years in business | Mean of years | # of Companies |
|------------------------|---------------|----------------|
| ≤ 2                    |               | 4              |
| 2.1 to 3.0             |               | 5              |
| 3.1 to 4.0             | 6.87          | 2              |
| 4.1 to 5.0             |               | 3              |
| > 5.1                  |               | 9              |
| <b>Total</b>           |               | <b>23</b>      |

**Table 2: Distribution of Sales**

| Categories of Sales   | Frequency | Percent (%) | Average of Years in Operations |
|-----------------------|-----------|-------------|--------------------------------|
| Less than \$35,000    | 11        | 48%         | 3.18                           |
| \$35,000 to \$100,000 | 7         | 30%         | 10.14                          |
| More than \$100,000   | 5         | 22%         | 10.40                          |
| <b>Total</b>          | <b>23</b> | <b>100%</b> |                                |

**Table 3: Sales Volume**

| Sales Volume (Annual) |           |
|-----------------------|-----------|
| Mean                  | \$85,890  |
| Median                | \$44,200  |
| Minimum               | \$5,200   |
| Maximum               | \$600,000 |

## TYPOLOGIES OF INFORMAL VENTURE CAPITAL INVESTORS IN SWEDEN

Sofia Avdeitchikova

### **Abstract**

Earlier research has indicated that the informal venture capital market is highly heterogeneous, and that there are several different kinds of investors. However, only a handful of authors have tried to develop typologies of informal investors, to reach a deeper understanding of markets characteristics and functioning. The purpose of this study is to estimate the size of informal venture capital market in Sweden and to analyze its structure by making a categorization of informal investors and identifying differences and similarities between those categories. The aspiration is to determine the distinguishing characteristics of different types of informal venture capital investors in term of background characteristics and investment behaviour. This study is the first to be based on a large representative sample of a countries population, allowing robust categorization and statistical nationwide generalizations.

## INTRODUCTION

Informal venture capital, i.e. private individuals who invest risk capital directly in unquoted companies in which they have no family connection, has gained a major significance in the financing of the entrepreneurial start-ups and growth firms. The Global Entrepreneurship Monitor Report recognizes informal venture capital as the single most important source of new ventures financing, filling the gap between founders, family and friends, and institutional venture capital funds (Reynolds, 2003). In the United Kingdom informal venture capital investors make ten times as many investments and invest four times as much capital as the institutional venture capital investors. Apart from investing money, informal investors contribute their commercial skills, entrepreneurial experience, business know-how and contacts taking a hands-on role in the company (Mason and Harrison, 1995).

Informal investors often undertake the investments that institutional venture capitalists find unattractive, due to high uncertainty and small size of investments. Informal investors are only partly motivated by financial rewards, and therefore can make more risky investments. Furthermore, the transactions costs can be minimized due to the administration costs being small, which makes it justifiable to invest smaller sums of money (Landström, 1993a). Few venture capital firms are prepared to make investments under one million dollars, meanwhile much smaller resources are needed to finance an entrepreneurial start-up and early stage expansion. According to an analysis of the Inc500 “America’s fastest growing private companies” in 2000, 16 per cent of those firms started with less than \$ 1 000, 42 per cent with \$10 000 or less, and 58 per cent with \$ 20 000 or less (Reynolds, 2003). Most of the fastest growing firms in US have therefore started without any financing from institutional venture capital funds.

Several attempts have been made to estimate the size of informal venture capital market, most of them in the US (e.g. Wetzel, 1986; Arum, 1987, Gaston and Bell, 1988; Gaston, 1989), but some even in Canada (Riding and Short, 1987) and in the UK (Mason and Harrison, 2000a). Those studies have provided useful insights in the scale of informal venture capital market in those countries. The estimates have however been based on components like the number of start-ups that supposedly needed external financing and the proportion of informal investors in the population, and the result vary considerably dependant on the assumptions made (Gaston and Bell, 1988). Therefore the more reliable approaches to estimate the scale of the market are needed (Mason and Harrison, 2000a).

In addition, earlier research has indicated that the informal venture capital market is highly heterogeneous and that there are several different kinds of investors (see Gaston, 1989; Coveney and Moore, 1998; Sørheim and Landström, 2001). However the researchers have been mainly interested in one particular group of informal investors, namely the so called “business angels” – investors with high investment activity that contribute considerable resources to the companies they invest in. Thus we have no deeper knowledge about informal investors other than “business angels”, i.e. those investors who make a small number of investments, and those who contribute small amount of resources to the investment object. They are nonetheless the prevalent group of informal investors that have been largely neglected in previous research (Reynolds, 2003). Mason and Harrison (2000b) point out the importance of separating the different types of informal investors from each other, to reach a better understanding of the market. Sørheim and Landström (2001) claim correspondently that by dividing informal investors into several categories, one achieves a more exhaustive picture of informal investors than by viewing them as one homogenous group.

## AIMS AND CONTRIBUTIONS

Despite a long history of research on the informal venture capital in the US and several European countries, the scope and the structure of the market is still a highly unexplored matter (Mason and Harrison, 2000b). Only a handful of authors have looked into the structure of informal venture capital market and tried to develop typologies of informal investors. The classifications are however eclectic, and the methodology used has not been elaborated. The lack of studies on typologies of informal investors can be explained by the difficulties involved in identifying the investors, which makes it problematic to create sufficiently large representative samples (Mason and Harrison, 2000a). In this study informal investors are identified by screening a large random sample of adult population in Sweden. This method of identifying the informal investors is rather costly and time-consuming, and the method is rarely used in studies of informal investors. Based on this methodological approach, the purpose of this study is to estimate the size of informal venture capital market in Sweden and to analyze its structure by making a categorization of informal investors and identifying differences and similarities between those categories.

The aspiration is to determine the distinguishing characteristics of different types of informal venture capital investors in term of background characteristics and investment behaviour, and to quantify the impact of each investor group on the Swedish market. This study is the first to be based on a representative sample of a country population, allowing robust categorization and statistical nationwide generalizations. Further, it gives a more exhaustive and nuanced picture of informal venture capital market structure, functioning and characteristics.

Mason and Harrison (1997) argue that such an analysis could make a significant practical contribution by making it easier to advocate the introduction of specific public and private

measures, which can positively affect the efficiency of the informal venture capital market. A more detailed picture of this market also could help entrepreneurs with the decisions about which type of informal investor to search for.

This paper contains seven sections. In the following section I will present the frame of reference of the study, followed by a description and discussion of the method used. Thereafter the introduction to Swedish market is presented to give a picture of context of the study. The empirical findings are presented in the subsequent section, including description of the sample, categorization, analysis of categories and extrapolation of the result to the Swedish population of informal investors. The final section contains the conclusions and the discussion of results.

## **FRAME OF REFERENCE**

We have a rather good understanding of the characteristics of so called “business angels” through 20 years of research within the field. The first attempt to describe the extent and character of the business angel market was made in the beginning of 1980s by William Wetzel at the University of New Hampshire in the US. After a couple of years Wetzel’s research was followed by a number of other studies from USA (Arum, 1987; Haar et al., 1988; Gaston and Bell, 1988). Informal investors started attracting international attention in the late 1980s and the beginning of 1990s, and research surveys were carried out in Canada (Short and Riding, 1989), the UK (Mason et al., 1991) and in Sweden (Landström, 1992). On the base of this research some international comparisons have been made on the later stage, primarily focusing on the characteristics of “business angels” in different countries (Harrison and Mason 1992, Landström, 1993a). This is what Mason and Harrison (2000b) call “first generation studies”.

In the recent years the research has become more extensive and sharply focused. The “second generation studies” are characterized by an increased interest in the informal venture capital process (Riding et al., 1993, Mason and Rogers, 1997), and a stronger focus on policy issues (Mason and Harrison, 1995, Wetzel and Freear, 1996), but we have also seen an introduction of theoretical approaches in the research such as portfolio management theory (Norton, 1990, Harrison and Mason, 1991), decision-making theory (Landström, 1995, Feeney et al., 1999), agency theory (Landström, 1993b, Fiet, 1995) etc.

### **The scope of informal venture capital market**

The first attempt to estimate the size of informal venture capital market was made by Wetzel (1986) on the US data. Wetzel used what came to be called the *market-based approach*, and based his estimation on two assumptions. On the one hand he estimated the proportion of the start-up companies that needed external financing to 5 per cent, and the amount raised by those companies to \$ 200 000 each. On the second hand, he estimated the proportion of informal investors in the population by looking at the Forbes 400 Richest People in America. He further assumed that those investors would make one investment every two years, and that the average amount invested is \$ 50 000. This gave a total number of 100 000 investors who invested \$ 5 billion. Wetzel (1986) himself acknowledged that the calculations were crude, based on the extrapolation of fragmentary data. However this estimates played an important role in establishing the informal venture capital market as a legitimate field of study, and draw much attention from policymakers (Mason and Harrison, 2000a).

Arum (1987) and Gaston (1989) tried a different approach of quantifying the informal venture capital market called *firm-based approach* (Mason and Harrison, 2000a). A random sample of

SMEs in US was taken to identify those that had raised finance from informal investors. The percentage share of firms raising informal venture capital was extrapolated to the total number of firms in the US, and then multiplied by the total number of investors per firm. The amount invested was calculated using the average size of investment from the initial sample, and further divided by the investment holding period to obtain the annual amount of investment. The final estimation of the number of informal investors in the US was 720 000, and the annual flow of informal venture financing was estimated to be \$ 32.7 billion (Gaston, 1989).

A third approach to estimating the size of informal venture capital market is the *capture-recapture approach* used by Riding and Short (1987). The method is based on measuring the number of times each investor in the sample is mentioned by other investors. The number of informal investors in the studied region (Ottawa-Carleton) was estimated to 87 investors. This is however a very problematic approach in several senses. Due to the regional nature of informal venture capital market, the result cannot be extrapolated to the national level. Further, the approach does not provide information on the number of investments made or the funds invested by the identified population of informal investors (Mason and Harrison, 2000a). Finally, the result depends on the willingness of the investors to give the names of other investors known to them (Lumme et al., 1998).

Finally, Mason and Harrison (2000a) introduced a different approach to measuring the scope of the informal venture capital market. They looked at the “visible part” of the informal investors – those registered in the business angels networks. After calculating the registered number of investors (5 651 in 1999-2000), they made an adjustments for over- and undercounting, and estimated the percentage share of all informal investors that are members in the business angels network. The assumptions made in those adjustments are however crucial for the result. Dependent on the

estimated proportion of registered investors, the results varied between 20 000 informal investors that invested £ 500 million, and 80 000 informal investors that invested £ 2 billion.

### **Typologies of informal investors**

All these studies are however largely concentrated on the group of “business angels”, and we have rather limited knowledge about the informal venture capital market as a whole. Some attempts have however been made to explore and analyze the diversity of informal investors. Gaston (1989) was the first one to identify different kinds of informal investors. He suggested that the informal venture capital investors can be divided into ten distinctive groups based on their background and investment behaviour. Gaston looked especially into investors’ personal characteristics, market activity, investments portfolios and investment goals. However it is not clear what method the author uses to identify those ten groups.

Coveney and Moore (1998) segment informal investors market and identify six groups of informal investors, four active and two passive. The authors choose investment activity, in terms of number of investments and total funds invested, and investors financial and business background as primary criteria to distinguish between the four active types of investors. Another two of identified groups are “virgin” and “latent angels” – those that either never have made investments in unquoted companies, or that currently are not making investments. Coveney and Moore create the detailed profiles of different types of informal investors, allowing for entrepreneurs seeking funds to identify the most appropriate investor. Yet the authors neither describe how the groups are identified, nor do they show the relative distribution of the investors among those groups.

The most recent effort to segment informal venture capital market was made by Sørheim and Landström (2001). Authors identified four types of informal investors by dividing the investors according to their investment activity and competence. The investment activity level is measured as number of investment made and the funds invested, including both former and planned investment. The competence is measured as education and professional and entrepreneurial experience. The empirical findings show that there are considerable differences between the four identified groups of informal investors, regarding among other things the information sources used in the decision process, the level of involvement in the investment, investment horizons etc.

From previous research on diversity of informal venture capital investors we can conclude that several distinctive types of informal investors can be identified, where investment activity level is often used as one of the segmenting variables, together with some background variable(s) of the informal investors. Another common feature of the previous studies is that they suffer from the same methodological shortcomings. In their review of Mason and Harrison (2000b) was concluded that “the single most important methodological problem in undertaking research on the informal venture capital market arises from the great difficulty in finding business angels” (p. 228). The studies have mainly been based on “sample of convenience” whose representativeness could not be verified. The existing estimates of the informal venture capital market are based on extrapolation of fragmentary data (see e.g. Wetzel, 1986; Gaston, 1989), so the more robust estimates of the informal venture capital market are needed.

## METHOD

### Data collection

In this study the data on individuals' investment propensity has been gathered from the large random sample of Swedish population. There are two main purposes with the research design in this study. First, due to statistically random sample being used, both the size and the characteristics of informal venture capital market in Sweden can be determined. Second, there are no pre-requisitions in choosing the investors (e.g. no minimum investment or involvement activity requirement), which makes it possible to capture the variety of investors.

The study started with a random survey of 24 166 private individuals between 18 and 79 years to determine the number of informal venture capital investors in this group. The purpose was to find out how many individuals have within the last five years made non-collateral investments in unquoted companies to which they do not have any family connections; the number of investments made and the amount invested, as well as some background information. The survey was carried out externally by RUAB (Swedish Radio Surveys) and completed March the 31st, 2004. This is the largest sample ever been used in studying informal venture capital investors, and due to its statistical representativeness, the results are extrapolated to the whole population of informal venture capital investors in Sweden.

After the preliminary survey we were able to identify some 861 (3.56 per cent) persons that claimed to have made informal venture capital investments. Each individual were then asked if they were willing to participate in a longer telephone interview. Those 548 who agreed to participate in the second phase of this study were contacted during summer and fall 2004, to get detailed

information about their investments. Out of these, it was possible to establish contact with 396 individuals (72.3 per cent response rate). From this group, 114 did not fulfil the criteria for the informal investors. Some of them have never made investments in unquoted companies; others made investments through intermediaries (such as investment banks and insurance companies) or invested money in a family member's company. 28 individuals did not want to participate, and finally 254 (64.1 per cent) were qualified as informal venture capital investors (see Table 1).

-----  
Table 1 about here  
-----

### **The survey**

All the interviews were made by phone and the structured set of questions was used. The questionnaire consisted of three major sections: general investment activity, three recent investments and background information. After the data were gathered and screened for missing values and data quality, following items were decided on for further analysis (see Table 2).

-----  
Table 2 about here  
-----

## The cluster analysis

Cluster analysis classifies objects (respondents) so that each object is very similar to others in the cluster with respect to some predetermined selection criterion (Hair et al., 1998). Cluster analysis was chosen as a tool for categorization of informal investors in accordance with the purpose of the study.

Based on the previous research (Gaston, 1989, Coveney and Moore, 1998, Sørheim and Landström, 2001) I have chosen to use the informal investors' level of activity as a main dimension for the analysis. As a second segmenting dimension I have chosen the investors' activity in the company that they invest in. According to the definition, "business angels" are hands-on investors (Mason and Harrison, 1995) with high investment activity that contribute considerable resources to the companies they invest in (Sørheim and Landström, 2001). This implies that investment activity, in terms of number of investments made and the contributed resources, and the investor's involvement in the object of investment are central for distinguishing between "business angels" and other informal investors (see Table 3).

-----

Table 3 about here

-----

For the purpose of the analysis I will make a distinction, between who the informal investors are, i.e. background characteristics, and what they do, that is investment behaviour. In the first stage of the analysis the informal investors will be divided with respect to the segmenting variables, and in

the second stage the groups will be compared on the basis of investors' background and investment behaviour, to analyze differences between groups.

As shown in the Table 3 there are two items describing investment activity level (total funds invested and total number of investment) and only one item describing investors involvement in the firm. Therefore the items that describe investment activity level are translated into an index ranging from low (0) to high (2), while investor's involvement can have a value of either (0) or (1). Both variables were standardized before the clustering procedure to make sure that they have the same impact on the formation of clusters.

Selecting the number of clusters is central for the outcome of the analysis. The hierarchical clustering procedure shows the process of cluster formation. In the first step the N-1 cluster solution is produced, where N is the number of objects. In each subsequent step, the number of clusters decreases by one, finally resulting in one cluster (Norusis, 1992). The process of cluster formation can be illustrated in the dendrogram, which shows the construction of the hierarchy (Hair et al., 1998). The dendrogram indicates that the most appropriate number of clusters, which in this case showed to be four.

The selection of number of cluster can also be based on the theoretical or intuitive conceptual assumptions (Hair et al., 1998). The four-cluster solution seems most appropriate since there are two variables ranging from low to high activity that can be combined in four possible ways.

Therefore, using the knowledge on previous categorizations, and to enhance the comparability to other studies (Coveney and Moore, 1998; Sørheim and Landström, 2001) I have decided to accept the four cluster solution.

After the cluster analysis was completed and the four groups were formed, the remaining issue was to make a comparison between groups with respect to those variables that were not used in the clustering. Values in each group were compared in pairs with Independent Samples T-test, using cluster membership as a grouping variable.

### **Strengths and weaknesses of the study**

This study's strength lies in the fact that it is based on a large random sample of informal investors. This is a first study within the area of informal venture capital conducted on a representative sample of a countries population. This means that the results can be extrapolated to the whole population of informal venture capital investors in Sweden. The categorization captures the whole variety of informal investors in Sweden and reflects their actual characteristics.

Another methodological strength is that the data gathering was conducted through telephone interviews. The response rate is very high (64.1 per cent) compared with similar studies in other countries (Sørheim and Landström, 2001, Harrison and Mason, 1992). Furthermore, the personal contact with the respondent reduces risk for the misinterpretation of the questions.

Finally, all data on investment behaviour is based on the actual investment history rather than hypothetical assumptions. This enhances the objectivity and reliability of the data.

The weakness of this study is that the data are gathered solely from the respondents own words. Neither the investment activity nor the background information has been double-checked with the tax authorities. I chose this way of gathering data because of my belief that not all investment

activity is registered, and because of the difficulties to gain access to non-public information through tax authorities.

## **THE SWEDISH CONTEXT**

### **Entrepreneurship and Swedish economy**

Small firms dominate Swedish business and industry, and 99 per cent of all firms have less than 50 employees. The SME sector accounts for 59 per cent of total turnover and employ 58 per cent of the private sector workforce. SMEs have become an increasingly important source of employment and growth as large enterprises no longer create the same number of jobs due to globalization and rationalization of operations (Lundström, 2003).

However, even if small firms are important for Swedish economy, the number of new firms is quite low. The 2003 Global Entrepreneurship Monitor ranked Sweden 31 out of 37 nations in its Entrepreneurial Activity Index (TEA). About 2 per cent of adults in Sweden are currently trying to start a business, and 2.1 per cent are involved in the ownership of a new firm that is less than 42 months old (Reynolds, 2003). Sweden's overall TEA index puts it in the group of low entrepreneurial nations. It is therefore a high priority for Swedish government to support the SME sector, to ensure a stable level of employment and long-term economic growth. The lack of access to finance is considered to be one of the important obstacles to the establishment and development of entrepreneurial ventures.

## **SME financing in Sweden**

A Swedish study by Landström and Winborg (1995) shows that the majority of small firms are reluctant to external equity financing, and that banks are the most important external financial source for small businesses in Sweden. The study is based on the financial data from 320 companies and shows that 86 per cent of the firms rely on bank financing, capital from family and friends are used by 10 per cent of the companies, institutional venture capital by 5 per cent, and only 3 per cent of all companies used to some extent the informal venture capital financing. This implies that Swedish firms rely on venture capital to a lesser degree than their counterparts in the US (Landström and Winborg, 1995).

The difference between Sweden and the US regarding the extent of venture capital reliance can be explained by the fact that the financial systems in those countries are based on two different traditions. Sweden along with Germany, Austria and France has a credit-based financial system which implies a high reliance on debt financing, unlike the US and the UK that represent capital market-based system and are much more equity-oriented (Gerschenkron, 1966 in Zackrisson, 2003).

The difference in use and supply of venture capital, especially the informal venture capital, in Sweden and US can also be explained by philanthropy, which is seen as a part of the American spirit (Acs and Phillips, 2002). While entrepreneurship is the creation of wealth, the informal venture capital investments can be seen as the reconstitution of wealth. This is consistent with Acs and Phillips (2002:190) definition of philanthropy as “giving money or its equivalent away to persons and institutions outside the family without definite or immediate quid pro quo for purposes traditionally considered philanthropic”. Given the high risk associated with informal venture capital

investments, philanthropy can at least partly explain the scope of informal venture capital in the US.

## EMPIRICAL RESULTS

### Data set

Individuals in the final data set have an average age of 47 years (min=18, max=79), 77 per cent are married and nearly half have children under age of 20. The percentage share of men in the data set is 80 per cent. Individuals are quite highly educated, as 86 per cent of them have graduated from high school (Swedish average = 47 per cent), and 62 per cent have some kind of higher education (university or corresponding) (Swedish average = 29 per cent).

About half (49 per cent) of the individuals in the data set are entrepreneurs, some of them with multiple start-up experience, so called “habitual entrepreneurs” (MacMillan, 1986, Westhead and Wright, 1998). Average number of start-ups for those with entrepreneurial background is 1.92 venture (min = 1, max = 15) (see Table 4).

-----

Table 4 about here

-----

Individuals' potential to make investments is dependent on their disposable income and wealth. Wealth and income is quite moderate within the group, where 80 per cent of households<sup>1</sup> have assets worth less than \$ 267 000, and 77 per cent have income less than \$ 100 000 per year. The median wealth is \$ 67 000 – 133 000, and the median income is \$ 67 000 – 100 000 per year.

Investment activity varies substantially between individuals in the data set. The majority of the individuals (58.5 per cent) are fairly low active investors with only one investment, and only 4 per cent have made more than ten investments (see Table 5). The majority of investors have invested between \$ 1 000 and \$ 9 999 (see Table 6).

-----

Table 5 about here

-----

-----

Table 6 about here

-----

The informal investors in the group are mostly passive investors. Only 27 per cent of all investors have taken an active role in at least one of companies that they invested in. Regarding the most recent investment made by the individuals in the data set, their involvement in the company is reflected in Table 7.

---

<sup>1</sup> Household's rather than individual's income and wealth is measured because of my belief that this is a better estimate of capital available for the investment purposes.

-----  
Table 7 about here  
-----

Finally, an important factor to consider when analyzing investments is individuals' risk propensity. It has been previously stated that informal venture capital investors make more risky investment than venture capital funds (Landström, 1993a). Consequently, prevailing number of investments is expected to take place in the early stages of company development, when the risk for failure is the largest. As illustrated in Table 8, 57 per cent of all investments are made in the seed, start-up and early development stages, and very few investments are made in the established and stable companies.

-----  
Table 8 about here  
-----

**Extrapolation of the empirical results**

To calculate the total number of investors in Sweden, the number of investments made and the total funds invested, the results from the sample were extrapolated to the adult population of Sweden. According to Statistics Sweden, the adult population of Sweden at the end of 2004 measured as number of individuals in the age of 18 to 79 years was approximately 6 590 000 individuals.

Out of 396 people that were interviewed 114 were not investors. Under the assumption that the same proportion of people who answered “yes” to the screening question in reality were not investors, the actual number of investors within the sample would be 613 or 2.54 per cent, which is also an estimate of the percentage share of informal venture capital investors in adult population of Sweden. The confidence interval has been calculated to approximately 2.34 - 2.73 per cent, and the number of informal investors in Sweden was estimated to between 154 000 and 180 000. The total funds invested by each group are calculated by multiplying the average investment with the total number of investments in each group. The total amount invested by all categories of informal investors is between \$ 11.65 and 13.6 billion, as showed in Table 9. This is about 40 - 45 per cent of the total funds managed by institutional venture capital funds in Sweden, which at present are around \$ 31 billion (SVCA, 2004).

-----

Table 9 about here

-----

### **Categorization of informal venture capital investors**

According to the purpose of this study this section presents the categorization of informal investors. The results of the cluster analysis yielded in the following informal investor categories (Figure 1).

-----

Figure 1 about here

-----

The definitions of different categories of informal investors on the basis of Figure 1 are following:

- (1) “Micro investors” are characterized by low investment activity and low involvement in the company that they invest in. This means that they make few informal investments, invest small amounts of money and otherwise do not make any sufficient contributions to the investment object in terms of skills and expertise.
- (2) “Fund managers” show high investment activity in terms of funds invested and number of investments made, but have mostly a passive role in the companies that they invest in. This means that they provide considerable financial resources, but otherwise do not take any active roll in the investment company.
- (3) “Mentors” have a low investment activity level, but are actively involved in the companies that they invest in. They contribute with professional expertise and entrepreneurial experience, but their financial contribution is rather small.
- (4) “Business angels” are the most active of all informal investors. They contribute both knowledge and skills to the companies that they invest in, and they show high investment activity in terms of funds invested and number of investments made.

### **Analysis of categories of informal venture capital investors**

Looking at the demographic characteristics of informal investors we can see some major differences between the identified groups of informal investors (see Table 10). There is a considerable difference in the percentage share of men between groups. Among “mentors” and

“business angel” there is a significantly higher proportion of men (96 per cent) than in the “micro investors” group (73 per cent). There are also variations between groups regarding age of the investors. “Fund managers” showed to be older than both “micro investors” and “mentors” with a median age of 52.5 years, compared to respectively 45.5 and 45 years.

Informal investors appear to be rather highly educated, with 62 per cent having some form of higher education. The analysis showed that “business angels” are considerably higher educated than the three other groups of informal investors with a median value of the “university degree”, while there was no difference in the education level among the remaining three groups.

-----

Table 10 about here

-----

Informal investors have as expected quite high entrepreneurial activity, where about half of investors have entrepreneurial experience from one or several start-ups. The entrepreneurial activity range from 44 to 60 per cent between groups, which didn't show to be a significant variation.

“Business angels” and “fund managers” are better-off than other informal investors groups with a significantly higher net worth than both “micro investors” and “mentors”. Further, both “business angels” and “mentors” have significantly higher income than “micro investors”. Moreover “business angels” also have higher income than “fund managers”.

Differences and similarities between groups regarding their investment behaviour can in many cases be explained by variables “investment activity” and “involvement in the company” used in

the cluster analysis. Yet, there are relations that have not been captured during the clustering process.

“Micro investors” together with “mentors” have low investment activity measured as number of investments made and funds invested, in opposite to “fund managers” and “business angels” who have high investment activity, as predicted by cluster analysis. “Business angels” however invest considerably more money than “fund managers”, while “mentors” invest more money than “micro investors” and make more investments than them (see Table 11).

-----

Table 11 about here

-----

Table 11 shows that all four categories of informal investors tend to make investments in rather early stages of development, with start-up or early development as median values. Furthermore, Table 11 indicates that “business angels” tend to invest in earlier stages of development than both “mentors” and “micro investors”. The T-test showed however that difference is significant only in relation to “micro investors”, but not to the other groups.

The overall “investor involvement” level is 27 per cent, and according to the definition of the groups, “mentors” and “business angels” take an active role in the companies that they invest in, while “micro investors” and “fund managers” do not. Yet there is a difference in what role the “active” investors take. Analysis showed that “business angels” are involved in the companies that they invest in mostly as members of the board, while “mentors” generally take consultant positions.

The categories of informal investors can be summarized in the following way:

(1) Micro investors:

- are typically young (median = 45.5 years), have a largest percentage share of women (27 per cent) and tend to have a lower income and net worth than other investor types;
- have the lowest investment activity, take no part in the companies that they invest in and tend to invest in the early development stage of company development.

(2) Fund managers

- are the oldest group of investors (median = 52.5 years), have a near median percentage share of women (21 per cent) and have high net worth and moderate income;
- have high investment activity level but do not take any active role in companies that they invest in and tend to invest in the start-up stage of the company development.

(3) Mentors

- are the youngest (median = 45 years) and male-dominated (96 per cent men) group of investors with low net worth and moderate income;
- have low level of investment activity, but are actively involved in the companies that they invest in, usually taking a consultant position and tend to invest in the early development stage of company development.

(4) Business angels

- have an age near median and are a male-dominated group (96 per cent men) with high net worth, high income and a higher education level than the other categories of investors;

- have high investment activity level, take an active role in the companies that they invest in, usually as members of the board, and tend to invest in start-up stage of company development.

I was not able to identify any differences in level of entrepreneurial experience between groups.

## **CONCLUSIONS AND IMPLICATIONS**

### **Theoretical contribution**

The major contribution of this study is the estimation of the size of informal venture capital market in Sweden, and the categorization of informal investors. The number of informal investors was estimated to 2.34 – 2.73 per cent of adult population in Sweden, or between 154 000 and 180 000 investors. Those individuals have totally invested between \$ 11.65 and \$ 13.6 billion.

Four distinctive groups of informal investors were identified based on their level of investment activity and involvement in the companies in which they invest. The differences and similarities between groups were analyzed with respect to background and investment behaviour variables. By including such variables as gender and age, the important background characteristics of investor categories were captured. The categorization captures the whole variety of informal investors due to absence of methodological pre-requisitions when identifying the investors.

## **Policy implications**

Given the credit-based nature of the financial market in Sweden, the scope of informal venture capital market is surprisingly large. This means that informal investors should be considered important suppliers of start-up and growth financing in Sweden, and that their investment activity should be supported and stimulated.

Different informal investors categories are expected to respond differently to public and private efforts introduced to stimulate the informal venture capital market (Sørheim and Landström, 2001). Establishing the “arenas” where entrepreneurs and investors could meet might be beneficial for the investors with high level of investment activity, i.e. “business angels” and “fund managers”, as they may be interested in gaining access to a larger range of investment opportunities, thereby reducing their search costs. The introduction of “match-making” services might be beneficial even for “mentors” that take interest in investments that they make, but do not seem to fully use their investment potential. “Micro investors” however appear to be very little interested in the access to new investment opportunities judging by their low investment activity and no involvement in their investments. They can be stimulated by tax incentives which make investments in unquoted new ventures more attractive.

## **Acknowledgements**

I would like to thank Swedish Business Development Agency (NUTEK) and Swedish Foundation for Small Business Research (FSF) for the funding that made this research possible.

## **ABSTRACT**

This study examines the demographic profile of 'Tamil' women entrepreneurs in the NorthEast of Sri Lanka who became entrepreneurs as a result of war. Five main areas of interest was examined, namely, i) characteristics of these women entrepreneurs; ii) factors that spurred them into entrepreneurship; iii) their challenges; iv) their measures of success; and v) the demographic profile of these women entrepreneurs. Findings indicate that a large percentage of these women were highly entrepreneurial who were motivated into entrepreneurship to get a better life, be self-reliant and support their families. Many of them went into business only after having lost their husbands at war. Most of these women were married with children and business was seen as a means to an end. These women were educated with a minimum secondary-level education and were involved in businesses such as livestock farming, office services and craft / textile which did not require a high capital outlay and expert skills and knowledge of the business. A large majority of these women were in business for the first time and most of them rated their businesses as successful ventures. Their measures of success were self-fulfilment, and a balance between family and work.

The findings of this research are important for several reasons. The women entrepreneurs of the NorthEast are seen as a powerful driving force for the economic development of the country. However, they lack basic training and development programmes which will be able to transform them into skilful and expert entrepreneurs. Presently, they initiate entrepreneurial ventures based on their own expertise, advice from friends and family, and some aid from their local NGO. INGOs, Donor Agencies and UN Agencies can play a critical role in the upliftment of the socio-economic status of this group of women entrepreneurs.

## INTRODUCTION

The NorthEast of Sri Lanka has been an area that has been ravaged by war for more than two decades now. The war, the result of an ethnic conflict between the Tamils and the Sinhalese of Sri Lanka, has impeded socio-economic development and growth in the NorthEast. Within this region, there has been a sustained struggle for liberation and creation of a separate homeland. The “Tamil Tigers”, as they are more commonly known as, are the defacto government in the NorthEast of Sri Lanka today. After a Ceasefire Agreement that was signed in February 2002, the NorthEast has had the assistance of international non-governmental organisations (INGOs), local non-governmental organisations, donor agencies and foreign government intervention in the socio-economic development of the NorthEast.

Women have played a prominent role in the struggle for liberation as well as for the economic development of the NorthEast region. With a population of approximately 1.8 million, women constitute slightly more than forty percent of the total population. The focus of this study will be on the women entrepreneurs in the NorthEast of Sri Lanka. The women of the NorthEast have been victims of war in different ways. They are often direct victims, being killed, raped or maimed in the process of conflict. There have also been women combatants and the ‘famous’ “suicide bombers” originated from the NorthEast. Women close to armed conflict are often widows, their menfolk having been killed at war. As members of female-headed households, they face an uphill task in fighting to survive and in bringing up their children. It is this category of women that this study will focus on - women who became entrepreneurs as a result of war. There will be five main areas of interest that will be examined: i) characteristics of these women entrepreneurs; ii) factors that spurred them into entrepreneurship; iii) their challenges; iv) their

measures of success; and v) the demographic profile of these women entrepreneurs. The area in focus will be the eight districts in the NorthEast region, namely, the districts of Jaffna, Mullaitivu, Trincomalee, Batticalao, Amparai, Vavuniya, Mannar and Kilinochchi.

## **PROBLEM STATEMENT**

Numerous studies have been undertaken on women entrepreneurs worldwide but none of them have focused on women entrepreneurs in the NorthEast of Sri Lanka. A series of SEED (Small Enterprise Development) working papers by the International Labour Organisation (ILO) has focused on South Asian countries as in Nepal, India, Bangladesh, Pakistan and Sri Lanka, but not on the NorthEast of Sri Lanka. Most studies on Sri Lanka have looked largely at the 'Singhala' women of Sri Lanka and not on the 'Tamil' women of the NorthEast of Sri Lanka. The 'Tamil' women entrepreneurs, a major driving force in the economic development of the NorthEast, is a group of women that has been neglected in past research and needs to be highlighted to attract international aid and assistance for women entrepreneurship development. They are a different breed of women, women who have been subjected to war and women who have come out stronger than most women entrepreneurs in society. This study will highlight this group of women entrepreneurs and present a profile of an undisclosed force.

## **OBJECTIVES**

The objectives of this research will focus on five main areas of interest in drawing out a profile of the Tamil women entrepreneurs of the NorthEast.

- i) The characteristics of these women entrepreneurs will be examined. The “entrepreneurial characteristics” as defined by McClelland (1961), Glennon (1966), Hornaday and Aboud (1971), Timmons (1978), Carland (1984), Yoffie and Bergenstein (1985) and Gartner (1989) will serve as a guideline in determining the entrepreneurial characteristics of these women entrepreneurs.
- ii) The factors that spurred these women into entrepreneurship will be examined.
- iii) Challenges, problems, obstacles faced by these women entrepreneurs will be identified.
- iv) The “measures of success” – how these women entrepreneurs interpret their success will be discussed.
- v) Demographic information about these women entrepreneurs will disclose the profile of these women entrepreneurs in the NorthEast of Sri Lanka

## **REVIEW OF LITERATURE**

Extant literature provides numerous studies that have examined characteristics of female entrepreneurs, motivational factors, success measures, access to capital, and comparisons between male and female entrepreneurs. These studies have focused on female entrepreneurs in developed countries, developing countries and the lesser developed countries. However, none of these studies have focused on female entrepreneurs in war-torn zones. The International Labour Organisation has published a series of working papers on women entrepreneurs and these studies have focused on countries where the ILO has established several programmes to promote women

entrepreneurship development and gender equality as in Africa, Vietnam, Bangladesh, Nepal, Mauritius and Sri Lanka, to name a few. However, the ILO's working paper in Sri Lanka focused on the 'Singhalese' women and not on the 'Tamil' women of the NorthEast. Hence, it can be concluded that there has been no past research on women entrepreneurs in the NorthEast of Sri Lanka.

### **Characteristics of Women Entrepreneurs**

Richardson, Howarth and Finnegan (2004) conducted a study on Women's Enterprise Development (WED) in Ethiopia, Tanzania and Zambia throughout 2002. The WED study confirmed the findings of other research and showed that many women entrepreneurs were motivated by factors and desires very similar to men in starting their own micro and small enterprises – the desire to be self-employed, to be their own boss, to generate an income for themselves and their families, and to utilise skills. The groups of women entrepreneurs in the three countries were shown to have proactively decided to be entrepreneurs, and they were formalising and growing their businesses, rather than being driven by the necessity arising from poverty. In terms of a recent report commissioned by the OECD (Hall, 2003), they were closer to being "growth-oriented women entrepreneurs", rather than "lifestyle" entrepreneurs. Whilst the primary research seemed to show that many of the women's motivations for starting their business were typical of both women's and men's desire for business ownership, differences were seen in women's stated "conditions of start-up." Women entrepreneurs in this WED study and others, refer explicitly to their roles as mothers, wives, daughters, and their need to generate income for the family as important "drivers" for business ownership, whereas other research on men in business shows that men tend to give reasons such as, "to generate income."

An ILO report on the findings of a survey conducted in 2000/2001 on a “Start Your Business” training programme in Vietnam by Barwa (2003) revealed interesting findings on the background information of the Vietnamese women entrepreneurs. Forty percent of the women said that their main reason for starting a business was to supplement an existing family income. Twenty-eight percent said that they had a business idea which prompted them to go into business. The women entrepreneurs were engaged in four main business sectors, that is, trade, agricultural production, manufacturing and service. Many of them were engaged in more than one business activity. As most of the women entrepreneurs owned family-run businesses, 49 percent responded that they employed family members, while only 21 percent employed outsiders on wage employment basis. Nearly 97 percent of the entrepreneurs confirmed that their business performance had improved considerably since their participation in the ‘Start Your Business’ training. Most of them indicated increases in profit, customers and sales.

In studying women entrepreneurs in Bangladesh, Karim’s (2001) report based on desk research and analysis of an earlier ILO study in 1995 found that in general female entrepreneurs in Bangladesh were younger than male entrepreneurs, the average age being 33 years for females, and between 36 and 37 years for males. Most of the female and male entrepreneurs (81 percent) were married. On educational levels, it was found that 42 percent of the female entrepreneurs have less than 10 years of schooling (below the secondary school level), while the corresponding figure of their male counterparts is 56 percent. There were more female entrepreneurs (43 percent) than male entrepreneurs (37 percent) with higher education (secondary school onwards). The study found that the family environment influences the creation of entrepreneurial enterprises. Fifty-eight percent of the women entrepreneurs’ spouses were independent workers,

57 percent of them had self-employed fathers and 88 percent of these women entrepreneurs received support and cooperation from their families. Female entrepreneurs start their business at a slightly earlier age than do male entrepreneurs (27 years for females in rural areas and 28 years for those in urban areas). More than half the female respondents had no previous work experience. The age of the majority of female-headed enterprises (61 percent) ranges between 1 and 5 years. For the majority of the respondents (74 percent), the choice of an enterprise idea results from the natural inclination of respondents, irrespective of education or working experience. The majority of the female entrepreneurs (66 percent) rank desire to supplement family income as the primary reason for starting the enterprise. Preference for earning an income and doing family chores simultaneously ranks second, while pursuing a personal interest or hobby comes third.

Hookingsing and Essoo (2003) in studying female entrepreneurs in Mauritius found that these women were strong willed, showed initiative, were eager to look for avenues of assistance/guidance, and were ready to face challenges, including the somewhat daunting task of going through all the permits procedures in Mauritius. On educational status, 40 percent of the women had a GCE 'O' level and 32 percent had a GCE 'A' level or had studied to a higher level. Overall, 92 percent had secondary-level education and 40 percent had vocational qualifications. It was also found that the younger women were better educated with 81 percent of the women in the age group of 30 to 40 having a GCE 'O' level or higher education. The main reasons cited for starting a business were independence, additional income, the need to be one's own boss, to keep oneself occupied and to have the flexibility to cope with family commitments. The barriers faced

by women entrepreneurs were the hassle of getting permits, the lack of market, the ability to raise capital and not being taken as seriously as men.

A study by Maysami et. al (1999) on female business owners in Singapore revealed that the majority of female entrepreneurs in Singapore had an average age of 41, are mostly married and have an average of two children. Teo (1996) as cited in Maysami (1999) found that most of the female Singaporean business owners had at least 10 years of schooling, while 35 percent held first or postgraduate degrees, 15 percent had professional or polytechnic qualifications and 50 percent had completed secondary-level education. Results from previous studies indicated that prior to setting up their ventures, the majority of female business owners had previous work experience. The majority of these female entrepreneurs were in the service and retail industries. The five major factors which best motivate Singaporean female business owners were: i) the perceived presence of a business opportunity; ii) the desire to put their knowledge and skills into use; iii) the need for freedom and flexibility; iv) the desire to achieve personal growth and recognition; and v) the need to make more money for financial independence (Teo, 1996) as cited in Maysami (1999). Moreover, it was the prospective female owners' own personal decision to start a business in fulfilling their sense of self-worth, and not the influence of family and friends, that inspired them. The most common problems faced by female business owners were lack of a start-up capital, lack of confidence in female business owners' abilities on the part of banks, suppliers, and clients alike, as well as family issues. Factors that Singaporean business women cite as having contributed to their success are product and service qualities, quality of personnel, adequate knowledge of products and services, and customer loyalty.

## **Support Agencies for Women Entrepreneurs**

SEED (Small Enterprise Development, ILO), provides a rich source of materials on women entrepreneurs in Mauritius, Bangladesh, Sri Lanka, Africa and Vietnam. The SEED Working Paper No. 58 (2003) on female entrepreneurship in Mauritius revealed several public sector institutions that were active in supporting small enterprises and entrepreneurship in Mauritius. The Ministry of Women's Rights, Child Development and Family Welfare was aimed at increasing the economic empowerment of women, and the National Women Entrepreneur Council was aimed at creating a strong base of women entrepreneurship culture. In the nineties, the Mauritius Employers' Federation introduced a structured entrepreneurship programme with the support of Management Systems International (MSI), based in Washington. The training programme was aimed at developing entrepreneurs in the country and helping participants improve their management skills and achieve greater success in their enterprises.

The SEED Working Paper No. 14 (2001) on "Jobs, Gender and Small Enterprises in Bangladesh" revealed an aggressive government policy of integrating women into the mainstream of economic development. There were various projects being undertaken to alleviate poverty amongst women who were the poorest of the poor in Bangladesh. Most of these projects targeted poor destitute women and promoted self-employment through income generation activities. There were also a number of United Nations Agencies, Donors, INGOs and NGOs that were engaged in poverty alleviation and women's development programmes in Bangladesh. Prominent among the UN agencies involved are the United Nations Development Programme (UNDP), the International Labour Organisation (ILO), United Nations Fund for Population Activities (UNFPA), the Food and Agriculture Organisation of the United Nations (FAO), the

United Nations Capital Development Fund (UNCDF), the United Nations Children's Fund (UNICEF), and the International Fund for Agriculture Development (IFAD). Prominent donors and financing institutions include the Netherlands, German GTZ, Swedish Sida, Norwegian NORAD, the European Union (EU), USAID, and the Asian Development Bank (ADB). Apart from contributions to self-employment programmes and income-generation activities for poor and destitute persons, USAID and the ILO have been involved in entrepreneurship development at a higher level. USAID has funded the women's entrepreneurship development programmes, and the ILO assisted the Productivity Services Wing of the Bangladesh Employers' Association in providing consultancy training and related services to improve the productivity of small and medium-scale enterprises. The Grameen Bank, almost a household word in Bangladesh, is a success story in rural poverty alleviation, especially among the women, admired around the world. Under the Grameen Bank concept, loans are made available to individuals and groups for self-employment and income-generation activities. A similar concept called the Kalanjiam, a micro-credit system, exists in India.

The ILO-SAAT (International Labour Organisation-South Asia Multidisciplinary Advisory Team) has been engaged in a range of activities to assist women's entrepreneurship development in Bangladesh, India, Nepal, Pakistan and Sri Lanka, all of which are in South Asia, and these programmes have been supported by Swedish Sida, UNDP and the ILO's Regional Office for Asia and the Pacific. As examples of the work undertaken by ILO-SAAT in the 1990s, training materials were developed and field-tested to train trainers in entrepreneurship development for women. Regional Training of Trainers (TOT) programmes were held in Bangalore (India), Chiangmai (Thailand), Colombo (Sri Lanka), Manila (the Philippines) and Kathmandu (Nepal)

at which almost 140 trainers were trained on a specially produced ILO-SAAT manual called GET (Gender + Entrepreneurship Together). The training package – GET Ahead for Women in Enterprise – aims to assist ILO partner organisations in promoting enterprise development among women in poverty who want to start or are already engaged in small-scale business.

In Vietnam, ILO in collaboration with the Vietnam Chamber of Commerce and Industry (VCCI) introduced the Start and Improve Your Business (SIYB) training project (ILO Vietnam Working Paper Series No. 1, 2003). The training project was developed to address the needs for basic business management skills in the micro and small enterprise (MSE) sector and to increase income and employment creation in MSEs. Women who participated in SIYB training reported increases in sales, income and additional money for private spending. The SIYB training offered the women an opportunity to network with other women and to build their confidence. Oxfam-Quebec is a project in Vietnam that has exhibited great commitment in training women entrepreneurs operating at the micro-level, especially women who are engaged in household enterprises.

## **METHODOLOGY**

A survey instrument was developed to capture the information relating to the research objectives. A structured questionnaire was prepared in English and translated into Tamil for the purposes of interviewing the Tamil women entrepreneurs. The resulting questionnaire comprised of five sections. The first section examined entrepreneurial characteristics, the second section looked at factors that stimulated entrepreneurship, the third section identified challenges of

entrepreneurship, the fourth section gathered demographic information and the final section identified measures of success.

A total of 200 women entrepreneurs were randomly selected from the eight districts in the NorthEast. They were all micro-enterprises with less than five employees across a range of businesses. The questionnaires were distributed to the women entrepreneurs and collected after a period of one month. Overall, 139 questionnaires were received at a response rate of 69.5%.

## **SURVEY RESULTS**

The data was analysed based on the five research objectives, that is, i) to identify entrepreneurial characteristics of women entrepreneurs in NorthEast Sri Lanka; ii) to identify factors that stimulated entrepreneurship; iii) to examine challenges of these women entrepreneurs; iv) to draw up a profile of these women entrepreneurs; and v) to determine measures of success used by these women entrepreneurs.

### **Entrepreneurial Characteristics**

Entrepreneurial characteristics as defined by Gartner (1989), Yoffie and Bergenstein (1985), Carland, James W. Hoy, Boulton and Carland, Jo Ann C. (1984), Timmons (1978), Liles (1974), Hornaday and Aboud (1971), Glennon (1966), and McClelland (1961) were examined in the study. The means and standard deviations for the 14 constructs based on entrepreneurial characteristics are shown in Table 1. Mean scores of entrepreneurial characteristics of women entrepreneurs are high in 7 characteristics out of 14 characteristics. This indicates that the women entrepreneurs of the NorthEast are entrepreneurial to a certain extent though not fully.

They scored highly in order of the highest mean score of 1.66 to the lowest mean score of 2.15 in the following characteristics: i) high need for achievement; ii) high level of determination and desire to overcome hurdles and solve problems; iii) high level of confidence; iv) set clear goals for business; v) risk-taking behaviour; vi) opportunity-driven; and vii) profit and growth.

### **Factors That Stimulated Entrepreneurship**

The factors that stimulated entrepreneurship were derived based on the writer's observation after conducting a series of consultancy training sessions with the women entrepreneurs. The means and standard deviations for the 9 constructs based on factors that stimulated entrepreneurship are shown in Table 2. Mean scores of factors that stimulated entrepreneurship in women entrepreneurs were high in 5 of the 9 constructs. This indicates that women entrepreneurs in the NorthEast are motivated into entrepreneurship by the following factors: i) to get a better life; ii) to pursue a business idea; iii) to be self-reliant; iv) to support the family; and v) due to lack of opportunities in the employment sector.

### **Challenges of Women Entrepreneurs**

The term 'challenges' in this study would encompass obstacles, problems, hardships, and limitations faced by the women entrepreneurs, basically socio-economic and political factors. The means and standard deviations for the 6 constructs based on challenges of entrepreneurship are shown in Table 3. Mean scores of challenges of entrepreneurship indicated that the women entrepreneurs in the NorthEast were not challenged by the factors identified in the study. The mean scores very strongly indicated that the challenges were neutral to less important for the women entrepreneurs. Lack of financial support, lack of government support, lack of support

from society, lack of support from family and friends, unstable political environment and lack of knowledge and expertise were not seen as obstacles or problems or hindrances to these women entrepreneurs. This indicates that the women entrepreneurs of the NorthEast were strong willed, determined women who were willing to face the challenges in entrepreneurship to achieve their goals. They were focused on achieving the goals they had set for themselves and pursued their goals against all odds. This is because these were goals that could not be compromised; they were about supporting themselves, their children and their family members. This also indicates that these women entrepreneurs were desperate to survive and make some money from their businesses, hence the challenges did not pose a threat or obstacle to them.

## **Demographic Information**

### **Age of women entrepreneurs**

|          |    |
|----------|----|
| Below 29 | 25 |
| 30 - 39  | 40 |
| 40 - 49  | 44 |
| 50 - 60  | 18 |
| Above 60 | 4  |

The study found that the maximum number of the entrepreneurs (64 percent) were in the age group of 30 to 50, indicating that the women entrepreneurs in the NorthEast went into business only after having lost their husbands at war. They were forced into business to take care of themselves and the family, more so if they had children to support.

### **Marital status of women entrepreneurs:**

|                          |    |
|--------------------------|----|
| Married with children    | 58 |
| Married without children | 7  |
| Single                   | 27 |
| Widow with children      | 37 |
| Widow without children   | 7  |

The results indicated that the majority of the women (43 percent) were married with children, and another 27 percent were widows with children. Overall, 80 percent of the women entrepreneurs were married and 20 percent remained single. However, single women too were involved in entrepreneurship either to support their families or due to unemployment. The NorthEast is a war-ravaged area where employment is very limited. Some women remained single after having being maimed at war, and some avoided marriage and turned to social work as caring for the victims of war, and there is a small percentage that remained single due to fear of losing their spouses at war. This indicates that reasons such as having to take care for themselves, their immediate family, and the children, are some of the main reasons why the women entrepreneurs of the NorthEast went into business.

### **Education of women entrepreneurs**

|                     |    |
|---------------------|----|
| University          | 6  |
| A-Levels            | 26 |
| O-Levels            | 33 |
| Secondary Education | 43 |
| Primary Education   | 17 |
| No Formal Education | 14 |

The results found that 78 percent of the women entrepreneurs had a minimum secondary-level education. Only a small percentage (12 percent) had primary education and 10 percent had no formal education.

Hence, it can be concluded that the larger majority of women entrepreneurs in the NorthEast were educated and literate. This indicates that though a war-torn area, the NorthEast has managed to groom a literate society with provision for schools and colleges.

### **Length of time the woman entrepreneur has been in business**

|                    |    |
|--------------------|----|
| more than 20 years | 21 |
| more than 15 years | 15 |
| more than 10 years | 12 |
| more than 5 years  | 30 |
| 1 to 4 years       | 31 |
| less than 1 year   | 20 |

The results indicated that 60 percent of the women entrepreneurs had been in business for more than 5 years. It has been more than 30 years since the war began in the NorthEast. The women of the NorthEast have been involved in small business activities such as cattle and goat rearing, poultry farming, tailoring, production of spices, provision shops and other small business activities to support themselves and their families due to the hardships of war.

### **Type of business**

|                      |    |
|----------------------|----|
| livestock farming    | 34 |
| office services      | 20 |
| craft / textile      | 17 |
| retail trade         | 15 |
| agriculture          | 14 |
| food product         | 12 |
| manufacturing        | 7  |
| education            | 4  |
| consultancy services | 4  |
| Others               | 5  |

The results showed that the largest percentage (26 percent) of women entrepreneurs were involved in livestock farming. Another 15 percent were involved in office services and 13

percent in craft/textile. This indicates that the women entrepreneurs were involved in businesses which did not require high capital and businesses in which they had prior expertise and experience. These businesses were easy to start with minimum capital requirement and did not require technical knowledge or skills to manage.

**Reasons why the woman entrepreneur chose the business she is in**

|   |    |
|---|----|
| flexible hours  | 82 |
| had the idea for the product or service                       | 33 |
| identified a need in the market                               | 25 |
| had special skills and experience necessary for this business | 70 |
| parents' business   | 36 |

Results indicated that the two main reasons why the women entrepreneurs chose the business they were in were flexible hours and the special skills and experience required for the business that they had.

**Number of employees in the business**

|     |    |
|-----|----|
| 1   | 8  |
| 2   | 10 |
| 3   | 4  |
| 4   | 6  |
| 8   | 1  |
| 9   | 1  |
| 10  | 1  |
| 15  | 1  |
| 16  | 1  |
| 22  | 1  |
| 24  | 1  |
| 30  | 1  |
| 120 | 1  |
| 125 | 1  |

26 percent of the women entrepreneurs had more than 5 employees in their businesses. 74 percent had less than 5 employees in their businesses. This indicates that the women entrepreneurs were involved in businesses that did not require many employees, and businesses which the women entrepreneurs could handle on their own or with their children, as in livestock farming, textile, and office services.

**Is this the first business?**

|     |    |
|-----|----|
| Yes | 92 |
| No  | 26 |

The results indicated that the present business was the first business venture for the larger majority (78 percent) of the women entrepreneurs. This indicates that entrepreneurship is still a very new field to the women of the NorthEast and they are still very new to the idea of “women in business.”

**Previous ventures run by the woman entrepreneur**

|     |     |
|-----|-----|
| 0   | 125 |
| 1   | 5   |
| 2   | 3   |
| 3   | 3   |
| 6   | 1   |
| 8   | 1   |
| 180 | 1   |

The results showed that the majority of the women entrepreneurs (90 percent) were in business for the first time, which reinforces the result of the previous question where most of the entrepreneurs said that this was their first venture.

### **Is the business a success?**

|     |     |
|-----|-----|
| Yes | 111 |
| No  | 15  |

The results showed that most of the women entrepreneurs (88 percent) were very optimistic about their business and believed that their business was a success. This is typical of the people of the NorthEast of Sri Lanka. They are people who have very high self confidence, determination and will power and they have demonstrated this extremely well in their struggle for a liberated homeland.

### **Measures of Success**

This section identified the measures of success as interpreted by the women entrepreneurs; their yardstick for entrepreneurial success.

|                                       |    |
|---------------------------------------|----|
| profit/sale                           | 77 |
| achievement of personal goals         | 51 |
| self-fulfilment                       | 91 |
| a balance between family and work     | 85 |
| growth and expansion of business      | 30 |
| making a difference by helping others | 40 |
| employee satisfaction                 | 51 |
| Social contribution                   | 64 |
| contribution to the economic growth   | 45 |

The results showed that most of the entrepreneurs believed the measures for success for them were either self-fulfilment or a balance between family and work. Another factor that was found to be important was profit and sale. These results were found to be consistent with the findings of the marital status of the women entrepreneurs where they started business ventures to support themselves and their families, and the fact that this is their first and only business venture.

## **DISCUSSION**

The women entrepreneurs of the NorthEast were victims of war. They did not become entrepreneurs out of choice; they became entrepreneurs as a result of war. In their pursuit of supporting themselves and their families, they demonstrated entrepreneurial characteristics and capabilities. They demonstrated high need for achievement, high level of confidence, high level of determination and desire to overcome hurdles and solve problems, and set clear business goals for themselves. These were clearly strong entrepreneurial traits that is required in order to succeed in any business venture and these women entrepreneurs had them. Their strong entrepreneurial characteristics is reflected in their response to the challenges posed to them; they were not deterred by the challenges.

They were prompted into entrepreneurship to get a better life after losing their spouses or breadwinners; to be self-reliant and support their family; to pursue a business idea that they only conceptualised due to the circumstances they were in; and due to lack of opportunities in the employment sector. These women entrepreneurs were not deterred by the numerous challenges they faced because they were desperate to survive and support their families. They were victims

of war who had seen greater challenges during war and entrepreneurship challenges were not an issue compared to the hardships they had undergone due to war.

These women were very confident about the success of their business ventures. For them, success was measured by either self-fulfilment or a balance between family and work. This again reflects their main objective of starting a business venture – to support themselves and their families.

Hence, we find a group of strong willed women entrepreneurs in the NorthEast who act and behave entrepreneurially without even knowing that a term called “entrepreneurship” exists in today’s business world. They are oblivious to their entrepreneurial capabilities and manage their business ventures based on their drive and passion to succeed because failure would mean their children may not be fed and their families may have to go into welfare homes.

These women entrepreneurs were educated middle aged women with families to support. For most of them, this was their first business venture. They were small businesses with less than five employees and were mostly engaged in livestock farming and cottage industries. They went into business mainly because of the flexible hours which they needed to balance between work and family, and also because they already had prior skills and experience required of the business. This meant that they need not have to spend time training or acquiring the necessary skills, they could embark on the business immediately. This was important because they were in business as a matter of survival, though some did mention profit and sale.

Ninety percent of these women entrepreneurs had never managed a business before. Hence, they were managing their business ventures based on trial and error, gut feeling, family support and the occasional training that was given to them by the various INGOs and NGOs in the NorthEast. There is only one active women's organisation in the NorthEast of Sri Lanka involved in helping women entrepreneurs and that is the Centre for Women's Development and Rehabilitation (CWDR). This organisation is aimed at rehabilitating women affected by war and enhancing the quality of life for women in the NorthEast by supporting them in income generation activities. The CWDR is involved in setting up small businesses for women affected by war and also gives out micro-credit financing to these women entrepreneurs.

## **CONCLUSION**

The women entrepreneurs of the NorthEast are an undisclosed 'force'; they are a powerful group of women who have experienced war, if not fought at war, and they were determined to succeed at all costs, in business and in war. They were women who had held a gun and business start-ups and challenges were not a problem or obstacle to them. These women, if trained and developed, could be transformed into dynamic women entrepreneurs. As we are well aware, entrepreneurs can be made and these women entrepreneurs of the NorthEast can be developed to become a strong entrepreneurial force contributing to the economic development of the country. These women can play an important role in the socio-economic development of their country. They can be a major driving force in the rehabilitation and reconstruction of their country that has been ravaged by more than three decades of war.

What these women entrepreneurs need is a structured developmental plan to take them from the basics of entrepreneurship to become skilled and expert entrepreneurs. A structured training and development package such as the ones introduced by the International Labour Organisation in Bangladesh, Vietnam and Mauritius can be introduced to the women entrepreneurs of the NorthEast. These women entrepreneurs who have the confidence and desire to succeed will be very receptive to an entrepreneurial development programme. However, the training programme has to be strategic and structured. In this respect, the International Non-Governmental Organisations (INGOs) can play a more aggressive and participative role in the development of women entrepreneurship in the NorthEast of Sri Lanka. Though it cannot be denied that there is a strong presence of INGOs in the NorthEast, their contribution towards the development of women entrepreneurship is minimal and limited. UN agencies, Donors, INGOs and NGOs can play a more active role in the development of women entrepreneurship in the NorthEast.

The government of the NorthEast can also play a more active role in promoting women entrepreneurship by supporting them in the form of loans, subsidies, overdrafts, micro-credit financing, skills training and entrepreneurship consultancy training. The government can introduce policies which encourage and support women entrepreneurship in the NorthEast. Support agencies to help and assist women entrepreneurs can be set up to ensure the success of women entrepreneurial ventures. The government can include in its strategic plans development plans for women as in vocational training, rural development programmes, establishment of cottage industries production and the creation of facilities for working women and children.

Finally, the society has to be 'educated' to start thinking entrepreneurially. The entrepreneurial mindset must be inculcated at various levels of the social makeup. Entrepreneurship must be seen as a means of enhancing women's life in a holistic way, at a personal level, at the family level, and in the context of the community and society in general.

### **Abstract**

Many studies provide convincing evidence that highly educated individuals, particularly academics, most successfully start up businesses. Survival rates are higher, growth is faster, and innovation more widespread. However, many talented people do not even consider starting a business, but rather restrict their occupational choice on being an employee. We argue that this reluctance is due to a systematically distorted occupational choice decision. We develop a model of becoming an entrepreneur based on prospect theory, and test its implications with a rich data set covering 5,000 students in and around Cologne, Germany. We regress the willingness to become an entrepreneur on an individual's entrepreneurial competence, institutional knowledge (particularly about labor market flexibility or restrictions), and risk aversion. Our empirical results confirm firstly that individual perception can be explained by institutional knowledge and secondly individual perception determines the affinity to become an entrepreneur. Thereby, a lower probability to become an entrepreneur is determined by a low level of institutional knowledge rather than unfavorable facts within the institutional environment. Thus, academic education aiming to increase entrepreneurship should not only concentrate on analytical tools but have a strong emphasis on institutional details, too. At the same time, less skeptical media coverage on institutional constraints and hurdles might as well boost entrepreneurship because it fosters positive perception.

## 1 INTRODUCTION

Birch (1987: 1979) and many follow-up studies (Zacharakis/Neck/Bygrave/Cox 2002; Reynolds/Miller/Maki 1995) provide convincing evidence that newly founded companies create more jobs and economic growth than established and big companies. Among the most successful are highly educated entrepreneurs, particularly academics. Survival rates are higher, growth is faster and innovation more widespread (Davidsson/Honig 2003; Moog/Backes-Gellner 2003). However, many talented people do not even consider starting a business, but rather restrict their occupational choice on being an employee. Explanations based on traditional microeconomic theory argue that regulations in general hinder a market efficient solution for start-ups (for market entry) (OECD 1999) because they reduce entrepreneurial flexibility. For Germany, particularly labor market regulations concerning hiring and firing, overtime and short time work, etc. are supposed to have this effect. Academic start-ups as growing companies and often with personnel intensive production are supposedly hindered to grow due to excessive costs of employing and laying off new employees due to a lack of flexibility. Since there are many restrictions to layoffs in Germany it is argued that it is too difficult and expensive for a start-up company to layoff employees in case of economic downturns. Therefore, they not even consider hiring new employees. Furthermore, if new labor market entrants like academics know about such problems with labor market regulations, they are not willing to start a business. In contrast, it is argued that labor market regulations may help to diminish the effects of market failures and externalities and may therefore be a valuable asset for human resources management (Backes-Gellner/Frick/Sadowski 1995), even for or particularly for start-up companies. The consequences of labor market regulations on start-ups are not determined yet (Freeman/Kleiner 1999).

With our study we go even beyond this rather old discussion and argue that the reluctance of academics to start a business is due to a systematically distorted occupational choice decision. We assume that the individual perception of the relevant regulations for a start-up – irrespective whether this perception matches with real regulations – will have its own, direct impact on the individual's occupational choice decision. We argue that especially the gap between perceived and real regulations concerning institutional flexibility has a strong impact on occupational choice. Therefore, a perception of limited freedom of action for human resources decisions has a significant influence on the willingness to become self-employed.

We assume that the effect is particularly strong for one-men (sole proprietors) and small businesses, because this is most likely the situation when subjective evaluations of the owner are decisive. The owner or potential owner use their subjective evaluation of labor market regulations to calculate potential personnel costs resulting from labor market regulations and its perceived inflexibility. An anticipation of inflexibility leads to an anticipation of lower profits and personal income for the potential founder, which in turn affects his occupational choice in a very early stage. So, in accordance with standard economic theory we assume that expected income plays an important role in occupational choice, but in deviation to standard reasoning we argue the alternative to become self-employed is not only determined by factual labor market regulations but is severely distorted by the *perception* of labor market regulations.

A second deviation from standard economic reasoning is that we do not assume risk neutrality for entrepreneurs. Traditionally, an entrepreneur is seen as risk neutral, which means he is indifferent to income volatility. In our second model, entrepreneurs may as well be risk averse. So, we analyze the impact of different degrees on risk aversion on the probability to become an entrepreneur.

In a third model, we challenge a second assumption of traditional economic entrepreneurship theory, i.e. we no longer assume fully rational decision making in occupational choice. So far, traditional economic entrepreneurship research uses expected utility theory (EUT) with fully rational decision makers<sup>1</sup>. However, there is a vast amount of literature with increasingly convincing evidence for bounded rationality in decision making (e.g.: Goette/Huffman/Fehr 2004; Felten 2002; Shleifer 2000; Gigerenzer/Todd 1999; Selten 1990). The traditional EUT ignores limited knowledge, time restrictions and emotions in decision making. We argue, that taking into account individual perceptions of risk and reference points as a means to evaluate the outcome of a decision, is an important development to explain occupational choice of potential employees/entrepreneurs. Therefore, we use prospect theory to explain the probability to become an entrepreneur (see originally Kahneman/Tversky 1979). According to Kahnemann/Tversky we consider firstly, subjective probability weighting depending on individual knowledge and secondly, that individuals evaluate gains and losses subject to a reference point.<sup>2</sup> Based on these assumptions we will analyze the effect of entrepreneurial competence and the effect of individual income reference points on the probability to become an entrepreneur.

The paper is structured as follows. In chapter 2.1 we present a basic decision tree of the occupational choice decision of a labor market entrant. In the following three chapters we present firstly, a simple rational choice model with a risk neutral potential entrepreneur, secondly with a risk avers decision maker, and thirdly, a prospect theoretical model with decision-makers with bounded rationality. In chapter 3 we specify three alternative empirical models to test the theoretical implications with a rich data set covering more than 5,000 students in and around Cologne, Germany. Finally, we summarize our results and draw first conclusions for entrepreneurship theory and policy.

## 2 OCCUPATIONAL CHOICE AND THE PERCEPTION OF LABOR MARKET FLEXIBILITY

### 2.1 The model - basic assumptions

In the next section we assume that every individual has the choice to become self-employed or not  $\{s,e\}$ , with  $s$  determining the occupational status of being self-employed and  $e$  working as an employee (cf. figure 1). There are two types of decision maker  $j$ : one who perceives labor market regulations to be flexible (*type f*) and the other who perceives them to be inflexible (*type i*). So, *type f* assumes that labor market regulations are not hindering efficient employment adjustments, whereas *type i* anticipates restrictions to employment adjustments. Entrepreneurs of the latter type expect limited flexibility when running their business employees of *type i* expect lower fluctuation and thus stable employment relations. Expected incomes of both decision makers as either entrepreneur or employee are given in figure 1.

Figure 1 about here

When labor market entrants decide on their occupational choice, wages of future employees are assumed to be known and fixed at a certain level. In contrast, entrepreneurial income is assumed

---

<sup>1</sup> Following von Neumann/Morgenstern (1947) or Savage (1954).

<sup>2</sup> People tend to evaluate outcomes as gains and losses relative to a reference point (Moore/Cain 2004).

to vary substantially. The distribution of entrepreneurial income  $S$  is assumed to be known. Standard deviation or range may reach quite high levels. However, to keep matters simple, we assume a symmetric distribution.<sup>3</sup> Entrepreneurial income is determined by developments in the respective market. Here we distinguish between three situations:

a) Steady state. In this scenario the market develops steadily along a stable trend. An entrepreneur can easily foresee the labor volume at any given time he or she will recruit the number of employees that is needed for an efficient production and there will be no need to adjust staffing plans. Entrepreneurial income that is generated under this scenario is  $s_j^b$ .

b) Market underperformance due to not predictable future events. Those events lead to a diminishing demand and the need to downsize. This market situation will lead to a lower entrepreneurial income  $s_j^a$ , which is assumed to be even lower than employee income  $w$ .

c) Market overperformance. Demand booms far more than expectable and labor volume is much higher than planned. An entrepreneur can either hire additional personnel or have people work overtime, but very likely at additional cost. Overperforming markets are in general assumed to lead to higher entrepreneurial income  $s_j^c$ , although profit might not increase as much as sales due to excessive expansion costs resulting from inflexible institutional arrangements. However, we assume entrepreneurial income in overperforming markets always to be higher than in stable or underperforming markets. So,  $s_j^a < w_j < s_j^c$ .

Entrepreneurial profit or income is sales minus cost. So, depending on labor intensity of production, entrepreneurial income is more or less influenced by employment costs. Producing at suboptimal employment levels diminishes entrepreneurial income.

If markets perform worse than expected (case a), it is in the entrepreneurs' interest to reduce their employment level instantly. If this is not possible or at high adjustment costs only, profits are negatively affected. Therefore, *type i* entrepreneurs expect lower flexibility and higher adjustment costs than *type f* entrepreneurs. Accordingly, *type i* entrepreneurs anticipate lower entrepreneurial income than *type f* entrepreneurs due to suboptimal employment levels or high adjustment costs, so  $s_f^a > s_i^a$ .

In contrast, in a stable market situation (case b), the entrepreneur has no need to deviate from his planned employment levels. So both kinds of decision makers, *type f* and *type i*, expect similar costs because there are no unforeseeable adjustment costs. Therefore, entrepreneurial income is assumed to be identical: so  $s_f^b = s_i^b$ .

If markets perform better than expected (case c), entrepreneurs need to increase their employment level more than planned. In such a situation *type i* entrepreneurs will hire employees more carefully or more slowly than *type f* entrepreneurs because of their perception of inflexible labor market regulations: *Type i* entrepreneurs fear the costs of having to lay off those employees in case markets adjust downwards again. Therefore, *type i* may temporarily produce below the optimal employment level, for example by using overtime with overtime premia in order to produce on a higher level. In contrast, *type f* entrepreneurs will adjust their employment level instantly to any market situation. Therefore, they always work at an optimal employment level

---

<sup>3</sup> We thereby ignore studies that give reasons to assume that entrepreneurial income is not symmetric. Lazear (2004) e.g. concludes that entrepreneurial income should be skewed.

and thereby expect to generate higher profits (and entrepreneurial income) than *type i* entrepreneurs. So  $s_f^c > s_i^c$ .

On top of the aforementioned effects, the perception of labor market regulations and particularly the flexibility to adjust employment levels also exerts an effect on the expected income of the different types of employees  $w_f$  and  $w_i$ . On one side, *Type i* assumes a stable employer-employee relation due to his perception of strong labor market regulations and low flexibility. Therefore, employee income  $w_i$  is considered to be riskless. On the other side, *type f* anticipates frequent layoffs and fluctuation. Therefore, *type f* employees do not consider income to be fully downward rigid, which leads to lower expected incomes for *type f* than for *type i*. So:  $w_f < w_i$ . Now we analyze how these assumptions on income etc. affect a risk neutral decision maker.

## 2.2 Risk neutral decision makers: perceptions of labor regulations and their impact on occupational choice

A risk neutral individual decides on his occupational choice based on expected income  $E(s_j)$ . Expected entrepreneurial income is  $E(s_j) = qs_j^a + ps_j^b + qs_j^c$ . Expected employee income is  $w_j$ . So the decision to become entrepreneur or employee is taken according to the following rule:

If  $qs_j^a + ps_j^b + qs_j^c < w_j$  with  $j \in \{i, f\}$  the individual decides to become employee.

If  $qs_j^a + ps_j^b + qs_j^c \geq w_j$  with  $j \in \{i, f\}$  the individual decides to become entrepreneur.

If expected entrepreneurial income is higher than expected employee income, an individual prefers to be self-employed. If we apply this decision rule to the two different types of individuals *i* and *f*, we obtain the following results for occupational choice.

If we compare decisions of *type f* and *type i*, we see that a decision maker of *type f* who perceives labor market regulations to be more flexible, is more likely to become self-employed for two reasons: Firstly, in case of an under- or outperforming market, anticipated entrepreneurial income of *type f* is higher, i.e.  $E(s_f) > E(s_i)$ . Secondly, *type f* as an employee anticipates higher fluctuations than *type i*, so expected employee income of *type f* is lower wage than expected income of *type i*, i.e.  $w_f < w_i$ . Both effects result in a higher probability of *f type* decision makers to become entrepreneurs. So we obtain a first hypothesis.

*Hypothesis 1:*

*Individuals who perceive labor market regulations to be restrictive have a lower probability to become self-employed than individuals who perceive labor market regulations to be flexible.*

So, whenever costs of obtaining full information on labor regulations are high (e.g. due to a large number of a vast variety of regulations) entrepreneurship rates are low independent of de jure and de facto flexibility. It's perceptions that matter.

## 2.3 Risk avers decision makers: entrepreneurs as innovators rather than risk takers

In a second step, differences of the decision maker in the attitude towards risk are integrated in our model. In standard economic theory employees are assumed to be risk avers and entrepreneurs to be risk neutral. We assume that even entrepreneurs may be risk averse. From Knight's point of view the constitutional characteristic of an entrepreneur is to take and to deal with risk generated by capital restrictions. So the entrepreneur is assumed to be risk neutral.

However, Schumpeter separates the entrepreneur (identifying opportunities to barter, trade, or innovate) from the individual(s) supplying capital; the first is generating innovation etc, the latter is taking the financial risk. Accordingly, the entrepreneur may as well be risk averse and can still run a business.

To analyze the effect of risk aversion on occupational choice, we have to deal with the expected utility of an individual. We compare the decision situation of a risk neutral and a risk averse individual. The general rule of occupational choice can then be modeled as follows:

$$EU(s_j) = qu_r(s_j^a) + pu_r(s_j^b) + qu_r(s_j^c) \geq u_r(w_j) \implies \text{entrepreneur}$$

$$EU(s_j) = qu_r(s_j^a) + pu_r(s_j^b) + qu_r(s_j^c) < u_r(w_j) \implies \text{employee} \quad \text{with } j \in \{i, f\}$$

$u_r$  is a Bernoulli utility function with a constant, absolute degree of risk aversion with  $u_r' > 0, u_r'' < 0$ . Since being self-employed is associated with substantial risk (associated with situations a to c), a risk averse decision maker expects a positive risk premium if he is to become an entrepreneur. The risk premium increases the more risk averse the individual is.

*Hypothesis 2: The higher is the degree of risk aversion, the lower is the probability of becoming an entrepreneur.*

At the same time it can be shown that the general pattern of hypothesis 1 does not change. *Type f* individuals are more likely to become entrepreneurs than *type i* individuals. But the decision of *type i* individuals is more heavily influenced by the degree of risk aversion than decisions of *type f*. This results out of two aspects: a) *Type i* expects a lower entrepreneurial income and a higher wage than *type f*. b) The variance of the expected entrepreneurial income is higher for *type i*.

## 2.4 Decision-makers and bounded rationality: occupational choice and prospect theory

Based on prospect theory developed by Kahneman/Tversky (1979) we analyze the influence of systematic deviations from rational decision making on occupational choice. First, Kahneman/Tversky (1979) have provided extensive evidence of departures from the prediction of expected utility theory. Unlike EUT assumes, individuals' estimates of probabilities are systematically biased, i.e. they use an individual decision weight function. Second, individual's perceptions are attuned to the evaluation of changes rather than to the evaluation of absolute magnitudes. Previous experiences define a reference point. Decision outcomes are evaluated in relation to this reference point and decision-makers appear to be more adverse to losses, relative to their reference point, than attracted by gains of the same size (Kahneman/Tversky 1979).<sup>4</sup>

The *decision-weight function*  $g_\gamma$  is a transformation of the objective probabilities  $p$  and  $q$ . The function is monotonically increasing, with discontinuities at 0 and 1. It systematically overweighs small probabilities and underweighs large probabilities (Moore/Cain 2004). The extent to which objective probabilities are over- or underestimated is assumed to depend on the level of competence of the decision maker, which is specified with the following function.

$$g_\gamma(p) = \frac{p^\gamma}{(p^\gamma + (1-p)^\gamma)^{1/\gamma}} \quad \text{with } \gamma = f(\text{competence}), 0 < \gamma \leq 1.$$

---

<sup>4</sup> The idea that the carriers of utility are changes of wealth rather than asset positions is a cornerstone of prospect theory (Kahneman/Tversky 1979).

The more competent a person is, the less distorted is the decision-weight function and the higher the level of *incompetence*, the higher is the bias in this function. Thereby, an individual's occupational choice decision is systematically distorted depending on his or her competence level. So, based on prospect theory we expect that the decision to become an entrepreneur is systematically distorted depending on the competence level  $\gamma$  of the decision maker. Occupational choice can thus be modelled as follows:

$$P(s_j) = g_\gamma(q)u(s_j^a) + g_\gamma(p)u(s_j^b) + g_\gamma(q)u_r(s_j^c) \geq (g_\gamma(q) + g_\gamma(p) + g_\gamma(q))u(w_j)$$

⟹ entrepreneur

$$P(s_j) = g_\gamma(q)u(s_j^a) + g_\gamma(p)u(s_j^b) + g_\gamma(q)u_r(s_j^c) < (g_\gamma(q) + g_\gamma(p) + g_\gamma(q))u(w_j)$$

⟹ employee

How does this affect the probability to become an entrepreneur given the above mentioned decision tree? According to our assumptions entrepreneurs are faced with a symmetric function of market situation. Steady market trends are most likely and over- or underperforming markets are less likely. So, the mass of the probability function is concentrated around a steady market development ( $s_j^b$ ) which has a probability of  $p_b$ , which is higher than that of ( $s_j^a$ ) and ( $s_j^c$ ), so  $p_b > p_a, p_c$ . If individual competence is high, the individual's subjective probability distribution ( $g_\gamma$ ) hardly differs from this objective probability distribution. In contrast, if an individual's competence is low, the subjective probability distribution is heavily distorted. According to the assumptions of prospect theory, small probabilities are overweighted, so the probability of ( $s_j^a$ ) and ( $s_j^c$ ) is overweighted. At the same time the remaining probability of a stable market development ( $s_j^b$ ) is underweighted. An incompetent decision maker will weigh the smaller probabilities ( $q$ ) of over- or underperforming markets higher than a competent decision maker. In contrast, he will underweigh the high probability ( $p$ ) of stable market developments. The incompetent decision maker redistributes probability mass from the stable market situation to the over- or underperforming market situation. Thus, the incompetent decision maker "gains" by overweighting excess profits ( $dc$ ), but at the same time he "loses" more by overweighting unexpected losses ( $da$ ). As long as the utility function is concave, the "loss" due to incompetence  $da$  exceeds the "gain" due to incompetence  $dc$ .

To illustrate the effect on occupational choice we distinguish between two kinds of decision makers (cf. table 1): a perfectly competent decision maker who uses the objective probabilities to calculate his prospects, and an incompetent decision maker who weighs the probabilities with the function ( $g_\gamma$ ).

Table 1 about here

Thus, an incompetent decision maker will always get lower prospects from being an entrepreneur than a competent one. This leads us to a third hypothesis regarding the probability to become an entrepreneur:

*Hypothesis 3a: All else being equal, incompetent decision makers are less likely to become entrepreneurs than competent decision makers. The more competent a decision maker is, the higher is the probability to become an entrepreneur.*

Secondly, the assumption that individuals evaluate risky prospects on the basis of changes relative to some reference point, they become risk averse towards gains and risk loving towards losses. They value large gains less than proportional and large losses less than proportional, which is in line with (experimental) evidence (Kahneman/Tversky 1979). So we introduce a reference point into our occupational choice model, assuming that previous income may be the reference point for occupational choice.

*Hypothesis 3b: All else being equal, decision makers having higher previous income should be more likely to become an entrepreneur than decision makers with lower previous income (because the first ones value losses less severe).*

### **3 DATA, MEASUREMENT ISSUES, METHOD AND EMPIRICAL RESULTS**

We test our hypotheses with our own database (Cologne Founder Study<sup>5</sup>). It is a very rich data set, which was gathered to analyze the potential of academic start-ups. The dataset is a sample of students from five universities in the metropolitan area of Cologne. It contains of 3,806 students. The data were collected with a standardized questionnaire sent out by mail in 1998/99. The questionnaire includes more than 300 variables. For every student we have data about their perception of different labor market regulations and expected market conditions. Moreover, we have information on formal education and work experience (employed and self-employed), which partly determines their competence level. We have information on their willingness to become entrepreneur as opposed to becoming an employee. Furthermore, we have a big number of objective and subjective indicators concerning personal attitudes, like importance of job characteristics, valuation of entrepreneurs in society, or intention of studying.

*Measurement of the dependent variable: probability of becoming an entrepreneur*

The dependent variable we use is the “willingness of a student to become self-employed”. Since students usually have not finally taken their occupational decision while still studying, and therefore neither entrepreneur nor employee, we can only take their “willingness to become an entrepreneur”. However, as many empirical studies have shown, actual entrepreneurs are a subsample of the so called nascent entrepreneurs. So someone who never thought about becoming an entrepreneur is almost certain to become an employee, and someone who considers becoming an entrepreneur in an early stage of his occupational choice will become an entrepreneur with a positive non trivial probability (z.B. Franke/Lüthje 2002; König/Meder/Schulz 1999; Hinz 1999; Welter/von Rosenblatt 1998). So our results can be interpreted like an upper bound of the probability to become an entrepreneur.

Our dependent variable “willingness to become entrepreneur” is a discrete variable ranging from -4 (low willingness to become entrepreneur) to +4 (high willingness to become entrepreneur). It is calculated based on several likert scaled occupational preference items and therefore treated as

---

<sup>5</sup> The students database is, next to another company database, part of a project supported by the German Research Foundation (DFG) in the context of “interdisciplinary start-up research”. We express our thanks to the Deutsche Ausgleichsbank (DtA), the Sparkasse Köln and the City of Cologne for their financial support. For more information about the project and the survey see Backes-Gellner/Demirer/Moog (2000).

quasi-metric (Peel/Goode/Moutinho 1998). As the distribution of the variable is also close to a normal distribution (table 2), we use OLS to test our empirical implications.

|                    |
|--------------------|
| Table 2 about here |
|--------------------|

35 % of all students in all five universities have a strong interest in becoming an employee (-4 to -2). Only 17 % of the students have a strong willingness to become an entrepreneur (+2 to +4). Most of the students (46 %) are still more or less indifferent.

#### *Measurement of independent variables*

In the next section we specify three empirical models to analyze the willingness to become an entrepreneur. The three empirical models follow the three alternative theoretical assumptions and models given in chapter 2. The independent variables we use are driven by the variables discussed in the respective chapters and are summarized in table 3. In addition to the explanatory variables derived from our theoretical models, we use a number of standard control variables, such as gender, numbers of semester studied, faculty enrolled in, importance of ideas, importance of fame/reputation or the actual financial status.

This leads us to the following three empirical models.

|                    |
|--------------------|
| Table 3 about here |
|--------------------|

#### *Model 1:*

$$\text{Willingness to become an entrepreneur} = \beta_0 + \beta_1 \text{flexlaw} + \beta_2 \text{flexreg} + \text{control variables} + \varepsilon$$

First, we test the influence of the perception of labor market regulations. We differentiate between the perceived (in)flexibility due to labor law ( $\beta_1$ ) and the perceived (in)flexibility due to collective bargained regulations ( $\beta_2$ ). The higher the coefficient is, the higher is perceived flexibility. So, according to hypothesis 1 we expect  $\beta_1$  and  $\beta_2$  to be positive, because a higher labor market flexibility should lead to a higher willingness to become an entrepreneur.

#### *Model 2:*

$$\text{Willingness to become an entrepreneur} =$$

$$\beta_0 + \beta_1 \text{flexlaw} + \beta_2 \text{flexreg} + \beta_3 \text{riskavers} + \beta_4 \text{promotion} + \text{control variables} + \varepsilon$$

Model 2 is an extension of model 1 and adds variables covering the degree of risk aversion of the decision maker. A first variable we use, is the importance of a foreseeable future income ( $\beta_3$ ). We assume that a student is more risk averse, the more important it is for him or her, that his future income is foreseeable (not subject to irregular changes). So, we expect  $\beta_3$  to be negative because the more risk averse a person is, the less likely he or she is to become an entrepreneur. A second variable we use is the importance of foreseeable promotions ( $\beta_4$ ). Here we also expect a negative coefficient because again, the more important it is that the career is foreseeable, the higher is risk aversion and the lower is the probability to become an entrepreneur.

#### *Model 3:*

$$\text{Willingness to become an entrepreneur} = \beta_0 + \beta_1 \text{flexlaw} + \beta_2 \text{flexreg} + \beta_3 \text{riskavers} + \beta_4 \text{promotion} + \beta_5 \text{friend} + \beta_6 \text{parents} + \beta_7 \text{self-employed} + \beta_8 \text{freelancer} + \beta_9 \text{apprentice} + \beta_{10} \text{internship} + \beta_{11} \text{employee} + \beta_{12} \text{infointens} + \beta_{13} \text{actfinstat} + \text{control variables} + \varepsilon$$

In the third model, we include a set of variables to operationalize the competence level. In general we assume that people who have a broader information base have a higher competence level when forecasting potential market developments. Firstly, we use a set of variables about the *entrepreneurial spirit in the social surrounding* of a student, because we assume that students who are in contact with people who are entrepreneurs implicitly learn from them how to evaluate their market. We ask whether the student has a friend who started a business or whether their parents work as entrepreneurs. Secondly, we use variables representing a student's *work experience in an entrepreneurial context*. We ask whether they have any experience as an entrepreneur or whether they have been working as a freelancer, which is quite similar to being an entrepreneur. Thirdly, we use general work experience as an indicator for the level of *general business related competence*. Here we asked whether they ever went through an apprenticeship, worked as an intern or as an employee. We assume, if students have more experience in practical work and real business experience they have a higher competence level to assess potential opportunities as well as problems and market conditions in general. So, the more general the students work experience is, the higher is their willingness to become self-employed. A fourth variable to measure the competence level, is the intensity of economic information intake. We assume, the higher is the number of news-media students use for economic information, the higher their competence and thereby, the higher their willingness to become an entrepreneur. *Control variables*: In addition to the explanatory variables, we use a number of control variables which are common in occupational choice studies. These are e.g. the importance of realizing ones own ideas, dummy variables for field of study and sex, or number of years studied.

Table 4 summarizes the results of OLS regressions. Results for model 1 clearly indicate that entrepreneurship is determined by individual perception of labor market flexibility (labor law and collective agreements). Both variables are significantly positive, i.e. the higher is perceived flexibility, the higher is the willingness to become an entrepreneur. The perception of the (in)flexibility due to collective agreements has a stronger influence than that of labor law. The second model shows that the willingness to become entrepreneur is affected by an individual's degree of risk aversion. The higher the risk aversion the less pronounced is the willingness. The impact of foreseeable income is stronger than the importance of promotion. The two additional variables in the regression model do not lower the significance of the flexibility variables. So, the perception of labor market regulations remains significant. The fit of model 2 is better. This indicates that the degree of risk aversion is important for the entrepreneurial choice.

Table 4 about here

Model 3 provides mixed results. Firstly, entrepreneurial experience, general knowledge, work experience, and entrepreneurial competence in the social surrounding are positively correlated with the willingness to become an entrepreneur. Surprisingly, entrepreneurial parents have no significant effect. The intensity of economic information intake has a significant positive influence on start-up willingness. Students who use more news media to stay informed have a higher willingness to become entrepreneurs than students who are less well informed. Having

personally experienced being an entrepreneur in the past significantly increases the willingness in the future. Working as a freelancer has no effect, as well as having finished an apprenticeship. Looking at working experience as an employee, we find a significant negative effect on becoming an entrepreneur. However, the competence gained by participating in an internship significantly increases the willingness. This might be caused by the fact that internships are generally located in higher hierarchical level than students working as regular employees. The actual financial status as a reference point has the expected positive effect. The variables from model 1 and 2 remain important. The influence of the perception of flexibility of collective agreements becomes stronger, the perception of labor law becomes insignificant. The degree of risk aversion measured by importance of foreseeable income remains significantly negative. Overall, the use of our competence variables in the regression increases the fit of our model. It explains 32 % of the variance in the willingness to become an entrepreneur.

#### 4 CONCLUSION

The aim of this paper was to analyze theoretically and empirically the decision to become an entrepreneur, and particularly to see whether prospect theory helps to better explain this occupational decision. We start with a traditional decision model of occupational choice, we then introduce varying degrees of risk aversion into our model, and finally we use the concept of weight probability distribution from prospect theory to explain occupational choice. Based on these models we expected the willingness to become entrepreneur to be higher if labor market regulations are perceived to be more flexible, if individual risk aversion is lower and if general entrepreneurial competence is higher and the reference income is higher. All implications are borne out in the data. Particularly, we find positive effects of a more positive perception of labor market flexibility (independent of real facts) and of a higher business and entrepreneurial competence level. Therefore, we firstly conclude that not only de jure or de facto regulations matter, but even more so media coverage of labor market flexibility. Public opinions driven by media affect individual perception of flexibility and thereby the willingness to think of becoming an entrepreneur. Due to bad news many students may be withheld from considering becoming an entrepreneur in a very early stage. Since individual perception of flexibility concerning regulations has one of the strongest impacts on occupational choice, media coverage on this subject is probably very important for the entrepreneurship rate in a country. Secondly, since we find that higher competence levels have a positive effect on the willingness to become entrepreneur, the amount at which real facts on labor market regulations and market developments is taught, might be important for the entrepreneurship rate. Higher competence of students to evaluate market opportunities and risks realistically is also a major factor increasing the willingness to start a business. So if a university wants to increase its entrepreneurship potential, teaching market competences by case studies, guest lecturers and business plan competitions are likely to increase the willingness to consider entrepreneurship as a realistic occupation alternative. As regards the explanatory strength of different theories, we find prospect theory to be very powerful since it introduces the degree of competence about a subject or decision area as an important variable. Competence determines the deviation of the individual decision-weight function from the objective probabilities and thereby the prospect of being self-employed strongly.

**Table 4: Results of the OLS regressions**

| Dependent Variable: Willingness to become entrepreneur | Model 1            | Model 2            | Model 3           |

**The impact on growth from public seed-financing to  
new technology projects in small enterprises**

Lars Bager-Sjögren\*

Hans Lööf\*\*

**Abstract**

In Sweden, NUTEK (the national board for technical and business development at that time) being one of the main actors, supplied conditional loans between 1994 and 2004 to new technical project mainly pursued in small business. In this study we analyze the development of the firms supported 1994 to 1997. We compare the population of supported firms with a population of firms not funded by NUTEK but with the same age, size and business sector affiliation.

This study differs from other studies in having longitudinal annual report data for both populations of supported and not supported enterprises between 1990 and 2003. The main result from the analysis of survivors is that the support to new technical project has had no effect when considering all supported firms. Also in sub-populations as only independent firms and independent firms within the manufacturing sector, no positive additionality emerged.

For new and independent firms, established between the years 1994-1997 there are increases in sales, increases in employment, increases in productivity and increases in solidity were all larger for the supported firms than the comparison group of non-supported firms. There is thus evidence that public support for technical projects may have societal positive effects but only for a limited population of firms, the newly started and independent ones.

## **Introduction**

One common policy tool stimulating innovation is the supply of public seed financing support to new technology projects. In for example the USA the SBIR program is targeted to this (Wessner 2000, Lerner 1999, Wallsten 2000) In Sweden authorities like National Board for Technology Development (STU) in the 1970ties and 1980ties and its later incarnation The National Board for Economic and Technologic Development (NUTEK) has supplied a similar type of support. The reason for this is the alleged importance of new technology in economic growth and that new technology seems to be more likely to be introduced in new enterprises mainly because these are not affected by sunk costs from earlier technology investments (Oakey 199?). The "valley of death" debate (Wessner ibid) has underlined the need for seed financing support to especially new technical small firms which is the character of the programs mentioned above. This paper is written with the background that in Sweden no comprehensive quantitative evaluation of such programs has taken place. Process evaluations and surveys on participators have been made but no scrutinization of the alleged growth contributions of the seed financing programs has actually been performed. This paper is a start of such an endeavor by making an analyze using only administrative data on annual report. The papers outline is as follows: first we briefly present the NUTEK seed financing program. Secondly we define main variables of interests and discuss the dilemma of evaluation and how we in this study try to coop with that. In the third section we present the results and make some conclusions about the limitations of the results and paths for further research.

### **The NUTEK program for seed financing of new technical projects**

The National Board for Economic and Technologic Development (NUTEK) in Sweden and its predecessor National Board for Technology Development (STU) has since the end of 1960ties supplied conditional loans for product development projects.

The general aim with this support was to finance development of products and processes based on the application of new technology with large commercial growth potentials.

It is to be noted that the support is supplied not to firms but to projects or ideas which can equally be hosted in an already established enterprise as in a newly started one. The support has mainly been in the kind of conditional loans but also grants has been supplied but in a lesser degree and amount (Table 1). A conditional loan in the NUTEK form is a loan which must be paid back if the project generates a commercial application which in turn generates sales. In order to receive support the enterprise must finance at least half of the estimated project budget. The loan might be distributed in sequences in order to insure that the project progress according to plan. The amortization payment of the loan starts if the project generates incomes. The payment of interest can be capitalized and postponed up to five years. According to the Swedish venture capital Association these kinds of loans among venture capitalist are considered more like equity increase than debts. However it must be noted that in contrast to equity which earn its rate of return conditional on performance i.e. profits generated the conditional loans of NUTEK must be reimbursed on positive sales although break even is not reached. In this respect the conditional loans put a harder pressure on the company to enforce the commercialization process.

There is a backdoor for enterprises not having enough means to amortize if according to plan and that is to change the loan to a royalty agreement.

---

*Table 1 about here*

---

Table 1 depicts number of loans distributed in the period of 1994 to 2003. In total 498 conditional loans amounting to almost SEK 400 million (approx \$50 million) was supplied to technical projects. In table two the distribution on supplied seed money exhibits that on average this amounted to SEK 340 000 (\$50 000).

---

*(Table 2 about here)*

---

In this paper we will focus on conditional loans supplied between the years 1994-1997. The reason for this is to have a reasonable time for success to emerge. In public programs notorious references are frequent about success in a distant future. A relevant question posed is: What is the distribution for projects with both new technology relevance and high commercialization potential? In this paper we are inspired by two sources to set a success time frame. The first is the experience of venture capital investments which on average has a time frame between three to seven years. However considering that these projects are in the very early phase where venture capitalists in lesser degree do investments we also consider the results from an earlier evaluation of the repayment of conditional loans. Reitberger (1982) analyzing such repayment in form supplied conditional loans in the 1970 concludes that if a project has not generated income after five years it must be considered a failure. Another interesting factual from Reitberger (1982) as the estimation of success ratio as the proportion project actually realized a reimbursement of loan. For small enterprises this proportion was 5 percent or one company out of twenty.

The general problem to analyze effect of project success is economic data on project level. In Sweden there is no such database, so one has to resort to assumptions regarding the influence the project have on the total of enterprise performance. For small firms it might be a reasonable assumption and especially for new, small firms the assumption that the project dominates the enterprises economy and performance seems realistic.

### **Variables of interest, data and method of analysis**

Commercial success is undoubtedly to generate profits. However in order to generate profits you have to generate sales. Thus a relevant success criterion must be data on sales.

Considering that we actually study project in a early stage sales might not be the first "success". The project success actually lies in pushing the concept to commercialize forward

in order to make more reliable for private equity investment. A success indicator in the short perspective might be the change in the solidity measured as the ratio of equity to total capital.

Besides these economic measures we also focus on employment and productivity, two concepts referred to indicate societal utility besides private enterprise utility.

In previous research which utilizes sample survey methods it is common to try to collect data on other variables than just economic ones. Table 3 lists some of these. However these studies put forward other questions than we are interested in here. Mainly the investigates if there are certain structural factors which correlates with enterprise success. Storey (1994) concludes that these factors might be appealing but seldom explains much of the observed variance in enterprise economic performance.

---

*(Table 3 about here)*

---

In this study we will focus only on economic performance and have collected annual report data in order to have well defined and well measured variables. These variables have been checked by professional accountants and tax authorities and are probably the best kind of measures available today. The population of enterprises is incorporated companies. The NUTEK supported enterprises industrial code classification and age of establishment has been governing the construction of the relevant control group. Thus all enterprises with the same age and industry classification at the most detailed level are included in the database. For both groups supported (treatment group) and not supported (non-treated) we have annual report data from 1990 to 2003 in the case the enterprise has existed for the full period. In this paper we only utilize part of the material.

### **Hypotheses in this investigation**

The main issue for this study was to whether NTSBF, defined as participators in the NUTEK seed financing program in a seven years perspective exhibits increased growth in four

traditional measures as: sales, productivity, employment and solidity. The general hypothesis is that the “treated firms” are expected to exhibit higher growth than the comparison group. In estimating these measures it must be underlined the importance to consider extreme values. In ordinary measurement of central tendencies the recommendation is to down weight the effect of outliers and extreme values especially if the distributions measured are not symmetric. However albeit that the general case is skewed distributions in almost all economic phenomena dealing with effects of innovative behaviour one has to change focus and explicit observe and include the extreme values into the analysis. Considering that successful innovations are an infrequent event the advantage of population analyses that is considering the full total population of firms is if not a necessity a distinct advantage. Thus the estimated growth in the selected economic measures is the population averages. In brief this analysis differs from others in the same area in the following respects:

- Only administrative data or register data
- Whole population both for the treated group of firms and non-treated included in analyses. No sampling errors and full coverage.

We also have information if firms also been treated in two other similar public financial support schemes

### **The evaluation dilemma**

The evaluation dilemma consists of not having information about the same unit of analysis in two different statuses at the same time. An enterprise can not be supported with public means at the same time as not having been supported. Thus a before-after analysis might be a relevant approach on the individual level if one can make reliable that the surrounding and co-founding factors will be the same before and after or that these can be controlled for. In dynamic processes like technical development a before-after analysis can meet the objections of not being realistic.

The statistical solution to the evaluation dilemma resides in moving from the individual to the level of population (Holland 1986). This consists of the estimation of a characteristic in a population receiving support and then comparing this estimate with an the same characteristic estimated in a relevant group of controls not having support. However, solving one problem turns often into another. Now the problem lies in how to create the relevant control group and convince others about this relevance.

The main problem analyzing program effects is thus the problem of creating a relevant counterfactual. In part we solve this by instead of using a random sample strategy have population data in this respect we do not exclude relevant observations. However the problem of possible self selection bias influencing the estimates of additionality must be addressed. According to Heckman et al (1997) there are four sources of biases in estimation of program effects. First, bias can stem from the use of different definitions in the objectives of interest between treated firm and non-treated firms. Second, bias can emanate from differences in economic environment between the two groups of firms. Third, bias might occur due to different distribution in confounding variables, differences in observables. Finally and fourth, bias can be generated as self-selection bias which is differences in distribution of un-observable characteristics (for an outside observer) in the two groups of firms. Building upon annual report data regulated by both international standards and legislation and having population coverage on these we find it reasonable to assume that that the first and second sources of bias are reduced to a minimum. Our general strategy in order to minimize bias from the other two sources of bias is to focus on changes in the objective variables. The so called difference in difference estimator (DiD) has been considered as one of the most robust estimators in the literature on matching estimators (Todd & Smith (2001), Meuser, P., R., Troske, K., R., & Gorislavsky, A. (2004)). This estimator compares differences between supported firms and the identified comparison group. Bias generated by static properties in

supported firms not present in non-supported firms is differenced away and will thus not influence our estimates of growth. In this paper however we will only report estimates of simple differences in a future more elaborated paper we will also make conditional DID-estimation for matched observations.

## **Results**

In Table 4 for we start the analyses with investigating if there are differences in the survival rate of the enterprises. We only report results for independent enterprises. In our data we also have information if the enterprise has been acquired by another enterprise in the time period of interest; however the incidence of such mergers or acquisitions is very rare and not included in this analysis. We see that there are indication of higher survival rate at the year 1997 for the firms which received support between 1994 and 1997 in comparison to the comparison group of non-supported firms. For the sub-group of only new firms which are defined as being established between the year 1994 and 1997, the survival ratio for 2003 for supported firms are much lower than for the comparison group. This might indicate a problem with relevance of the comparison group in the respect that these in to large extent are dominated by firms without pursuing risky technical projects.

Although these are population means in order to make conclusions one has to relate these two groups to some kind of super population. One reasonable suggestion to such a super population is future enterprises entering the market in these industries. We thus might consider our data as sample from the population of both present and future enterprises. In this case the conventional statistical test becomes relevant. The t-tests for differences in survival rates are not statistically significant neither 1997 nor 2003.

---

Table 4 about here

Turning to the main results in this paper still focusing on independent enterprises table 5 presents difference-in-difference estimates for the time period of 1997 up to 2003. The

principal result is that considering all enterprises and only enterprises in manufacturing sector actually the comparison perform better than the NUTEK supported firms. However for new established firms (bottom panel) there are positive "effects" while evaluating the differences. However comparing the levels of 2003 for the measured variables we find that the comparison group lies ahead. This might also be an indication of that the sub comparison group is as stated above dominated by firms not pursuing risky technical projects with innovative implications.

---

Table 5 about here

---

Now an indication of risk might be that only few enterprises succeed and most of them fail albeit generate some income. In the distributions of Sales this could be indicated by highly skewed distribution in the non-treated group with high kurtosis. In table 6 we present the full statistical distribution for the levels of Sales 1997 and 2003. These indicate that the comparison group characterized by larger skewness and kurtosis.

---

Table 6 about here

---

One speculative conclusion is that administrative selection process at NUTEK might not have been that adventurous as daring to select the project prone to be most innovative and contiguous, this might be a support for the argument put forward by Wallsten (1997).

## **Conclusions**

The preceding analysis strength lies primarily in the availability of population data. The main weaknesses are two. The alleged control group might not consist of enterprises pursuing technical projects similar to the group of supported firms. Only more expensive surveys will have an opportunity to handle this problem succinctly. A possible way to go is to merge patent data records on our data. Thus patents as an indicator of on-going project would probably

single out a more relevant control group. The second problem lies in the small number in the treatment group. Although the treatment group is the grand total of firms supported in the time period the must be considered as a sample of a super population of future supported firms. Such a small sample considered here can only be looked upon as a first indicator on problems in the analysis however this sample grows for each year and in another year or so we will have at least twice the number permitting to more elaborated analysis and perhaps conclusions.

Making conclusions on such indicators might be premature, however the indicators seems to align to other empirical results showing that new ideas in new firms is a more sensible approach for a innovation policy than spreading out public means to all “new” project. Established firms do have a record of performance and should attract the necessary means by this merit without the need for public finance. A final comment deserves the time for evaluation. To evaluate a program at a certain time like 2003 as in this paper is most certainly not adequate as the sole judgment of the program. Contingencies typical for economic development might play a role. A program should at least be evaluated for different time frames. For example one could consider 3-years moving averages in order to sort contingencies out.

Table 3 Other common factors used to explain success

| Factors   | Referens                      |
|---|-------------------------------|
| Motivation, eagerness to pursue an idea   | Utterback & Reitberger (1982) |
| Education   | Storey (1994)                 |
| More than one founder, a proxy for the possible representation of larger network and broader skills in top management | Storey (1994)                 |
| Middleage entrepreneur (35-55)  | Utterback&Reitberger (1982)   |
| Newly established enterprise  | Storey (1994)                 |
| New products  | Storey (1994)                 |
| Experience from earlier employment in MNC (spin-off)  | Storey (1994)                 |
| Family business background  | Lindholm Dahlstrand (2004)    |
| Management willing to let in external capital   | Storey (1994)                 |
| Limited corporation   | Storey (1994)                 |
| The ability to explain (sell) the product versatility   | Storey (1994)                 |
|   | Utterback & Reiberger (1995)  |

## **ABSTRACT**

It is generally acknowledged that social and family networks have an important influence on business development, particularly in the context of ethnic minority entrepreneurship. However the networks of refugee entrepreneurs have received scant attention in the literature. This study explores the role that transnational networks play in the start-up and operation of UK Vietnamese nail shops in London. The research involved in-depth, face-to-face interviews with 10 owner-managers, and 4 key informants. The analysis draws on concepts of “strong” and “weak” network ties (Granovetter, 1973) and “mixed embeddedness” to explain why the Vietnamese continue to enter such a competitive sector. The results highlight the importance of transnational family networks within all aspects of the business and suggest that in general an over-reliance on these “strong-ties” inhibits “break-out”. Networks, which include better educated, and/or innovative family members, could however, be important in encouraging diversification. This suggests that there is a need to support Vietnamese entrepreneurs in developing more diverse networks as a means of encouraging business diversification. Trusted community members with links to the wider community are essential for brokering these links.

Keywords: entrepreneurship; Vietnamese; networks; “break-out”

## **INTRODUCTION**

Social and business networks are generally thought to be good for the economy and policy has frequently sought to “implant a culture of competitiveness through co-operation (Huggins 1998:814). Networks are seen as a ‘resource’ through which small business managers gain access to important social and cultural resources, information and capital (Birley 1985, Aldrich and Zimmer 1986, Curran and Blackburn 1991) and research has confirmed the importance of personal networks for company performance (Ostgaard and Birley 1996). So vital is networking thought to be that Business Link, the UK’s nationwide agency for business support has recently been promoting ‘Speed Networking’ events, in which businesses can “meet a new business contact every three minutes allowing you to really explore the diverse nature of the many businesses present and make the right business connections”. Whilst a recent study for the UK government’s Small Business Service has further emphasised the importance of networks and recommended that business advisers would benefit from a greater understanding of them. (Blundel and Smith 2002)

In the case of ethnic minority firms Ram (1993) notes that it is the ‘family and the ‘community’ which lie at the heart of ethnic firms social networks. Family and community resources have been shown to be important to the establishment, development and ‘competitive advantage’ of ethnic minority businesses (EMBs). With globalisation there is an increasing tendency for families to be widely dispersed, and this has led to an increasing number of EMBs with a transnational economic organisation and networks. However, research in this area has tended to focus on larger and more established communities such as the Chinese, and those who have migrated out of choice or chosen to operate as transnationals (Li 1998, Tseung 2002). The role transnational networks play in the development of micro businesses run by smaller, ethnic groups, and in particular refugee entrepreneurs, has been largely neglected in the literature. Similarly, few researchers have explored the role of the family in the networks of those starting a business (Greve and Salaff 2003).

A particular concern with respect to ethnic minority enterprises in the UK is their continuing concentration in a few, generally lower order sectors (Ram and Jones 1998). The concern of policy makers and enterprise support programmes has been to encourage such businesses and new entrepreneurs from these communities to “break-out” of traditional sectors and diversify or move into higher order areas where markets are not so competitive. This paper is concerned with the role that networks play in this process.

The paper focuses on the UK Vietnamese business community, a relatively new group of ethnic minority entrepreneurs who have only been establishing businesses in significant numbers during the last 5 years. The nail shop sector is chosen to provide a case study of a new type of ethnic minority business that is emerging in the UK, which unlike traditional EMBs is not based on serving the local ethnic niche market, and which has developed as a result of economic restructuring, and with the support of transnational family networks. The Vietnamese have owned nail shops in the US for over 10 years, having taken over businesses from the Koreans, but it is only during the last 3-4 years that a sizeable number have been established in the UK. As the fastest growing UK Vietnamese business sector it now accounts for over half of all Vietnamese businesses in London (Bagwell et al 2003). The paper explores how family networks, both within the UK and abroad, influence business ideas, and the start-up, operation and development of the business. It draws on theories of social capital and mixed embeddedness to explain why the Vietnamese continue to enter such a competitive market. The paper focuses on two key issues:

- How do Vietnamese businesses in the nailshop sector make use of their networks?
- What role might these networks play in facilitating or hindering break-out?

It argues that by developing a better understanding of the role networks play in ethnic minority business development policy makers and enterprise support agencies will be better able to develop interventions which are more likely to encourage ‘break-out’, and it concludes by making some suggestions regarding the shape these interventions should take.

## **SOCIAL NETWORKS AND SOCIAL CAPITAL**

Networks can be described as referring to the relationship between the firm or the individual and the myriad of links with organisations and other individuals in the wider environment. Networks have been studied at the firm level, for example, business clusters and industrial districts, and the level of the individual entrepreneur. Networks may also be formal, defined as intentionally formed groups of companies, generally operating in close proximity to each other (Kingsley and Malecki, 2004) or consist of an informal collection of organisations and individuals who have an interest in or links with the firm and/or its owner.

The network approach to entrepreneurship is based on the hypothesis that founders use their personal network of private and business contacts to acquire resources and information they would not (or not as cheaply) be able to acquire on markets (Witt 2004). Several studies have highlighted the importance of networks to business development (Witt 2004). For example Davidsson and Honig (2003) found that nascent entrepreneurs who were members of a business network such as a Chamber of Commerce were more likely to have more rapid start-up.

Social or personal networks, defined as being made up of the family, friends and personal contacts of the entrepreneur have also been found to have an important influence on the business by providing access to resources not available internally. (Ostgaard and Birley 1996). These personal networks are important not only for providing information and access to important physical and financial resources, but also for accessing human and social capital. (Johannisson (2000). The central proposition in the social capital literature is that networks of relationships constitute, or lead to resources that can be used for the good of the individual or the collective. (Dakhli and de Clercq 2004).

However not all network ties will be of equal value to the entrepreneur. Granovetter (1973) developed a model of strong and weak ties within the network. Family and friends are defined as strong ties, which were seen as being reliable, but not able to offer such reliable information as weak ties. Ultimately friends and family are likely to hold similar views, beliefs and problems solving techniques. In contrast Granovetter (1973:1367) claims that weak ties act as “bridges” to information sources not necessarily contained within an entrepreneur’s immediate (strong-tie) network. Thus dependence on family members may restrict the network from which the entrepreneur seeks a wide range of complementary resources when planning or establishing a business (Greve and Salaff 2003). Whilst a network of loosely coupled acquaintance offering skills, knowledge and insights will reduce the importance of family members (Renzulli et al 2000)

## **FAMILY NETWORKS AND ETHNIC MINORITY ENTERPRISE**

Social and family networks have been found to be particularly important to ethnic minority enterprises. (Light et al, 1993; Waldinger, 1995). These networks enable the ethnic minority entrepreneur to draw on unique cultural resources or social capital not generally available to the mainstream, including cheap family labour, pooled savings and access to trusted networks which facilitate trade and provide access to information, thus providing a particular competitive

advantage (Coleman, 1988). These informal networks have also been found to be important as a means of mobilising resources and generating sales (Fadahunsi et al 2000)

However research has also suggested that an over-reliance on the family and co-ethnic community can be a constraint on business development (Flap et al 2000). In a study of a number of different BME groups in north London (Bieler, 2000) found that whilst social capital provided some advantages, it could also be limiting as the co-ethnic group is not necessarily the best source of information, and the social constraints of the community could inhibit break-out. Groups with the strongest co-ethnic ties tend to be weakly connected with outside agencies thus missing out on the information and support such agencies could provide.

Similarly cross cultural-studies suggest that certain cultures tend to be characterised by networks with stronger ties than others. In nations with a highly collectivist perspective strong tie networks are likely to be based exclusively on kinship and friendship ties (Drakopoulou and Patra 2002:12). Whilst these tight knit networks offer benefits of resource leverage and strong levels of support and trust their lack of diversity limits access to information and advice and can inhibit innovation (Tiessen, 1977). Differences in the networking behaviour of entrepreneurs from different countries have also been found, with entrepreneurs from more collectivist family orientated cultures such as Greece tending to spend longer on maintaining their strong-tie network (Drakopoulou and Patra, 2002)

## **TRANSNATIONAL NETWORKS AND ENTERPRISES**

Most network studies have assumed that networks are based on relationships with those in close proximity, but as Light and Gold (2000) note the transnational social ties of migrant families can play an important role in shaping ethnic economic arrangements. Links to family members overseas provide resources for importing or exporting goods and/or capital, and networks bring in workers with needed skills as well as those willing to accept low-level jobs. "Transnationals can be very innovative, introducing new products and ways of doing business in countries of origin and settlement" (Light and Gold 2000:152). Globalisation, and in particular the availability of cheaper air travel, long-distance telephone, fax and electronic mail has led to an increasing number of EMBs with a transnational economic organisation and networks. Transnational businesses have been defined as those with locations in more than one country and the transmigration of the owner in order to operate it (Wong and Ng (2002).

The Chinese are frequently cited as an example of an ethnic group with strong global networks in which shared ethnic, linguistic and cultural ties underpin the development of transnational economic links (Douw and Huang 2000, Tseng 2002). For example Wong and Nga (2002) describe the transnational actors of small Chinese firms in Canada who rely on the extended family networks of Chinese families straddling different societies. Sometimes one member of the family runs the operation of the business in Canada whilst another spends several months of the year overseeing operations in China. However, research in this area has tended to focus on larger and more established communities such as the Chinese, and on economic migrants rather than refugees.

## **BREAK-OUT AND MIXED EMBEDDEDNESS**

Whilst family networks have been shown to play an important role in the operation of EMBs others have argued that an over emphasis on ethnic resources can mask the influence of the external political and economic environment (Barrett et al 2001, Ram 1993). Racism and lack of alternative sources of employment it is argued account for the greater propensity for many ethnic groups to enter self-employment and their concentration in a few key sectors of the economy. Recent theories have advocated a more interactive framework of “mixed embeddedness” in which the internal ethnic resources and cultural milieu of the ethnic entrepreneur interact with the external influences of the wider economic and institutional environment (Kloosterman, 1999). In the case of the UK Vietnamese, their history of migration as refugees, their skills and experience, and the economic context in the UK determined the job and business opportunities that were available to them. Whilst cultural influences such as strong collectivist and family values interact with the former to influence business practice. Thus whilst the focus of this paper is on the role family networks play in business start-up and development an attempt is also made to understand the wider context which also contributes to the business entry decision.

## **METHODOLOGY**

The methodology involved a mixture of qualitative methods, including in-depth, face-to-face interviews with 8 nail shops owner managers, a former nail shop owner now running a Japanese restaurant, and the main Vietnamese nail shop supplier in London. Interviews were also held with a Vietnamese business advisor and three key informants from the Vietnamese community in order to obtain an overview of the Vietnamese business community as a whole and the key issues (cultural and structural) facing it. The interviews with the owner managers took place in the nail shops, enabling observations of the business to be made.

There is no general database of Vietnamese businesses in the UK, however an earlier mapping study of Vietnamese businesses in London conducted by the author (Bagwell et al, 2003) provided the population from which the individual business interviews were selected. The sample was designed to be broadly representative of the geographical distribution of nail shops in London.

Two Vietnamese-speaking research assistants helped with the recruitment of business participants and enabled the interviews to be conducted in Vietnamese where necessary or preferred by the owner manager. They and their contacts in the community provided vital access to the businesses, which would have otherwise been difficult to secure. The interviews concentrated on the key stages of business development: start-up, operation and development of the business, and who had provided support and information at each stage. The interviews were taped and transcripts were analysed for emergent themes.

## RESEARCH FINDINGS

### Networks and Support for Start-up

It is important to place the business entry decision within the context of the wider economic environment in which the Vietnamese community were operating. Many of the older nail shop owners arrived as refugees in the 1980s, with few skills or qualifications relevant to the UK job market. Most came from rural areas in North Vietnam and had little prior experience of business, in contrast to the US Vietnamese who tended to be from the more business orientated South. They eventually found work in the clothing sector, a major source of employment for the Vietnamese community in London until its demise in the mid 1990s. As work in this sector diminished alternative sources of employment were sought. The success of the Vietnamese in the nail care sector in the United States, where the fashion for manicures and false nails was already well established, provided the inspiration. The willingness of the Vietnamese to work long hours for low wages, and the use of a faster more automated process, enabled them to provide the service quicker and cheaper than traditional beauty parlours, thereby making it affordable to a much larger customer base. A further attraction of the nail sector was its low entry costs. Basic equipment and supplies can be brought for about £7,000, an amount that is relatively easy to raise from within the extended family. A special 'start-up kit' for new nail shop owners, together with advice on licensing requirements, which was available from the supplier, also facilitated start-up. It is not surprising therefore that so many Vietnamese perceived nail shops as being an attractive business proposition.

Three of the businesses interviewed – the supplier, one nail shop owner and the former nail shop owner had learnt the trade working in the US, and had run businesses there for some time before spotting the market opportunity in the UK and bringing the business idea over. As the niece of the nail shop owners explained,

“My aunt and uncle used to live in California and it was them that set up this business. They had two over there but she got homesick and they came back and set up here. ... I manage it. They are back and forth all the time.”

These two businesses were the early pioneers who displayed many of the characteristics of transnational businesses. They maintained strong family and economic ties in more than one country, which they relied on for running various aspects of the business. They travelled regularly during the course of their business and tended to be more open to new ideas.

The other businesses interviewed, having observed the success of these early pioneers decided to copy them. The availability of relatives already running nail shops in the US meant that they could learn the trade in salons there before returning to start-up their own business in the UK. The following scenario was fairly typical.

“Nearly 5 years ago I went there to see my family over there. I've got a cousin there and I heard about nails over there and I stayed there for a year and went to college, I was there for about a month. After that I worked in a salon over there to get experience.”

With this group the presence of relatives in the US provided a useful source of training at the start-up phase, and one or two went back to learn new techniques once their business was established, but the family networks of these businesses tended not to incorporate economic arrangements in the same way as those operating on a more transnational basis.

With the increasing number of nail shops being set up in London later entrants to the market were able to learn the trade from friends and family running nail shops in the capital rather than travelling to the US.

As research with other ethnic groups has found (Fadahunsi, 2000; Ram and Smallborne, 2003), the Vietnamese tend to rely on their own social and trusted community networks for business advice in preference to mainstream business advice agencies. With a couple of notable exceptions, which are discussed later, advice for start-up was mainly obtained from family or friends working in the sector or the Vietnamese nail shop supplier. The latter played a pivotal role providing advice on licensing arrangements, new designs, and brokering on the job training arrangements with existing businesses for those wanting to enter the industry. He claimed to have 900 Vietnamese customers who had all found him through word of mouth – demonstrating the strength of the community network. The interviews confirmed the importance of informal networks based on tight-knit family and community ties. There are no Vietnamese business associations, and none of the businesses belonged to Chambers of Commerce or other business associations. The long hours worked by the businesses, often 10-12 hours a day, 7 days a week, coupled with a lack of trust of outsiders, meant that there was little spare time or inclination for developing new contacts outside their existing network.

### **Employing Staff**

Family networks tended to be used initially for staffing the business and a number of nail shops had sponsored various members of their family to come over from Vietnam to work for them. One owner explained that his staff were:

“All family members, cousins, nieces, nephews. .. I want to offer the opportunities to members of the family first. If there is still vacancies I would offer it to other people. ..There is an obligation to do it. I have a responsibility to find them work” (male nail shop owner).

This sense of responsibility towards the family is deeply embedded within Vietnamese culture and has been shown to still have a strong influence on the business practice of younger, UK educated business managers (Bagwell 2004). Thus a reciprocal arrangement operated within the family network in which businesses could obtain cheap loyal labour, and employees obtain work that they might have found difficult to secure elsewhere. However the strength of these network ties sometimes prevented the family members involved in the business from entering more profitable business or employment areas. It was often easier and less risky to stay employed in the family business than start up on your own. The manager of one business, a 29 year old woman, who was the owner’s niece, and who had grown up and been educated in the UK, explained the dilemma she was in.

“... people have asked me to go and work for them or set up on my own...European as well. But because it’s family I have to be quite loyal to them. They’d probably feel

betrayed if I left them. Because it's family you are inclined to put 110% into what you are doing. If everything comes down to you, you sort out all the problems and sort out all the paperwork, but I'm quite lucky in that I have a stable job where I know the people, you are quite flexible if you need time off."

Where family members were not available or had moved on to establish other nail shops, local community networks provided a source of employees. As one nail shop owner explained:

Interviewee: It's all Vietnamese people, they get together in one place and they know each other

Interviewer: Where do they get together?

Interviewee: In a restaurant or in a bar or a pub. There is one famous pub in Mare St, full of Vietnamese people

Interviewer: So that's how word of mouth gets around?

Interviewee: Yes and you get employees from that

Most employees worked on a part-time self-employed basis handing over a commission from their earnings to the nail shop owner. This highly flexible employment arrangement was ideally suited to the growing pool of informal Vietnamese labour entering the UK as students or by other means.

### **Diversification and Development**

Five of the businesses interviewed had expanded by opening up new branches in other areas with different family members taking responsibility for their management. For example one business owned three nail shops and the owners' friends and family had a further seven trading under the same name. For these businesses the ability to expand depended partly on the availability of members within the close-knit network who could be trusted to run the new branch.

Two of the businesses interviewed had however diversified into new business areas. The female owner of two nailshops, who was of Chinese Vietnamese ethnic origin, had branched out into Chinese medicine, a trade that she had learnt from her grandfather and uncles in Vietnam. The former nail shop owner, had tried unsuccessfully to run a nail shop before nail treatments became popular, and having learnt to cook Japanese food from his siblings in the US and cousins in Germany had decided to open his own Japanese restaurant in London, in partnership with two Vietnamese friends. The daughter of his 'adopted mother' provided a lot of business advice as she was, "a professional – she has been working in England for 10 years – a lot of the big companies – so she knows about the finances, the council and everything". He had also enlisted the help of specialist market research consultants in locating a suitable area for his latest venture. Significantly, none of his nuclear family was directly involved in the operation of the restaurant, perhaps leaving him freer to pursue his personal ambitions than some of the other business owners who may have been more constrained by family loyalties. Thus these two entrepreneurs, whilst still relying on their family for business ideas and training, appeared to have a more diverse range of more innovative and better educated family members within their network than the others. They were also more likely to seek advice and information from sources outside the family and community network, and were less dependent on family members for the operation of their businesses.

The role of education in providing the entrepreneur with a wider range of resources to call on was also apparent in the case of some of the younger nail shop owners. For example, two of these had studied Health and Beauty at college in the UK and as a result were planning to offer beauty treatments in their salon. One regularly attended beauty shows as a means of seeking out new ideas and had tried a range of suppliers, whilst the other was actively researching the market and had a number of contacts – both English and Vietnamese working in this field. Both showed a greater tendency to rely on the human capital acquired as a result of their training, and, having been educated in the UK had a wider range of weak-ties in their networks.

## **CONCLUSIONS AND IMPLICATIONS FOR POLICY**

This small scale exploratory study has attempted to provide some insight into how Vietnamese nail shop owners in London use their informal networks to support the development of their business. The findings emphasize the heavy reliance on strong family network ties for almost everything related to the business; including the business idea, training and finance for start-up, and employees. In this respect the Vietnamese share a lot in common with many other ethnic minority businesses in the UK. In the case of the Vietnamese nail sector however, it is the international family links with relatives in America, which have played a key role in providing the initial business idea and training. Some of these transnational network ties also have an economic basis, in a similar way to transnational enterprises run by the Chinese community. Unlike the Chinese, who have been found to make use of much larger trusted networks or *guanxi*, the networks of the Vietnamese tend to be more tightly confined to a smaller group of family and friends.

The heavy concentration of the Vietnamese in the nail sector can be attributed to both economic and cultural influences. Economic restructuring has provided the push, whilst a growing market for nail care, and co-ethnic ties with the know-how provided the “pull”. Cultural values, which encourage family needs to be considered before individual desires, and even sometimes the best interests of the business, place an obligation on the individual to help the rest of his or her family. This tends to encourage family members to enter similar business sectors, as information about the business can easily be provided, training given and start-up costs are affordable. The result is the current situation in which the marketplace, in London at least, is saturated and characterised by ruthless competition. The growing number of Vietnamese nail technicians working informally from unlicensed premises is creating additional friction within the sector.

The more innovative businesses in this study tended to have a more diverse range of strong family ties than others, or were younger and better educated and more integrated into mainstream society. The presence of well-educated and more innovative members within the family network appeared to be particularly important for encouraging business diversity. With the younger UK educated businesses, greater exposure to a wider network of loose ties, including sources of information such as the internet, is as one might expect, encouraging them to consider entering other business areas, but there remains a tendency to fall back on traditional sectors in which family support is more readily available.

Previous research has suggested that human capital is positively related to innovation (Dakhli and de Clercq, 2004), and that migrants with greater levels of human capital are less reliant on co-ethnic networks or social capital (Marger 2001). The findings of this study indicate that in the case of refugee enterprises, the human capital of family members within the international diasporic network also need to be considered. Thus the findings provide some support for previous research, which has highlighted the benefits of a more diversified mix of strong and weak-ties for business start-up and development (Davidsson and Honig, 2003 ). However, this study also emphasises that it is the nature of these strong ties which are important, and that those that provide the entrepreneur with innovative ideas and additional human capital are more likely to encourage “break-out”.

These conclusions suggest that policy and enterprise support programmes designed to assist groups such as the Vietnamese need to be more aware of the influence that the transnational diaspora can have on business development. Strong transnational network ties can provide a fertile source of new business ideas and could be further exploited. However a diverse network of local advisors with the necessary human capital, is needed to help translate ideas into viable businesses back home. Thus new and existing entrepreneurs need to be encouraged to develop networks with a wider range of “weak-ties”/individuals outside the family network. Given the Vietnamese community’s lack of trust of outsiders it is suggested that trusted individuals from the community who can act as a “bridge” to mainstream sources of support are vital to this process.

# **FOUNDER/CEO TURNOVER: A SOCIAL CAPITAL APPROACH TOWARD REDUCING THE PERFORMANCE IMPACTS IN ENTREPRENEURIAL STARTUPS**

## **ABSTRACT**

CEO succession is a significant event for all business organizations. However, such activities can be more disruptive for entrepreneurial startups due to the critical role Founder/CEOs play in the organization and the relatively fragile state of a new venture. A social capital perspective suggests that the ability of the firm to perform might be conditional upon the efforts made at increasing the social capital within the organization. This study examines the impact upon performance of Founder/CEO turnover and the offsetting social capital developed within the firm.

There has been a wide variety of research that has examined the impact of the departure of a CEO on firm performance (Begley, 1995, Daily & Dalton, 1992, Jayaraman, Khorana, Nelling & Covin, 2000, Wilard, Krueger & Feeser, 1992). Unfortunately, the evidence from these various streams of research has not provided a consistent set of findings (Jayaraman, e. al., 2000). Entrepreneurial startups present the opportunity to examine a setting where the performance impact of CEO turnover may be particularly dramatic. New ventures offer such insights as these organizations would appear to be more dependent on the Founder. The role of a Founder/CEO in a new venture setting is critical not only for their leadership but also for the web of relationships which they build. It is this ability to develop relationships that help a new firm overcome a liability of newness (Freeman, Carroll, & Hannan, 1983; Li & Guisinger, 1991). Therefore as a setting, the examination of entrepreneurial startups offers the potential to provide fresh clarity on the overall impact of CEO turnover.

The potential loss of a Founder/CEO would suggest that a priori there could be actions that would protect the new firm. The actual loss of a Founder/CEO has organizational impacts that should cause an entrepreneurial firm to address the loss of social capital associated with that individual. We would expect, *ceteris paribus*, that those organizations that can overcome the loss of social capital will outperform those firms that are unable to recover that social capital. However, we might also expect that those firms who are able to retain their Founder/CEO would outperform, at least in the short run, those firms that are forced to deal with a CEO transition easily in their company's life.

This study examines the means available to the organization to offset the loss of social capital associated with the loss of the Founder/CEO. While it has been implied

that organizations can replace social capital, the loss of the Founder/CEO appears to be a unique blow to the organization. This manuscript will examine the actions available (both a priori and ex post) to offset the loss of social capital. Potential mitigating factors might include: 1) efforts to keep the Founder/CEO in place for the first three years of the company's life; 2) efforts to prevent multiple CEO changes during the early years of existence; 3) increasing the size of the management team; and 4) ensuring the presence of founding teams that extend beyond the Founder/CEO. These individuals can provide the organization additional social capital connections and may be able to offset the social capital loss when the Founder/CEO leaves.

We hope that this study will make three contributions to the literature. First, the manuscript extends the application of social capital by examining the means to replace social capital. The manuscript also provides fresh insight to the understanding of how organizations overcome the loss of a CEO by examining the topic from a social capital perspective, a perspective not previously employed. Finally, we hope that this manuscript provides fresh insight into entrepreneurial organizations and how they survive their initial years of newness (Stinchcombe, 1965).

## **THEORY**

### **Social Capital and New Ventures**

Although multiple definitions exist, we suggest that social capital is the degree to which an organization has relationships that allow it to collaborate and cooperate (through such mechanisms as networks, shared trust, norms and values) to achieve

mutual benefits (Putnam, 2000). Social capital can be a unique resource for the new venture.

That resources such as social capital are critical to the firm has gained increasing prominence in recent years (Florian, Lubatkin, & Schulze, 2003; Tsai & Ghoshal, 1998; Yli-Renko, Autio, & Sapienza, 2001). Specifically, an argument suggests that if the firm can develop resources (be they tangible or intangible) that are immobile, valuable, rare, inimitable, and non-substitutable they could lead to a rent-generating competitive advantage (Barney, 1991, Conner, 1991). Social capital would appear to have the potential to be a particularly powerful means to develop competitive advantage for the firm. Social capital is considered an intangible asset, in other words it does not have a physical presence. Other intangible assets would include the firm's brand image, culture, knowledge, as well as expertise held by the firm. Such assets are much more difficult to observe, replicate or substitute and thus have a greater potential to provide a competitive advantage.

Contrast intangible assets to the tangible resources such financial assets, capital assets, and land. Such resources have some physical presence and are acquired in the marketplace generally at or above market prices and in the full view of the competition. It is possible that tangible assets such as a unique location or a previously unknown source of capital could provide the new venture with the potential for economic rents, however, due to the nature of their acquisition, tangible assets do not commonly provide this type of opportunity to the new venture.

Therefore, intangible assets such as social capital would appear to have a greater potential to create a competitive advantage for the firm. This advantage is particularly

important for the pre-startup and initial founding period of the firm (Kogut and Zander, 1988; Nahapiet and Ghoshal, 1998; Schendel, 1996; Spender, 1996; Liebeskind, 1996). These assets include the social capital possessed by the firm (Nahapiet & Ghoshal, 1998). The social capital of an entrepreneurial venture may be either from the relationships and connections internal to the firm (Bolino, Turnley, & Bloodgood, 2002) or the relationships and connections external to the firm (Koka & Prescott, 2002). These relationships and connections can be developed by individuals prior to coming to the entrepreneurial startup or developed during the existence of the entrepreneurial venture (Hansen, 1995).

New ventures have a greater propensity to fail than do mature firms, in part, since they do not have well-established relationships and connections nor standardized efficient routines (Stinchcombe, 1965). Relationships and connections of individuals in the entrepreneurial startup are critical to helping to create and support these routines. The absence of relationships and routines has been recognized as resulting in a “liability of newness” for startup firms (Freeman, Carroll, & Hannan, 1983; Li & Guisinger, 1991). Thus, we believe that the social capital of the firm is an important part of the survival of the new entrepreneurial venture.

### **Development of Social Capital in the Entrepreneurial Ventures**

One of the key sources of social capital for the firm is the Founder/CEO. This individual embodies the visible relationships and connections that form the basis of the new venture. Studies have suggested that investors bet on these individuals as often as they bet on an idea (Douglas & Shepherd, 2002). Additionally, in their role as CEO they will develop other relationships and connections as the spokesperson for the company.

However, the founder/CEO typically does not begin the firm by themselves; rather that person is part of a team (Ensley, Carland & Carland, 2000). The founding team is recognized for bringing resources to entrepreneurial startups (Bruton & Rubanik, 2002). These resources are critical to the firm and its' survival and there is some evidence that larger teams have the ability mitigate the liability of newness (Eisenhardt & Bourgeois, 1988; Eisenhardt & Schoonhoven, 1990). Although not specifically examined, the value of larger teams may lie in the fact that the larger team brings the individual team members' specific relationships and connections to the startup (Bruton & Rubanik, 2002). The impact upon the organization is potentially amplified with new ventures as their knowledge, planning and ability to evaluate the environment is more concentrated in fewer people in the organization (Baysinger & Hoskisson, 1990).

Therefore, in visualizing the range of individuals critical to the startup, researchers should not restrict their investigation to the Founder/CEO. It would seem quite logical that it would also include the top management team. Each unique member of the top management team brings their unique social capital to the new venture aiding not only the new venture's potential legitimacy but also providing additional communication channels within the organization (Florin, Lubatkin & Schulze, 2003; Sparrowe, Liden, Wayne, & Kraimer, 2001).

### **Social Capital and the Top Management Team**

The loss of a CEO leaves an organization with a hole to fill in its internal and external organizational relationships (Kesner & Sebor, 1994). The loss of social capital would appear to be compounded when the CEO is also a founder of the firm and the firm

is in its formative years. Social capital theory would argue that this loss of social capital would have a negative impact on the firm and there has been some strong evidence of the negative impacts to performance of CEO turnover in older organizations (Dahya, McConnell, & Travlos, 2002). Florin, et.al. (2003:375) suggest that “superior human resources enhance a venture’s ability to attain, sustain, and even enhance its competitive advantage...” Therefore, it is hypothesized that:

*Hypothesis 1: Turnover in the Founder/CEO has a negative impact upon the Performance of the firm.*

We would go on to suggest that firms that suffer repeated replacement of the CEO in their formative years are continuously prevented from developing an effective base of social capital. A punctuated-equilibrium approach would suggest that such rapid changes would prevent the firm from developing structures that were essential to success. Furthermore, strategic change researchers have warned about the negative impact of repeated strategic change (Bamford, Rogers & Miller, 1999; Ginsberg, 1988; Hannan & Freeman, 1984). The new venture would never have the opportunity to establish the social capital necessary for sustained success. Therefore, we suggest:

*Hypothesis 2: Firms in which the Founder/CEO remains for at least the first three years will outperform those that lose their Founder/CEO during the first three years.*

*Hypothesis 3: Repeated Turnover in the CEO position has a negative impact upon the performance of the firm.*

Social capital theory suggests that firms might have the ability to recognize the potential for the loss of significant human capital and respond by actively seeking to fill the void (Florin, Lubatkin & Schulze, 2003; Sparrowe, Liden, Wayne, & Kraimer,

2001). For example, a Founder/CEO may have had relationships with key external constituents such as a key customer group. Those key relationships will be lost when the CEO leaves unless the startup has established individuals within the top management team as credible contacts with this connection. The new CEO will likely replace some of that lost social capital but social capital is not determined strictly by time. It is both possible and practical to hire individuals in other positions that have key relationships with the same constituent group contact lost when the CEO left or have relationships with another individual or group that will fill the same function. Therefore, we might expect that the startup firm will look for an individual or individuals who bring relationships with key constituent groups. The firm in fact may have to hire multiple individuals in the top management team to equate to all of the social capital possessed by a CEO that leaves the organization. The resulting social capital should moderate the negative performance effect of the loss of the Founder/CEO on the entrepreneurial firm's performance. Therefore, in terms of the top management team we suggest:

*Hypothesis 4: The presence of at least one additional individual (beyond the CEO) in the TMT at founding will positively moderate the relationship between CEO turnover and the performance of the firm.*

*Hypothesis 5: The TMT size will positively moderate the relationship between CEO turnover and the performance of the firm.*

## **METHODOLOGY**

### **Data**

The above hypotheses are examined using a database of all new banks formed in the United States (U.S.) between 1996 and 2000. This industry was chosen since bank formations provide researchers an opportunity to obtain high-quality secondary data at

the point of firm formation as well as the large number of new firms formed each year in a single industry. Banks, while regulated at the most basic operational level (checking/savings account), are given wide strategic latitude within the context of their industry. It is often difficult to establish the specific date in which a startup firm begins operations. However, the date of inception for banks is clear as regulations require that all banks be chartered prior to beginning operations. Additionally, limiting the investigation to a single industry also helps to increase the reliability of the investigation by limiting the impact of extraneous variables.

The prior research in this area has typically relied on evidence from older firms where the impacts of founding may no longer be of importance (Bamford, Dean & Douglas, 2004; Cooper & Gimeno-Gascon, 1992; Low & MacMillan, 1988). Indeed, empirical entrepreneurship research efforts have typically regarded firms up to eight years old as “new” ventures (Biggadike, 1979; McDougall, Covin, Robinson, & Herron, 1994). Research evidence (Jayaraman, Khorana, and Covin, 2000) has suggested that as the distance from founding increases, the impact on the organization of changes in top management decreases. Thus, this study sought to examine startup firms from the point of founding.

Data on new bank formations was gathered from the Sheshunoff BankSearch Database. Using data provided by Sheshunoff we identified the population of bank formations in the period from 1996 to 2000. Of these, we excluded subsidiaries of other banks or bank holding companies since they were not independent ventures. Also excluded were trust banks and credit card banks as these are established with unique missions and are not generally comparable to commercial banks. This yielded a sample

of 901 firms, of which we had full data on the CEO, top management team and performance for 798 firms.

## **Measures**

**CEO/Founder Change.** The founding CEO is identified in the data provided by the Sheshunoff BankSearch Database and the CEO is further reported each year that the business remains in operation. A change was recorded as 0 for no change and a 1 if there was a change when the CEO left the organization. Multiple changes in subsequent CEO's were recorded as a separate data item

**TMT.** The number of unique members of the top management team were recorded for each year. The average number of TMT during the study period was recorded. The CEO was removed from this calculation.

**TMT at Founding.** The presence of at one unique member of top management in addition to the Founder/CEO was recorded as a dichotomous variable.

**Controls.** To control for the size of the firm we included: Average Assets at the time of Founding and a set of dummy variables for the year of formation (1996- 2000).

**Performance.** The average Net Interest Margin (NIM) was used as a standard performance measure of effective management in banking (Lindley, Verbrugge, McNulty, & Gup, 1992). Following extant research, we assumed a lag impact to performance and measured NIM two years after a Founder/CEO exit event or in Year 7 if no Founder/CEO exit occurred for that firm. There were no significant differences found in a year to year analysis of NIM.

## RESULTS

Summary statistics and the correlation matrix for all variables are presented in Table 1. All variables were within the bounds of normal distribution.

-----  
Insert Table 1 about here  
-----

Hypothesis 1 suggested that having the Founder/CEO leave the firm would negatively impact the performance of the firm. Table 2 shows that this hypothesis was supported.

-----  
Insert Table 2 about here  
-----

Hypothesis 2 suggested that retaining the Founder/CEO for at least the first three years of the firm's existence would improve the performance of the venture relative to other firms that suffered a Founder/CEO turnover event. That hypothesis was supported.

Hypothesis 3 stated that repeated turnover in the CEO position would have a negative impact upon performance in the new firm. Table 2 shows that this was supported as well.

Hypothesis 4 suggested that the presence of at least one additional member of the Top Management Team in addition to the Founder/CEO would moderate the relationship between a Founder/CEO exit event and performance. This was not supported.

Finally, hypothesis 5 suggested that as the average size of the TMT rose, that this would also moderate the relationship between Founder/CEO turnover and the performance of the firm. This hypothesis was supported.

## **DISCUSSION**

Prior research, while somewhat inconsistent, has not found a significant performance impact with CEO turnover. This has been especially true as firms' age. This is not as surprising a result from a social capital perspective as the theory would suggest that as firms age that the social capital of the organization would embed and disperse within the organization. The social capital loss of a Founder/CEO can be offset by the stability of other members in the TMT, legitimacy in the market, administrative history in the industry, and accumulated goodwill. Thus, beyond some impact from industry effects and/or small personal ability differences in a sufficiently sized sample there would be virtually no impact from the loss of a Founder/CEO or subsequent CEO exit event. This situation is quite different when we examine new ventures from the point of founding. Embedded within the Founder/CEO *is* much of the social capital of the organization. Indeed we found in this study that the loss of the Founder/CEO is strongly related with a performance loss for the firm. This situation appears to be effectively moderated with the addition of individuals in the top management team. As the number of individuals increases the ability of the new venture to maintain its performance also increases. Although we also expected that presence of at least one member of the top management team would also moderate the performance loss in the event of a Founder/CEO exit event, we found no significant findings.

Furthermore, we felt that the social capital of the new firm would be negatively impacted by repeated turnover in the CEO position. Indeed we find this situation to be true within our sample. This examination finds support for the observation that the social capital perspective is potentially valuable in explaining performance results from changes

in the Founder/CEO and TMT of a new firm. There is also evidence that the social capital perspective will provide an effective framework that might shed light on the question of the impact of the changes in CEO or Founder/CEOs of firms in new ventures.

We would suggest that the next step would be an examination of how firms react to the loss of social capital. Thus, richer examinations that employ qualitative methodologies that allow for the classification of the social capital of the Founder/CEO and the top management team would be valuable. This type of rich in-depth analysis will require a longitudinal investigation.

Anecdotal evidence suggests that entrepreneurial startups are clearly aware of their intangible assets including their social capital and seek to manage that intangible asset. Thus, as research on entrepreneurial startups progress, an area of potential insight appears to be in the management of intangible assets such as reputation and culture of the firm. It is these factors that may ultimately lead to the most defensible strategic advantage and the entrepreneurial startups seem keenly aware of this fact.

The evidence presented here suggests that social capital has the potential to provide insight into the analysis of entrepreneurial settings. Future research should continue to build on these findings and employ this theoretical lens to a greater extent. Particularly, it is hoped that this exploratory research can lay the ground work for the in-depth rich investigation of social capital and how it is impacted by the change in the CEO of the entrepreneurial startup.

**ABSTRACT**

The object of this paper is to point out the importance of the cultural variable in the process of family business transmission. Using a qualitative method, the research focuses on father-to-daughter business transmissions in two countries: Tunisia and France.

## **INTRODUCTION**

Although a certain lack of consensus exists as to the very definition of family businesses, points of convergence arise as to the greatest difficulties they are confronted with. The management of continuity (Cadieux, Lorrain and Hugron, 2000; Chua, Chrisman and Sharma, 1999; Churchill and Hatten, 1987; Davis and Taguiri, 1989; Dumas, 1989; Dyer, 1988; Handler, 1989; Hugron, 1985; Perrault, 1994; St-Cyr and Inoussa, 2000) and the intertwining of the subsystems which make up this type of firm (Benckard and Dyer, 1983; Hugron, 1998; Lansberg, 1998) are the stakes most frequently cited for this type of business. An in depth examination of the succession process discloses this series of stakes (Solomon, King, Tarabishy and Winslow, 2000).

The integration of the socio-cultural dimension in the study of small businesses, offers new insights into the factors likely to come into play during the different stages of the succession process. With respect to studies on cultural differences (Hofstede, 1997 ; Kirby, 2003 ; Tompenaars and Hampden-Turner, 2003) that demonstrate, at the same time, the diversity of the genre, close consideration of this dimension seems particularly necessary for understanding the case of father -daughter (choice of successor) handing over. Indeed, as Hayton, George and Zhara (2002, p.1) observe “Conceptual arguments for the association between cultural characteristics and entrepreneurship have existed for decades but only in the last 10 years has this relationship been the focus of empirical scrutiny” .

From this point of view, the present research belongs to the field of comparative entrepreneurship applied to the process of entrepreneurial succession, thereby extending the 2002 study (Barbot and Bayad) based on a set of French cases, the results of which were later applied to a set of Tunisian cases (Barbot, Bayad and Bourguiba, 2004). After conducting a state of the art of the literature on the succession process of heirs of family businesses, while integrating the role of the cultural variable, we will present the methodology adopted and the results obtained from the Tunisian and French cases. The methodology is based on five case studies using the method of narrative accounts of heiresses in order to collect their experiences and pinpoint cultural incidents which arise during the succession process. The main interest of our contribution lies in illustrating the importance of the cultural dimension in the process of handing over family businesses. The cultural approach chosen seeks to better understand the systems of representation, the internal reasoning of each firm (the ways of being together) so as to adapt management practices to national particularities.

### **WHAT RESEARCH HAS BEEN CARRIED OUT ON THE SUCCESSION PROCESS?**

A large number of authors are interested in the phenomenon of family business transmission. Research carried out since the seventies in this field has given way to several perspectives and various attempts at modeling. Certain authors describe the main stages in the process of succession, others focus on the key factors of success and the phenomena coming into play during the process of succession planning. Likewise, some research focuses on the study of difficulties encountered during the stages of succession. The first investigations were based on the life cycle approach (Barnes and Hershon, 1976; Gersick, Davis, McCollom, Hampton and Lansberg, 1997; Holland and Boulton, 1984; Holland and Olivier, 1992) giving way to the elaboration models centered on the roles of actors (Handler, 1989). Their contributions include the identification of two main components in the succession process, the entrepreneurship and the family component and, on the other

hand, two types of transfers involved in the succession phenomenon: the transfer of management and property (Handler, 1990; Hugron and Dumas, 1993).

Authors who have focused on identifying the key success factors and the phenomena contributing to the process of succession (Ambrose, 1983 ; Barrach, Gantisky, Carson and Doochin, 1988; Haddaj and Andria, 2001; Handler, 1994; Morris, Williams, Allen and Avila, 1997) have pointed out the effect of the quality of the interpersonal relationship between the predecessor, the successor and the members of the family (Cadieux et al., 2000; Davis and Harveston, 1998; Lansberg and Astrachan, 1994; Saint-Cyr and Inoussa, 2000), as well as the role of the competencies of the successor (Haddaj and Andria, 2001) in the planning and in the successful completion of the transfer. Furthermore, the vast amount of research aimed at understanding why successors are interested in taking over the family business (Barrach et al., 1988; Birley, 1986; Handler, 1989; Sharma, Chrisman and Chua, 1998; Stravou, 1999) has led to various notions such as accessibility, credibility of the successor and the « need to prove his or her capacities » to predecessors, members of the family, and employees, as well as legitimate development and leadership.

Certain difficulties observed during the succession process (Handler<sup>1</sup>, 1989 by Cadieux, 2002), notably mutual adjustment between the predecessor and the successor, stimulate further research on the identification of challenges to succession and the key success factors of the process.

Moreover, certain authors observe that managerial transmission is considered to be more delicate and complex than patrimonial transmission (Cadieux, Lorrain, Hugron, 2002; Hugron and Dumas, 1993; Zahra and Sharma, 2004). Indeed, this dimension of the transfer process is strongly linked to the individual characteristics of the actors and underlines the importance of the quality of the predecessor-successor relationship. Intrinsic analysis of the transfer of responsibilities and authority allow schematizing the two-way dialogue between the owner-manager and the successor.

In general, recent studies take into account the dynamic dimension of the succession process, during which the roles of the two main types of actors, predecessor and successor, evolve in an intertwined way (Handler, 1990; Hugron and Dumas, 1993). Intertwining enables the transmission of power (Chrisman, Chua, Sharma, 1998; Churchill and Hatten, 1987; Handler, 1990; Hugron, 1993; Morris et al., 1997) and property in the firm (Ambrose, 1983 ; Churchill and Hatten, 1987 ; Dunn, 1999 ; Morris et al., 1997). As managerial and patrimonial transfer are closely linked, the process of succession is not described in a linear way (Handler, 1990; Hershon, 1976; Hugron, 1991; Longenecker and Schoen, 1978; Mc Givern, 1989)<sup>2</sup> but rather in a dialectical manner (Barbot and Bayad, 2002).

More specifically, certain researchers have focused on the difficulties encountered during the stages of succession as witnessed through the influence of psychological and family factors on the choice of the successor and the nature of the difficulties encountered by the latter (Davis and Harveston, 1998; Dumas, 1989; Dunn, 1999; Gilding, 2000; Kets De Vries 1990, 2002; Pailot, 2003). These authors have pinpointed the effects on equity, patterns, the grieving process (...) and their impact on the preparation and the development of the succession. Moreover, the difference between daughters and sons in terms of involvement in

---

<sup>1</sup> Handler (1989, 1994) demonstrates, beyond the two dimensions of transfers which are inherent to succession (the transfer of management and property as well as their evolution in time), the necessity for mutual adjustment between predecessor and successor. According to Handler, obstacles commonly arise to mutual adjustment during the second or the third phase of the evolution of the succession process. He identifies four types of obstacles: individual, interpersonal, organizational and environmental.

<sup>2</sup> Nevertheless, certain authors express their own conceptions of the interactions within models of this type. Examples include the combination of five external variables for McGivern (1978, 1989), the socialisation of the successor for Longenecker and Schoen (1978), the double approach of the transfer of management and the transfer of property for Hugron (1991).

the succession process and their access to positions of responsibility within the family firm has been frequently underlined (Barbot and Bayad, 2002; Cadieux et al., 2000; Dumas, 1989; Hugron, 1998; St-Cyr et al., 1998).

Finally, the majority of the previously mentioned models of the succession process neglect to consider the gender variable and most often emit the implicit hypothesis that the successor is male. Indeed, the studies which deal with the experience of daughters as successors are much more rare. Nevertheless since the seventies, a rich body of literature has developed on the managerial and entrepreneurial specificities of women (Chaganti, 1982; Duchénaut and Orhan, 2000; Dumas, 1989; Dumas, 1992; Dumas et al., 1996; Helgesen, 1990; Henning et al., 1977; Josephowitz, 1987; Lauffer, 1979; Mione, 2002; Rosener, 1995; St-Cyr and Inoussa, 2000; Vier Macahdo and Rouleau, 2002).

What is more, with regards to the fore mentioned main works, rare is research on the succession process which takes into account the cultural variable. Out of 190 articles published between 1996 and 2003, Chrisman, Chua and Sharma (2003) notes the predominance of studies on the succession of family businesses (22% of all articles focused on this issue) and one relative exception (only 5% of all articles focused on this issue) on problems dealing with the cultural aspect. Zahra and Sharma (2004, p.335) add that “The focus of the literature on succession mirrors the primary concern of family business managers” (Chua, Chrisman & Sharma, 2003). Paradoxically, key issues related to effective management of family firms, such as strategy formulation, (...), culture (...), are routinely ignored or remain understudied”.

#### **THE ROLE OF CULTURE IN THE PROCESS OF FAMILY BUSINESS SUCCESSION**

The particular nature of family firms lies in the interaction between family and firm life (Dunemann and Barrett, 2004; Feltham, Feltham and Barnett, 2005; Gervais, 1978). Within these firms, family values enable to build a strong system of cohesion (Cady and Buff, 1996; Trompenaars and Hampden-Turner, 2003). In addition to considering the intertwining between the family culture and that of the firm, the analysis of family and socio-cultural values seems necessary to study the planning process of succession, as noted by Dunemann and Barrett (2004, p. 24): “Family values and other social considerations have a demonstrable influence over the conduct of family business. Examining all of these factors should form an integral part of the succession planning process”.

If entrepreneurship can be considered as an event induced by socio-cultural factors (Shapiro and Sokol, 1982), the cultural variable gains greater meaning when applied to the quality of the relationship between actors of the succession process and the choice of successor and specifically, in the present paper, for the father to daughter case. National culture generates behavioral changes through family, training, education, traditions, lifestyles (Duchénaut, 1996), politics, religion (Kirby, 2003) and degrees of masculinity -femininity, individualism -collectivism (Hofstede, 1997; Trompenaars and Hampden-Turner, 2003). In this respect, Hugron (1998, p. 37) points out that « Chinese, Jewish, Italian (...) families educate their children according to their own cultural codes ; these factors are not insignificant to understanding business styles in family firms ». Within family firms, the cultural context can affect behaviors and, in the same way, management styles, be they an individual's, the family's or the firm's. In these companies, culture has an influence on the individual's way of being, thinking, and doing and can influence the role of each member of

the family, as well as how the patrimony is passed on from one generation to another, the choice of the successor and the predecessor –successor relationship.

Moreover, through Freud's work, we know that parental models contribute to « orienting the existence » of children, notably when they are of the age to make occupational choices (Belle, 1991). From this respect, the social learning stream of theoretical thinking (Bandura, 1997, p. 85) considers that learning and motivation stem from observing the behavior of others who act as models; which underlines the influence of the family and lifestyles on social and entrepreneurial behavior of children. Duchénaut and Orhan (2000), following the path of Stanworth, Granger and Blythe (1989), remarks an existing pre-eminence of the social context on the psychological model of the entrepreneur. Dunemann and Baret (2004, p.25) states that “From the earliest basic childhood experiences to those that flow with more specific connection to the family business, successors, for good or ill, are shaped by culture and formative influences surrounding them”. In other words, the family environment, especially that of the close family, constitutes an « entrepreneurial model » and a « favorable field for fostering company spirit» notably for women entrepreneurs (Duchénaut, 2000, p. 114). In line with this, Haftendon (2003, p.1) adds “one has to find out how the national cultural attitude influences the entrepreneurial activities of the population of a country or region”.

From this same optic, in line with the implicit hypothesis found in the majority of succession process models, according to which only the sons are considered to be potential successors; researchers are interested in the specificity of the father-daughter transfer. These last authors (Barbot and Bayad, 2002; Chrisman et al., 1998; Dumas, 1989; Dumas et al., 1995; St-Cyr et al., 1998; St-Cyr and Inoussa, 2000) who find that the daughter is considered to be a better successor than the sons (Ward, 1987) and others with a specific interest in the family business (Duchénaut and Orhan, 2000), observe that the daughter encounters particular barriers when taking over the family business.

With respect to the insufficient amount of research integrating culture on one hand and the specificity of female taking over of family businesses, the present research aims at exploring the incidence of national cultures on the process of father-daughter succession of family businesses. From this perspective, we are most particularly interested in family businesses in two countries seldom considered in Anglo-Saxon literature: Tunisia and France.

With due respect for the important contribution of this last body of research, we nevertheless explored the particularities of North African<sup>3</sup> culture, because, as pointed out by Russell (1997, p.3), « The social and cultural histories of most less developed countries and the industrialized West (...) are very different ». These investigations allowed us to identify factors which influence the succession process, according to different cultural contexts. From this respect, beyond the sexual diversity (female/male), the stages of the succession process could change within the same gender of successors (females). We consider that within the frame of female taking over, differences can be stated and explained through the predominance of the influence of national culture.

On the basis of these observations and adopting a comparative point of view, we investigated differences and/or similarities between how father to daughter successions occur in Tunisian and French family businesses. In doing so, we opted for a dynamic vision of the succession process.

---

<sup>3</sup> In this respect, note that no African country has, according to our knowledge, conducted a study on the specificity of father-daughter succession. Likewise, more generally speaking, the transmission of family businesses remains a seldom studied domain for African-based research.

## **PROPOSAL OF A MODEL TO TAKE INTO ACCOUNT THE CULTURAL DIMENSION OF THE FATHER-DAUGHTER TRANSFER**

In order to address the question of the specificity of father-daughter transfer, while considering the impact of the cultural variable, we adopted a dialectic model thus stressing the dialogique<sup>4</sup> character of the two types of transmission (managerial and patrimonial) and the psychological characteristics of the key actors. By depicting the succession process as based on two principal actors, the retained model integrates both the psychology of the actors and their intertwining (which constitutes one of the essential characteristics of the family business). Equally demonstrated is the impact of culture on relationships between the different actors of the process.

---

Figure 1 about here

---

The proposed approach, as shown by the previous figure, points out the influence of the leader's personality on the preparation, the setting up and the successful completion of the transfer. Moreover, the successor's attitude toward the firm and the predecessor is believed to influence his credibility (Barach et al., 1988) and capacity to take on the role of the leader within the family firm as well as his success during the transfer process. The integration of three components (firm, predecessor and successor) attests to the complexity of the issue of choosing a successor within the family, putting into play several factors including the assignor's psychology (Kets De Vries, 1990) and the potential successor's technical competencies (expertise) and relational competencies (confidence) (Haddadj and Andria, 2001) as well as the various dimensions of the different stages of each one of the two types of transfers (managerial and patrimonial).

Moreover, the family relationships change from one cultural context to another (Hugron, 1998). This difference will eventually give way to modifications in the predecessor-successor relationship and most notably with respect to confidence and criteria such as acceptability, credibility and legitimacy. On the basis of this hypothesis and in line with the comparative framework, we inquired into the differences and/or similarities between how Tunisian and French family businesses are passed on to the daughter.

### **METHODOLOGY**

The choice of the method and selection of criteria for the cases and data collected will be gradually detailed. While the choice of a qualitative research method is certainly uncommon when undertaking this type of research, our aim is not to measure a phenomenon but rather to characterize it. With this in mind, the different cases we studied allowed us to penetrate the culture of the two countries in question.

For the case of field studies, as Bertaux (1997) points out, the notion of a « statistically representative sample » makes little sense. Rather it is replaced by that of a « progressively constructed sample ». It is thus necessary to delve further and include phenomena we suggest referring to as « differentiality ». What counts, above all, is to promote the researcher's possibilities in exploring reality by way of a variety of accounts. The stake at hand is not only

---

<sup>4</sup> Dialogique, according to Morin, allows « maintaining duality within the unit. It associates two terms which are both complimentary and antagonistic ». Source : Morin, 1990, p. 99.

descriptive; it lies in the validity of the model. From a methodological point of view, this work merits further development using a more quantitative approach.

The studies that are interested in the specificities of father-to-daughter transfers demonstrate that the heiresses are the «invisible» successors (Dumas, 1989) and rarely perceived as «natural» heirs (St-Cyr and Inoussa, 2000). Acknowledging, on the one hand, the limited number of studies integrating the influence of gender differences on the succession process and, on the other hand, the almost inexistent comparative research on father-to-daughter transfers; we deem necessary the adoption of a qualitative method, both exploratory and descriptive (Robson, 1997). Such a research approach allows us to contribute to the body of knowledge on the difficulties faced by heiresses. Indeed, the purpose of qualitative research is to understand social processes by showing how individuals and groups experience them (Deslauries, 1991), thus allowing a more systematic and global vision of reality (Deslauries, 1991; Rubin and Rubin, 1995; Russman and Rallis, 1998 as cited by Bertaux 1997). Understanding the diversity of intra-family relationships is essential to the study of difficulties encountered by daughters during this process.

As Pailot (1999, p. 28) remarks, « the narrative accounts method, with regards to its epistemological orientation, is an interdisciplinary perspective which presents an interesting framework for understanding how the past lives of leaders allow us to make sense of the reasoning behind certain actions ». Without advocating a mechanical vision of man trapped in a narrow psychological and sociological determinism, this method recognizes the overlapping areas between family and firm concerns, which can hardly be neglected when analyzing family businesses. Narrative accounts can contribute to the knowledge of modes of transmission of family capital or, in broader terms, societal change and historical evolution of social relationships interactions. Investigation by way of narrative accounts, through the exploratory, analytical and expressive approach, allows us « to capture the reality of mechanisms and social processes related to the object under study » (Bertaux, 1997).

### **Criteria for constituting the case studies and the data collection**

In response to the research objectives, six criteria were retained for the selection of the study sample: firm of French or Tunisian origin, firm owner and manager belong to the same family, first to second generation father-daughter succession, completed or initiated succession, daughter already engaged in the succession process through actual participation in the patrimony and through active management responsibilities within the firm.

The semi-guided interviews<sup>5</sup> were carried out on the French and Tunisian fields with the daughters of business founders using an interview guide inspired by the literature review<sup>6</sup>. The research was aimed at uncovering certain fundamental points leading to the identification of father-daughter specificities, differences in the modes of communication and management in the firm and within the family in each cultural context. The non inclusion of the perception and opinions of other individuals in the succession process is justified by the choice of our research question.

---

<sup>5</sup> The semi-guided interview is based on predetermined questions and themes concerning subjects which must be covered during the interview. The quality of the collected information is strongly influenced by the researcher's capacity to establish a climate of confidence.

<sup>6</sup> The interview guide used was elaborated, in collaboration with Canadian researchers, and applied in the study conducted in France by Barbot. M.C. and Bayad. M., CIFPME 2002.

(<http://www.hec.ca/airepme/pdf/2002/183FA%20-%20Marie-Christine%20Barbot.pdf>).

The main themes covered are summarised in table 1.

To our knowledge, a French and Tunisian data base centered on female transfers does not exist. With the realization that this type of information would be difficult to obtain, we were able to make contacts with three Tunisian heiresses through information supplied by organizations such as the *Center of Research, Studies, Documentation and Information on Women* (CREDIF) and the World Association of Women Entrepreneurs (FCEM) in Tunisia. The French cases also stemmed from professional contacts.

Although the five firms were of comparable size, they belonged to different sectors of activity. Nevertheless, we argue that this diversity offers fresh insights on differences in the development of the succession process.

---

Table 1 about here

---

Firstly, the individual interviews were recorded and then transcribed immediately after in a literal way. Secondly, a thematic and comparative analysis was conducted in line with the chosen model with the aim of identifying the differences in perception between the participants. This analysis allowed us to integrate significant information on the succession process.

## **RESULTS AND ANALYSES**

Using the components of the proposed model, the determining factors of the transfer process are summarized in the following table.

---

Table 2 about here

---

These different cases allow pinpointing distinctive data concerning the links between the actors of the family business, the development of the succession process (managerial and patrimonial transfer) and the expressed difficulties of the heiresses. Could these differences be due to contingent reasoning?

In all five cases, the founders were strongly attached to their companies and this link seemed to reinforce their desire to implicate the heiresses in the succession process albeit, at the same time, it made the withdrawal of the founder more difficult.

In the Tunisian firms, confidence and complicity are common characteristics of the father-daughter relationship and appear to be catalysts for initiating the transfer. These characteristics are less obvious in the French cases and are progressively acquired through learning and training. The understanding of the leader-successor-firm relationship is necessary to study the succession process. The nature of the links between these three components determines the course of the transmission.

For the Tunisian heiresses, the transfer stems from the desire to maintain family relationships. The first task, which is to insure continuity, is proof of love and consideration towards the father's work efforts. In this respect, the daughters play the role of relays, linking

the members of the family within the firm. For the daughters, the continuity of the family depends on the continuity of the family firm. It is not the business of the family but a family business. The desire to take on the family activity is also present in the French cases; these women invested heavily in a mission: insuring the continuity of the family enterprise in respect of the founder's toil. Meanwhile, for the French successors, the quest for self-actualization achieved by taking over the business is greater than that of family cohesion and commitment to the family.

The characteristics of the Arabic-Moslem environment and culture steep the conceptions of the fathers as well as the daughters. The cultural variable can be source of certain conceptions which facilitate/constrain the unrolling of the succession process.

Although Arabic-Moslem traditions have not always allowed women to take on an active role in economic life beyond family obligations, the Tunisian conception of this culture integrates more on a complementary perspective. Indeed, the Tunisian context was already familiar with working women since 1956 and supportive of a more formal recognition of daughters in the process of succession planning. The three heiresses were familiarized with the family business from a very young age. Contrary to certain assumptions about the Arabic-Moslem context, the rational aspects of competencies and aptitudes can override emotional factors of preference for sons. Although the daughters must prove to their fathers and to other members of the family that they are competent, the legitimacy dimension seems, for the Tunisian cases, more accessible than for the French cases. The French daughters encountered an identity problem and attempted to affirm their independence toward the father, a characteristic typical of Western culture (Dumas, 1990).

Furthermore, for all the successors, degrees, education and training, offers solutions in confronting problems of legitimacy and credibility (Barrach et al. 1988, Duchénaut and Orhan, 2000) in the family, as well as in the firm. Training and the social level of the predecessor and the successor, education and society's degree of tolerance appear to be variables meriting consideration in the succession process of family businesses.

Taking into account the cultural context in which the transmission takes place is even more significant when it concerns the development of these two types of transfer. In the Tunisian context, the problem of patrimonial transmission does not exist given that it is carried out in respect of religious laws in place (1/3 for the daughter, 2/3s for the son). The succession process for the Tunisian case, hence, focuses most especially on the managerial transmission. In addition, the particularity of how the Tunisian daughter has been educated dotes her with the capacity to adapt and to communicate well with a founding father that is often authoritarian and very attached to his company which thereby increases the likelihood of a smooth transfer of management. On the contrary, these two dimensions of the transmission (managerial and patrimonial) are complimentary in the French case. These women are truly considered as the successor only when the other two dimensions have been satisfied. (I'm unsure here –which other 2 dimensions are you referring to?)

The cultural specificities of these two countries, as previously discussed, are found in the differences in the relationships between the main actors of the process and the development of the process itself.

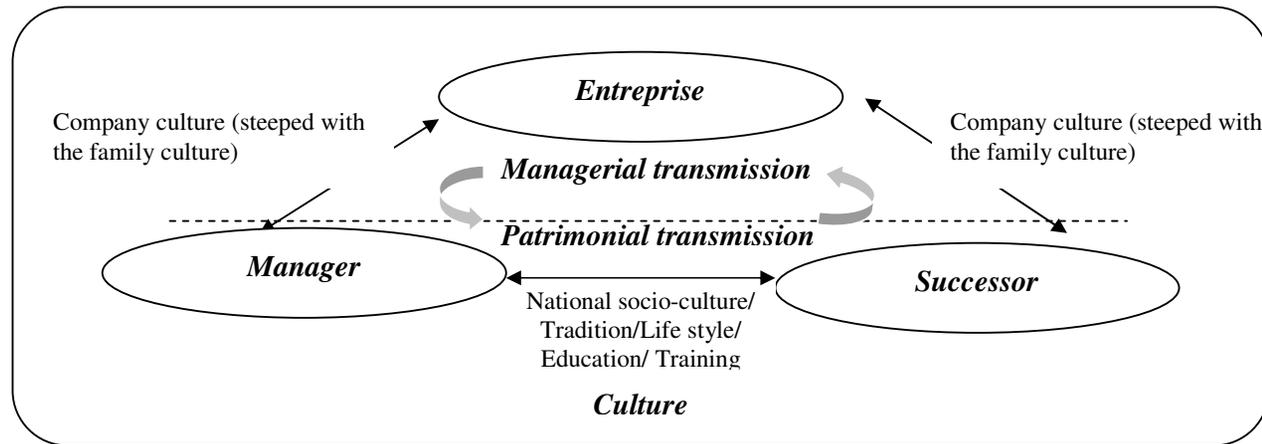

## CONCLUSION

The study provides a basis for continued research for researchers in the field of family business dealing with succession issues, in addition to new insights for consultants and educators. This work must be put in perspective with respect to other research in the field which compares first and foremost the case of succession in countries with similar characteristics (Furio and Desai, 2000).

With respect to entrepreneurship in general and transmission in particular, project leaders must take into account the cultural context, which is not to say that they are passively subjected to it. The effect of these traditions is not mechanical and depends largely on initiatives. The recognition of the importance of tradition leads us, by no means, to consider societies as motionless, mere reflections of folkloric caricatures.

Finally, we may conclude that best practice research cannot be undertaken as an end to itself. Indeed, instead of imitating other countries, it is necessary to identify the value of one's own traditions as well as possible departures from the norm. Each country is characterized by "*fundamental traits which pass the test of time*" (D'Iribarne, 1989). Entrepreneurship is truly a phenomenon which is above all cultural. With this in mind, the successful transmission of a firm involves respecting the national culture in which it is found. With regards to this last observation, firm transfer assistance programs do not always offer the perfect solution.

## **Abstract**

Contributing to the agency theory literature, this identifies relations between family control and corporate governance structure. Although the sub-set of theory that specifically relates to family control is in its infancy, emerging literature supports the notion that family control creates a number of strong incentives that have potentially competing influences on the manner in, and extent to, which internal corporate governance mechanisms are utilised. A sample of 100 listed companies (evenly divided between family and non-family firms) is used to test the hypotheses that corporate governance structures are different between family and non-family firms; and that family firms adopt optimal corporate governance structures. This paper finds evidence suggesting that family firms do utilise substantially different corporate governance structures from non-family firms. Some further evidence is provided to support the notion that these differences do lead to performance differentials. Indeed, the results suggest that family control creates, rather than negates, agency costs. Future research may be well rewarded by pursuing this latter notion further.

## **Introduction**

New research on family controlled firms provides a novel method for re-examining a maturing economic paradigm: agency theory. The progeny of Jensen and Mecklings' (1976) ambitious attempt to expose the inner machinery of the black box called the firm, agency theory has been used by myriad theorists to explain how the misalignment of interests between the firm's participants is brought into equilibrium throughout a diverse range of contexts. One context that has been represented in the literature with relative paucity is family control. The purpose of this paper is to contribute to the small but emerging body of literature that seeks to resolve the dearth of family firm literature; providing a new and powerful perspective on the agency theoretic.

While prior research has focused on the manner in which the different incentives faced by family members impact on outcomes such as performance, a purpose of this paper is to examine the relation between family control and other potentially substitute or reinforcing internal control mechanisms (i.e. corporate governance). The combined effect of any interaction will then be regressed on performance within a simultaneous equations framework to establish if family firms adopt a wealth-maximising set of corporate governance mechanisms.

It has been posited in previous papers (e.g., James, 1999) that family blockholders in family controlled companies have different incentives to atomised shareholders in widely-held companies. However, the question of whether family ownership provides incentives to reduce agency costs (through a better alignment of shareholder and managerial interests) or create agency costs (by providing opportunities for family members to expropriate the wealth of outside shareholders) remains a reasonably open empirical issue. The strongest evidence in emerging literature would tend to corroborate the former (Anderson & Reeb, 2003; Anderson, Mansi &

Reeb, 2002), however, research by Schulze et. al. (2001), conducted in the context of proprietary companies, would support the alternative. The manner in which family members respond to alternative incentives will be reflected in the extent to which other internal corporate governance mechanisms are utilised. In this sense, research that extends the family firm literature to include a discussion of corporate governance will be both an end in itself (in that relationships will either be evidenced or remain uncorroborated) and a means to other ends by further illuminating the nature of the incentives faced by the firm's participants.

The first purpose of this paper is to examine the nature of the relationship between family control and individual corporate governance variables using a similar set of variables to that used by Anderson, Bates, Bizjak and Lemmon (1998), a study of corporate governance in the context of firm diversification, rather than family control. Agency theory suggests that family owners experience different incentives to diversified, atomised shareholders; these differences should manifest themselves through differences in the utilisation of other control mechanisms; this paper produces evidence to support this notion. As the focus of the agency argument relates to the incentives of the firm's internal participants, it follows that it is reasonable to restrict the discussion to internally set controls (i.e. corporate governance mechanisms). The influence of external control mechanisms (eg. the takeover market, the labour market, etc.) is assumed to be fairly uniform across all observations in the sample.

The second purpose of this paper is to examine the degree to which family firms adopt wealth-maximising internal controls. The shift in focus between the first purpose and the second is an attempt to go beyond developing isolated relationships - to identify the extent to which the

matrix of control mechanisms operate in unison in resolving competing incentives (the incentive to reduce agency costs as opposed to the incentive to expropriate wealth and create agency costs). The second hypothesis is tested on a reduced sample (excluding non-family firms) within a simultaneous equations framework (analogous to the methodology used by Agrawal and Knoeber (1996). Evidence of significant results on individual coefficients indicates the use of sub-optimal corporate governance structures.

The remainder of this paper is partitioned as follows: section 2 is a review of the literature motivating the subject; section 3 amalgamates the various themes within the literature with a view to developing several testable hypotheses; section 4 reviews the data collection procedures; section 5 explains the empirical methods; section 6 details the results of the empirical tests; section 7 briefly considers other robustness and diagnostic issues; section 8 summarises the paper;

### **Literature Review: Motivation and Significance**

***Family Firms and Agency Theory*** - It was Adam Smith (1776) who first foresaw, with unprecedented prescience and insight, that managers of widely-held companies, being the managers of other people's money, cannot well be expected to watch over it with the same anxious vigilance as, say, the managers of a partnership. Smith's sentiments were developed in the pioneering work of Berle and Means (1932) and formalised by Jensen and Meckling (1976), creating the catalyst for a fruitful area of financial research: agency theory. Jensen and Meckling argued that traditional conceptions of firms as control structures are flawed. 'Firms', as such, are

merely legal fictions. Rather, a firm is actually a nexus between a series of complex contractual relationships between various stakeholders.

An important contractual relation is the relation between the owner and the manager. This relationship takes on the special character of being an agency relationship, a relationship that involves delegation of decisions. If both parties are rational utility maximisers, it follows that the contract may leave scope for the manager to make decisions that are not in the owner's interests. The costs of this divergence of interests, in combination with the costs of monitoring and bonding the manager to limit this divergence, are termed agency costs.

A great deal of the literature has been devoted to applying agency theory to the diffusely held corporation; that is, those firms where professional managers pursue the control function on behalf of a variety of diversified, atomised shareholders. However, the effect of agency costs in other ownership structures, in particular, the family founded, owned and controlled firm is covered by the academic literature with relative paucity. While important work has been directed towards developing an understanding of this unique ownership structure, when it is considered that family firms account for around 20% of the listed companies in Australia (Mroczkowski & Tanewski, 2004; Harijono, Tanewski & Ariff, 2004), and are represented similarly in the S&P 500 in the U.S. (Anderson, Mansi & Reeb, 2002), it would seem that the economic significance of family firms has been underrepresented by the academic literature.

Research on family firms provides an avenue for developing agency theory in a new and fundamentally different context. This is largely the result of the entirely different incentives that

motivate family shareholders in contrast to diversified shareholders. Consistent with Demsetz and Lehn (1985), Anderson and Reeb (2003) acknowledge two reasons why family firms have several incentives to reduce agency costs. Firstly, as family firms have concentrated shareholdings, they have an increased incentive to reduce agency costs because “the more concentrated is ownership, the greater the degree to which the benefits and costs are borne by the same owner” (Demsetz & Lehn, 1985, p 1156). However family ownership extends beyond concentration. As the wellbeing of the family is tied directly to the welfare of the company, families have further incentives to reduce agency costs that might impede performance. Additionally, a family’s special technical knowledge concerning a firm’s operations may put it in a better position to monitor the firm more effectively. Essentially, the special relationship between a family and a family firm provides incentives for the family to counteract the free rider problem that prevents atomised shareholders from bearing the costs of monitoring, ultimately reducing agency costs.

Secondly, it is maintained that family firms make decisions on much longer time horizons than non-family firms. It is suggested that family owners view the firm as an asset to be passed on to subsequent generations (Chami, 1999) leading to strict adherence to maximising the value of the firm (James, 1999). Contemplate the mindset of a new CEO who knows the average CEO tenure in Australia to be 4.4 years (Booz Allen, 2003), accepts that it is unlikely that he or she will outperform the average and therefore decides to manage the company over a short time frame with strict adherence to his or her own utility maximisation. Contrast that outlook against the mindset of a founding family CEO who intends to maximise the long term wealth of a family company that bears the family’s name, and with it carries the family’s reputation. Indeed,

Schulze, Lubatkin, Dino and Buchholtz (2001), as well as echoing the benefits of personal involvement, and special relationships, also acknowledge the altruistic benefits unique to family ownership. Altruism, the notion that self-interest is pursued through the welfare of others, promotes loyalty, facilitates communication and increases time horizons, ultimately reducing agency costs.

However, it has also been posited that family ownership leads to an increase in agency costs. Anderson and Reeb (2003) identify the possibility that family firms might use their concentrated blockholding to expropriate wealth from other shareholders through excessive compensation, related party transactions and special dividends. Anderson, Mansi and Reeb (2002) add the possibility of risk avoidance, that is, because of their undiversified exposure, family firms may use their control of a firm to avoid risks acceptable to the other, diversified, shareholders. Morck and Yeung (2003) note the potential for family business groups to organise into pyramidal control structures that facilitate the expropriation of wealth from non-family shareholders in family subsidiaries to family holding companies. It is asserted that agency costs in family business groups stem from either management not acting for the shareholders, or rather, acting only in the interests of family shareholders. Schulze, Lubatkin, Dino and Buchholtz (2001) elaborate on the potential for non-family shareholders to be held ransom to the mercy of family owners. While Jensen and Meckling (1976) acknowledge the potential for conflict to arise between owner's interests, these would be resolved efficiently by one of the owners selling their shares. However, this assertion is predicated on the assumption that capital markets are efficient, allowing the conceding owner to sell their stake in the firm at its full value. Schulze, Lubatkin, Dino and Buchholtz point to inefficiencies in the capital market that may put pressure on the

conceding owner to acquiesce. While the focus of their research is directed at proprietary companies (with illiquid capital markets), similar problems could affect public companies. In the spirit of Coase (1937), who acknowledged that activities will be included within the bounds of the firm when it is less expensive to do so than to go through external markets, Demsetz and Lehn (1985) were the first to directly acknowledge that, while concentrated ownership generally serves the interests of diffuse shareholders well, if the concentrated owner can achieve their consumption goals more effectively through the firm than privately, the welfare of the diffuse owners may be threatened.

***Corporate Governance and Economic Significance*** - While new research on family firms would further develop a fledgling body of literature that provides a new perspective on an established academic paradigm, incorporating other aspects of corporate governance into the discussion would give original research an economic significance that would be valuable to a range of the market's participants. Research addressing the relationship between family firms and corporate governance would be of nontrivial value to professionals, policy makers, regulators and anyone else concerned with either sphere of interest.

While the concepts encompassed by corporate governance are as old as Adam Smith, the term itself has only really gained mainstream prominence since the corporate collapses of the 1980's. The Cadbury Commission report (1992, p 12) "... based on compliance with a voluntary code coupled with disclosure ..." was the progenitor of corporate governance discussion within the U.K.; the response to a number of high-profile collapses. Recommendations of the report related to non-executive directors, audit committees, disclosure of director's compensation, disclosure of accounting statements, internal control systems and the role of the auditor. The Commission's

sentiments were echoed locally by the Australian Investment Managers' Association (1999) in the 'Blue Book.' It is interesting that some ten years later, after the latest round of corporate collapses, the tenor of the arguments remains principally the same despite the lapse of time.

Corporate governance has become increasingly topical since the adoption of the Sarbanes-Oxley Act (2002) in the US, a legislative response to the excesses encompassed by the spectacular collapse of the 'dot-com' and 'telco' speculative bubbles of the late 1990's. Provoked by the collapse of Enron and Worldcom (Enron had used complex off-balance sheet vehicles to hide extraordinary losses leading to a write-down in shareholder funds of US\$1.2 billion; Worldcom had used accounting improprieties to inflate reported earnings and cash flows by US\$3.9 billion (Bartholomeusz, 2002), the SEC's response, while similar in theme to earlier reforms, differs fundamentally in that the requirements are mandatory. The implications for other regulators are unambiguous, for Australian regulators no less so: if Australian companies are to compete in international markets, their standards of corporate governance must be no less effective than those imposed in the largest capital market in the world. Even so, the attitudes of Australian as well as UK regulators have maintained their voluntary tone. The mandatory components of the Australian response involve those requirements proposed under the 9<sup>th</sup> redevelopment of CLERP, (Corporate Law Economic Reform Program (Audit Reform and Corporate Disclosure) Bill, 2003; Corporate Disclosure, 2002), relating to the role of the auditor, accounting standards, continuous disclosure, and enforcement issues. The voluntary component relates to changes in the ASX's listing rules in line with the ASX Corporate Governance Council Implementation Review Groups's (2004) principles on corporate governance. While the principles maintain the same character as those outlined in Sarbanes-Oxley; compliance with the listing rules is

voluntary; either companies comply or they don't but explain why. Motivated by the Higgs report (2003) and the Smith Report (2003), the approach in the UK has developed in a similar vein. While policy on corporate governance continues to be generated, it is unclear exactly how much is grounded upon firm empirical evidence rather than anecdotal accounts, or perhaps, politics. For example, the response in the US, the UK and Australia has largely focused on the role of independent directors. However, extant research has shown no compelling relationship between the proportion of outsider directors on the board and performance (Hermalin & Weisbach, 2003; Klein 1998). It would seem that normative policy is being advocated without the grounding of a firm positive understanding of how the misalignment of interests between various participants is actually brought into equilibrium. Convincing research on the role of corporate governance in family firms would allow policy makers to develop a regulatory framework that recognised the contingencies inherent in different ownership structures. Market efficiency would also be improved by information that allowed market participants to correctly value different ownership structures after taking into account the differences in value attributed to different corporate governance structures. Research relating to corporate governance and family firms would be of practical value to a myriad of interested parties, providing a positive basis for a consistent set of normative assertions.

***Corporate Governance and Family Firms*** - While there are compelling reasons for pursuing research on family firms and corporate governance independently, there are further incentives to develop the relationship between the two. One incentive, in particular, is motivated by the emerging body of financial literature that focuses on rights as a determinant of corporate value. On a macro level, recent research by La Porta et. al (1998, 1999) has identified the relationship between variation in property rights and corporate value between different property rights

regimes. While the focus of La Porta and his colleagues' paper is directed across different firms in different nations, the essence of the argument operates at the firm level: the rights attached to a security affect the ability of the security holder to procure the security's value and hence, the value of the security itself. While, in a macro sense, the greatest source of variation in the rights of a security will relate to differences in legal regimes, within the same legal regime, the greatest source of variation in shareholder rights will relate to firm-specific corporate governance (that is to say, the Corporations Act (2002) operates fairly uniformly across all Australian firms). As corporate governance mechanisms are largely set by the internal participants within the firm, they should be consistent with wealth maximisation. That is, according to the 'optimal governance hypothesis' (Anderson et. al., 2003), firm participants will voluntarily adopt corporate governance mechanisms to the point where the marginal benefit of adopting further mechanisms (the reduction in agency costs) is just offset by the extra cost of implementation.

A purpose of this paper is to determine whether the optimal governance hypothesis holds true in the presence of family control. One stream of extant literature would suggest that family control is, potentially, an agency cost reducing mechanism in itself. Family firms are concentrated blockholders with a unique incentive to overcome the free rider problem that prevents atomised shareholders and, indeed, some other blockholders from effectively monitoring management (Tufano, 1996; Anderson & Reeb, 2003). Furthermore, as the wealth of the family is directly tied to the future of the company - and decision making in family firms is predicated on much longer time horizons than in non-family firms - family firms more strictly adhere to wealth maximisation than their counterparts (Chami, 1999; James 1999). These reasons, in combination with the ancillary benefits of altruism (Schulze et. al., 2001), would suggest that family control is

an agency cost reducing mechanism. When it is considered that family control is one of several potentially substitute or reinforcing mechanisms, it follows that the combination of corporate governance structures adopted by family firms will be different to the combination of structures used by non-family firms but no less consistent with wealth maximisation.

However, there is also a line of argument within the agency theoretic that would suggest that family control creates (rather than negates) agency costs. It has been suggested that family control provides family members with a unique opportunity (not available to other shareholders) to use their concentrated blockholding to expropriate the wealth of outside shareholders through excessive compensation, related party transactions, special dividends and risk avoidance (Anderson & Reeb, 2003; Anderson, Mansi & Reeb, 2002; Morck & Yeung, 2003). If family members use their control of the firm to expropriate the wealth of outside shareholders, it would be expected that corporate governance structures would be different between family and non-family firms and inconsistent with wealth maximisation. Furthermore, any differences in corporate governance variables between family firms and non-family firms are, ex ante, predictable: if the wealth of outside shareholders is being expropriated, managerial compensation should be higher in family than in non-family firms, the sensitivity of compensation to performance should be lower, board characteristics should portray inefficiencies and the CEO's personal characteristics should be consistent with entrenchment. The effects of inside ownership are more complex when it is considered that low levels of inside ownership facilitate the reduction of agency costs whereas high levels of inside ownership may create further entrenchment effects.

The following hypotheses (stated in the alternative) naturally follow:

**H1:** Family firms adopt different corporate governance structures to non-family firms.

**H1A:** Managerial compensation is different between family and non-family firms.

**H1B:** Managerial compensation differs in sensitivity to performance between family and non-family firms.

**H1C:** Board characteristics are different between family and non-family firms.

**H1D:** Ownership structure (excluding the family) is different between family and non-family firms.

**H1E:** The CEO's age and tenure are different between family and non-family firms.

**H2:** Family firms adopt optimal (wealth maximising) corporate governance structures.

## **Method**

**Sample Selection** - The sample includes a cross-section of 100 firms, listed on the Australian Stock Exchange in 2002, with each having a common CEO (who is a board member) over 2001-2002 and a common reporting period (June 30). The constraint of a common CEO diminishes the effects of confounding noise on the compensation variables. It also increases the likelihood that randomly chosen non-family firms will have similar ownership characteristics to family firms (as family control, by definition, includes a CEO with a large shareholding). However, it does have the potential to introduce a survivorship bias (ie. more successful companies are less likely to have CEO turnover). Sampling proceeded on the basis that all family firms that met the above constraint were included in the sample (assuming data was available). After eliminating outliers, 50 family firms were present in the sample. A further 50 matched firms were chosen on the basis

of size (total assets) and ASX industry classification. Unfortunately, thin coverage over the ASX industry codes meant that companion firms could not be identified for about 10 companies. As a consequence, a further 10 companies were chosen at random to provide symmetry to the sample.

Firm-level data on corporate governance and accounting variables were collected for each firm as reported in corporate reports (available from Datastream). Share price information and some further accounting information were collected from Datastream. Data were collected solely for 2002 for all variables except those required in the compensation analysis (where data covering 2 years was collected). Corporate governance variables are reasonably static over time such that the absence of a time-series dimension to the analysis remains a limitation of the paper.

The adopted definition of family control will correspond with that used by Mroczkowski & Tanewski (2004), who define a family controlled firm as “an entity controlled by a private individual, directly or indirectly, in conjunction with close family members” (p 10). Inclusion is based upon the following criteria: the existence of a founding member involved in management with greater than 20% of voting shares; the shareholder is CEO or a key member of the board (i.e., chairperson); at least one other related party is a member of the board and; the original shareholder and the related parties hold greater than 40% of the voting shares of the company. The dummy variable FF will take on the value “1” for firms that satisfy the above criteria or “0” if otherwise.

**Compensation-** The measurement of compensation variables requires an analogous technique to that used by Anderson, Bates, Bizjak & Lemmon (1998). Fixed emoluments (salary, cash bonus, superannuation, allowances motor-vehicle expense etc.) are aggregated to form the fixed portion

of total income (C\_FIXINC02 & C\_FIXINC02). A second measure calculates the value of the CEO's option portfolio (C\_OPTINC02 & C\_OPTINC01). Details on each executive option package were manually collected from annual reports (exercise price, time to maturity and the number of options granted). Share price information on DataStream was used to calculate six-month historical volatilities. The ex-ante dividend yield was approximated by the ex-post 2 year average. Separate firm-level volatilities and dividend yields were calculated for each of the 2 sample years. The Australian 10 year bond yield (as of the two reporting dates) was used to proxy for the shadow risk-free rate. The value of the portfolio was calculated using the Black-Scholes (1973) model adjusted for continuously paid dividends.

**Board of Directors** - Board composition is determined using Weisbach's (1998) trichotomous classification scheme. A director who is a full-time employee of the company is classified as an inside director. A director who is neither an employee nor has extensive dealings with the company is referred to as an outside director. All other directors, who are not full-time employees but have relationships with the company (eg. family relationships, consultants etc.) are designated as 'grey' directors. Director classification is determined by reading biographies in annual reports, analysing related party transactions and by inference from the definition of family firm.

**Performance** - Performance is measured using Tobin's Q ratios (Q). The adopted measure of Q is calculated by dividing the sum of the market value of equity by the book value.

## Empirical Specification

The models used to test H1 are similar to those used in Anderson, Bates, Bizjak, and Lemmon (1998) in the context of diversification and corporate governance, whereas H2 involves an adaptation of the methodology used by Agrawal and Knoeber (1996) in their analysis of alternative control mechanisms. The first set of regressions is as follows:

$$Var_{ij} = \beta_{0j} + \beta_{1j}FamilyFirm_i + \beta_{2j}Size_i + \beta_{3j}Industry_i + \varepsilon_{ij}$$

where the subscript i denotes the firm-level observation for each variable in 2002 and  $Var_j$  represents each of the possible corporate governance variables that may be used as dependent variables. It is proposed that each of the ownership, board composition and compensation variables be substituted as the dependent variable. The second set of regressions, directed at testing the sensitivity of compensation to performance, take the following form:

$$\Delta Compensation_{ij} = \beta_{0j} + \beta_{1j}FamilyFirm_i + \beta_{2j}\Delta MVE_i + \beta_{3j}\Delta MVE_i * FF_i + \dots \\ \dots \beta_{4j}\Delta EBITDA_i + \beta_{5j}\Delta EBITDA_i * FF_i + \varepsilon_{ij}$$

where  $\Delta Compensation$  is the first difference in any of the (j) compensation measures between 2002 and 2001. The compensation measures include the change in the level of fixed income, the change in the level of option income and the change in the aggregate of the two. The interaction terms test whether compensation is more (or less) sensitive to previous performance in family firms as opposed to non-family firms. Previous performance is measured by the change in the market value of equity (a stock performance measure) and the change in EBITDA (an accounting measure). If family firms adopt compensation policies that promote entrenchment, it is predicted that the direction of the interaction terms will be negative.

**2SLS Regression Analysis** - Tobins's Q is adopted as a measure of performance. However, extant literature highlights potential endogeneity problems surrounding regression analyses of corporate governance mechanisms and performance. For example consider the following equations:

$$(a) \text{ InsideOwnership}_i = \beta_0 + \beta_1 Q_i + \varepsilon_i$$

$$(b) Q_i = \delta_0 + \delta_1 \text{ InsideOwnership}_i + \delta_2 \text{ Size}_i + \delta_3 \text{ Industry}_i + \mu_i$$

Inside ownership is a function of performance (i.e., when firms perform well, insiders increase their holdings), however, performance is not exogenous. Performance is a function of inside ownership (i.e., inside ownership leads to a decrease in agency costs and an increase in performance) as well as other control variables. If  $\varepsilon$  and  $\mu$  are correlated, Q (a function of  $\mu$ ) will be correlated with  $\varepsilon$  and  $\beta_1$  in (a) will be biased. The simultaneous bias will occur as long as  $\varepsilon$  and  $\mu$  are correlated and equation (a) is over-identified (this is so even if inside ownership is not a determinant of Q in (b) but Q is not exogenous).

Agrawal & Knoeber (1996) propose the use of 2SLS (two-stage least squares) regressions in the context of endogenously determined corporate governance mechanisms. The method involves, first, estimating OLS predictions for each endogenous regressor. Secondly, each of the predictions is regressed on Q (the ultimate dependent variable) together to determine consistent estimates for each endogenous regressor. This method allows for the interdependence and alternative use of all of the governance mechanisms.

To test the second hypothesis, an analogous method to that of Agrawal & Knoeber is applied to a restricted sub-sample that includes only the 50 family-firms. A 2SLS regression is estimated by regressing 6 endogenous corporate governance variables on Q. Predictions for each of the endogenous independent variables is estimated from the following equations:

$$\begin{aligned}
 (1) \quad P\_CEO_i &= \beta_0 + \sum_{j \neq P\_CEO} \beta_j Var_{ij} + \beta_7 STDEV_i + \beta_8 SIZE_i + \beta_9 IND_i + \varepsilon_{ij} \\
 (2) \quad P\_OD_i &= \beta_0 + \sum_{j \neq P\_OD} \beta_j Var_{ij} + \beta_7 STDEV_i + \beta_8 B\_SIZE_i + \beta_9 SIZE_i + \beta_{10} IND_i + \varepsilon_{ij} \\
 (3) \quad P\_BLOCK_i &= \beta_0 + \sum_{j \neq P\_BLOCK} \beta_j Var_{ij} + \beta_7 INDEX_i + \beta_8 SIZE_i + \beta_9 IND_i + \varepsilon_{ij} \\
 (4) \quad B\_PO_i &= \beta_0 + \sum_{j \neq B\_PO} \beta_j Var_{ij} + \beta_7 SIZE_i + \beta_8 IND_i + \varepsilon_{ij} \\
 (5) \quad C\_PEQ02_i &= \frac{C\_OPTINC02_i}{C\_OPTINC02_i + C\_FIXINC02_i} = \beta_0 + \sum_{j \neq PEQ02} \beta_j Var_{ij} + \dots \\
 &\quad \beta_7 STK\_RET_i + \beta_8 SIZE_i + \beta_9 IND_i + \varepsilon_{ij} \\
 (6) \quad DEBT_i &= \beta_0 + \sum_{j \neq DEBT} \beta_j Var_{ij} + \beta_7 CFR_i + \beta_8 SIZE_i + \beta_9 IND_i + \varepsilon_{ij}
 \end{aligned}$$

where  $Var_{ij}$  (firm 'i', variable 'j') is the observed value of each of the seven endogenous variables for each firm-observation in the restricted sample (Q is also endogenous). Control variables have been adopted in line with Agrawal and Knoeber. By estimating each of the above regressions, predictions for each endogenous regressor may be purged of simultaneous bias. Hence, the coefficients of the independent variables in the following regression should be consistent:

$$(7) \quad Q_i = \beta_0 + \beta_1 \hat{P}\_CEO_i + \beta_2 \hat{P}\_CEO_i^2 + \beta_3 \hat{P}\_OD_i + \beta_4 \hat{P}\_BLOCK_i + \beta_5 \hat{B}\_PO_i + \dots \\
 \beta_6 \hat{C}\_PEQ02_i + \beta_7 \hat{DEBT}_i + \beta_8 SIZE_i + \beta_9 IND_i + \varepsilon_i$$

where the first 7 independent variables (excluding the constant term) are the predicted values from regressions (1) through (6). If the coefficients in (7) are significant, the null in H2 will be rejected: there is evidence to suggest that family firms adopt sub-optimal corporate governance structures.

## Results

Table 1 provides descriptive statistics on the ownership variables. Each variable seems to be consistent with both intuition and prior research. It should be noted at the outset that, because the incidence of family firms is greater in the sample (i.e., 50:50 family: non-family firms) than it probably is in the population (prior research cited earlier suggests a split of 20:80), it is possible that many of the summary statistics are a function of the overweighting of family firms in the sample.

-----  
Insert Table 1 about here  
-----

Table 2 (Panel A to Panel D) reports the results of 14 regressions. In each regression, a family control dummy variable and a firm size control variable (the natural logarithm of total assets) are regressed on each of the ownership variables. The results of regressions demonstrate that the CEO is likely to hold 13% (.001) more of the outstanding capital in family firms than in non-family firms. The CEO's direct shareholding in family firms is not significantly different from that of CEO's in non-family firms. Rather, their incentives are likely to be derived from indirect shareholdings: typically nominee companies where the beneficial interest is held jointly with other family members. Similarly, outside directors are likely to hold 12% (.003) less of the outstanding capital. Consistent with the notion of reduced external monitoring, outside blockholders are likely to hold 17% less of the issued capital in family firms than in non-family

firms. Given the parsimony of the models, the R-squared values (9%, 7% and 18%) suggest that family control is an economically significant determinant of ownership composition. The regressions provide clear evidence that family ownership displaces non-family owners. Large blockholders are less likely to be prevalent. Moreover, outside directors are likely to hold substantially fewer shares (and, consequently, have less of an incentive to monitor). In both instances the scope for external discipline of the CEO's actions is reduced.

Table 2 (Panel C) supports the differences in board composition and while the proportion of insider representation is not significantly different between family and non-family firms, family control is associated with 18% less outsider representation, compensated by 15% more representation by affiliates. This result is robust to the inclusion of a firm size dummy (which is significant in 2 of the 3 models). The R-squared terms for the B\_PO (21%) and B\_PG (20%) variables further stress the economic significance of family control as a determinant of board composition. Regressions (7) and (8) find no evidence of any variation in board size between family and non-family firms.

Regression (9) is a logistic regression relating the probability of the chairperson and CEO roles being occupied by the same person to family control. Taking  $e$  to the power of 1.34, regression (8) suggests that singularity of the chairperson and CEO positions is 3.82 times more likely for family firms than it is for non-family firms. This is statistically significant at the 5% level. The regressions add further validity to the notion that family control is typically characterised by large shareholdings concentrated in the hands of a few family members who occupy most of the seats on the board. Non-family shareholders are offered little chance for either direct

representation on the board, or alternatively, indirect protection through the presence of external monitoring (through either outsiders occupying board seats or the presence of institutional activists or other blockholders).

Table 2 (Panel D) reports the results of 6 regressions examining the relation between family control and the level of compensation in 2002<sup>1</sup>. Firm size is significant in each of the 3 models. Interestingly, while the family firm dummy is not significant in either of the first two models (where family control is regressed on the fixed component and the equity component of income separately), the final model, that aggregates the two dependent variables of the previous models together, is significant at the 5% level for both specifications. Unfortunately, unlike the other corporate governance variables, which are fairly stable over time, the level of compensation is likely to vary considerably over time. Moreover, the sheer range in cross-sectional compensation levels isn't captured adequately by the small sample. There are many CEO's who are paid seven-figure salary's just as there are many who are paid five figure sums. A random sample of 100 firms will inevitably be thinly spread between the two extremes. It remains a limitation of this paper that the sampling constraints do not allow the notion of family firm compensation to be considered in greater detail. However, there would seem to be enough evidence to credibly prompt future research to examine the issue further with the luxury of a larger sample and, perhaps, a more detailed analysis.

Table 3 reports the results of the 2SLS regression on the sub-sample of 50 family firms. The first column includes 6 of the 7 endogenous regressors (Q is also endogenous). The suffix 'F' denotes

---

<sup>1</sup> 2001 data was not examined as data was not collected for various control variables used to test the robustness of the results.

that the regressor is the vector of predictions from the first stage. Agrawal and Knoeber (1996) suggest that, once the optimal determinants of each endogenous regressor are derived in the first stage, any significance that persists into the second stage is inconsistent with the notion of optimal use. That is, positive coefficients on independent variables suggest that increasing the use of the mechanism would improve performance, whereas, negative coefficients suggest that reducing the use of the mechanism would lead to performance improvements. If the mechanism is used optimally, the marginal benefits from increasing its use should be offset by the marginal costs, that is: it should not be significantly related to performance in the second stage. Tests of the first hypothesis rejected the null of no differences between the corporate governance structures of family and non-family firms. The analysis has now been redirected to determine whether these differences are consistent with optimal use.

The coefficient on P\_CEO\_AF suggests that, at low levels, family firms could benefit from performance improvements by increasing the level of the CEO's shareholdings. At high levels (captured by the quadratic term), inside ownership is consistent with optimal use. Together, these results are consistent with the notion that family ownership improves the alignment of incentives between shareholders and managers. If anything, those family firms where the CEO has a smaller personal stake in the equity of the company may improve the alignment of interests further by issuing more shares to the CEO. More interestingly, the negative coefficient on P\_ODF suggests that family firms would derive benefits by reducing the proportion of shares held by non-family board members. It would seem that there is evidence to suggest that the presence of non-family shareholders on the board creates a tension that ultimately results in sub-optimal performance. Perhaps the long-term interests of family members compete with the

interests of non-family directors. In any event, the evidence would suggest that family firms would benefit by redistributing the shares of non-family board members to the CEO. It is not clear why this would remain in disequilibria.

The positive coefficient on P\_BLOCKF suggests that family firms could benefit from further oversight from external shareholders with large blockholdings. Although marginally significant, there is some weak evidence to suggest that there wasn't enough external monitoring from unaffiliated shareholders in the sample. This is difficult to reconcile with the negative coefficient on P\_ODF. Taken together, the two coefficients suggest that family firms have sub-optimally low levels of unaffiliated blockholdings and sub-optimally high levels of unaffiliated board-shareholdings. While the two aren't necessarily mutually exclusive (it is entirely possible that the monitoring incentives of shareholders on the board and external blockholders are completely different), the relation between performance and the former seems to be economically significant. The negative coefficient on B\_POF would seem to give credibility to the former explanation. However; it lacks sufficient statistical significance to determine the issue conclusively. This should not be unexpected given the weak nature of tests that seek to explain the contribution of board structure to performance based solely on board composition. On the balance, it would seem that family firms would benefit by avoiding outside monitoring.

The insignificance of the coefficient on C\_PEQ02F suggests that the fraction of equity based compensation is set at optimal levels. This is despite previous evidence suggesting that the proportion of the CEO's equity-based compensation is likely to be lower in family firms than in non-family firms. Interestingly, the coefficient on DLF suggests that family firms are sub-

optimally leveraged: family firms could benefit by increasing the amount of debt in their capital structure. Previous research has suggested that family firms experience a lower cost of debt capital (Anderson, Mansi & Reeb, 2003) than non-family firms. Moreover, Australian evidence has suggested that family firms are likely to be more highly leveraged than non-family firms (Harijono, Tanewski & Ariff, 2004). Despite this, the evidence suggests that family firms don't fully utilise this competitive advantage over family firms.

On balance, it seems that family firms utilise sub-optimal corporate governance structures. This is somewhat odd given that all the mechanisms examined should be determined endogenously by the firm's participants. While it is possible that the limited sampling period is insufficient to capture the market in equilibrium, evidence of suboptimal use of corporate governance mechanisms is consistent with the notion that family firms utilise different structures to non-family firms in a manner that ultimately affects performance. It is also possible that the 2SLS method is too crude a framework for correctly testing optimality.

### **Discussion and Implications**

This paper began by outlining the literature on the agency implications of family control. Within this context, family control was posited to be one of several alternative substitute or ancillary internal control mechanisms, with the potential to either ameliorate or exacerbate the ultimate agency problem. This paper produces evidence that family control does interact with other control mechanisms. Family control displaces other owners: large blockholders are less likely to hold the capital of family firms and board members are less likely to hold shares. As a

consequence family firms are less likely to be subject to the discipline of disinterested monitoring (disinterested in the sense that the monitor is not a party to the family). This paper also produces evidence that family firms are likely to have a lower proportion of disinterested directors on their boards than non-family firms. Moreover, just as the proportion of outsiders on family boards decreases, so does the proportion of 'grey' directors increase, suggesting that family firms substitute outsiders monitoring with interested bystanders. Furthermore, family firms are considerably more likely than non-family firms to allow the CEO and the Chairperson roles to be occupied by the same person. Together, these findings suggest that families maintain a close locus of control with little opportunity for external discipline.

Further evidence was produced to suggest that the compensation of family firm CEO's is less sensitive to prior performance than non-family firm CEO's. In contrast, there was some weak evidence to suggest that family firm compensation might be lower than that of non-family firms. However, while this might be consistent with the notion that family CEO's derive utility from a broader set of sources than non-family CEO's, the absence of a time-series dimension constrains the ability to generalise. In aggregate, these inferences are consistent with the notion that family firms adopt a set of corporate governance structures that are consistent with the expropriation of outside shareholder wealth.

Tests of the second hypothesis sought to discriminate between this interpretation and the alternative possibility that the differences were not inconsistent with wealth maximisation. The results were somewhat anomalous. While the results from the two-stage regression suggested that family firms have sub-optimally low levels of outside blockholdings, the results also

suggested that non-family board members hold too many shares. The two results aren't necessarily mutually exclusive, however, they are difficult to reconcile. In addition, it was found that family firms with low levels of CEO ownership would benefit from issuing more shares to the CEO. It was also found that family firms are sub-optimally leveraged; it would seem that family firms would experience performance improvements by increasing the amount of leverage in their capital structures. Overall, the results from the tests of the second hypothesis are not completely consistent with entrenchment. If some of the mechanisms are prevented from reaching equilibrium - because of other extraneous factors not accounted for in the model, or simply because the short time horizon captures the market out of equilibrium - it follows that significant results may persist. This paper leaves the issue to be taken up by future researchers. Ultimately, this paper evidences significant differences in corporate governance structures. The nature of these differences hint at entrenchment (in the sense they are largely consistent with *ex-ante* predictions). However, it remains a reasonably open empirical question whether this is indeed the case.

Furthermore, this paper produced strong evidence to suggest that family CEO's aren't likely to hold more shares in their own name than non-family CEO's. This supports previous evidence in the literature that suggested that family CEO's are motivated by altruistic concerns (that is, pursuing their self-interest through the welfare of others) rather than their immediate self-interest. Research that sought to clarify the distinction between altruistic and other motivations would be well advised to do so within the context of family firms.

In summary, this paper finds that family firms adopt substantially different corporate governance structures to non-family firms. Some evidence has been produced to suggest that these differentials ultimately impact upon firm performance. However, further research is necessary to pursue this notion with a larger sample over a longer time-frame to determine the degree to which this paper's results may be generalised.

**Table 2(A). Regression Analysis of Ownership and Board Composition**

The odd-numbered Regressions are OLS regressions. Where White's (1981) test for homogeneity of variance is rejected, test statistics have been corrected using White's heteroskedastic-consistent variance-covariance matrix. Regression coefficients and p-values from the even-numbered regressions are derived through M-estimation using Huber's (1981) influence function.

**Table 2. Regression Analysis of Ownership and Board Composition (Cont.)**

**Panel C.** Regressions (1) ,(3), (5) & (7) are OLS regressions. Test statistics (t-statistics in curved brackets, p-values in square brackets) are reported below coefficient estimates. Where White's (1981) test of homogeneity of variance is rejected, test statistics have been calculated using White's heteroskedastic-consistent standard errors. Regression (8) is a logitistic regression (z-statistics in curved brackets, p-value in square brackets). R-squared is the adjusted R-squared except for in regression (9), in which case McFadden's R-squared has been reported. Regressions (2), (4), (6) & (8) are derived using Huber's (1981) M-estimator.

**Table 3. 2SLS Results – Corporate Governance and Firm Performance in Family Firms**

In the first stage, predictions of 6 endogenous variables are modeled from the equations specified in section 5. The 6 variables are P\_CEO\_A, P\_OD\_A, P\_BLOCK, B\_POF, C\_PEQ02 and DL. In the second stage the predictions are regressed on Q along with Q's specific control variables (Ln(TA) and industry dummies). For the sake of brevity, estimates relating to each of the 12 industry dummies (reflecting ASX industry codes) have been omitted from the table. 6 of the 12 dummies were significant in the final model (at the 10% level) despite thin coverage of the sample over ASX industry classifications. The tests reported in this table were conducted exclusively on family firms (N=50). The 'F' suffix in the first column denotes that the variable is the prediction from the model specified in section 5.

### **ABSTRACT**

The importance of innovation for firm growth and survival has been well discussed in the entrepreneurship and innovation literature. We studied the factors that are either helping or hindering innovation in small and medium firms especially those related to the lead innovator in SMEs, the entrepreneur, the opportunity at the origin of the venture, the industry in which the firm competes, and strategies used by the entrepreneur. Results indicate that an entrepreneur's education level and entrepreneurial experience are positively related to firm innovation whereas an entrepreneur's industry experience is marginally negatively related to firm innovation. Stronger positive relations are also observed between firm innovation and the entrepreneur's creative personality and growth and perenniality motivations whereas an entrepreneur's autonomy motivation is negatively related to firm innovation. The entrepreneur's subjective value of the opportunity at the origin of the venture is also positively related to firm innovation. Firm innovation is positively related to firm growth, especially management and product innovation. However, we observe that different types of innovations have an effect on firm growth according to the industries in which firms compete. Finally, we observe that there is a U-shaped curvilinear relation between the degree of innovation in SMEs and the innovation productivity in terms of firm growth.

### **INTRODUCTION**

Innovation is seen by many actors in society as an important component of a firm's growth and survival and regional and national economic growth. Indeed, several researchers have looked at the relations between innovation and performance or growth and its beneficial impact on the competitive advantage of small firms (Hult et al., 2004, Verhees and Meulenbergh, 2004, for instance). Other researchers have looked at the factors and determinants promoting innovation or at the barriers preventing innovation in SMEs (Bhattacharyya and Bloch, 2004; Gudmundson et al., 2003, Huergo and Jaumandreu, 2004, Kickul and Walters, 2002, McAdam et al., 2004, among others). We will now review some of the findings from these authors.

### **REVIEW OF LITERATURE**

Gudmundson et al. looked at the impact of the types of ownership and customers served and organizational culture on innovation in small firms. They found out that innovation was

positively related to the level of management support and empowerment of workers in the organizational culture. In addition, family firms, by creating a more supportive organizational culture, initiated and implemented more innovations than non-family firms. Finally, only partial support was found for the relation between the types of customers served and innovation: non-family firms selling to businesses were more innovative than family firms selling to businesses or non-family firms selling to consumers.

In a similar note, McAdam et al. found that firms in the manufacturing, construction, transport, storage and communication sectors in peripheral locations were hampered by a certain lack of vision for the future and organizational culture not conducive to innovation.

Huergo and Jaumandreu wanted to explore the changing probability of innovation with firm age in Spanish firms. Their results show the probability of innovation to be rather stable over time, varying considerably across industries, and increasing monotonically with size. Thus, newer firms seem to innovate more than older firms and larger firms seem to innovate more than smaller firms. As small size is clearly associated by itself with less innovation, it therefore seems clear that small entering firms must be regarded as having extra capabilities which outweigh the size handicap. They also noted that exit from the market appears to be associated with relatively poor pre-exit innovative performance, mainly in process innovation. Also the oldest firms in industry tend to show lower probabilities of introducing innovations, especially in product innovations.

Bhattacharyya and Bloch also explored the effect of firm size on innovation. They observed that innovative activity increases significantly with firm size, but at a decreasing rate. Firm growth is insignificant in inducing subsequent innovation and R&D intensity is significantly positive in influencing successive innovation. In the high-tech industries, innovation increases significantly with firm size, but at a decreasing rate. In the low-tech industries, innovation also increases significantly with firm size, but its effect decreases at a slower rate than in high-tech industries.

Finally, in their study of internet firms, Kickul and Walters observed that the relations between opportunities and new ideas and e-commerce innovations were moderated by the entrepreneur's proactive aspects in his personality. Indeed, proactive entrepreneurs were more likely to introduce new product/service offerings and build e-commerce solutions/applications to satisfy the needs of both the organization as well as their customers. The authors also found that many of the proactive entrepreneurs developed and implemented innovative internal business relationships or management innovations.

On the relations between innovation and firm performance, Hult et al. observed positive correlations between firm performance and innovativeness and entrepreneurial orientation in the firm. Verhees and Meulenbergh also found positive relations between innovativeness and firm performance.

In short, several factors have an impact on firm innovation: firm age, firm size, industry, type of ownership, type of customers served, organizational culture, and the proactive elements of the entrepreneur's personality.

## **RESEARCH QUESTIONS AND METHODOLOGY**

As we have seen, Kickul and Walters observed a relation between innovation and the proactive aspects of the entrepreneur's personality. In addition, Huergo and Jaumandreu alluded that small entering firms must be regarded as having extra capabilities which outweigh their size handicap in innovation. We propose that these small firms' "extra capabilities" are in fact related to the motivations and creativity aspects of the entrepreneur's personality.

One of the authors, in earlier studies (Baronet, 2001 and Baronet, 2003), had looked at the personality characteristics of entrepreneurs, especially creativity and motivations for growth, autonomy and perennality, and their impact on discovery of opportunities, strategies entrepreneurs engaged in, and firm growth. It seems natural that we continue this line of inquiry in studying the relations that might exist between an entrepreneur's characteristics and innovation activity in his firm. Indeed, we consider here the entrepreneur as the lead innovator in the firm he has created to exploit an opportunity.

### **Research questions**

Therefore, in this paper, we examine the impact of the entrepreneur's demographic and personality characteristics as well as other firm and industry elements on the innovation practices of 348 US and Canadian SMEs in different industrial sectors. The questions we try to answer are:

- Do an entrepreneur's industry experience, education level, entrepreneurial experience, and the fact he created the business alone or with an entrepreneurial team have an impact on the degree on innovation in his firm?
- Do an entrepreneur's creative personality and motivations for growth, autonomy, and perennality have an impact on the degree on innovation in his firm?
- Does the subjective value of the opportunity (Baronet, 2004 and Baronet, 2005) at the origin of the venture have an impact on the degree on innovation in the firm?
- Do the strategies the entrepreneur might engage in, such as export and differentiation marketing strategy, have an impact on the degree on innovation in the firm?
- Does the level of innovation activity in the firm have an impact on firm growth?
- What kinds on innovation activities have an impact on firm growth?

### **Methodology**

Since this was an exploratory research, we asked students to interview entrepreneurs for a class project and have them answer our questionnaire. The questionnaire included personality tests covering the entrepreneur's orientation, creativity and motivations, demographic characteristics, and a quantitative description of the firm and its strategies. It also included a 25-item scale of innovation practices (Cronbach alpha of .906). Those 25 items were reduced to five factors related to five types of innovation: management, marketing, partnerships and financing, process, and product innovation (Cronbach alphas for each sub-scale were between .707 and .862).

The general level of innovation in the firm and the levels for the five sub-scales of innovation were the dependent variables in the first part of this study. The entrepreneur's demographic and personality characteristics, the subjective value of the opportunity, the industry in which the firm operates, and the strategies of export and differentiation were the independent variables.

In the second part of the study, the general level of innovation and the five types of innovation were the independent variables and firm growth in sales the dependent variable.

The final sample showed good variability, covering different industrial sectors, a range of firms that have been in business for 3 to 35 years, a range of growth in sales and number of employees, different strategies used, etc. We eliminated partial non-respondents, firms where the entrepreneur founder was no longer present, and firms with less than 5 years and more than 25 years of operations. The median number of employees for the final sample was 15 and the median sales were 2.5 millions dollars.

## **RESULTS**

Table 1 illustrates the results from the multiple regression analysis we conducted on the general level of innovation in the firm and the five sub-scales.

---

Table 1 about here

---

### **Demographics of the entrepreneur**

Of the four demographic characteristics we looked at, the education level is the only one that is significantly and consistently related to innovation, either at the general level or within all the sub-scales except process innovation. Industry experience has a significant negative impact on product innovation whereas the entrepreneurial team has a significant positive impact on product innovation. Finally, entrepreneurial experience has a significant positive impact on process and product innovation.

### **Personality of the entrepreneur**

An entrepreneur's creative personality and growth motivation have a significant and consistent positive impact on firm innovation, either at the general level or within all the sub-scales. In fact, they have the strongest impact of all the variables on innovation in almost all the different types of innovation. Perenniality motivation has a significant positive impact on management and process innovation and autonomy motivation has a significant negative impact on product innovation.

### **Opportunity**

In earlier works (Baronet, 2004 and 2005), the subjective value of an opportunity was defined as a combination of perception of knowledge asymmetry favoring the entrepreneur and entrepreneurial risk. This value has a significant impact on general innovation and marketing and partnerships innovation.

### **Industry**

We can observe some significant positive impact of the manufacturing industry on process innovation and some significant negative impact of the service and retail industries on the partnerships and product innovation.

### **Strategies**

Export activity seems to have a marginal significant positive impact on innovation. A differentiation strategy has a significant positive impact on innovation, especially management and marketing innovation.

### **Innovation and growth**

Table 2 shows the results of the multiple regression analysis we performed on firm growth using the types of innovation as independent variables. We ran into a problem of collinearity on marketing innovation with one of our sub-samples, firms in the retail sector. We therefore dropped marketing innovation from the analysis to ensure good quality of the analysis.

---

Table 2 about here

---

We can observe the significant positive impact of management and product innovation on firm growth for the total sample. In the manufacturing and service sectors, only management innovation has a significant positive impact on growth. We also observe a significant positive impact on firm growth of product innovation in the technology sector and of partnerships innovation in the retail sector. Finally, in the agriculture sector, process and product innovations have a significant positive impact on firm growth.

### **Serendipitous findings**

By chance, we also looked at the productivity of innovation activities in terms of the growth produced by innovation. Without embarking on a full analysis of this new variable, including taking into accounts other elements generating growth in the firms we studied, we were able to discern a few findings.

First, innovation productivity differs from one industry to the next. Thus, for one additional degree of innovation, firms in the technology sector will be able to get on average 1.71% additional annual growth, whereas firms in the agriculture sector will be able to get only 0.26% additional annual growth, firms in the retail sector 0.56%, firms in the service sector 0.70%, and firms in manufacturing 1.04%.

Second, we also found that there is a U-shaped curvilinear relation between the degree of innovation and productivity of innovation. Productivity of innovation for our sample appears to be stronger at the low end and the high end of the curve, according to the following equation:

$\text{Log of Innov.Productivity} = 0.5968 - (0.03 * \text{DegreeInnov}) + (0.0003 * \text{DegreeInnov}^2)$ .

## **DISCUSSION**

It seems clear that our findings put forward the importance of the entrepreneur, as a creative individual, in the innovation activity of the firm. Indeed, as we saw, the personality characteristics of the entrepreneur have the largest impact on firm innovation among all the variables studied. This remains so even as the firm ages and becomes larger and for all types of innovations. We could thus propose that as long as the entrepreneur is present in a managerial capacity the firm will be as innovative as he is creative.

It is also clear that innovation in all its forms has an impact on firm growth. This impact will differ from one industrial sector to the next but it will be present. Indeed, it is hard to imagine that a firm can grow without any innovation. Here we have yet another confirmation of the impact of innovation on growth.

For those of us whose role it is to assist entrepreneurial activity and by extension economic growth in regions or nations, the creative personality scale used in this study might be a useful tool. To be sure, if growth is related to innovation and firm innovation to entrepreneurial creativity, knowing how creative the main innovator in a firm (the entrepreneur) is, will be useful in predicting the level of innovation a firm can expect to reach. If an entrepreneur is perceived as "not creative enough", maybe some outside help might be offered to compensate for this lack of creativity. Also, considering the impact of different types of innovation on firm growth according to the industrial sectors where they operate, we could thus offer useful advice as to the best types of innovation in which one might invest for better results.

The serendipitous finding of a curvilinear relation between the degree of innovation and innovation productivity opens up possible further studies as to why this happens. A brief overview of the results on this finding shows that this curvilinear relation gets stronger as a firm has been in operation for longer time and weaker as a firm grows in size. Perhaps, we need to study the learning curve of innovation in firms to better interpret this curvilinear relation.

### **Limitations**

Probably the main limit of our study is situated in the small sub-samples we have for some industrial sectors, namely retail and agriculture. This limits the significance of our findings. Even though the statistical analysis appears to show a significant relation, further study with larger samples in these industries is necessary to really predict an impact of certain types of innovations on growth within these industries.

### **CONCLUSION**

We set out to observe if a set of variables, but mainly the personal characteristics of an entrepreneur, had an impact on the level of innovation in his firm. The results of our study do show such an impact. In fact, the entrepreneur's personality, defined as a combination of creativity and motivation for growth, is the most important element of all the factors favoring or hindering firm innovation.

We also wanted to verify the impact of innovation on firm growth. Again our results indicate that such an impact exists. We were also able to qualify this impact in terms of the types of innovation having an impact according to the industry in which firms compete.

## **ABSTRACT**

Job quality is usually assessed in terms of objective criteria such as wage levels, employment status (full-time, part-time, contract, casual etc), the provision of a skill-based career structure, provision of training, work environment, payment of benefits, and formal opportunities to participate in decision making. However in this paper we use an approach that takes into account structure and agency or the contexts (structures) within which people (agents) make decisions and take actions and therefore look beyond just objective measure of job quality. This paper addresses the question of ‘what is a quality small business job?’ from the perspective of small business employers and employees. We report on the results of a mail survey of 1000 (randomly selected) small business owners (or managers) and semi-structured interviews with 28 small business employers and 30 employees. The research was conducted in the Latrobe Valley, an old industrial area in south east Victoria, Australia where there has not been a vibrant small business culture due to a reliance on large industry centred around electricity generation. We conclude that subjective criteria are important in any assessment of job quality which is informed by prior experience as well as the history of the place in which the jobs are created.

## **INTRODUCTION**

Small business job creation is high on the Australian policy agenda and has been over the past decade. Yet the issue of job quality was only raised with the release of the report *Small Business Employment* (SEWRERC, 2003). This is surprising given that job quality is high on the EU’s agenda (Cowling and Storey, 1999; EFILWC, 2002; 2003; 2004; ILO, 1999; 2001). Part of the reason for Australian neglect is because the conciliation and arbitration system sets in place minimum standards of employment through industrial awards. Although at present there is widespread debate in Australia about the setting of minimum standards for employment, and with the federal Coalition government’s control of both houses of Parliament to take effect in July 2005, then we can expect radical change in this area.

Job quality impacts on individual and organisational performance, and has broader implications for business sustainability and growth but it is a difficult concept to measure and assess. As a result the findings about small business job quality are contradictory. That is, when job quality is measured in terms of objective criteria such as wage levels, employment status, job security, skill level, employment conditions, and training and career development opportunities, then small business jobs are found to be low quality jobs (Revesz and Lattimore, 1997). But when subjective measures, such as job satisfaction or quality of work life are used, then many small business employees are found to value the flexibility of their employment, the ability to see how they

contribute to the firm's performance, and the 'local' nature of their job (for example Considine and Callus, 2002).

The purpose of this paper is to address the question of 'what is a quality small business job?' This question will be examined from employers' and employees' perspectives and we will focus not only on the different attributes people perceive to make a quality job, but also the attitudes to work and employment of those who create the jobs and those who work in the jobs. This is an important task as it has been argued by Curran and Blackburn (2001) that very few studies of small business employment go beyond the question of 'what' ('what are the characteristics of the jobs?' or 'what are the characteristics of the small business employers and/or employees?') to ask 'why' ('why do small business employers create the jobs they do?', or 'why do people choose to work in small businesses?'). These 'why' questions are under-researched, even though they have implications for how the employment relationship is structured and managed, the quality of work life and sustainable economic development policy.

These 'why' questions about job generation and small business employment can be addressed using an analytical approach that takes into account structure and agency: that is the contexts (structures) within which people (agents) make decisions and take actions (Barrett, 1999; 2001; Barrett and Rainnie, 2002). This is important as it is this dialectical interaction of structure and agency that produces perceptions of job quality. Such an approach is supported by others such as Wilkinson (1999), Ram, Abbas, Sanghera, Barlow and Jones (2001) and Ram and Edwards (2003) who argue that employment relations are not only influenced by conditions in general and specific business environments but also by the employers' choices and actions as well as the employee's actions and interactions at the workplace and beyond. This paper utilises this approach to examine job quality and in doing so overcomes some of the theoretical and methodological problems inherent in many other studies of small business employment and employment relations (see Barrett and Rainnie (2002) and Ram and Edwards (2003) for an overview of these arguments and counter arguments). In particular this approach addresses the issue of small business heterogeneity and rather than resorting to size determinism and therefore this paper makes a contribution to understanding job generation and job quality on the basis of 'place': in this case the Latrobe Valley.

Restricting the analysis in this manner is essential as the history and socio-economic context of a region affects the way that people view themselves and their position within the labour market (Peck, 1995; *Labour and Industry* 13: 2, 2002, particularly Herod, 2002). As a result the type of small businesses that form, and the jobs created within them, differ between regions with contrasting socio-economic climates (for example metro v. rural or favored v. less favored regions). The Latrobe Valley has an interesting history being a small region with significant reserves of brown coal. The region has been dominated by the electricity generation industry (with strong, well organised and militant trade unions) but during the 1980s-90s the Latrobe Valley underwent massive industrial restructuring as the open cut brown coal mines and power stations were privatised (see Gough and Pullin, 1996; Fairbrother and Testi 2002; Fletcher, 2002; Pullin and Gough, 1996; Rainnie, D'Urbano, Barrett, Paulet and Grobbelaar, 2005). The region now has a significant small business (less than 20 employees) population and, in 2001, 92.8% or 2,632 of the 2,835 businesses that operated in the area were small (Snell, D'Urbano and Cunningham, 2002).

The paper is structured as follows. In the next section we address the issue of job quality in more detail and explore subjective and objective criteria in assessments of job quality. We then outline the research methodology and some of the results of our survey of small business employers and interviews with small business employers and employees. In the final section of the paper we discuss our findings and make some conclusions about job quality in a place such as the Latrobe Valley. In the final section we also address the contribution that this study can make to understanding small business and particularly to knowledge about job generation, job quality and the nature of work and employment in small business more generally.

### **SMALL BUSINESS JOBS: QUALITY AND QUANTITY**

Small business job quality is an important issue given that the 'small is beautiful' myth continues to be prevalent in the thinking underpinning small business policy. This is despite a widespread acceptance in the academic community that that neither 'small is beautiful' nor 'small is sweating' (bleak house) characterise small business employment relations (see for example Barrett, 1999; 2001; Barrett and Rainnie, 2002; Chapman, 1999; Holliday, 1995; Ram, 1991; 1994; 1999; Ram, Abbas, Sanghera, Barlow and Jones, 2001; Ram, Edwards, Gilman and Arrowsmith, 2001; Ram and Edwards, 2003; Wilkinson 1999).

Job quality is also an important issue given the resurgence of interest in small business employment. For example, the downward trend in Australian small business employment that emerged in March 2001 (Priestly, 2002) had led to a serious consideration of how small business jobs can be stimulated. Policy has focussed on structural conditions conducive to job creation and removing barriers to employment. In particular in Australia the focus has been on exempting small business from unfair dismissal provisions in the *Workplace Relations Act* 1996 (Cwlth) as this is said to be the major barrier to further employment growth. While it is highly questionable as to whether unfair dismissal actually does stop growth (see Barrett, 2003), the debate is effectively over. The federal Coalition government takes control of the House of Representatives and the Senate on 1 July 2005 and they have made clear in the media that one of their first steps will be to exempt small business from these provisions. They will then undertake a series of more radical workplace relations changes in the name of further stimulating employment, business and productivity growth more generally.

This interest in small business job generation is in part a response to the continual rhetoric about small business job generation, which was fuelled by Birch's (1979) seminal work on job generation in the United States showing 80% of new jobs were created by small business. This research was highly controversial, particularly as it relied on a dynamic, Schumpeterian view of capitalist markets rather than the more widespread static view associated with general equilibrium theory (Kirchhoff and Greene, 1998). Nevertheless, this research came at a time when increasing unemployment was beginning to concern many governments and therefore it was widely welcomed and continues to resonate through many small business policies.

The problem with such a policy interest is that research has produced inconsistent or diverging results about small business job generation (see Storey (1994) for analysis of UK research; Parker (2000; 2001); Revesz and Lattimore (1997) for Australian overviews). Kirchhoff and Greene (1998) illustrate the problem when they outline the differences between a comparative static analysis and a dynamic analysis of small business job creation, explaining that the use of the

former shows large businesses generate jobs and the use of the latter showing that jobs are generated by small businesses. Their conclusion is that although these methodological arguments are interesting they distract policy makers from small business economic development.

These methodological arguments also distract policy makers from the issue of job quality. Job quality is usually assessed in terms of objective criteria such as: wage level; employment status (full-time, part-time, contract, casual etc); provision of skill based career structure; provision of training; work environment; payment of benefits; job security; and formal opportunities to participate in decision making. Further, research mostly relies on sophisticated quantitative analyses of (usually) national level small business data (such as Baldwin, 1998; Cowling and Storey, 1999; Handel, 2005; Hohti, 2000), often with the intention of creating a job quality index (see [www.jobquality.ca](http://www.jobquality.ca) for example or Burgess, 2003). Job quality is high on the EU's agenda (Cowling and Storey, 1999; EFILWC, 2002; 2003; 2004; ILO, 1999; 2001). For example, the report by the European Foundation for the Improvement of Living and Working Conditions *Towards a sustainable corporate social responsibility* highlights the need to focus on issues such as job quality (EFILWC, 2003). *The Annual Review of Working Conditions in the EU* report 2003-2004 further emphasises the link between the improvement in job quality and the objective of raising employment levels (EFILWC, 2004). This supports the central goal of the *Social Policy Agenda* that is to achieve more and better jobs (EFILWC, 2004). However, the focus is largely on the objective aspects of the job quality.

Despite this, interest job quality is only beginning to gain attention in Australia (Burgess and de Ruyter, 2000) with the increasing incidence of non-standard employment arrangements. Part of the reason for Australian neglect is because the award system has set in place minimum standards of employment, although this is likely to change in the federal Coalition government's reform of industrial relations. However, despite minimums existing this does not necessarily mean these standards are met in small business and anecdotal evidence suggests they are likely to breach employment laws (see Kitay and Sutcliffe, 1989).

Studies that employ only objective measures to define or measure the job quality are often undertaken to claim that the quality of jobs has either declined or improved on various objective dimensions (see Handel, 2005 for an overview). But it is important to understand how employees themselves perceive the quality of their jobs and not to ignore the subjective dimensions of the employees' perceptions towards job quality. Few studies consider job quality from the small business employee's perspective and those that do primarily focus on job satisfaction (for example Blackburn, 1990; Curran and Stanworth, 1979; 1981a; 1981b; Goss, 1991). However, job satisfaction has an array of antecedents (Locke, 1976) including the individual's values, which are derived from an individual's socio-economic background as well as their geographic location (Rosenthal, 1989). The result is that individuals perceive situations differently, meaning two people doing the same job with the same pay and conditions may not both think their job is a quality job. This issue of values brings into question how useful studies relying on 'objective' criteria alone are to understanding job quality, and it is for this reason Cowling and Storey (1999: 73) argue that attempting to construct an "all encompassing index of job quality is fraught with danger". At the same time, however, if studies do not incorporate this information then the myth of small businesses being 'better' places to work, because of the closer and more personal relationships between the employer and employees and the employee's ability to see how their work contributes to the whole production process, will continue to remain pervasive, especially

in policy circles. This is why this paper examines job quality from both the employee and the employer perspective. In the next section of the paper we outline the research methodology for the study.

## **RESEARCH METHODOLOGY**

A mail survey was sent out to 1000 (randomly selected) small business owners (or managers) in the Latrobe Valley to collect the information required, which included data on the owner's background, previous business and employment experiences, education, motivations to establish or operate a small business, general business intentions, perceptions of local economic conditions, hiring intentions, recruitment practices and attitude to work and employment. The survey had a 21% response rate and was followed up by semi-structured interviews (Fontana and Frey, 2000; Lee, 1999) with 28 small business employers to examine the particular circumstances of their business in the context of the broader structures in which they make employment decisions. The interviews also explored employers' motivations to employ and the processes they used to recruit, select and manage employees.

As existing research generally neglects employees' perceptions of the quality of their jobs especially the subjective dimensions, we also conducted semi structured interviews with 30 small business employees. These employees were generally employed in the businesses run by the employers we interviewed (above). The purpose of these interviews was to understand why these people came to be working in the business, what they thought about their job and the quality of their job, why they thought that, what reference or comparators they used and whether these were based on direct experience or not. These interviews therefore covered: employee's background and previous experience; expectations of work generally and of this job in particular; perceived advantages and disadvantages of working in a small business; and job related attitudes (satisfaction, commitment, loyalty). An effort was made to explore in detail the subjective dimensions of the perceptions of employees towards the job quality as far as working in small business is concerned. In effect the purpose of the interviews was "to see the research topic from the perspective of the interviewee, and to understand how and why he or she comes to have this particular perspective" (King, 1994: 14).

## **FINDINGS AND DISCUSSION**

The survey sample characteristics are as follows. Of the respondents 28.3% employed no-one in the business other than themselves and 61.3% employed fewer than five people (including the owners) working in the business. The average firm size was 4.8 (standard deviation of 4.6). Most (91.3%) of these businesses were not part of a larger business and in the majority of the cases (68.8%) the business owner had started the business themselves rather than bought the business from someone else. The average length of time the current owner has been running the business was 21 years. Some 84.2% had total sales revenue for the last financial year of less than A\$1 million.

The majority (75.6%) of the respondent firms operated in the service sector, with retail traders the largest (29.6%) of the service sector groups. The small businesses operated under a range of legal forms with a private company structure being the most prevalent (41.6%), followed by partnerships (26.2%) and sole proprietorships (23.8%). The high incidence of private company

structures is associated with the degree of agreement with the firms being considered a family business – 59.3% of respondents indicated that their business was a family business with at least one (31%) to two (45.6%) members from the same family owning the business.

### **Business Practices**

By and large the respondents were not planners. For example, as Table 1 shows, only 36.5% had a business plan and only 22.2% had a staffing plan.

---

Table 1 about here

---

The questionnaire also addressed the existence of various policies covering employment matters and the results are shown in Table 2.

---

Table 2 about here

---

The questionnaire had a series of questions dealing with the employment practices of those businesses that either employed staff and/or intended to employ more staff in the next 12 months. Ninety nine respondents (57.6%) were intending to employ new staff: in 41.4% of cases this was because the business was expanding while in 35.4% of cases this was to replace another employee. Another 28 respondents also commented on their firm's employment practices as these employers had not made a conscious decision not to employ more staff.

Of those 127 respondents employing staff or planning to employ new staff over the next 12 months, the following employment (HRM) practices were used. There was a preference for recruiting new staff through referrals (77.5%) or using an agency (42.3%). While 73.9% of the 127 respondents used a list of skills and qualifications to recruiting, only 46.9% had job descriptions for all their staff. Interviews were used by 95.6% of the 127 employers to select new staff and 79.5% undertook reference checks.

In 45.5% of cases wages and conditions were set by the relevant federal award<sup>1</sup>, while another 29.5% used individual contracts and 17% used a verbal contract. Only 31.6% of employers regularly conducted a formal performance appraisal. In order to keep valued staff in the business the majority (95.7%) used praise and recognition followed closely by a salary increase (81.7%). Informal on-the-job training was offered in 67% of cases.

Respondents were asked about a range of possible concerns they had in relation to employment and these are rated on a 3 point scale of 1 (Not concerned), 2 (Concerned) and 3 (Very Concerned). The mean and standard deviation are shown for the different items in Table 3 in order of most to least concerned.

## Job Generation

A number of themes emerged from the survey and interviews and our initial analysis of this data provides some insight into the issues small business owners feel impact on their businesses and their ability to employ. For example, the problem of being unable to employ the 'right people' was thought to be made worse by the unfair dismissal regime and the shortage of skilled personnel in the region, obsolete school curriculum and a decreasing number of students taking up apprenticeships.

For example when it came to unfair dismissal employers were often confused about the application of the legislation. In the interviews a number of employers made it clear that they tend to avoid employing a new person unless it is really critical for the business. One business owner put it this way, "*It's just, it is a fear when you employ people, and I guess it's one you tend to try and avoid, I guess that is why you tend to employ people you feel you can relate to because you can perhaps communicate more with them*". As a result employers relied heavily on referral methods to recruit new staff. Others made it very clear that they had systems in place to ensure they did not fall foul of the law when dismissing staff. For example one said,

*We have this three month probation, we go through a pretty lengthy induction with them when they start and we give them a copy of what we call our own induction papers, which we go through with them. We then say 'take it home and talk about it with your wife or your partner or whoever and if at the end of the day you think this looks really good, this is the sort of organization I would like to work in, terrific, fill in the application and send it back. But if you think 'oh yeah right', well just don't bother' because that will do us all a favor then'.*

Another made the point that being a small business he has the capacity to make sure the fit is right. As he said,

*Being a small business means I can sit down with a lot of these people. I wouldn't say bluff them or drive them or anything, but you tend to give the staff member an opportunity to resign, because that's their best opportunity to get re-employment, and most people are aware of that now, if they get sacked, it's very difficult to get that next job. And if it comes to the point where... we've had one guy not so long ago, he understood that he wasn't going to get a job if he got that letter of 'see you later,' there was a lot of grounds that had records of, you know we tried to keep as much records as we could, Retail Traders Association gives us a lot of help with that, um, but we always give the person the opportunity. Probably out of the last ten years, five of those guys have taken up that option and have actually handed in a letter, so that's quite simple. Yeah, but it's always ugly if it goes down that line.*

In terms of skill shortages a recent report released by the Productivity Commission highlights the growing skills shortage in Australia (DEST, 2004). In our study a number of employers expressed the view that the region faces a shortage of skilled workers. Their belief was supported by their inability to find the 'right person' or in some cases even the 'right applicants' for a particular job that they had recently advertised. When asked about the staffing issue in the mail survey 48.8% respondents mentioned they were 'very concerned' about finding the 'right' staff and 42.4% mentioned they were 'very concerned' about finding the skilled staff. The inability to find the right person for a particular job is very disturbing for the businesses. A number of factors were perceived as being behind these shortages. For example there was a view that academic

institutions such as TAFEs and Universities should work very closely with industry to ensure the curriculum met their needs. A shortage of skilled staff was particularly felt in the trade professions such as plumbing and building. One view as to why there was this shortage was a lack of encouragement on part of the government for apprenticeships. Employers expressed concern about the ageing workforce and the lack of young people taking up the apprenticeships so that the country in general and region in particular has a viable workforce when baby boomers retire. One of the employers put it this way,

*We used to put an Apprentice on every year, but they're getting hard to find. We used to get work experience kids, but I've been told the government have stopped that because they [school work experience students] might be injured, so they can observe but not work. And they've just dried up.*

Another employer said,

*Yeah, it's hard to find skilled people.... and it's pretty hard to get kids. Like I've had some kids that can't even hold a drill, they don't even know the risks of a hammer drill jamming in a brick wall or something... they're just not taught how to use those sorts of things anymore, so it's very hard to get young kids that are good....*

All respondents were asked to indicate their level of concern about a range of external business environmental issues. The mean and standard deviation for their responses are shown in Table 4 where 1=Low, 2=None and 3=High.

---

Table 4 about here

---

In interviews employers identified over-regulation generally, high work-related insurance premiums, and the Victorian government's payroll tax regime as issues which could stall their business growth and hence their ability to employ. Many suggested governments should provide them with financial incentives to stimulate job growth. Table 4 shows that the GST and new tax system and high cost of public liability insurance were considered as having the most impact on the businesses. Many suggested governments should provide them with financial incentives to stimulate job growth.

As far as the infrastructure in the Latrobe Valley itself employers were generally satisfied with it although expressed the opinion that it could be improved with, for example, the fast rail link. Businesses expressed concern about the bickering between towns as a result of the amalgamation of the local councils during the 1990s. Employers were of the opinion that council could better serve business interests with a coherent investment and development policy. In general however, business owners are very positive about working in the Latrobe Valley. They agreed that the region had an 'image problem' but they were positive about the marketing programme for the Latrobe Valley to 'sell' it to outsiders and therefore, uplift its image.

### **Job Quality**

When asked about job quality, employers used objective and subjective criteria to define job quality in their business. As one employer said, "*job quality to me sort of goes into lifestyle and part of your whole life sort of thing*". This employer went on to argue

*It is not just a case of looking after people because they are people, it makes good business sense too. That is one of the things I am a bit surprised about with some of the new big companies that they talk the talk a lot but don't do too much walking at times. They seem to think that because they pay heaps so therefore they should have your soul. I don't think anyone could pay enough money for a soul anyway.*

However, many employers had limited capacity to offer incentives such as higher wages or other improved employment conditions, and they leaned towards subjective criteria to define job quality for employees. For example employers felt they were creating a good quality job when there was a good relationship between them and the employee, the employee lived close to the workplace and when the employee had flexible working hours. As one employer said,

*We have always, everybody has deaths in the family, everybody has births in the family and we have always just said to them 'right you just go, sort yourself out and when you are ready we'll cross that bridge', and hopefully they have been appreciative of that.*

Employees defined job quality using many of the same criteria as employers. Our analysis of the interview data suggests that employees were not necessarily motivated by wages and hours to work in a small business. For them these may be counted among the prime motivators but they were not necessarily the only motivators. As one employee put it,

*Money comes into it, because you can't work for nothing. But I think next would be appreciation. Promotion doesn't worry me much any more. I just enjoy my work now.....Don't get me wrong, money is... to be paid well to do a job is a good thing, but I don't always see money as being the ultimate.*

Another employee explained what a quality job meant to them.

*For me a good quality job is keeping busy, being happy, which is the main ones, get along with everybody..... I don't come around the corner and think, oh god, here I go again. I enjoy coming here. It's a laugh and you go home and to me that's a good quality job. I remember there was times when I worked at the [Name of large] Bank, I'd lie in bed in the morning and think, 'oh no, I just don't want to go'. Now to me that's when you shouldn't be there.*

Employees gave importance to having a close relationship with the 'boss', a flexible work schedule, 'not being just a number in the organisation', and, in some cases, short travel times to work. As one said, "I'm sure to get like road rage or something if I was stuck in an hour of traffic every single day." For another the close proximity to the boss was what made a quality job.

*I find it easier to go to someone like [Boss' name] and say 'have you got a problem,' or something. Whereas if you don't know someone in a large firm, you tend to not even bother, and then you'd feel 'well they wouldn't want to know or help,' or something, sort of thing. So I prefer the small group, the family type thing, instead of the big lot of people. You're more noticed and you're more welcome.*

In many cases the opportunity to stay within a particular geographical region close to friends and relatives was also cited as a motivator. For example one employee said:

*I love the Valley. You're in the middle of everything. It's only an hour and a half to Melbourne, I love the country feel. I live in a country town on an acre and, you know, it takes me 10 minutes to get to work and, I've got the best of both worlds.*

These subjective criteria were seen as measures to describe a 'quality job', for many fulfilling their aspiration to have a particular lifestyle that revolved around being close to friends and family.

Many of the employees we interviewed had been working since they had left secondary school and had not experienced employment in anything other than a small business. In most of the cases the employees were happy working for a small business, however there are limited opportunities in the Latrobe Valley to work in larger firms. Very few employees expressed any desire to leave their current employment.

## CONCLUSION

Politicians are in agreement that small businesses play an important economic and social role, particularly in terms of employment. Moreover, this role is significant to the functioning of rural and regional economies and communities. There is also agreement that 'something' must be done to boost small business employment and reverse the recent downward trend in employment growth. In the Senate report, *Small Business Employment*, there is an acknowledgement that not only must jobs be created but these must also be quality jobs. This is the case as the quality of any job has implications for workers' health and the long term sustainability of workplaces, communities, regions and the economy.

It is this dialectical interaction of structure and agency that produces perceptions of job quality. An analysis that takes into account both structure and agency to understand the job quality means three issues have to be addressed.

- a) The first is the process of small business job creation, which requires an examination of the structural conditions within which decisions are made to create jobs (employers) and to take jobs (employees);
- b) the second is to understand what small business employers perceive as being a quality job, which requires an examination of the attributes of new small business jobs in addition to the attitude of small business employers to work and employment; and
- c) the third is to question why people choose to work in small business, which requires an examination of what employees think about their jobs, their perception of that job's quality and what reference or comparators they use to make these decisions.

In this paper we have attempted to address these three issues. The study we report on incorporates both employer and employee perspectives of job quality as well as employer perspectives of the issues that help or hinder them create new employment. The study specifically focuses on one region, and a region that has had an interesting industrial history dominated by a single employer – the State Electricity Corporation (SEC) – until the 1980s.

The study highlights that a shortage of skilled workers and an inability to recruit the 'right' workers holds back employment growth. While there are not any statistics available on the extent of a skills shortage in this particular region, there are a growing number of reports in the national media highlighting the problems in regional areas. However, small business employers contribute to this problem by not planning or recruiting widely. This study shows that in a majority of businesses we surveyed, practices such as staff planning are seldom used. Further by using

referrals as the main method to recruit new staff, small business employers are losing out on a big pool of talent.

Over regulation is an area that has to be dealt with if governments want to give small businesses a chance to survive in the current environment of fierce competition from big businesses. Small businesses do not advocate scraping regulations but do want Government to look into areas where employers feel they are being unnecessarily over burdened. For example, in the area of workcover insurance, the premium charged to cover an employee who is at a substantial risk is same as the premium charged to cover an employee whose risk level is low. Such issues need to be addressed and streamlining such areas would go a long way in bringing some relief to the small businesses.

In terms of job quality, objective dimensions such as wage levels, employment status, and job security are not the only motivators for attracting and retaining staff. Subjective criteria play a critical role and these can be used by small business to attract staff and complement the basic objective motivators. In the regional context these subjective motivators may, for example, prevent the exodus of skilled people towards the cities.

A study of job quality using the approach outlined in this paper can assist policy makers in two key ways. First, the findings can help them to understand what people perceive to be a quality job and therefore what minimum employment standards and social welfare measures are needed to ensure small business employees are not disadvantaged because they work in a small business. Second, such a study sheds light on the process of job creation and therefore highlights the type of information, support, assistance, advice, mentoring and counselling arrangements needed by small business employers to create new jobs.

Finally, a study using the approach outlined in this paper benefits the academic community as it acknowledges small business heterogeneity and takes into account a) the contexts within which agents make decisions, and b) the actions and decisions of agents themselves within those contexts and how they impact on the quality of jobs created. In so doing a more general approach to analysing small business work and employment, which does not resort to size determinism, is the result.

## ENDNOTES

1. An award contains a range of terms and conditions of employment (no more than 20) and generally covers an industry sector. Federal awards are determined by the Australian Industrial Relations Commission, which is a statutory body set up under the *Workplace Relations Act* and as a result, awards are legally enforceable
2. Australia is one of two OECD countries, along with the USA, that does not provide paid maternity leave as an employee right.
3. The GST was introduced in July 2000, and increased the frequency and level of reporting to the Australian Taxation Office (ATO) (Dyt, 2003).
4. Public liability insurance has been problematic and increasingly expensive in Australia following the corporate collapse of the Australian insurance company HIH.

**ABSTRACT**

Small enterprises are often portrayed as static businesses with little sophistication and consistency in their human resource management practices. However, small enterprises can be characterized on a number of dimensions including complexity, sophistication, market position, value, industry, managerial versus entrepreneurial management and so on. The case of Axedale describes the stages of development in a small enterprise that deals with “the top end of town”. It provides a professional investment service to wholesale clients and, even though it is still a young firm, it has billions of dollars under investment.

The case describes the changes in organizational structure and leadership, and importantly, the attention given to human resource practices. Sophisticated recruitment, selection and extended realistic job preview/employment trial practices together with continuous daily objective performance assessment - albeit in a firm that stresses long-term value - along with paired/team bonus payments, a mix of entrepreneurial and, on occasions, somewhat autocratic management style, enrich our understanding of the range of characteristics of small firms. What makes this case different is the in-depth knowledge the researchers have of the people in the firm, which provides unique insights into the functioning of this influential enterprise in the financial services industry in Australia. The highly paid employees perform intensive knowledge work, the results of which can affect the well-being of thousands (if not millions) of people in their older years.

Although the firm has been successful to date, the risks it faces, particularly in human resource management issues, but also in its narrow client base, are noted.

## INTRODUCTION

Even though small firms account for the employment of the majority of workers in Australia (and, of course, in many other countries including the USA), small enterprises have almost been totally overlooked by the human resource management literature (Hornsby and Kuratko, 2003; Kaman, McCrathy, and Tansky and Heneman, (2003); Wilkinson, 1999). It has generally been assumed that small firms will be informally organized and have informal human resource management practices, but just as de Kok and Ulhaner (2001) found many exceptions to this expected pattern, Axedale – the focus of this paper – also forms an exception as it could be described as an entrepreneurial firm with formalized human resource management policies. Kaman et al (2001) suggest that human resource management practices in small firms might vary from autocratic, controlling and inconsiderate to modern, “high commitment” approaches. Axedale does have some high involvement human resource management practices, but they sit within an autocratic framework, thus suggesting that the literature tends to be somewhat too simplistic to encompass the complexity of small firms.

For service firms, the resource-based view of the firm – which suggests that long-term competitiveness will be dependent on resources that are durable and difficult to imitate and substitute - points to the importance of human resources and their management in the road to success. The efforts to get this part of the business correct will be the focus of this paper.

The business - which to preserve anonymity we have called Axedale Funds Management Ltd - was established in 1999 as a joint venture between a major international finance house and a small team of experienced, highly motivated and talented Australian investment specialists. The latter had worked in large Australian financial institutions and were attracted to the possibilities of setting up a boutique concern which they considered could compete effectively with what they saw as more cumbersome organizations. The aim of the new enterprise was to offer a professional investment service to wholesale clients (i.e. those with more than AUD2 million to invest) utilizing a disciplined, systematic and transparent investment process. A major component of this approach was its investment process incorporating strategic analysis, cash flow forecasting and valuation modeling. It was considered that such a disciplined approach together with knowledge of local markets, when combined with the financial backing, intellectual ‘know-how’ and systems support of the international partner, would ensure high levels of investment excellence and client service.

The major role in establishing this enterprise was taken by one person – whom we have called Peter Davies – at that time 36 years of age. He had previously been employed in a major Australian bank and whilst there had been involved in some teambuilding activities with one of the authors who had carried out consultancy activities in that organization. The other three founders – also highly talented financial professionals – were aged between 34 and 46. Peter Davies and his colleagues were acutely aware that the success or otherwise of their new venture would depend upon attracting and retaining talented individuals. Their view was that if they could gain a good reputation among their clients and be successful in developing an organizational culture that facilitated teamwork, they would enjoy a significant competitive advantage in the industry. In particular, three factors were seen as critical. One was a system of shared beliefs in both the investment philosophy and the processes developed. Another was the desirability of having

complementary skills and personalities within the team. The third was to recruit individuals of various ages. They appreciated that the development of the venture would be a challenging and demanding experience and thus it was important they complemented and supported each other. It was decided to seek some outside assistance in achieving these aims and the writers and another colleague have worked with Axedale with varying degrees of involvement since that time.

## **THE INDUSTRY CONTEXT**

The total amount of funds under management in Australia is in the region of AUD900 billion (a billion, in Australia, is one thousand million), of which wholesale accounts for 64 per cent and retail for about 36 per cent. Of this total sum, some AUD650 billion is represented by superannuation assets which were boosted as a result of the introduction by the Australian government of a superannuation (i.e. pension) guarantee levy in 1992. Initially this levy was for 3 per cent of an employee's salary and increased to 9 per cent in 2002. As a consequence, superannuation assets are estimated to grow at a compound average growth rate of nearly 12 per cent each year.

Typically, the industry is divided into three types of fund managers: large fund managers have more than AUD20 billion under management; medium sized managers have from AUD5 to AUD20 billion under management and the small fund managers have less than AUD5 billion under management. (PricewaterhouseCoopers, 2003). Industry consolidation has taken place over the past few years and the top ten firms in the industry account for almost 67 per cent of the market. Nevertheless it is still fragmented with some 65 participants and with no one fund manager having more than a 10 per cent share. Relatively low fixed operating costs and the low capital intensity of the industry made it possible for a number of smaller Australian equities managers, such as Axedale, to emerge in recent years. Such boutique organizations gain clients by offering superior long-term investment performance than their larger counterparts.

The Australian market did not suffer from the same volatility as some other OECD markets in recent years. A PricewaterhouseCoopers (2003) survey reports that negative employment growth occurred during the three-year period to 2003, with both profits and revenues down in the previous year. Respondents to this 2003 survey indicated that they anticipated that revenue growth in future years would come primarily from existing customers, but investment market performance and winning customers from competitors were also seen as important factors. In this industry a fraction of a percentage point is critical and, as a result, the pressure on performance is constant. One client removing a mandate, therefore, can have a dramatic effect, especially in the case of a smaller firm.

## **AXEDALE: STAGES OF DEVELOPMENT**

The start-up (1999 – 2001)

Although from the outset the potential vulnerability of an organization being heavily dependent on one person was recognized, the major lead in setting up Axedale was taken by Peter Davies. This interesting, intelligent and focused person possesses great reserves of energy and a high determination to succeed. His role was critical not only in the negotiations involved in establishing the firm, but also in gaining business (i.e. investment mandates) and in the selection and leadership of the analysts.

Initially, the organization consisted of three divisions, viz. Investment Management, Client Services and Business Operations. The Investment Management Division was headed up by Peter Davies and three analysts he had previously worked with, together with another two recruited the following year – one from elsewhere in the financial services industry and one from asset consulting. The Client Services Division was headed by another financial services professional and the Operations Division was led by an experienced administrator. The heads of these divisions were required to provide leadership in terms of the day-to-day management and strategic direction of their respective areas.

In order to encourage retention, all senior members of staff were offered equity participation. This is consistent with the research that has found profit sharing to increase organizational commitment (Coyle-Shapiro, Morrow, Richardson and Dunn, 2002). Corporate governance was provided by a Board of Directors (consisting of a chairperson and two other members from the international finance house, an independent non-executive director, Peter Davies and the Head of the Axedale Business Development Division). An Executive Management Committee, consisting of two Axedale representatives and two from the joint venture partner hold meetings monthly to oversee business operations, marketing and client service matters. An Investment Management Committee, comprising of the members of the Investment Management Division, meets weekly.

The new enterprise was fortunate in taking over the lease and fittings of high quality office accommodation at a prestigious location in the centre of the city. Visitors to the firm arrive at an attractive reception area and are shown into an impressive boardroom. In this respect their image to the outside world was of an established, successful and much larger organization. Similarly, this small enterprise also had some of the other attributes normally associated with major concerns, such as a detailed human resources manual which was a modified version of the human resource manual of the joint venture partner.

As mentioned above, Peter Davies had gained experience of a number of psychometric instruments whilst working with his previous employer, the major Australian bank. To assist in integrating the members of this new organization, they were provided with opportunities to complete and receive confidential individual feedback from the Cattell 16 Personality Factor Instrument; the Watson-Glaser Critical Thinking Appraisal and the Myers Briggs Type Inventory. All agreed to participate. These tests were administered to enable those concerned not only to provide some understanding of their likely interactions with others, but also to give them an objective assessment of their abilities and potential for development. Although encouraged to share their results with one another, the decision to do so or not was left to the individuals concerned. One approach where the results were shared by all concerned was based on the Belbin Team Role Model, with which Peter Davies had become familiar in his previous employment and considered might provide some useful insights for understanding how the new team would function.

#### The Belbin Team Role Model

The Belbin (1993) approach to team building and effectiveness began in the United Kingdom at what was then the Administrative Staff College (now the Henley Management College) in 1969. Belbin invited course members attending a senior

residential general management program to complete a battery of psychometric instruments before competing in teams in a one-week computerized business game. Each team had an observer who recorded the behaviour of the individuals concerned every thirty seconds using a system developed from Bales' (1950) interactive process analysis. Using the data obtained, the researchers then analysed the personality characteristics and critical thinking abilities of the various teams, comparing the successful with the less successful. With greater experience and insight into team functioning, Belbin and his co-workers began to predict before the game what the finishing order of the various teams would be.

It was from these investigations, some of which were later carried out at the Australian Management College, that Belbin defined eight team roles. A ninth role was added at a later date. Belbin (1981) defines a team role as: "A pattern of behaviour, characteristic of the way in which one team member interacts with another so as to facilitate the progress of the team as a whole." Brief details of these team roles are shown at Figure 1. Later, two further developments took place. One was the introduction of a Self-Perception Inventory designed to give users some insight into their own team role. The other was what Belbin (1988) terms a computer-based Human Resource Management System - Interplace - which produces reports based on both self-perceptions and assessments by independent observers.

A member of the Belbin research team, Mottram (1982), suggested that certain combinations of team roles made for more effective teams and noted that the team role of an individual was not necessarily associated with his or her functional role. He noted that the most effective managers seemed to be those that recognized their own best team roles correctly; perceived the most effective contribution they could make in the situation or the team they were working in and were prepared to work to their strengths rather than allow their comparative weaknesses to affect their performance. Mottram went on to propose that the ideal team consists of individuals occupying a range of the Belbin roles, although different team roles are likely to be seen as crucial at various stages in the growth of an organization. For example, someone with the Shaper role would be likely to be important in getting a project started, whilst the follow-through activities of a Completer Finisher could ensure its completion.

The results obtained from administering the Belbin questionnaires within Axedale are shown in Figure 2. These suggest that, with the exception of the Implementor team role, this was a well-balanced group. Three individuals, one of which was Peter Davies, were found to have the Shaper team role as their most preferred or secondary team role. Belbin (1993) describes a person in such a role as: "Challenging, dynamic, thrives on pressure. Has the drive and courage to overcome obstacles," and suggests that individuals with this team role can provoke others and hurt people's feelings. Fisher, Hunter and Macrosson (2000) suggest that such a person is likely to have: "A proneness to frustration and irritation and an inability to recover situations with good humour or apology." Experience suggests that Shapers have difficulty in working with one another unless the boundaries of their roles are very closely defined. Nevertheless, the drive associated with this team role would be expected to be particularly useful in a start-up situation, although a strong sense of direction has the risk of being seen as authoritarian.

---

By way of contrast, the Team Worker role was the most preferred role of only two people, one of these being the part-time non-executive director and the other a junior analyst. Team workers are mild, sociable individuals with a concern for others. They are good listeners, perceptive and operate with great sensitivity in work situations. The absence of anyone with the Implementer role was not surprising amongst this ambitious and highly-educated group. Typically, Implementers are people whose loyalty and interest lie with their organization and are not particularly concerned with the pursuit of self-interest.

Despite the espoused interest in teams, as mentioned above, the investment analysts in Axedale worked on their own, reporting to Peter Davies in his role as the Chief Investment Officer. Each member of the team, in addition to their responsibilities for researching, analyzing and making security selection decisions in particular Australian Stock Exchange sectors, was also responsible for the development and implementation of a part of the investment process.

All the employees initially recruited were accustomed to the leadership of Peter Davies and expressed admiration for his abilities as a fund manager. They pointed out to the writers that he had gained a national award for his performance as a fund manager and suggested that he could greatly enhance his salary if he were to leave and join one of the larger finance houses. All these factors – his role in setting up the business, the admiration and respect of his colleagues, his personal drive and demonstrated competence – combined to give Peter Davies a special status in Axedale. Nevertheless, several members of staff mentioned that they experienced difficulties in their dealings with him, reporting that he rapidly dismissed any concerns they might express and had a distinct tendency to dominate all discussions. He was seen as particularly competent in putting forward his views and had a distinct need to win any arguments.

In the first year of operation, the results obtained were above expectations with Axedale Funds Management exercising control over AUD1.1 billion in funds.

The second phase (2001 – 2002)

The initial success was reinforced the following year when the funds under management increased to AUD2.4 billion and the number of staff went up from six to fifteen. Shortly into this period, however, a number of mandates were withdrawn and by the end of 2002 the total amount of funds under management had been reduced to AUD1.3 billion. The management team was determined to rectify this situation and amongst other steps commissioned the writers to carry out an organizational review involving every member of staff. This culminated in a two-day offsite retreat.

Before this event took place the writers interviewed each member of staff, during which time they asked them to complete a short questionnaire. It was found that members of the firm were proud to work for it. On a five-point scale, for example, the average score for job satisfaction was 4.75 and that for satisfaction with the firm as an employer 4.5. The staff perceived the strengths of the firm to be its professional quality; the investment process that had been established; its people and particularly the diversity of personalities; their achievements in the short period of existence as a firm; the strength

of the joint venture arrangement; the equity sharing by staff and their team skills – although some were perceived not to be team players. The staff said they liked the generally relaxed environment; the smallness of the firm; its openness; the work ethic and their colleagues.

On the other hand, the reduced performance of the firm was seen as a major issue and raised by everyone. Reasons put forward for this could be summarized as a lack of clarity concerning the strategy of the business, the mechanistic nature of the investment process and the levels of stress experienced by some members of the Investment Management Division. These issues were all discussed in a very open and extremely frank manner and plans were drawn up to address them.

With regard to strategy, several said that they considered that there was no clearly-articulated vision. A few believed that the Board was aware of the strategy, but that this had not been disseminated. What was made very clear, they said, was the need to perform, exemplified by the expectation that they should work long hours and by the daily posting of the results of each analyst's stock selections. Sadler-Smith et al (2003) refer to obsession with measurement and performance management as being indicative of a non-entrepreneurial style. However, in this type of business it might be seen as a necessity, given its fiduciary responsibilities and how the market will assess the firm. Several put forward the view that all was in place for outstanding performance in the future, but that the enormous difficulties in developing an organization from scratch had been under-estimated by all concerned. Some of the staff stated that their aim was to make a lot of money and take early retirement. It was also evident from the interviews that the team had no shared vision except to make money, which is not generally considered as sufficient to drive the performance of an organization in the longer term – usually a more noble purpose is perceived to be necessary (Albrecht, 1994; Grant, 1998).

The investment process attracted a great deal of comment from the members of the Investment Management Division. This was seen as complex and took far longer than had been anticipated for those not familiar with it to be able to use it. Some analysts considered that this process was given undue emphasis and that the very complicated models in use should be subject to review. A few believed that the use of such a process caused delays which could prove to be costly.

Although many respondents had commented favourably about the openness and relaxed environment in the firm, there were many more comments about the lack of effective communication. Some felt that there was insufficient information provided to them on how well the firm was doing overall, some felt isolated and wanted fewer "closed doors". There was a feeling that it was sometimes hard to obtain a positive decision, that people were viewed as performance generators rather than as human beings and treated as children rather than as mature professionals. Some said that Peter Davies was not open to new ideas and not good at listening.

Concern was expressed about whether or not the teams were performing as well as they should. The analysts considered that they were constrained by attempting to outperform the industry averages. Although they were each supposed to take an interest in the activities of another analyst in order to provide back up, the pressure of work they experienced and lack of any reward for this resulted in only spasmodic attempts to do so. Levels of stress and conflict were reported to be high. Staff worked very long hours (actually 8.00am – 6.00pm during the week and at least one day at the week end) and any

overtime – for which payment was not made – had to be recorded in a register. Leaving the building at lunch time was seen to be disapproved of. As a result of these factors, several of the more junior staff reported that they found the organizational climate at that time to be oppressive.

The difficulties in leadership concentrated mainly on Peter Davies. Whilst applauding his achievements in the quest for technical excellence, his outstanding contribution to the marketing of Axedale and his drive to succeed, some of the analysts experienced difficulties in their dealings with him. He was perceived by all as being intellectually able, but a very dominant person. Several saw him as not being prepared to listen to their views and to impose his own. Whilst his prerogative as Chief Investment Officer to make final decisions was fully accepted by all, many thought that he would be wise to engage far more in genuine consultation before arriving at a final decision. His strong work ethic was seen to make him intolerant of those who worked fewer hours or whom he saw as less committed. It was said that when he was under pressure he could be curt and dismissive of his colleagues and sometimes did this in front of others. Finally, although it was recognized that he was generous with his time (with some, but not all the analysts), they felt that he was somewhat ‘distant’ and not an easy person to deal with. To assist Peter Davies in overcoming some of the interpersonal difficulties reported, one of the authors was asked to work with him in this task over the next couple of years and monthly meetings between them took place to assist Peter achieve this goal.

The keys to success in this industry were perceived to be team stability, relationships with assets consultants and with the superannuation industry as a whole, together with the capabilities and know-how of all staff. Within Axedale, the problems to be faced were how to cope with predicted growth, the ownership structure and consolidation in the industry. Also of some concern was how to manage the succession of the two older members of the team, in terms of replacement of their skills base but, importantly also of their management of client relationships and cost issues.

Although some of the feedback that he received must have caused him some personal concern, Peter Davies was remarkably open to what had been reported and a number of changes were made. He decided to relinquish the management of all his existing stocks to enable him to concentrate on portfolio investment decisions, the investment process and employee development. The Head of the Business Development Division was appointed as Chief Operating Officer in which role he was to determine the Axedale strategic direction, be responsible for managing the relationship with the joint venture partner and oversee the Operations Division.

At this time it was also decided to make redundant a member of the Investment Management Division. This was a most difficult task to undertake as the person concerned had been one of the original employees of the business. In the experience of the writers, such a step is frequently avoided, with the founder often preferring to wait until the person concerned reaches retirement age.

The third phase (2003 – 2005)

At the beginning of this period funds under management remained at AUD1.3 billion, but some 80 per cent of these funds had been mandated by one client organization. Fortunately, this client approved of the investment strategy adopted and was seen as

unlikely to remove their mandate. During the year a further mandate of AUD82 million was made by a prestigious institution.

Some further organizational changes were made within the Investment Management Division. The analysts were grouped into teams of two, each lead by a senior analyst. The performance objective of each team is to generate at least 1 per cent excess return over the industry average per annum over a three to five year period. In this new team arrangement, two-thirds of an analyst's performance bonus arises from the joint effort of the team and this is assessed in purely quantitative terms. The remaining third is assessed on qualitative factors. It is very much in the interests of the analysts, therefore, to work well with their partners as their bonuses will depend on both how they and their partner's stock responsibilities perform.

To assess how the changes made were seen by those concerned, a series of interviews was held in May 2003. Although a range of views was expressed, the outcome was generally positive with most of those seen reporting improvements in both performance and organizational climates. As one put it: "The whole place is now more cheerful and sociable." These impressions were confirmed by a response to the statement on a questionnaire: "The changes had left the organization more efficient," where the overall result was 4.1 on a five-point scale. Similarly, when scoring the statement: "The changes have resulted in a happier atmosphere," the overall result was again 4.1. (This result should be seen as only indicative, as due to some staffing changes, the group of people completing the scale on the second occasion were not identical to that which had done so on the first round.)

Generally, members of the investment teams spoke favourably about the support they now gained both from the Chief Investment Officer and the other member of their team. One spoke in glowing terms about the improvements that had taken place in communications and reported that - as a result of the changes that had taken place - everyone throughout the firm had become more aware of what the portfolio was doing. Several mentioned that the quality of decision-making had improved significantly, claiming that the analysts had become more confident, and thus bolder in making investment decisions.

Paradoxically, when the first series of interviews had taken place in 2002, the long hours of work had been a cause of complaint by the younger members of the firm. On this occasion, however, two of them were critical of what they saw as the lack of commitment to the firm by some of their senior colleagues. In particular, they expressed concern at the amount of time that senior people were spending in working at home and felt that this practice made it difficult to develop team spirit. Evidence to support that this view was more generally held was provided by the responses to the statement: "People at all levels in this organization work very hard." On a five-point scale, the overall score obtained was 3.9 whereas previously it had been 4.38. Overall the responses to the questions on job satisfaction and satisfaction with Axedale as an employer remained at high levels, but were slightly lower than on the previous occasion.

Most of those interviewed were positive in their comments about the changes in the role of the Chief Investment Officer, although some provisos were made. All approved of his decision to relinquish the management of an equity portfolio. Many referred to the improvements that had occurred in the way that Peter Davies carried out his role. Others appreciated that the role was still evolving and that Peter was also still developing in the

role. He was still held in awe by some of his colleagues, who commented on his experience in the industry and how valuable this was to Axedale. Two expressed the view that he did not exercise his power of veto over choice of stocks often enough and believed that this was due to his confidence having been shaken by some recent mistakes he had made. Others believed that these had provided a useful learning experience for him in that it enabled him to see more clearly that people did make mistakes and, as a result, had made him more tolerant. Two believed he should concentrate more on portfolio management and the understanding of major risk positions and spend less time on the development of models. There were still some criticisms of his management style with several reporting that they found it difficult to ascertain what he was thinking or feeling. What they sought was a more relaxed and informal relationship with him.

The criticisms were by no means restricted to Peter Davies. The four founders as a group were seen to be wanting in a number of respects and were portrayed by their critics as followers rather than leaders. As one put it: "If Peter doesn't see the need, the other founders are not strong enough to stand up and say so." Such a situation - where the founder is surrounded by a group of loyal lieutenants - is by no means rare in entrepreneurial concerns, but was perhaps surprising in an organization consisting of high-calibre individuals where so much overt attention was given to teambuilding.

A further organizational change was made with the appointment from within the organization of a Head of Research, responsible for identifying new stock investment opportunities and reviewing the research process and major assumptions underlying the strategic analysis of the research teams. Another analyst was made redundant. It was also recognized that the investment process which had been developed in the 1990s had been untested in the "bear market" and changes were introduced to make this more robust in dealing with different market situations.

As a result of partner mergers and takeovers, the ownership of the original Axedale joint venture partner has changed on two occasions. It would appear that the business philosophy of the present partner may not align as closely to Axedale as was previously the case, and it is possible that there may be some changes in the joint venture relationship in future years.

During this time the funds under management increased to AUD2.97 billion, with Axedale providing investment advice for funds of AUD312 million under in-house management. A recent survey by Intech Investment Consultants (2005) reported that Axedale had achieved a return in excess of nearly 36 per cent on its investments during the last year with the firm's performance ranked in the top 10 of the 57 Australian fund managers included in the survey.

## **CONCLUSIONS**

Peter Davies stated his motivation for establishing Axedale was the building of an organization. As he put it: "I want to create a business that goes well beyond me and I will judge my success by the development of Axedale." In the six years of its existence Axedale has grown and carved a niche for itself in the Australian financial services industry.

The success achieved is due to a number of factors. A major factor was the choice of the joint venture partner which has played an important role throughout. The normal financial risk associated with setting up a business has been reduced as the international finance house has provided financial backing. In addition, the joint venture partner has been important in giving systems support in a number of areas and guidance to those managing this new enterprise. Association with this major international finance house has also enabled Axedale to develop the ethos and characteristics of a larger professional organization, likely to foster confidence in its clients or potential clients. The firm was also particularly fortunate in acquiring the lease and fittings of the offices at a prestigious location. The general ambiance would be expected to assist in projecting the professional image of the organization.

In the view of the authors, however, the attention and importance given to human resource management issues were significant factors determining its success. Experience in the financial services industry has led to the view that human resource policies in this field are not generally regarded as crucial, although this is not the case for some of the larger finance houses which have very sophisticated human resource practices. Many roles in financial services require a high level of intellectual ability and, normally, a quantitative background. Frequently, those involved appear to be more interested in ideas and concepts than in people and their management. As a result, tasks associated with what are seen as the main purpose of the business – making investment decisions or the development of a theoretical model for investment purposes – are highly regarded. On the other hand, management issues – such as devising an appropriate reporting structure, developing an organizational culture and the development of individuals – are often seen as less important or even peripheral.

The situation at Axedale was very different. A keen interest in people issues and an understanding of how important these could be in determining the success or otherwise of an enterprise were mentioned by Peter Davies in the first discussions held with him. Interestingly, he also mentioned that when negotiations were underway to establish Axedale, the joint venture partner had expressed interest not only in the backgrounds and experience of the individuals concerned, but also in how they would perform as a team. Thus from its earliest days considerable attention was paid to the management of people and, in particular, to recruitment and the development of team spirit.

Of course, there have been problems and on occasions the management of individuals could have been better. In the early days, for example, young, inexperienced analysts were given major responsibilities and, as a result, experienced considerable work pressures. Again, in an organization which from its beginning had many of the trappings of a bureaucracy – detailed job descriptions and complex performance assessment of individuals – it might be expected that there would be some conflict between these control mechanisms and the need for the personal initiative, flexibility and entrepreneurial flair required. Such conflicts certainly occurred, but were dealt with in a constructive manner. In considering some of the difficulties discussed above, it should also be borne in mind that the management of talented people – often with delicate egos and strong opinions – is notoriously difficult to achieve, but is critical for the survival of such a knowledge-based enterprise.

Generally, the firm has been fortunate in the selection of its staff. Some assistance in assessing candidates' intellectual abilities, motivation and the likelihood of whether or not they would fit in the Axedale culture has been provided by the authors. In every

case, however, it has been made clear that any test results (which were always first discussed with the applicants) should be regarded as additional data to assist in the decision-making process, and that the decision on whether or not to hire remained the responsibility of the management. Should a top performing analyst leave to join a competitor, there is always the danger that the funds they manage will be transferred by their clients to the new employer. It is significant, therefore, that not one of the Axedale analysts has resigned, thus demonstrating that the strategies adopted for employee retention have been successful to date. The status Axedale now enjoys in the marketplace is such that it now mainly recruits analysts from a major Australian business school. Successful applicants for employment are required to complete a three-month period as an intern and, if deemed suitable after this initial period, are offered a full-time position.

Peter Davies and his colleagues have demonstrated considerable courage and judgement in coping with the problems encountered. They modified the investment process, reduced staffing levels which included retrenching one of the original team members, achieved considerable reductions in operating costs (with the founders agreeing to a substantial reduction in their own reward packages), and worked hard at gaining new and retaining existing mandates.

The organization structure has been changed to meet new demands and over time the leadership has become more shared as those involved have become more experienced. The new structure appears to be working well, particularly after the appointment of the Chief Operating Officer. Peter Davies – recently appointed as Executive Chairman in addition to his role as Chief Investment Officer - has modified the ways in which he plays the latter role. As he put it: “I see myself in a role akin to that of the coach in football. In other words, I’m concerned with recruiting good talent, inspiring the staff and getting rid of those no longer able to perform.” Rousseau (2001) argues that knowledge workers have considerable power to negotiate their employment conditions and expect flexibility and idiosyncratic deals in their employment relationships. Thus family friendly policies and greater work-life balance may be called for to prevent burn-out. There is some evidence that this is occurring in Axedale as analysts are now actively discouraged from working at week ends and are given five weeks annual holiday. On average they work some 50 hours a week. As a fledgling organization is unlikely to have the financial resources to attract and retain the services of an outstanding analyst from one of their competitors, the development of able, young people is important in fostering team spirit and employee retention.

Given the lack of a shared vision, and the reliance of the firm on knowledge workers with distinct competencies, it is likely that further adjustments to the human resource policies and modus operandi will be required. As a consequence, the adoption by Axedale of the human resource policies of their much larger joint venture partner, for example, may no longer be appropriate in future years as the firm adapts its policies to meet the needs of its staff and the markets served. The importance of adapting human resource practices in this way, of course, has relevance to many small enterprises and particularly those employing mainly knowledge workers.

As to the wisdom of involving consultants in the task of developing such an organization, Peter Davies has summed this up as follows:

“Long-term stability is a critical ingredient of a sustainable high performance funds management organization. However, most

managers of funds management teams ignore the science of team structure and team management. Using consultants has provided our team with frameworks that make individual differences an enduring team strength in terms of skills, personalities and ages... and the formula seems to work.”

**1. Introduction**

A wide range of support initiatives have evolved in the UK, aimed at assisting women to start and develop their businesses. These include training programmes on a range of personal and business specific topics, mentoring programmes, dedicated business premises and financial services. This paper looks at the development of networks as a means of supporting women in business. Networking has been demonstrated to be a powerful tool for new venture creation and business development yet it has been shown that women are often excluded from many traditional business networks and/or lack access to information about such networks. This paper, based on action research primarily in the north east of England examines:

The concept of relationship building through networking and networking as a vehicle for building social capital for women's enterprise as a critical component in helping to build self-confidence and self esteem. This paper is not an academic critique of models supporting women's entrepreneurship. It is however, based both upon practise of an award winning business support initiative Women Into the Network (WIN) based in the UK and action research (a study of bankers and their clients and a survey 1000 women running businesses) together with regular evaluations of WIN members that have been undertaken over the four years as part of an activities of the broader WIN Project. The research aimed to develop a better understanding of how networking helps to develop women's social capital. It identifies a number of themes related to networking support and raises a range of issues relating to the effective promotion of relationship building and social capital for women's enterprise and highlights implications for future interventions. The development of social capital is a relatively under-researched, understood and as such an under supported aspect of women's entrepreneurship.

This paper highlights how;

- Social asset building is critical for successful women's entrepreneurship
- Networking related support encourages and helps women to build contacts and confidence in doing this.
- Relationship and social capital building is a dynamic process, which involves life long learning for both women and the support sector – highlighted by a case study of an awards process.
  - Work on this aspect of 'doing business' - social capital and asset building for women- needs to be given more explicit attention by support providers and policy makers

In recent years there has been much commentary upon the ever-growing importance of women in the global market and that the growth of women's economic activities and their general level of activity in the paid economy can significantly influence the success or failure of each country's long-term economic health (OECD, 2003). Indeed, it is often claimed that women are the producers, suppliers and customers of the future.

Levels of entrepreneurship within a society has long been recognised as a prerequisite and a useful indicator of an economy's health. Although the relationship between entrepreneurial and economic growth is complex, recent international economic reports such as the Global Entrepreneurship Monitor Reports (GEM) ([www.gemconsortium.org](http://www.gemconsortium.org)) has clearly highlighted the positive correlation between economic growth and entrepreneurship and recently has highlighted the role of women's entrepreneurship. In the 2001 and 2002 GEM reports for the UK, noting that 'Expanding the involvement of women in entrepreneurship is critical for long term economic growth *in the UK*' (GEM, 2001,2002). In turn this was endorsed by the UK's Department of Trade and Industry (DTI, 2003), which recognised women's entrepreneurship, as a key way of enhancing the competitiveness of the economy

## **2. The State of Women's Entrepreneurship in the UK**

Women have always played a key part in enterprise ownership in the UK, but typically, this has been hidden by the invisible support roles they have played – rarely being 'seen' as the owners or entrepreneurs as such. Good quality data on women's entrepreneurship is problematic as with statistics on small businesses per se (Carter et al, 2002) in particular there is little cumulative information about the experience of women business owners in the UK, which would help to understand the factors that underpin women's attitudes and experiences around the whole area of business ownership. Although there are difficulties in obtaining consistent data across different countries on the actual economic impact of women's entrepreneurship in most OECD countries; there is sufficient research to illustrate the challenge that the UK faces as regards the growth of this sector (DTI, 2003, FSB, 2002, Lloyds TSB, 1998 & 2000, Carter, 2000, and Cabinet Office, 2001, Carter et al 2002, Marlow, et al, 2003, Harding et al 2004)

Despite considerable social and cultural change within the UK, the proportionate increase in the number of women starting their own business in the last two decades has been half that of other countries such as the USA. In simple terms the GEM 2001 UK Executive Report noted that men were currently around two and a half times more likely to be entrepreneurs than women. The 2002 GEM report, shows a slightly smaller gap between male and female entrepreneurship in the UK, but highlights a continuing low level of female entrepreneurial activity in comparison with many other countries taking part in GEM, including Canada, the USA, Australia, Norway and most countries in the Far East and South America.

In Spring 2000, 3.2 million people were self-employed in their occupation (Table 1). The self-employed constituted approximately 11% of the workforce, however women were underrepresented with only 845,000 (27%) in self-employment, which was nearly two-thirds less than that of men. The majority of men who were self-employed worked full-time (91%), while the full- and part-time split was more even for women (53% and 47% respectively). However, this was a steady growth in female self-employment as in 1979, women accounted for only 18% of all self-employed (Cabinet Office, 2001). Labour Force Survey figures (LFS, 2003) show that the number of full-time and part-time self-employed workers is 3.45 million (12.9% of all employed), with women still representing some 27% of all those running their own business, this represents some 7-8% of the total female workforce compared to 16-17% of the total male workforce running their own business. Research by Barclays Bank reinforces this showing in their samples that men are twice as likely to become entrepreneurs than women. "Over the five years the study has been running, the percentage of those surveyed (aged 16-64) who said they were setting up a business was 5.3% for males and fell to 2.3% for females" (Barclays 1999 and 2003 p5).

These numbers of female entrepreneurs puts the UK near the bottom of global rankings – UK women's business ownership is on a par with other Northern European countries but is far lower than USA levels. GEM (2003p24) found that female attitudes towards opportunities for business start-ups are far more negative compared to men, with only 22.1% of the sample seeing good opportunities compared with 31.8% of the male sample. Women were also more likely than men

to let fear of failure prevent them from setting up a business and although women have the skills to start their own businesses, they themselves do not see this.

### **3. An Overview of Supporting Women's entrepreneurship**

Whilst there has been significant growth in the number of women owned businesses in the UK over recent decades has been achieved over the years, it has been noted repeatedly that women owner-managers still face a number of problems, for example, (Allen and Truman, 1993, Richardson and Hartshorn, 1995, FSB, 2002, Lloyds TSB, 1998 & 2000, Carter, 2000, and Cabinet Office, 2001, Carter et al 2002, Marlow, et al, 2003, Harding et al 2004). Interest in assisting women as business owners in their own right began to emerge in the 1980's with a range of local, regional and more recently initiatives providing specific support to women being launched throughout the 1980s and early 1990s. Most of these initiatives have focused on helping women to start up their own businesses and have looked at the very overt barriers they face to doing this i.e. concerning their abilities and skills, their experience both generic and business specific, their ideas and their access to resources – see Figure 1 overleaf.

These issues have been dealt with by the design and delivery of a whole range of training programmes both women-specific programmes and generic business development programmes and those targeted at different groups of women (*Cabinet Office, 2001, Small Business Service SBS, 2003*). ) These support activities include training programmes on a wide range of personal and business specific topics, mentoring programmes. In addition specific interventions have been developed addressing the type of ideas and markets that women's business are located with a view to helping them to build on their ideas and to move out of locally saturated markets into broader opportunities. Targeted schemes have tackled the problems that women face in accessing physical resources both financial and non-financial such as business premises in the form of incubators. Particular attention has been given to the barriers that women face in getting start up money be this using their own capital, and the role of banks other institutions and the place of micro-finance initiatives as financiers (Koper, 1989; Read, 1998; Lloyds TSB 2000 Marlow, et al, 2003, Harding et al 2004).

# Ingredients for a Successful Business

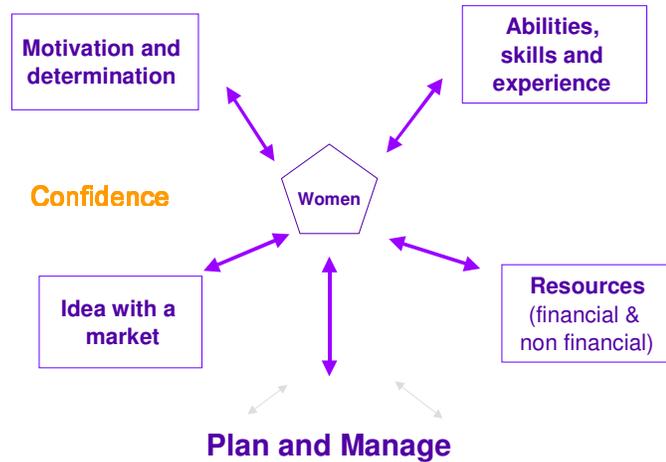

Figure 1

Based on the work of Gibb and Ritchie (1986) (Understanding the Process of Starting Small Businesses, Journal of European Industrial Training 14.1)

In the past five years there has also been a focus on the development of women's business networks and helping women to effectively network for their businesses. Networking as a business activity has been demonstrated to be a powerful tool for new venture creation and business development See for example (Hall and Bennett, 1999 and 2002) and yet it has been shown that women are often excluded from traditional business networks and /or lack access to information about such networks (Shaw, 1998). This note looks at networking as a means of supporting women in business.

## 4 Confidence Networking and Social Capital for Business

Most of the above support measures whilst focusing on tackling the resource problems faced by women have also aimed to increase women's confidence about business ownership. In this way issues concerning confidence were tackled implicitly, with issues of motivation, determination and confidence being grouped together under the broad label of 'confidence' or more particularly 'lack of confidence'. Confidence or lack of confidence is a factor that is quoted by much of the research that has looked at the differences between men and women starting and running businesses. While confidence is no doubt an issue for men, they do not raise it as an issue or researchers do not address it explicitly when talking to men in business. Gould and Parzen (1992) are just one example of researchers who posit that women entrepreneurs often face barriers not usually encountered by men. These barriers are usually associated with the following:

- Their dual role and domestic responsibilities;
- Low self esteem and lack of confidence (Halpern and Szuruk, 1989);
- Lack of socialisation to entrepreneurship in their homes, school, and society.
- Exclusion from traditional business networks and lack access to information (Shaw, 1998).
- Discriminatory attitudes of lenders, gender stereotypes and expectations that label women entrepreneurs as are 'dabblers' 'hobbyists' or merely lifestyle business owners.

Godfrey (1992) supports this and adds that women have a socialised ambivalence about competition and profit together with a lack of self-confidence! The GEM reports also add to these views stating that 'Women are more likely to let fear of failure prevent them from setting up an entrepreneurial business than men' (GEM 2003). Comments such as the above present very broad generalisations about all the attitudes of women considering or practising business. Confidence is a complex, very personal and relative issue concerning a whole range of psychological, sociological, cultural and economic issues impacting upon individuals and their choices in life. It is not the place of this paper to explore the whole concept of confidence rather it looks at a dimension of confidence that comes from people's – in this case potential and practising business women - relationships with others in their networks.

Much research has shown that contact networks and developing relationships with a range of different people both formally and informally are critical for business success (Hall and Bennett 1999, 2002). Successful entrepreneurs note that having a strong network of people behind them helps to build confidence in doing business. Such contacts and networks are often termed 'social capital' and the remainder of this paper looks at the nature and role of networking in helping to build social capital for women entrepreneurs and with it the confidence of women as business owners.

In addressing the issues of different forms of capital when initiating or growing a venture, it is clear that capital can take a number of different forms: *Physical capital* which can include plant, machinery and other assets; *Natural capital*, including clean air, water and other natural resources; *Human capital*, consisting of knowledge, skills and competences; *Social capital* which consists of the networks, norms, relationships, values and informal sanctions that shape the quantity and co-operative quality of a society's social interactions and *Financial capital*, used to fund, acquire or invest in the other forms of capital. Some writers also subscribe to the concept of *Cultural capital*, this includes familiarity with society's culture and the ability to understand and use educated language (Bourdieu, 1986 quoted in Aldridge et al, 2002).

These different forms of capital are not wholly independent of each other but mutually interdependent and re-enforcing. As noted above previous support has tended to focus on helping women to access human assets in terms of training and mentoring to recognise and use natural assets in helping women to use their local resources to build business ideas; to access financial assets in terms of women's savings, their own capital and interactions with financial institutions and the provision of physical assets in terms of premises, safe spaces, access to physical markets in

terms of doing business. Until recently less assistance has been given to explicitly helping women to build their social assets for business. See Figure 2 overleaf.

Social capital has been described as "...features of social life – networks, norms and trust – that enable participants to act together more effectively to pursue shared objectives... social capital, in short, refers to social connections and the attendant norms and trust" (Putnam, 1995, quoted in Aldridge et al 2002). Others highlight three main types of social capital: *bonding* social capital (e.g. among family members or ethnic groups); *bridging* social capital (e.g. across ethnic groups); and *linking* social capital (e.g. between different social classes). From this it can be seen that networking, developing contacts and relationship building are all integral to building social capital.

## 5. WIN in the North East

The North East of England, has one of the lowest self-employment rates in the country, (ONE, 2002). It also boasts one of the poorest records of business formation and survival rates. For example, during 1999 and 2000, 8,500 new VAT registered businesses were created, but a similar number deregistered and the formation rate per 10,000 head of adult population was 21 at a time when the national average stood at 38. In addition, women's self-employment rates in the region had been and were still seen as being particularly poor as Table 2 below indicates, with three times more men in self-employment in the region than women.

**Table 2: Percentage of People in Self-employment by Gender**

|              | North East | UK   |
|--------------|------------|------|
| <b>Men</b>   | 13.7       | 16.8 |
| <b>Women</b> | 4.1        | 8.1  |
| <b>All</b>   | 8.4        | 12.9 |

Source: Labour Force Survey, August 2003

It was this profile, which provided the backcloth that led to the establishment of Women Into the Network (WIN). WIN was launched in 1999. It began in 1998 when a piece of market research conducted in the North East of England had found that there were over 700 networks and organisations in the region that said they were providing assistance to existing and potential business women, but the majority of potential and practising women business owners interviewed were unaware of the existence of most of these networks and of what they offered (The Journal, 1999). There was a major mismatch between supply and 'customers' with the result that many women were potentially, missing out on a range of opportunities. Faced with such evidence Women Into the Network (WIN) was established to support the creation and management of effective businesses by women, through addressing their lack of integration into mainstream Business Networks.

WIN set out with the twin aims of '**integrating women into existing and new business networks and to bridge the gap between providers of business and professional support and women themselves**'. It does this by delivering a wide range of network related activities along with a wide range of partners throughout the northeast region and beyond. In its first three years, it has assisted in the creation of over 800 new jobs in women owned businesses.

WIN is an initiative composed of multi level – activities and key services which it designs delivers and disseminates with a wide range of partners.

- **Hosting Events** – around 30 per annum from training workshops to lunches. Regular networking lunches, dinners and workshops are offered which are aimed at facilitating new contacts these events offer an excellent informal opportunity to extend networks and offer encouragement and inspiration.
- **Establishment of Annual Women's Business Awards in the North East** – Since 1999 WIN has held an annual competition, which has rewarded the efforts of a range of successful women entrepreneurs in the North East. This has not only raised the profile of women through this competition but has encouraged more women to apply for other mainstream regional and national business awards. It is discussed in more detail in section 6 below.
- **Communications and Publications** –The primary objective of WIN is to facilitate good communication within the network. A survey of 1000 members demonstrated that many women were not on mailing lists or databases of any type and therefore missed out vital information. To overcome this a number of communications media are used: The online service gives an overview of the entire network ([www.networkingwomen.co.uk](http://www.networkingwomen.co.uk)) and its activities and offers the opportunity to register on a free business directory. A newsletter coupled with regular email bulletins circulates network news, diary dates and reports recent successes and opportunities. A series of

simple 'how to' start up and business development guides are available through the network.

- **Role models** – The importance of having positive role models to encourage women in business has been well documented (Richardson, and Hartshorn, 1995; Carter et al 2001). Another objective of WIN is to promote appropriate and accessible role models. It does this by promoting women business owners from a diverse range of backgrounds and sectors through various media outlet, at WIN events and through a specialist publication called Northern Lights.
- **Sectoral initiatives.** The development of new and existing businesses is integral to the objectives of WIN. A variety of workshops and programmes provide access to business training and personal development opportunities at affordable prices. Working in collaboration with local organisations, training programmes in pre-start up, start-up and business development will be delivered as bespoke packages or one-off events.
- **Research.** Research not only facilitates innovation and progress, but also confirms the appropriateness of existing ventures. WIN is currently undertaking research to:
  - Benchmark existing provision of business support for women in the North East region and to conduct and up-to-date needs analysis
  - Progress understanding of the factors contributing to the low number of women entrepreneurs within the technology and construction sector.
  - Understanding the relationship women entrepreneurs have with their bankers. It is this research that has helped to inform WIN's work on relationship building as a dimension of developing social capital. The research examined the relationships that entrepreneurs have with their banker. The nature of these relationships was explored through a qualitative study using a comparative sample of men and women to assess whether gender has any impact on this relationship<sup>1</sup>. It investigated the perceptions of both the bankers and owner managers in order to develop a more informed understanding of these issues (Bennett, 2000). This research was primarily based in the North East and geared towards practical learning and application.
- **Signposting** – WIN works with a range of partner organisations and signposting of women to appropriate support services is an important element of its work. These organisations include private sector (banks,

---

<sup>1</sup> Ten female business owners and ten male business owners together with sixteen bankers took part in this qualitative study. The bankers were representative of the five main business banks in the North East: All the bankers held the position of Business banker or senior business banker and had portfolios of small business customers ranging from 150 to 400.

other business professionals, associations etc), public sector (local authorities regional development agencies etc), voluntary sector as well as peer group providers.

- **Dissemination of best practice** – WIN acts as a key gateway of sharing good practice in women’s business support. The experience of WIN and its activities has already been ‘exported’ to a number of different regions throughout the UK as well as further field. WIN also endeavours to bring into the Region good practice from elsewhere.

The delivery of these services over the past 5 years has brought WIN into contact with thousands of women - both potential and existing women business owners as well as hundreds of business support organisations and consultants. Currently WIN has a membership base of some 1500. It is the experiences of these members and their feedback to WIN that underpins the following reflections on the role and value of networking for building the social capital and confidence of women entrepreneurs.

## 6 Lessons Learned from Practice and Research to Date

### Making Networking Explicit

Networking is a much-used term – business owners are encouraged to network and to build their networks but what does this actually mean? WIN ‘unpacks’ the concept of networking by researching perceptions surrounding networking and the practice of it. In this way it has developed a deeper understanding of networks and networking for women in business – especially how networks operate within different business cultures. Skills and competencies required for effective networking by women are identified from this work and passed on to women. The key lesson from this work to date is that women invariably have strong local ties and strong ‘core’ social capital from family and friends but benefit from help to develop ‘bridging’ and ‘linking’ social capital – especially if there has been no experience of business ownership in their immediate family or peer group. To assist with the development of such capital WIN has recognised the following in its work.

- *It is important to offer ‘easy entry points’* to enable women to access existing networks, services or activities. Segmentation of the women’s market is an integral part of this as it highlights the needs of different women and hence for a range of interventions and activities in a variety of venues.
- *Providing Rehearsal space.* WIN offers women the opportunity to practice their networking and relationship building skills before moving on and being integrated into more mainstream business networks. This space affords the opportunity to build their confidence alongside their peer group as well as developing their skills for networking.
- *Both women only and mixed provision is provided.* The question is often asked whether WIN supports women only provision – it supports both. Targeted women-only business support is not an alternative to ensuring that mainstream business support is women-friendly. Although the option of women-only provision is available for many WIN events and services, it is acknowledged that many women will prefer to develop their business in a mixed-gender setting. The key message is that all business support providers should take into account the particular needs of women and base their services on these needs.
- *WIN provides a conduit for the support sector* - Many business support agencies fail to reach their target group particularly women from more disadvantaged communities. WIN helps in this respect through signposting and offering ‘getting to know spaces’ where business owners and support providers are able to meet new clients at events and vice versa.
- *Lobbying for change to existing business networks.* Many of the mainstream networks still field sexist racist speakers at events, which reinforce negative perception of women in the community and deter women from attending. WIN challenges such practices and promotes

the use of speakers who are more aware of the profile and diversity of their audiences.

### **Segmentation is Critical**

Recognising individual needs is critical when helping people to develop social capital – relationships and trust are integral and how people build these with others is a very personal thing. Consequently segmenting ‘women’ as a client group is critical in attempting to really address and meet their needs.

- ***Women are not a homogeneous group!*** Whilst everyone states this fact it is surprising the number of researchers, policy makers and business support providers who still talk and deliver services for ‘WOMEN’. WIN is conscientious about segmenting its market/client base in a variety of different ways for both accessing women and supporting their development. Clearly WIN cannot serve the needs of all women all of the time – and in this respect signposting women onto other support providers can be critical and is an important aspect of how WIN works.
- ***‘Place, Space and Pace’*** are important issues for the delivery of any form of support. Taking these factors into account recognises that women at different ‘levels’ of business awareness, development and confidence require quite different forms of support at different times and venues. Offering networking opportunities at different times of the day, week, month and year is important. Likewise location is crucial with events being held in a variety of places and venues from slick inner city hotels to village halls.
- ***Self-selection is the key ethos.*** WIN makes efforts not to presume that it knows what women want. Instead the ethos is to clearly articulate what is on offer, what events are aiming to achieve and then it is up to the women themselves to decide whether the offering is appropriate for their needs.
- ***Churn is seen as positive.*** WIN doesn’t intend to hold onto their women members and welcomes women joining other networks relevant to their needs. WIN only ever intended having a membership of 100 women at any time but it now boasts 1400 members as women have felt the benefit of its activities and although they participate in other organisations and activities they opt to remain with WIN. Also WIN recognises that you cannot please everyone all the time – as noted above women are not a homogeneous group and WIN is not right for all!

### **Mixed Perceptions and Expectations**

Having a good relationship with your professional advisers, such as bankers can be critical for business success. As noted earlier it has been well documented, that women face particular problems accessing appropriate

funding and financial advice when setting up and running their own businesses. These problems include of issues of credibility when dealing with bankers i.e. this is often a weak area of social capital for many women entrepreneurs – especially those with no history of business ownership in their peer groups. The bankers research by WIN referred to earlier raised a number of points for helping women to communicate more effectively with banking professionals. The two key lessons from this were:

- **Varied Expectations need to be acknowledged**
  - Women wanted their banker to be more proactive and interested in their business. They viewed the bank as an important stakeholder.
  - Men merely saw the bank as a service provider and no more
  - Women viewed access to the bankers networks as the added value aspect of their relationship
  
- **Different Modes of Meeting needed.** Modes of meeting and venues used by banks were often not appropriate for women. For example women are invited to golf days and football matches and many tended to decline these invitations. Consequently they were potentially missing opportunities for developing their networks, especially 'linking' contacts as well as doing business. One positive outcome from the research is that subsequently interventions have been developed to highlight these issues and address them – for example WIN training seminars for women how to better manage their bank managers, seeing them as a help to develop 'bridging and linking social capital' contacts as well as effective financial support. Seminars are also held for bankers – in helping them to segment their market and provide more effective services for their women clients.

## **Role Models**

Again the powerful impact of introducing women to appropriate role models has long been recognised. The critical issue is the term 'appropriate'. Women role models have to be accessible to the women concerned otherwise the example is not someone who the women can model themselves upon. The UK has some very powerful women entrepreneurs such as Anita Roddick, founder of The Bodyshop. However she is too 'different and distant' – the bridge in social capital terms is too far! This is especially the case for many women in the northeast where as was noted earlier there are low levels and small numbers of women in business. Consequently WIN has focussed on developing and disseminating local role models from a variety of backgrounds taking up business ownership at different stages in their lives.

- WIN has been very active in developing publications with a diverse range of inspirational, aspirational and achievable role models from the north east and further field.
  
- WIN sees it is critical to disseminate local role models in order to highlight that it is not unusual for women to be in business and to be successful in business.

- Also once again the issue of heterogeneity of women - be this by business type, size or sector - is highlighted.
- Role model publications offer powerful visual imagery –that is overt and explicit. These publications are also used educational tools and promotional vehicles for the women who are featured in them and WIN itself.
- WIN has also brought leading national and international women entrepreneurs to the north east – so that local women can easily access opportunities to interact with very successful women who outside of their normal networks.

### **Stereotyped Assumptions & Impressions of business support providers**

Biased/naïve assumptions about women in business and their support needs by frontline staff in business support services often present challenges for effective and trust based relationship building and can close off areas of support to women.

Examples from WIN research include:

- A woman in a rural area, having made a decision to visit her bank manager, spent time and resource arranging domestic and care responsibilities prior to the meeting and most certainly had garnered confidence for the meeting. Her overwhelming impression was that of 'not being taken seriously' as a 'part time business owner' with her 'country lifestyle'. She never approached any other business support agency until many years later when her business was ready for substantive growth- first impressions are critical especially when the transaction costs of getting to the meeting for the women are high.
- All too often home based portfolio or part time businesses are viewed as diminutive by the support and professional service sector and hence not worth time or attention. Such stereotyping is not uncommon by support agencies and is a critical issue determining women's access to effective support.
- It is not uncommon to hear of women searching websites for support, to find that the search using the word 'women' generates references to activities for the 'socially excluded' or 'disadvantaged'. This 'label of disadvantage or social exclusion' is one that is used by many business support agencies whose funding comes with these 'eligibility tags' attached to it. However to be quizzed whether one falls into these categories as one of the first questions in response to an initial enquiry instantly gives a negative message and deters women from further pursuing support.

### **8. The Awards – a case study of how to practice networking and provide a vehicle for building confidence through social capital.**

Taking WIN's annual awards event as a case study we can look at the development of social capital and its role in building confidence.

### **The Awards and development of the Award Process**

WIN has developed and hosts 'The Annual Women Entrepreneur of the Year Awards'. This event is a powerful mechanism for developing and promoting women's business role models to both men and women throughout the region and has become a very popular occasion with seats selling out very quickly – see Table 3 overleaf profiling the awards

**Table 3 Facts and Figures about the Award Process**

|            | No of Awards | Total Applicants | No. Attending | Press coverage | Nomination Events                         | Launch  |
|------------|--------------|------------------|---------------|----------------|---|---------|
| WIN 1 2000 | 5            | 51               | 200           | 9              |   |         |
| WIN 2 2001 | 6            | 52               | 210           | 7              | 15 October                                |         |
| WIN 3 2002 | 8            | 103              | 240           | 11             | 19 September                              | 26 July |
| WIN 4 2003 | 9            | 130              | 319           | 54             | 3 July<br>2 September                     | 29 May  |
| WIN 5 2004 | 9            | 144              | 450           | 27             | 10th June<br>19th August<br>3rd September | 7th May |

However the event also provides another important opportunity – it is a live case study on networking. Through the practicalities of organising the award event each year, WIN engages in a series activities that practically demonstrate a multi-levelled process of relationship building. This ranges from winning support for awards (sponsorship) through to effective engagement with the media and the business support sector (communication) and most importantly of all encouraging buy in from those the awards are directed (women entrepreneurs themselves).

WIN are very clear as to why they set up ‘The North East women Entrepreneur of the Year Awards’ The current awards in the region were called the Business Man of the year Awards which was an appropriate title as only men were entering and winning them. However in 1997 a women won the awards for the first time in and she too was called the Businessman of the Year. WIN challenges language and visual imagery in terms of the message they are imparting to women and felt this was inappropriate. Win lobbied to have the names of the awards changed to Businesses Executive of the Year

and also found that very few nominations were coming from women hence the need for awards to celebrate successful women running businesses. WIN is clear that these awards would have a clear focus of women in enterprise and not women in management or women of achievement of which there are a plethora. WIN is also clear that the award categories would be very much business focussed and certainly not award prizes in the names of Greek goddesses for example. In 2000 when the WIN awards started there were five different categories in 2004 there are nine – including rural, ICT, International business, newcomer, innovative and social.

In 2001 The Susan Dobson Memorial Fund, set up to honour a remarkable women entrepreneur who hailed from the North East and who was passionate about both her native region and women in business, approached WIN to explore ways of working together. It was decided that the Memorial Fund would sponsor the main award itself each year as a fitting tribute to Susan who died of breast cancer in 1999.

Beginning with the Launch Event where key stakeholders in women's enterprise, award sponsors, past winners, existing and aspirant women business owners gather to hear about the effect of winning both on women's confidence and the development of their business. These are followed up by Nomination Events in smaller settings where women are encouraged to enter for the next year's award. At these events previous award winners and runners up tell of their own experiences of entering the awards and the benefits to them and their businesses. The regional business paper runs a series of weekly media coverage examining each business category in the awards and profiling previous years winners. The Awards Event, where the awards are presented each year and which grows year on year this year attracting 550 people, is now a truly mainstreamed event attracting a variety of men and women from the regional and national business communities. After the event itself a series of post Award activities take place and media coverage continues through until the next cycle of nominations.

### **Individual benefits that arise from the awards**

For women who are short listed, runners up and winners the benefits include:

- Increased confidence
- Greater visibility
- a voice which is now heard (women have said that they say the same things as winners as they said before but now newspapers want to quote them and they are invited as guest speakers at a variety of events)
- Increased contacts and networks
- More business

### **Collective benefits that arise**

For women entrepreneurs in the North East

- Increased profile and credibility
- Greater interest, the Small business editor insists on profiling at least women in the business pages each day.
- Voice – the media both regional and national regularly want to quote these women in articles on a variety of topics
- Acceptance into mainstream business networks. People see that women do do business and should therefore be invited to and accepted on mainstream business committees and events

### **Benefits for others**

- Support agencies are given credit for support and have their profiles raised. They are also given access to women role models that they can use to generate business.
- Media – newspaper and journals have ready-made copy for articles on women in business.
- Funders, are aware of the profile they are given for their sponsorship monies that goes far beyond the awards themselves
- Access to women entrepreneurs

The lessons learned from this process are about proactively increasing opportunities for social contacts in terms of volume, quality, diversity and in a variety of different contexts and enabling women to develop social capital out of the

## **9 In Summary**

Women's business ownership is on the increase in the UK albeit at differing rates within the country and at a much slower rate than the US. Much research looking at the experiences and trends of women's enterprise have identified a number of barriers facing women in their pursuit of business ownership. Business support in the UK, to date, has tended to focus on the explicit/ 'visible' and practical barriers for women primarily relating to lack of skills, appropriate finance, childcare support and access to non local markets. One barrier, which is seen as gender specific to women is that of low, or lack of self-confidence. Lack of confidence is seen as a somewhat 'umbrella' term being the reason behind women's s/lower start up rates, especially in non-traditional sectors; their allegedly risk averse attitudes to business; their unwillingness to borrow and their reluctance to grow more substantive businesses. One more recent form of support - networking and relationship building has sought to address the area of self-confidence by helping women to understand the place and importance of relationships for business, to review their own range of contacts and build additional contacts and relationships where there are gaps. This paper gives a brief insight into how

WIN, a networking based business support initiative for aspiring and practising women entrepreneurs, has sought to use more effective networking to help build women's self confidence about business through helping to build their social capital.

In essence WIN has been helping women to build their social capital especially 'bridging' and 'linking' social capital through accessing them to new contacts and new contexts. WIN has achieved this – largely 'implicitly' through its broad portfolio of networking and networking related activities. In reviewing these activities with members WIN has found that these activities seem to have really encouraged women and helped them to build contacts and confidence in themselves. The WIN project has also seen the emergence of and encouraged other local women's' business networks within the Northeast region. WIN has shown that hundreds of jobs have been created in and by women owned businesses within region and WIN has been selected as best practice model by a EU commissioned survey on women business support and the WIN model and approach is being disseminated to four other regions in the UK as well as three different countries.

The key conclusion from WIN's research and experience so far is to work more explicitly with social capital and asset building. Social asset building is critical for successful women's entrepreneurship and work on this aspect of 'doing business' needs to be given more attention – making the tacit explicit. WIN has supported networking as a development tool for business and a means of helping women to build their confidence. To date WIN's experience shows that relationship and social capital building is a dynamic process, which involves life long learning for all concerned. A more in-depth understanding, mapping and tracking of the concept, 'relationship building' and its role in social capital accumulation and building self confidence is now an integral part of WIN's work.

# **SYNDICATION IN THE VENTURE CAPITAL INDUSTRY DURING DIFFERENT STAGES OF THE BUSINESS CYCLE**

Björn Berggren<sup>1</sup>, Royal Institute of Technology, Sweden

Christer Olofsson, Swedish University of Agricultural Sciences, Sweden

Lars Silver, Royal Institute of Technology, Sweden

## **ABSTRACT**

In this paper we describe and analyse the development of the Swedish venture capital industry and its syndication pattern during the years 1996–2004. These nine years can be divided into three different stages in the business cycle. The period from 1996–1998 is considered to be a period of moderate growth, where the Swedish economy and capital market was still recovering from the crisis in the early 1990s. The level of investment and syndication was relatively low in comparison with the following years and the primary reason for syndication was that of sharing risks. In the overheated Swedish economy between 1999 and 2001 supply of capital to early stage investments were plentiful and new venture capital firms entered the market every month. Since capital was plentiful the investors was in constant search for new ventures to invest in which made it easy for venture capitalists to find syndication partners for their second round financing at a good valuation. After the drastic downturn in the venture capital industry in 2001 the level of investments was relatively low during 2002–2004. In all, the total number of investment during the period 2002–2004 was lower than during 2001. Furthermore, the investments during this period were to a large extent in the form of syndication. During the shake out period, the survivors of the industry were more prone to do

first round syndications again. The sharing of monitoring costs and risk sharing were the most common reasons for syndication in this period.

## **INTRODUCTION**

In comparison with other European countries, the Swedish venture capital market is relatively large (Reynolds, et al. 2002). As with other business sectors it has had its ups and downs. During the prolonged recession of the early 1990s the level of investment within the venture capital industry was very modest. Starting in the mid 1990s the venture capital sector started a remarkable recovery and expansion that culminated in the first year of the new millennium. The downturn began in March of 2001, with the crisis in the telecommunications and information technology sectors. Over night hundreds of Swedish venture capital funds found them selves in a situation where they had thousands of investments with no functioning second hand market. Since then, the Swedish venture capital sector has been subject to far-reaching consolidation and restructuring. The surviving venture capital firms seem to be more prone to syndicate than they were before the crisis.

European venture capital has over the last couple of decades been more targeted towards the later stages of the development of firms as compared to the U.S. venture capital (Brouwer & Hendrix, 1998). There is a widespread belief within the Swedish debate that the pro-longed crisis within the telecommunications and information technology sectors has contributed to this development. The investors are less willing today to accept the relatively high risk associated with investments in early stages. Hence there is less traditional venture capital (Bygrave & Timmons, 1992) and more capital is allocated to the later stages of the firms' development, i.e buy-outs and buy-ins. The trend towards more buy-outs and buy-ins is widespread across Europe (Brouwer & Hendrix, 1998). In short, the growth of venture capital

in Sweden seems to have been generated to an extent by large investors diversifying their holdings in public companies by also investing in later stages of the business cycle. For a number of years venture capital became a high-risk investment opportunity for capital that would otherwise have been allocated to the already inflated stock market.

### **REASONS FOR SYNDICATION IN THE VENTURE CAPITAL INDUSTRY**

In Bygrave (1987; 1988) the syndication patterns between venture capital funds is described and analyzed. The results indicate that syndication is more common in situations characterised by high levels of uncertainty, such as investments in high technology firms in early stages. Syndication is seen from this perspective as a means to reduce the uncertainty by acquiring competence and information from other venture capital firms (Lerner, 1994; Lockett & Wright, 2001). A second reason for syndication among venture capital firms is to reduce the financial risk (Bygrave, 1987). This can be seen from two perspectives. First, according to classical financial theory (see e.g. Markowitz, 1991) the overall risk in a portfolio of investments can be reduced by investing in firms belonging to different industries or different stages of development. Second, the overall investment in a portfolio firm can be too large for one venture capitalist. Syndication might be one way to overcome this problem. According to De Clercq & Dimov (2004) syndication can also be seen as a means to increase the deal flow. If one venture capital firm invites another one to take part in an investment, this increases the likelihood for more investments from the latter part in the future (De Clercq & Dimov, 2004). In times where the competition between venture capitalist firms increases, as is the case in a booming market, we would expect that syndication is a way to reduce the bargaining power of the entrepreneurs seeking financing.

The purpose of this paper is to analyze the development of the Swedish venture capital industry and its syndication patterns in during the period 1996–2004. We postulate that during the overheated venture capital market in the late 1990s, a number of actors poured into the market with little or no competence as regards business development. Instead they were attracted by the profits made by the already established venture capital firms.

The hypothesis put forward in this paper is that the reasons for syndication will be different depending on which stage of the business cycle that the investment is being made. Firstly, on a relatively stable market with few new entrants and little competition between the actors, the foremost reason for syndication will be that of sharing risks both by acquiring competence and capital from other actors. Second, in a booming market, with an increased inflow of capital and many new entrants, the foremost reason for syndication is postulated to be that of increasing the possibilities of picking a winner among the portfolio firms. Finally, in the bottom of the business cycle in a market characterized by low levels of investments and investors with few exit options, we postulate that the foremost reason for syndication is to reduce monitoring costs and the financial risk.

### **METHODOLOGY AND SAMPLE**

The empirical data for this paper has been acquired from Förvärv & Fusioner AB (“Mergers & Acquisitions Ltd”); a Swedish firm specialized in collecting data on investments and divestitures in the Swedish venture capital industry. The data covers the period from 1996 to 2004 and consists of all the 1740 new investments made by Swedish and international venture capital firms during the investigated period. In all 199 different venture capital firms made at least one investment during the period 1996-2004.

## EMPIRICAL FINDINGS

In this section we will describe the development of the Swedish venture capital industry and its syndication patterns. We have divided the period 1996–2004 into three different phases that will be described below. But first we will give the reader a brief review of the entire period.

As can be seen in figure 1, the investment activity has shifted dramatically during the investigated period. From a relatively low level of investment activity in 1996, the industry picked up speed in the following two years. The period 1999–2001 saw a massive entrance of new venture capital firms into the booming venture capital sector, many of which had very little or no experience of business development. The downturn in investment activity in the venture capital sector started with the stock market crash in the spring of 2001. A very low level of investments characterizes the period from 2002 to 2004. Many of the new entrants from the earlier period have left the scene or have made very few investments in the latter period.

---

Figure 1 about here

---

As can be seen in figure 2, the numbers of venture capital firms that have made investments over the years have also changed rather dramatically. From only 30 venture capital firms doing a new investment in 1996 to 141 firms in 2000, back to almost 30 in 2004. It is notable that many of the old venture capital firms that were active in 1996 are still the ones that are making new investments in 2004. Many of the very high profile venture capital firms from

1998-2000, who were focused on investments within the IT and telecommunications sector, have in a number of cases filed for bankruptcy, and are not around anymore.

Figure 2 about here

---

### **The years of recovery and moderate expansion – 1996–1998**

With 57 total investments 1996 is actually a better year for VC investments than both 2003 and 2004. It signals a recovery from the recession in the early 1990s. The venture capital fund 3i, originally from Great Britain, heads the group of investors, by investing in a mix of manufacturing, IT and biotech. The largest investors in terms of number of investments are private investors. The government-owned The Swedish Industry Fund only manages 3.5 percent of total investments, but is later to grow into one of the most important investors on the market. The fund's purpose is to support Swedish industry by making substantial investments in areas of strategic importance for Swedish industry. SEB Företagsinvest and Investor Growth Capital are both members of the Wallenberg sphere in the Swedish economy. Wallenberg as an old industrial family with roots in the 1850s, and benefactors of the great Swedish industrial expansion, holds an important part in Swedish industrial life.

As regards the nature of the investment, it is notable that a relatively large share of the investments being made during the year can be considered to be low-tech, such as investments in breweries, wholesalers and paper mills. The level of syndication is relatively low, in that only 15.8 percent of the total investments are syndicated. The most common type of

syndication is first round syndication that accounts for 80 percent. Furthermore, there was no third round syndication during 1996.

During 1997 the interest in venture capitalism is on the rise in the Swedish economy as more investors chose to enter the industry. 3i is still the largest fund, with a wide range of investments but Health Cap, soon to become the giant in Swedish biotech financing, now joins 3i. Health Cap starts off with an array of investments in medicine and biotechnology, Innovationskapital emerges in Sweden's second largest city close to Chalmers Technical University. This fund starts off with investments in telecom, medicine, engineering and IT. SEB Företagsinvest and Investor Growth Capital manage 6.6 percent of investments in total and trails the major three.

The foremost area of investment during the year is that of biotechnology and information technology. But some investors, foremost MBO/MBI funds, continue to do investments in low-tech sectors. As regards syndication, the second round syndication emerges as the most common type of syndication during the year, although by a slim marginal to the first round syndication. There is still no third round syndication within the industry.

During 1998 two governmental funds takes over as the most active investors on the venture capital scene. At the same time the venture capital industry is more diversified as the largest investors shrink well below 20 percent of the total number of investments. The Swedish Industry Fund mainly invests in manufacturing, as is their traditional policy. The 6<sup>th</sup> Pension Fund invests funds for pensioners and chooses mainly manufacturing as well for its investments. Novestra starts out by investing in high-risk IT projects. They will continue to do

so, but their recognition as one of the most active investors will be short-lived. They are, however, an advertisement of the types of investments to come in the venture capital industry.

The investments being made during 1998 are again focused on biotechnology and information technology. Yet another rapidly expanding sector has raised the interest among venture capital firms – the Internet consultants. Still, some of the largest deals in the year were made in more mature industries. The syndication pattern is the same as in 1997, with second round syndication being slightly more common than first round syndication. During the year the first third round syndication has been made in firms within the biotechnology sector.

---

Table 1 about here

---

### **The high tide of the Internet era – 1999–2001**

The total number of new investments in 1999 was an impressive 344. In the same year, the expansion of the number of new entrants continues as the big three's share of the total investments falls to 16.0 percent. The 6<sup>th</sup> Pension Fund takes the lead as The Swedish Industry Fund is hit with a one-year stop for investments in the wake of some troubles in earlier investments. Investor Growth Capital and SEB Företagsinvest together manage to accumulate 9.0 percent of total investments and since the total number of investments increase dramatically it is clear that the Wallenberg family intends to make venture capital their kind of game. The range of investments is remarkable, with everything from the odd ABBA musical (actually turns out to be a good investment) to IT, biotech and telecom. The industrial background does not appear to prevent a genuine diversification. 3i makes a

comeback at third, but the major news is the startling amount of new venture capitalists appearing on the scene. The primary investment focus of these new entrants is IT related businesses.

The syndication pattern among the venture capital firms is the same as in 1997 and 1998 in that second round syndication is slightly more common than first round syndication. During the year approximately 10 percent of all syndication were in the form of third round syndication. These syndications were almost all within the biotechnology sector, with some exceptions in that a couple of investments being made in Internet related firms.

In the year 2000 it is the relatively small but very fast moving venture capital investors who occupy the leading positions. These new venture capital firms have an approach to venture capital and management inspired by the American venture capital industry. Many of the new entrants are furthermore very specialised in that they only invest in IT related businesses. The Swedish venture capital scene has never been more diversified, in all 141 different venture capital firms made new investments during the year. 3i moves into the IT industry while the government owned 6<sup>th</sup> Pension Fund and The Swedish Industry Fund staunchly refuses to leave manufacturing. It is also noteworthy that a number of very large international funds make investments in Sweden, not via Swedish venture capital firms, but by themselves.

As regards the investment focus, the biotechnology, information technology and software industry stands out. The largest deals of the year however are once again in low-tech areas. A major shift in the syndication pattern can be seen in 2000. The second round syndication stands out as the most important form of syndication with almost 60 percent of the total syndications. Furthermore, the third round syndication is now more common than the first

round syndication. These third round syndications were primarily directed towards growing IT firms, rather than biotechnology firms. A number of the relatively large syndications during 2000 have been some of the more spectacular failures within the Swedish economy in the beginning of the new millennium.

As the momentum disappears from the Swedish venture capital scene in 2001, some old actors reappear as the most common investors. The Swedish Industry Fund now invests more into IT-related areas whereas world-leading venture capitalists 3i continues to invest in a vast range of industrial fields. These two actors dominate as the number of actors making new investments decreases. Brainheart Capital picks up third place with investments in the wireless industry, thus telecom related investments. Most of the smaller investors disappear from the scene. The fall is indeed dramatic. So does The 6<sup>th</sup> Pension Fund with two final investments, as the government decides that retired people's capital belong in the stock market. Thus a major player is gone, even though they are to be found in indirect investments through a number of other venture capital firms.

As regards the syndication pattern it is clear that the second round syndications is losing ground to first round syndication, even though the former is still the most common. More than 20 percent of the syndication in 2001 is third round syndication. In comparison with 2000 it is clear that the biotechnology sector has gained some ground on the IT sector when it comes to third round syndication.

---

Table 2 about here

---

### **The last charge by The Swedish Industry Fund and a dormant market – 2002–2004**

For the second year in a row, the total number of investments was once again cut in half. In all 131 new investments were made in 2002. The big three this year actually consists of the big one. The Swedish Industry Fund stampedes its colleagues by a whopping 26.0 percent of total investments. FöretagsByggarna consists of a couple of veterans in the venture capital industry, with investments in IT, medicine and telecom. CapMan is another venture capital firm with relatively experienced investment managers, controlled by the Finnish venture capital firm CapMan. The year is in the whole rather disappointing as it is very clear that the good times for venture capital investments are long gone by. Even 3i has by now all but left the scene with only three investments during the year, to be followed up in 2003 by one more investment. Once again biotechnology firms and software producers are the ones that venture capital firms seem to be most willing to invest in.

The syndication patterns in 2002 reveals the relatively largest numbers of third round financing during the period 1996–2004. Approximately one third of all syndications are in the form of third round syndications, foremost within the biotechnology industry. Second round syndication is still the most common type with almost 50 percent of all syndications.

In 2003 the investment activity reaches a new bottom level, with only 55 investments. Again, the big three dominate the dormant market by a sheer lack of competition. The Swedish Industry Fund receives new life and in true Keynesian economics fashion bolsters what is left of the venture capital investment market. New funds are far between for entrepreneurs as biotechnology dominates. The Swedish Industry Fund's less than impressive total of eight

investments are made in manufacturing and medicine. CapMan and Innovationskapital pitches in with four investments each in biotech and IT.

A shift can be traced in the pattern of syndication amongst the surviving venture capital firms. For the first time since 1996 the most common type of syndication is once more the first round syndication. It is obvious that the still active venture capital firms are less interested in making the deals on their own.

The total number of investments is not cut in half yet again in 2004 but the fall continues. The big three holds 21.6 percent of total investments, but three investments each is the only requirement to hold first place, a far cry from the ten or so investments most venture capitalists in the top flight managed merely a couple of years ago. The three most active investors are; Nordic Capital that mainly is a MBO/MBI fund and Scope Capital Advisory that is a foreign-based investor that focuses on early stage investment, but is a relatively small fund, and Amplico Kapital that invests for The 6<sup>th</sup> Pension Fund and goes with the times in basing its business on reconstruction of ailing companies. The sweepers of the industry have arrived.

As in earlier years, biotechnology and information technology are the preferred areas of investment for venture capital firms. The largest deals of year are as before in rather low-tech areas. As syndication is concerned first round syndication once more is the dominating form of syndication. In comparison with 2000 and 2001 the investments as such were rather modest, foremost in relatively small IT firms.

## ANALYSIS AND DISCUSSION

In this paper we have analysed the development of the Swedish venture capital industry in the last nine years. Starting from a relatively low level in the first year of our study, the industry reached unprecedented heights in 1999 and 2000. New venture capital firms were established on a weekly basis and the competition within the industry accelerated. The downturn came in the first quarter of 2001, when the IT related stocks plummeted on the Stockholm Exchange. The venture capital firms faced a completely different world than they were used to. The IPO market was more or less closed for firms in biotechnology and information technology in the years coming. Furthermore investors were less prone to back new venture capital funds owing to the bad track record of many of the new entrants in the industry. Hence, the venture capital firms were squeezed between two forces that were hard to come to terms with. The result was a far-reaching consolidation of the surviving firms and very few new investments in the following years. Many of the high profile newcomers to the business filed for bankruptcy in the aftermath of the crisis in 2001. When we compare the active investors from 1996 and 2004 it is clear that many of the active firms in 1996 are still active today.

The syndication patterns have differed a lot over the investigated period. As can be seen in figure 3, the syndications were at a relatively low level in the years 1996–1998. In those years less than one out of five investments made by venture capital firms were made together with another partner.

---

Figure 3 about here

---

The interest in syndication increased as new entrants entered the venture capital industry in 1999 and 2000. The supply of capital was reaching new heights and the need for syndication

from a risk sharing perspective was less important than during the earlier period. Instead, it seemed as though many venture capital firms were set on making as many deals as possible to be able to find the new Apple or IBM. In the aftermath of the crisis of 2001, the interest in syndication has surged. In the year of 2003, almost half the investments made by the venture capital firms were made together with at least one other venture capital firm. In a time where the IPO market was ice cold and many investments turning out bad, the survivors of the industry tried to reduce the monitoring costs by sharing their investments. In short supply of new capital from the backers of their funds, the emphasis of reducing the risks by sharing information and competence between syndication partners was also an important factor behind these syndications.

As regards the syndication pattern it is also apparent that it is a pattern of which venture capital firms that syndicates with one other. Venture capital firms with a track record of good investments in the first half of the 1990s with experienced investment managers had even before 1996 made some investments together and continued to do so through out the investigated period. The new entrants on the other hand were less prone to syndicate than the more experienced venture capital firms, and if they did syndicate they tended to do so with other new comers in the industry. It is reasonable to assume that they in many instances lacked the legitimacy in the eyes of the more experienced actors in the market.

We have also noticed that small funds in many cases need to team up with a larger partner to be able to see the investment through to exit. Even though the small fund will see its share of the portfolio firm be reduced through second or even a third round of financing, the alternative might be not to be able to make the investment at all.

The preferred type of syndication in the period as a whole is second round syndication. In all but three years this was the most common type of syndication. During the first three years of our study the first and second round syndications were totally dominating the deals, as can be seen in figure 4. But as we move into the high tide of the investments in IT firms, the level of first round syndication drops, especially in 2000 and 2001. Instead, many of the relatively large portfolio firms, mainly within the biotechnology and IT sectors, swallow huge amounts of capital, therefore third round syndications become more frequent. Finally, in the aftermath of the stock market crash in 2001 the tables have turned again, and once more the first round syndication is the preferred form of syndication.

March 2005

We would like to thank the entrepreneurs and venture capitalists who agreed to participate in this study—especially vSpring Capital for help in obtaining entrepreneurial respondents. We thank Matt Wassum for his research assistance and the Center for Entrepreneurship and the Kevin and Debra Rollins Center for eBusiness at Brigham Young University for financial support.

## ABSTRACT

What characteristics do entrepreneurs believe make them successful? We interview entrepreneurs and venture capitalists (VCs) to determine traits that each of these groups perceive as necessary for entrepreneurial success. We show that entrepreneurs cite traits inherent to their nature (e.g., hard working, persistent, risk-taker) significantly more than VCs. We also test to see if entrepreneurs are able to identify factors that VCs consider most important for the funding decision. We find that entrepreneurs who do not have previous VC funding experience differ significantly from VCs in what factors are important for VC funding; whereas, entrepreneurs with previous VC funding experience did not differ from VCs in identifying important funding-decision factors. Overall, our results demonstrate that even though entrepreneurs believe factors they are born with are most important to achieve success, they still learn through experience.

## 1. INTRODUCTION

The question, “What makes entrepreneurs successful?” is important to multiple constituencies. Despite the interest in this question, measuring success has proven problematic because there is no agreed upon definition of what constitutes a successful entrepreneur (Rogoff, Lee, and Suh 2004). In general, most research studies use company longevity as a proxy for entrepreneurial success without consideration of other qualitative or quantitative measures. While there could be many viable definitions of success, a fruitful first step would be to ask entrepreneurs and their capital providers what entrepreneurial traits lead to a successful business venture and whether these traits are an inherent part of an entrepreneur’s character or whether they can be acquired through experience or training. For instance, would an entrepreneur who sought venture capital in the past learn from this experience and change his/her approach and thinking?

A continually debated question in the popular press is whether people are “born” or “made” to be successful. Each year companies spend millions of dollars hiring consultants to train their staff to be successful—with some companies claiming that it worked and others believing it was a waste of time and money. Numerous books, articles, and internet sites argue about what aspects of success are inherent to a person’s nature versus what is learnable through study or experience.

Successful entrepreneurs also carry out this debate with varying opinions about how much of entrepreneurial success can be attributed to nature versus nurture. On one end of the spectrum, Bo Peabody—an internet entrepreneurial multi-millionaire—stated, “One does not decide to be an entrepreneur. One is an entrepreneur. Those who decide to be entrepreneurs are making the first in a long line of bad business decisions (Farrell 2005).” On the other end of the

spectrum Lloyd Shefsky—author, entrepreneur, and adjunct faculty—claims that through his research of more than 200 entrepreneurs that successful entrepreneurs are made and not born (Shefsky 1996). Finally, in the middle of the spectrum are voices like Herb Kelleher, co-founder and former CEO of Southwest airlines, who believes that successful entrepreneurs have a combination of innate character traits and training (Watkinson 2004).

This study asks entrepreneurs and venture capitalist to identify characteristics of entrepreneurs that are important for their success. First, we report which specific *traits* entrepreneurs believe make them successful, thus addressing what entrepreneurs believe in the born versus made debate. Second, we compare the entrepreneurs’ responses to an important “gatekeeper” in small business success—venture capitalists (VCs)—and show that entrepreneurs overweigh inherent characteristics. Third, we demonstrate a statistically significant difference in what the two groups consider to be the most important factors for venture capital funding decisions. Finally, we show that entrepreneurs who have solicited funding from venture capitalists seem to learn from this experience and are able to identify what venture capitalists are looking for in their funding decisions.

The rest of this paper proceeds as follows; in the next section, we discuss relevant literature and our research questions. In section three, we present the methodology used to evaluate our research questions followed by a discussion of the results in section four. In section five, we discuss implications of our findings. We conclude in section six with limitations of our research and recommendations for future studies.

## **2. LITERATURE REVIEW AND RESEARCH QUESTIONS**

### **Entrepreneurial Success**

Many studies have attempted to catalog factors that contribute to entrepreneurial success (Sahlman 1990; Sapienza 1991; Timmons 1994; and Rogoff et al. 2004) and failure (see Zacharakis, Meyer, and DeCastro 1999 for a review of the relevant literature). Past research about entrepreneurship has attempted to define the personality of entrepreneurs, hoping to show that entrepreneurs are intrinsically different from other people (see Smith-Hunter, Kapp, and Yonkers 2003 for a review of the literature). The underlying theme of this type of trait-based research is that no amount of training will make an entrepreneur (Smith-Hunger, Kapp, and Yonkers 2003). However, the results of this stream of research have not produced a definitive personality of an entrepreneur. From these studies, the only consistent difference found between entrepreneurs and nonentrepreneurs is that entrepreneurs have higher achievement motivations (Shaver 1995).

The inability of this line of research to define a specific entrepreneurial personality has caused a debate about the efficacy of personality-based research as a way of finding significant differences between entrepreneurs and others (Aldrich 1999; Begley and Boyd 1987; Gartner 1988; Johnson 1990; Mueller and Thomas 2001; Shaver 1995; Shaver and Scott 1991; Shaver, Gatewood, and Gartner 2001; Spangler 1992). In contrast to the trait-based research, another line of research is looking for ways to better understand the factors that influence how entrepreneurs behave (Baron 1998; Douglas and Shepard 2000; Simon, Houghton, and Aquino 2000). We contribute to this line of research by examining what traits entrepreneurs believe contribute to their success so that future studies can have an established baseline from which they can measure to see if psychological theories predict entrepreneurial behavior.

In a recent study, Rogoff et al. (2004) focused on what makes entrepreneurs successful by asking entrepreneurs and a group of “experts”<sup>1</sup> to define factors that contributed to business

success. They found that entrepreneurs attribute a disproportionate amount of success to factors inherent to an entrepreneur's nature—consistent with their attribution theory motivation—when compared against a group of experts. Of particular interest, the broad sample of entrepreneurs cited individual characteristics (e.g., hard work, ethics, knowledge, dedication, and professional service) 39.8% of the time as factors contributing to their success. In contrast, the experts cited individual characteristics only 27.8% of the time. These results suggest that entrepreneurs overemphasize individual inherent characteristics as contributing to the success of an entrepreneur when compared against a group of experts.

We build on the work of Rogoff et al. (2004) by examining the character traits that entrepreneurs believe create success. Motivating our research is the question, what traits make entrepreneurs successful? Specifically, we measure whether entrepreneurs believe that some entrepreneurs are born to be successful versus being able to learn how to be successful. This question is of particular interest considering the wide range of opinions about whether entrepreneurs are born or made as described in the introduction. Our first research question stated formally is:

Research Question 1 – Do entrepreneurs perceive traits related to inherent attributes as more important for success than traits that can be learned or acquired through experience?

### **Venture Capital Providers**

VCs serve an important role in helping businesses succeed. Previous research has shown that VCs are very successful at predicting new venture success (Sandberg and Hofer 1987; Hall and Hofer 1993). Extensive research has been conducted about how VCs make this decision—most of these studies have produced lists of criteria that VCs consider in the decision process (e.g., Tyebjee and Bruno 1981; 1984; Gorman and Sahlman 1986; MacMillan, Siegal, and

SubbaNarasimha 1985; MacMillan, Zemann, and SubbaNarasimha, 1987). To our knowledge, no study has looked at the traits of entrepreneurs that venture capitalists consider most important for success. We therefore test to see if entrepreneurs and VCs differ in the traits they believe make an entrepreneur successful. Our principal investigation is whether entrepreneurs view inherent traits as more or less important than do VCs. Since VCs are skilled at predicting future venture success, we believe they provide a strong benchmark against which we can compare entrepreneurs' responses. Our second research question stated formally is:

Research Question 2 – Do entrepreneurs perceive that traits related to inherent attributes are more important determinants of success than do VCs?

If entrepreneurs and VCs perceive different characteristic traits as important for success then they might also have different opinions on which companies should receive funding.

Although extensive research has examined what factors VCs consider to be most important in the funding decision, this study investigates how well entrepreneurs understand those factors. Our final research question stated formally is:

Research Question 3 – Do entrepreneurs and VCs differ in their opinion of what factors VCs consider to be most important when making funding decisions?

### **3. METHODOLOGY**

To answer our research questions we interviewed 28 entrepreneurs and 13 VCs, all operating in the state of Utah. Descriptive statistics are presented in Table 1.

Insert Table 1 about here

We categorized the 28 entrepreneurs into seven different industry groupings using the MoneyTree survey definitions.<sup>2</sup> The entrepreneurs belong to the following industries: business products and services, consumer products and services, electronics/instrumentation, IT services, financial services, software, and other. The average number of years the entrepreneurs'

businesses had been in existence was 11.7 (standard deviation=7.8, median=8.5), ranging from 1.5 years to 32 years.

The companies had on average nearly 66 employees (standard deviation=56.5, median=45) ranging from five employees to 200 employees. We selected these entrepreneurs in two ways. First, one of the VC firms provided us with a list of names of entrepreneurs who had received some type of external funding (e.g., VC funding, loan from bank, etc.). Second, we received names from the Brigham Young University Center for Entrepreneurship. All 28 entrepreneurs were operating primarily in Utah.

The 13 VCs are from seven different VC firms and represent the major Utah-based VCs that control virtually all VC money that flows into the state. The investments the VCs make in a single company range from \$230 thousand to \$12 million with an average of just more than \$4 million (standard deviation=\$4.0 million, median=\$3 million). Combined, the VCs had invested in 169 companies in the last five years (ranging from three companies for the smallest VC firm to 41 companies for the largest VC firm). An averaging of investment preferences reveals that the companies collectively prefer to invest most often in early stage companies, followed by expansion stage, later stage, and seed stage, respectively.

To collect our data we had two interviewers meet in person or over the phone (via speakerphone) with all the interviewees and asked them the following two questions:

1. What are some common traits of successful entrepreneurs?
2. How do you (or, How do venture capital providers) decide which companies to fund?

The interviewers recorded the interviewees' responses and then together transcribed the responses into individual phrases. In order to prevent interview and coding biases, the interviewers were not told the research questions. After the interviewers finished transcribing

the conversations, one of the authors combined similar phrases and established category titles for the responses. For question one, the categories included attributes (defined as traits inherent to the entrepreneur's nature), skills (traits that can be taught), experience (traits gained over time), and other (did not fit in the other categories). For question two, the categories included future returns (responses directly related to profits the VC can earn), management (responses related to the management team in place), product/service (responses relating to the good or service the company provides), and other (did not fit in the other categories).

The remaining three authors independently categorized the responses into the different groupings. The authors that performed the coding did not see how many times each item had been mentioned by different interviewees before they categorized the responses. The inter-rater reliability for each question was well within the typical inter-rater reliability scores of 66 to 95 percent as reported by Berelson (1952) (71.1% for question one and 78.3% for question two).

For question one, the entrepreneurs identified 39 unique answers and the VCs identified 30 unique answers. For the entrepreneurs' responses, at least two of the authors did not agree on groupings for two traits. For the VCs' responses, at least two authors did not agree on the grouping for one trait. For question two, the entrepreneurs identified 35 unique answers and the VCs identified 13 unique answers. For the entrepreneurs' responses, at least two of the authors did not agree on groupings for two traits, but for the VCs responses, at least two authors agreed on groupings for all the traits. We exclude from our analysis the traits that at least two authors did not agree upon.

#### **4. RESULTS**

Our first research question asks whether entrepreneurs perceived traits inherent to the entrepreneur's nature as more important for success than traits acquired through learning and

experience. The results, as listed in Panel A of Table 2, show that entrepreneurs cite attributes (inherent traits) 62 times out of the 83 total responses (75%). Skills were cited 11 times (13%) and experience 9 times (11%). Even when skills and experience are aggregated, entrepreneurs still cite traits inherent to their nature more often than acquirable traits.

Insert Table 2 about here

An analysis of the individual responses provides stronger evidence that entrepreneurs believe attributes are the most important factor in success. The five individual traits cited most frequently, as shown in Panel B of Table 2, include five attributes (% of total responses): hard-working (14.5%), persistent (10.8%), risk-taker (8.4%), vision (7.2%), and independent (4.8%). From these results we conclude that entrepreneurs consider traits related to attributes inherent to the entrepreneur's nature as more important for success than learnable traits.

Our second research question asked whether entrepreneurs and VCs differ in what traits they believe are most important for success. The VCs' responses, also listed in Panel A of Table 2, indicate that attributes were the most important factor for success (cited 43 times out of 97 or 44% of the time), followed by experience (33 responses or 34% of the time) and skills (21 responses or 22% of the time). The overall distribution of responses by the VCs was significantly different than the responses by the entrepreneurs when skills and experience are considered separately (chi-square distribution test  $p\text{-value} < 0.0001$ ) and when skills and experience are combined into one category (chi-square distribution test  $p\text{-value} < 0.0001$ ).

To test if each category grouping response is significantly different between entrepreneurs and VCs, we use a binomial test where the number of successes is the number of times cited by the entrepreneur and the hypothetical  $p$  is the category response rate as a percentage of total citations from the VCs. Using this test, we find that entrepreneurs cite

attributes as more important for success significantly more often than VCs ( $p\text{-value}<0.001$ ). In addition, we find that VCs cite experience significantly more often than entrepreneurs ( $p\text{-value}<0.001$ ). Although VCs cited skills (22%) more often than entrepreneurs (14%), the difference is only marginally statistically significant ( $p\text{-value}=0.063$ ). If we combine skills and experience into a learnable traits category, we still find that the difference is statistically significant ( $p\text{-value}<0.001$ ) and that entrepreneurs believe the combination of skills and experience is less important than VCs believe.

Additional analysis of the individual factors that VCs consider as the most important traits for success is also telling (See Panel B of Table 2). While the five most important traits listed by entrepreneurs were all attributes, VCs list three experience factors and two attributes as the most important overall traits for success including (% of total responses): industry/domain/market experience (9.3%), marketing experience (8.2%), passionate (7.2%), leadership (7.2%), and start-up experience (6.2%).

From these analyses, we conclude that entrepreneurs and VCs have significantly different views of important entrepreneurial success traits. Entrepreneurs view characteristics inherent to their nature as more important than VCs. VCs, on the other hand, place significantly more weight on experience than do entrepreneurs.

Our third research question asks whether entrepreneurs and VCs differ in their opinion of what factors VCs consider to be most important in making the funding decision. As seen in Panel A of Table 3, the overall distribution of responses is significantly different (chi-square distribution test  $p\text{-value}=0.024$ ). We found that VCs reported that future returns are the most important factor (40%), followed by management (36%), and then products/services (24%). Entrepreneurs believe that VCs use future returns more for their decision (49%), management

less (25%), product/service less (14%), and other factors more (12%). Comparing the individual categories we find that VC's look significantly more at management and product/service than entrepreneurs believe they do (p-values of 0.043 and 0.046 respectively).

Insert Table 3 about here

A comparison of the top five responses by each group reveals some differences. As seen in Panel B of Table 3, entrepreneurs cited the management team 14 times (18.2%), followed by growth potential five times (6.5%), profitability five times (6.5%), ROI five times (6.5%), business plan four times (5.2%) and market size four times (5.2%). In contrast, VCs cited experienced management 10 times (22.2%), followed by market size six times (13.3%), first-mover/sustainable advantage and patented technology five times each, respectively (11.1% each), and trustworthy management four times (8.9%).

In conclusion, entrepreneurs differ from VCs in the overall distribution of factors that VCs consider most important in the funding decision. Specifically, VCs look significantly more at management and product/service issues when deciding who to fund than entrepreneurs believe they do.

To investigate further the differences between VCs' and entrepreneurs' perceptions of important funding factors, we split our sample of entrepreneurs into two groups: (1) those who have applied for VC funding (nine subjects – experienced entrepreneurs), and (2) those who have not (19 subjects – inexperienced entrepreneurs). We then test for differences in the responses of these groups.

As seen in Table 4, inexperienced entrepreneurs differ significantly from VCs in identifying what VCs look for when making funding decisions (chi-square distribution test p-value=0.025). However, experienced entrepreneurs do not differ significantly from VCs in

identifying what VCs look for when making funding decisions (chi-square distribution test p-value=0.484). Inexperienced entrepreneurs differ most significantly in their view of the importance of management to the funding decision; they cite management as an important factor only 21% of the time compared to VCs who cite management 36% of the time. Experienced entrepreneurs cite management 33% of the time and are not statistically different from VCs. These results suggest that entrepreneurs learn what VCs are looking for only after experience with a VC funding decision.

Insert Table 4 about here

## **5. DISCUSSION AND IMPLICATIONS**

Using a survey of entrepreneurs and VCs, we demonstrate that there is significant difference in what the two groups perceive as the most important traits that an entrepreneur should possess to be successful. Our results demonstrate that entrepreneurs believe that traits that entrepreneurs are born with make up 75% of the factors that contribute to entrepreneurial success. In contrast, venture capital providers believe that only 44% of the traits necessary for success are inherent to an entrepreneur's nature. Venture capital providers believe experience is far more important in determining an entrepreneur's success than entrepreneurs believe.

These results are important to entrepreneurs, VCs, and other groups that deal with entrepreneurs because they show that entrepreneurs believe that success is more a factor of who they are than what they learn: "Entrepreneurs are born not made." Entrepreneurs may therefore undervalue opportunities to gain experience and skills because they do not believe these traits will help them to become successful.

Since we found a difference in what entrepreneurs and VCs identify as the traits necessary for management to be successful, we would expect a difference in what they view as

important factors for deciding which companies VCs should fund. With our second question, we examined the factors that entrepreneurs and VCs consider to be most important in the funding decision process. Congruent with the expectations derived after our first analysis, we find that the two groups emphasize different factors. VCs claim to look at management issues more than entrepreneurs believe they do.

We conduct an additional analysis to determine if entrepreneurs with previous VC funding experience are able to better identify factors that VCs look for than entrepreneurs with no VC funding experience. We find that experienced entrepreneurs were able to better identify the factors VCs consider important for funding decisions. These results suggest that entrepreneurs do learn through experience, even if they believe success comes mostly from inherent characteristic traits. Entrepreneurs who want funding—especially those who have not previously applied for VC funding—may want to consider these findings before applying for venture capital.

## **6. LIMITATIONS AND FUTURE RESEARCH**

The limitations to our research study present opportunities for future research. As with most academic studies, the generalizability of these results may be limited. Because we did not take a random sample of entrepreneurs or VCs, our results may not generalize to the entire population of entrepreneurs and VCs. Also, we examine a relatively small number of entrepreneurs and VCs and our sample is derived entirely from one geographic location. Future studies may wish to extend our study by interviewing more entrepreneurs and VCs, collecting a random sample of entrepreneurs and VCs, or, expanding the geographic coverage in their sample.

In our study, we give equal weight to the interviewees' answers and therefore if a factor was mentioned it carries equal weight with all other mentioned factors. Although there is a clear difference in the number of times each factor was mentioned, entrepreneurs and VCs may place more emphasis on some factors compared to other factors. Future studies may wish to extend our study by seeing if the frequency of factors mentioned is the same as the individual weighting of factors by entrepreneurs and VCs.

We only examined the views of entrepreneurs and VCs and therefore did not capture the views of other important parties such as informal or angel investors, investment-banking firms, and other service providers. Research into what these other parties consider to be important could also provide needed insights.

The final limitation is that we interviewed entrepreneurs about what they perceive to be important traits for success. Although the businesses of all of our entrepreneurs were currently succeeding in the sense that each business was still solvent, we did not attempt to measure the "successfulness" of each entrepreneur. Future studies may want to test whether these attitudes are similar for entrepreneurs that have succeeded and those who have failed.

Future research may also wish to address implications from the results of this study. For example, future research may wish to address such questions as the effects of the "high-inherent-factor attitude"; do entrepreneurs benefit from a university education or training programs given their disposition to believe success is inherent to an entrepreneur; do entrepreneurs with this type of attitude succeed more often; and, is this attitude a result of success, or is it truly inherent to entrepreneurs' thinking.

## ENDNOTES

1. The group of experts used by Rogoff et al. (2004) consisted of professors of entrepreneurship, graduates of an M.B.A. program who majored in entrepreneurship, and business counselors in a college-based entrepreneurship center. One advantage of our study over Rogoff et al. (2004) is that we use VCs as a comparison group. VCs evaluate entrepreneurs and businesses on a frequent basis and prior research has shown that VCs are very successful at predicting new venture success (Sandberg and Hofer 1987; Hall and Hofer 1993).

Email contact: [r.blackburn@kingston.ac.uk](mailto:r.blackburn@kingston.ac.uk)**

This paper examines the ways in which entrepreneurial characteristics interact with organizational context and business strategy to influence business performance. Three conceptual areas are included: *business characteristics*, *owner manager orientation* and *business strategy*. We anticipated differences in the performance of firms according to *business characteristics*: including sector, size and age of enterprise. The influence of the *owner-manager orientation* is, however, more debatable. Whilst qualitative studies emphasise the influence of owners on business goals, processes and performance, quantitative surveys strive for multidimensional explanations. The orientation constructs include factors captured through a series of statements on, for example, whether business owners considered themselves to be '21<sup>st</sup> Century entrepreneur' or a 'traditional business owner', and whether they were 'happy to take risks provided the rewards were high' or they 'make decisions based on known facts'. We cover the notion of *business strategy* through a range of variables to embrace the way in which businesses plan resource use (marketing, human resource), evidence of the take-up of new technologies and involvement in external collaboration. It was anticipated that there would be a positive relationship between these factors and business performance. Three main measures of business performance used include employment change over two years; turnover change over three years; and profitability. We employ 'path analysis' to explore an original data set of 360 business employing 5 – 249 employees. The results build on a growing body of literature seeking to understand the relative importance of context, orientation and strategy on business performance.

**REACHING THE BUSINESSES THAT OTHER POLICIES HAVE FAILED TO  
REACH? DEVELOPING ETHNIC MINORITY BUSINESS SUPPORT IN THE  
UK THROUGH INCREASING ENGAGEMENT WITH MINORITY  
COMMUNITIES**

One of the fundamental issues in the landscape of UK business policy is the unevenness in the take-up of mainstream support and advice by businesses, particularly by ethnic minority owner managers who have tended to rely instead on self-help and informal sources of assistance. This paper contributes to the debate on the development of policy designed to reach the businesses that have traditionally been under-represented in the client base of mainstream business support agencies. The paper analyses a model of business support which seeks to enhance the activities of existing, community-based organisations and utilise them as a vehicle to reach business owners within their own ethnic minority groups. *A priori* the advantages of this approach includes the ability to develop support that is appropriate to the needs of ethnic minority owned businesses and reach those business owners who require support. This culturally embedded model has the potential to overcome the barriers that have historically impeded the appropriate development and take-up of business support. On the other hand, questions may be asked of the quality of the support and assistance provided if business advisers are not sufficiently trained and connected with the mainstream. The paper concludes by placing the role of culturally embedded support into broader policy debates.

## **EXPLAINING GENDER DIFFERENCES IN PERFORMANCE AMONG SMALL BUSINESS OWNERS IN GHANA.**

### **ABSTRACT**

Programs designed by International development agencies and implemented in various developing countries often fail to achieve the desired outcomes because they are not tailored to the specific situation of the recipient countries. In this paper we employ two gender based theories (the liberal and social feminist theories) to explain differences in performance, business strategy, resources, and owner-manager characteristics between male and female owner-managers. From our review of the literature we develop a framework for examining gender differences in performance among small business owners in Ghana and develop propositions for subsequent investigations. We conclude that whilst the experiences of Ghanaian women are similar in some respects to those of women in the Western world, the differences are significant enough to merit programs tailored specifically to the Ghanaian situation. Assistance programs that aim at addressing differences in educational background and managerial experiences between the genders and at educating parents about the potential of their female offspring should provide a longer-term solution to any gender disparities in performance.

### **INTRODUCTION**

The small business sector is recognized as an integral component of economic development and a crucial element in the effort to lift countries out of poverty (Wolfenson, 2001). To this end, the World Bank and other international funding agencies have linked grants to developing countries to the implementation of policies and programs aimed at creating stable macro-economic environments conducive to private investment, and in particular to developing the small and medium enterprise (SME) sector (Cook & Nixon, 2000). For example, the International Monetary Fund's (IMF) Structural Adjustment Program (SAP) implemented in Ghana in the 1980s, emphasized reduction in government influence on economic activities, enhancement of the private sector and reduction in barriers to free market operations. Specific reforms executed as part of the program include devaluation of the national currency, liberalization of trade and exchange control, withdrawal of subsidies, retrenchment of labor, and reduced government expenditure (Steel & Webster, 1992). Whilst the SAP did enhance macro-economic indicators such as annual growth rate, it failed to generate employment and enhance the wellbeing of the average Ghanaian (Cook & Nixon, 2000). The contribution of SMEs to the economic development of Ghana is still very low. The sector accounted for 15.5 percent of the labour force and 6 percent of the Gross Domestic Product (GDP) in 1998 (Kayanula & Quartey, 2000), although on average 95% of registered enterprises are small (Boeh-Ocansey, 1996). The experience indicates that for economic programs to be successful they must be tailored to a country's specific situation (Baffoe, n.d.).

The performance of the small business sector as a whole is dependent on the performance of the individual firms that comprise the sector (Kotey & Meredith, 1997; Watson & Everett, 1993). Thus, in addition to macro-level reforms, policies and programs that address problems

at the micro (or grass root) level is necessary to improve performance of the sector. One area consistently mentioned in the popular press as a setback to development of the SME sector in Ghana is the impact of gender on small business performance. Whilst various programs have been implemented to address the problem the boundaries of the problem and the factors associated with it are not clearly understood. In this paper we draw on the Western literature to develop a theoretical framework of performance and its determinants that is used in conjunction with the liberal and social feminist theories to draw propositions for examining performance differences between male and female small business owners in Ghana and the factors that account for these differences.

## **THE CONCEPT OF SMALL BUSINESS PERFORMANCE**

Performance has been the subject of extensive and increasing empirical and conceptual investigation in the small business literature (Chandler & Hanks, 1993; Jarvis, Curran, Kitching, & Lightfoot, 2000; Lachman & Wolfe, 1997; March & Sutton, 1997; Murphy, Traylor, & Hill, 1996; Rodsutti & Swierczek, 2002; Watson, Newby, & Woodliff, 2000). Whilst it is generally agreed that performance should be viewed in relation to one or more goals (Etzioni, 1964) the issues that remain unresolved are the goals against which performance should be assessed and from whose perspective the goals should be established.

Organisational theories and the accounting literature, driven by classical economic theory emphasise profit maximisation as the central goal of the firm (Jarvis, Kitching, Curran, & Lightfoot, 1996). These theories, modelled on large enterprises, generalise the concept of performance and fail to take account of differences in goals between firms of varying sizes (LeCornu, McMahon, Forsaith, & Stanger, 1996). The separation of ownership and control from management in large firms and the agency relationship gives rise to profit maximisation as a performance goal, measured by indicators such as return on assets and return on investment (Jarvis et al., 2000).

The situation is different in small businesses where ownership and control as well as management of the firm are usually vested in one key person (the owner-manager). The owner-manager does not only dictate the goals of the firm but also exerts a powerful influence on the way the firm pursues these goals (Glancey, 1998; LeCornu et al., 1996; Verheul, Risseuw, & Bartelse, 2002; Watson et al., 2000). Consequently, researchers have challenged the application of the conventional goal of profit maximisation to the assessment of performance in small firms, advocating instead non-financial goals that portray the 'big picture' of the small firm (Ryan, 1995). The major goals of the small firm must be first understood before its performance can be assessed (Birley & Westhead, 1990; Jarvis et al., 1996; LeCornu et al., 1996; Watson et al., 2000).

Owner-managers pursue a range of goals, emphasizing in particular survival and stability of the firm (Jarvis et al., 2000; Tsai, MacMillan, & Low, 1991). Other goals pursued include efficiency, market share, liquidity, size, leverage, growth, customer satisfaction, quality of products, contribution to community development and employment of family members (Glancey, 1998; Murphy et al., 1996). Assessment of performance in small firms must therefore take account of a range of goals, both financial and non-financial. Since research interest in the small business sector derives from its contribution to economic development, performance of individual firms in the sector can be assessed by the extent to which they add value to the economy (Kotey & Meredith, 1997).

## **DETERMINANTS OF SMALL BUSINESS PERFORMANCE**

The factors that influence performance of small firms can be classified into two main areas – those that emanate from the firm's internal environment (labelled micro-level factors) and those associated with the external environment (ie the macro-level factors) (Kalleberg & Leicht, 1991; Keats & Bracker, 1988). The micro-level determinants include the psychology and demographics of the owner-manager, the resources of the firm, and the strategies adopted (Kalleberg & Leicht, 1991; Keats & Bracker, 1988), while the macro level determinants cover markets, economic, financial, technological, legal and political conditions as well as the socio-cultural context in which the firm operates (Kalleberg & Leicht, 1991; Keats & Bracker, 1988; Wiklund, 2003). Researchers have examined small business performance using various theories associated with these micro and macro level factors. The population ecology theory is the main macro-level theory whilst at the micro level, performance has been examined using the resource-based and strategic adaptation theories as well as in relation to the demographics and psychology of the owner-manager.

### **Population Ecology Theory**

The basic argument underlying the population ecology theory is that the environment largely determines the survival of organisations (Bruderl, Preisendorfer, & Ziegler, 1992; Schindehutte & Morris, 2001). Opponents of the population ecology theory argue that it proposes a relatively deterministic view of organizational design and performance outcomes and that by emphasising only the external constraints on a firm's performance the theory neglects those constraints that are internal to the firm and imposed by the owner-manager's motivations (Keats & Bracker, 1988).

Advocates of the micro level determinants of organisational performance argue that small business performance depends on their ability to adjust their internal structures to the contingencies imposed by their task environment (Iakovleva, n.d.; Kalleberg & Leicht, 1991). These researchers contend that, the better performing firms are those that best adapt to fit the opportunities provided and constraints imposed by their environments. This adaptation depends however, on the choices and actions of owner-managers and the resources at the firm's disposal (Lerner & Almor, 2002). These micro level factors have led to the resource-based and strategic adaptation theories of performance as well as theories based on owner-manager's psychology and demographics.

### **Psychology and Demographics of the Owner-manager**

Begley & Boyd (1986), Kalleberg & Leicht (1991) and Verheul et al., (2002) observed that differences among owner-managers in psychological traits, experiences and skills needed to accomplish their managerial tasks, explain differences in their performance. Traits found to be positively associated with performance in small firms include creativity, courage, aggressiveness, risk-taking (Stevenson & Gumpert, 1985), need for achievement (Kalleberg & Leicht, 1991), and internal locus of control (Brockhaus, 1980). In addition, Bauerschmidt & Hofer (1998) showed that the more skills and experience the owner-manager brings to the business the more successful the business is likely to be. Cooper (1998) cautioned that on their own these psychological and demographic characteristics do not directly influence performance but do so through other variables such as strategy and environmental characteristics.

## **Resource-Based Theory**

The resource-based theory of performance accentuates both the structural characteristics of the firm and the environment in explaining performance (Bruderl et al., 1992). Hadjimanolis (2000) noted that the resource-based view seeks to bridge the gap between the theories of internal capability of the firm on one hand and external competitive strategies on the other. It treats organisations as potential creators of valued capabilities and postulates that the assets and resources of the firm has to be viewed from a knowledge-based perspective (Caldeira & Ward, 2003).

Iakovleva (n.d.) criticised the resource-based theory on the basis that it is difficult to identify which of the several resources of a firm account for its success. In addition, she argued that the resource-based theory does not differentiate between performance factors associated with the resources of the firm and those related to the characteristics of the owner-manager. To overcome this limitation both the characteristics of the owner-manager and his/her resources should be examined separately in assessing small business performance.

## **Strategic Adaptation Theory**

The strategic adaptation theory postulates that the environment influences performance through the strategic choices of owner-managers (Covin & Slevin, 1989; Keats & Bracker, 1988). In emphasizing the role of strategic choice to business performance, the theory accentuates the influence of the owner-manager on the firm. It suggests that the key to business success lies in the decisions of the owner-manager who identifies opportunities, develops strategies, assembles resources and takes initiative (Lerner & Almor, 2002).

Since the major deficiency of each of the above theories is its neglect of the other determinants of performance, an inclusive theory is proposed that encompasses both macro-level factors (environmental factors) and micro-level variables (psychological and demographic characteristics of the owner-manager, the firm's resource and strategies). Figure 1 depicts the relationships between these factors and small firm performance and will form the basis of the conceptual framework developed for this paper.

---

Figure 1 here

---

Psychological and demographic characteristics of the owner-manager and the environment determine resources available to the firm and these three variables influence strategic choices, which then determine performance. Thus, the relationships between resources, the psychology and demographics of the owner manager, the environment and performance are mediated by the strategic choices made. The above conceptual framework is developed further to include the impact of gender.

## **GENDER AND SMALL BUSINESS PERFORMANCE**

Until more recently gender differences in small business performance remained largely unaddressed by social scientists (Greene, Hart, Gatewood, Brush, & Carter, 2003). The majority of studies either disregarded gender as a variable of interest or excluded female subjects from their design (Du Rietz & Henrekson, 2000). However, it is generally accepted that male and female owner-managers behave differently and that these behavioural

differences influence their performance (Brush, 1992), but these differences have been recognized but not fully explained (Brush & Hisrich 2000).

A comparison of performance of male and female owner-managers in Java, Indonesia showed that female-owned businesses tend to be less oriented towards growth compared to male-owned businesses (Singh, Reynolds, & Muhammad, 2001). Boden & Nucci (2000) investigated start-ups in the retail and service industries and found that the mean survival rate for male owned businesses was four to six percent higher than for female owned businesses. Loscocco, Robinson, Hall & Allen (1991) in their study of small businesses in the New England region of the USA found that both sales volume and income levels were lower for female- than for male-owned businesses. In a longitudinal study of 298 small firms in the United Kingdom (UK), of which 67 were female owned, Johnson & Storey (1994) observed that whilst female owner-managers had more stable enterprises than their male counterparts, on average the sales turnover for female owners were lower than for male owners. Brush (1992) suggests that women perform less on quantitative financial measures such as jobs created, sales turnover and profitability because they pursue intrinsic goals such as independence, and the flexibility to combine family and work commitments rather than financial gain.

In contrast to the above findings, Du Rietz and Henrekson (2000) reported that female-owned businesses were just as successful as their male counterparts when size and sector are controlled for. In his study of small and medium firms in Australia, Watson (2002), after controlling for the effect of industry sector, age of the business, and the number of days of operation, also reported no significant differences in performance between the male-controlled and female-controlled firms.

## **GENDER AND THE DETERMINANTS OF SMALL BUSINESS PERFORMANCE**

Performance differences between the genders have been ascribed to several factors (Lerner, Brush, & Hisrich, 1997). Various researchers have reported that gender influences business performance as a result of its close association with decision-making, business management, strategy formulation and the functional areas emphasised (Carter, Williams, & Reynolds, 1997; Fielden et al., 2003; Mukhtar, 2002). Two theoretical orientations have emerged that seek to explain performance differences between male and female owner-managers in terms of the determinants of performance presented above. They are the liberal feminist and social feminist theories (Liou & Aldrich, 1995).

Fischer et al., (1993) noted that the liberal feminist theory is rooted in liberal political philosophy which encompasses basic beliefs in the equality of all beings, and in human beings as essentially rational, self-interest-seeking agents. The liberal feminist theory attributes gender-based differences to the variations in power and opportunity accorded men and women in society (Beasley, 1999), that is the structural positions women and men occupy in society (Fischer et al., 1993). Thus, differences in the achievements of men and women are ascribed to the inability of women to realise their full potential because they are denied equal access to opportunities in the labour markets and to resources. This in turn has hindered women from acquiring the skills and capabilities necessary to compete on equal basis with men. According to the liberal feminist theory, once equal access to resources is ensured, gender differences in performance seemingly disappear (Carter et al., 1997).

In contrast to the liberal feminist theory, the social feminist theory, which emanates from the social learning theory and psychoanalysis, holds that differences between men and women exist from their earliest moments in life and result in fundamentally different ways of viewing the world (Beasley, 1999; Fischer et al., 1993; Kutanis & Bayraktaroglu, 2003). These differences are seen in the way women and men construct and interpret reality and how these influence the formation of their values and intentions (Carter et al., 1997). Men and women are inherently different because of differences in their socialisation, training and experiences encountered prior to entry into particular work positions. Differences in nurturing result in different self-perceptions, motivations and belief structures. As a consequence women adopt different approaches to work which may, or may not be as equally effective as those adopted by men (Fischer et al., 1993).

Drawing on these two feminist theories and research on the factors that influence performance of small firms, this paper proposes a conceptual framework to guide the examination of gender differences in small business performance in Ghana. In the next section the model is applied to the Ghanaian situation and propositions developed for testing.

## **APPLICATION OF THE THEORETICAL FRAMEWORK TO GHANA**

The Ghanaian society is an interrelated social system with the extended family system the hub around which the traditional social organization revolves (Federal Research Division, n.d.). Relationships are built around family membership, inherited status and ancestral beliefs. Traditional sex-role identification and living arrangements have established division of household responsibilities among various members of the family (Bortey and Dodoo, n.d.). Children internalize the gender specific roles assigned them and act in ways that conform to societal norms.

With no formal social security system in Ghana, men are perceived as the main source of livelihood for their families. They are nurtured to lead their households and to take responsibility for the welfare of all household members. In the process they are given control over the resources required to effectively discharge their responsibilities. The Ghanaian male is encouraged to be brave, even aggressive and not to display emotions openly. Values developed through this nurturing process include assertiveness, independence, achievement orientation, confidence and self-esteem (Bortey & Dodoo, n.d.). These values are recognized in the literature as entrepreneurial.

Ghanaian females, on the other hand, bear the responsibility for providing primary care for their families with duties such as child-rearing and various household chores (Dolphyne, 2000). Boys are selected over girls when the family allocates funds for the children's education. The subordinated position accorded the Ghanaian female is fuelled by a general perception that girls need not be as educated as boys as they are to be supported by and subservient to their husbands (Dolphyne, 2000). There is fear in most circles that a girl's marriage prospect is dimmed by extensive education. Consequently, on average Ghanaian women receive lesser education than their male counterparts (Tsikata, 2001). Although efforts are being made by various advocacy groups to minimize the disparities in nurturing and opportunities opened to the genders in Ghana traditional social values continue to endure. There is a general belief among the older generation that the Ghanaian race will be lost if its cultural values undergo changes and that Ghanaian traditions must be closely guarded in

order to preserve the Ghanaian race (Loth, 1999). Whilst modern lifestyles and Western influences have reduced the disparities in nurturing between the genders, particularly among the urban dwellers, Ghanaians are still bound through the kinship system to traditional social values that require them to assume the responsibilities that such associations entail (Bortey & Dodoo, n.d.; Federal Research Division, n.d.). The World Bank's (1999) report and the 2000 population and housing census by the Ghana Statistical Service (2002) revealed the following inequalities between the genders in Ghana –

- a. Girls receive less education than boys. In 1994, girls comprise 47 percent of primary school students, 35 percent of senior secondary school students, and only 26 percent of tertiary school students.
- b. Adult illiteracy rates were 47 percent for women in 1995 and 24 percent for men
- c. Women have less access to credit from formal channels than do men due to lack of collateral because of weak land tenure rights.
- d. Girls and women are pushed into female stereotyped careers such as teaching, tailoring, secretarial work, nursing and prevented pursuing careers in other areas such as the “hard” sciences, engineering, accounting and management

Parallel to the systematic discrimination that in general should leave Ghanaian women worse off in their ability to earn income, is a micro and small business sector dominated by women. With limited employment opportunities resulting from lack of education and experience, the majority of Ghanaian women engage in some form of micro or small enterprise, whether selling food items, clothing, and various other tradable commodities, or providing services such as hairdressing, tailoring, and cleaning. Many girls grow up helping their mothers in their commercial endeavors. They learn to haggle, budget, keep accounts, and to save early in life. In the process they develop the qualities required to survive in the commercial sector. Thus, in the effort to prevail in a society in which they are marginalized, Ghanaian women develop entrepreneurial qualities.

In contrast, small private enterprise does not fit well with the role expectations of Ghanaian men. Up until the 1980s, with the retrenchments that followed the implementation of the SAP, men were looked down on if they engaged in the micro or small business activities. Ghanaian men achieved social respect if employed in large multinational firms, the public sector, manage large manufacturing concerns or were self-employed in professional services. Men who engaged in commercial activities had bigger private concerns and employed workers (usually from their families). Although Ghanaian women have longer experiences as entrepreneurs than their male counterparts, their managerial skills are rudimentary, passed on through informal (on the job) training from mothers or other female relatives with little or no formal education. We draw the following propositions from the above observations.

**Proposition 1 Entrepreneurial values are similar for Ghanaian men and women small business owners.**

Women would have acquired entrepreneurial values from their involvement in private enterprise early in life whilst men are nurtured to develop these values in consonance with their role expectations.

**Proposition 2 On average Ghanaian women have more entrepreneurial experience than Ghanaian men.**

**Proposition 3 Ghanaian male small business owners have better managerial skills than their female counterparts.**

When it comes to resources Ghanaian female business owners are caught in a spiral web that makes it difficult for them to progress beyond their micro or small sized businesses.

Ghanaian female business owners lack access to resources particularly finance because - they have little or no assets for collateral security, their low educational backgrounds are barriers to processing the necessary paperwork, and they are intimidated by the male dominated staff in the banks and other organizations they have to deal with when accessing resources. Men are given priority over women in the allocation of scarce resources. Added to these setbacks are the constant pressures of household responsibilities and the common perception that it is not good for women in business to be more successful than their male counterparts (The World Bank Group, 1999). Whilst various networking and mentoring programs as well as assistance from non-government organizations (NGO) are being used to overcome some of the difficulties associated with accessing resources, the low educational backgrounds and managerial skills of female owner-managers in Ghana pose major barriers to equitable resource allocation. From the above observations and the model in Figure 2 we draw the following propositions about gender differences in business performance of male and female owner-managers in Ghana -

**Proposition 4 Female business owners in Ghana have less access to resources than their male counterparts.**

**Proposition 5 Ghanaian female owner-managers adopt less proactive strategies than the male owner-managers.**

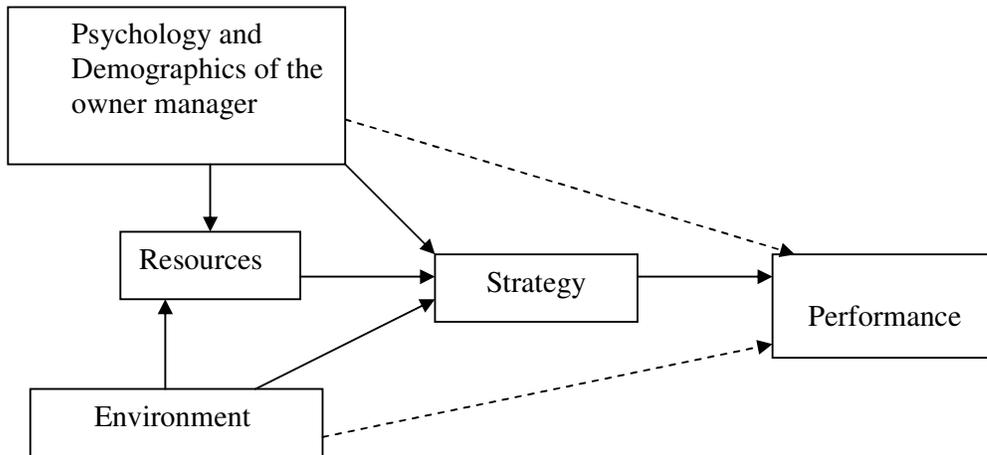

**Proposition 6 On the average Ghanaian women operate smaller businesses than their male counterparts.**

Confirmation of the above propositions by empirical analysis would imply that programs that enable temporal access to resources (such as networking and mentoring programs or access to informal sources of finance) would only provide short-term solutions to the gender inequalities in business performance. Long-term measures that equip Ghanaian women with the necessary education and managerial skills and place them on equal footing with the men should be more enduring in bridging the gender gap and assisting Ghanaian women to realize their full potential. These in turn require systematic education of Ghanaian parents about the potential of their female children.

Whilst the experiences of the Ghanaian woman bear some semblance to those of Western women, there are several areas of differences (e.g. predominance of women in micro and small enterprise, cultural influences) that would render direct implementation of some the programs used in the West to resolve gender differences in business performance ineffective (in the long-run) in Ghana.

If Ghanaian small business women have equal access to the capabilities, information and resources available to their male counterparts they should be able to adopt similar if not more proactive strategies than the male business owners and achieve equal or better performance.

## VIRTUAL ENTERPRISE: ENGAGING RECENT U.S. IMMIGRANTS AND MINORITIES IN ENTREPRENEURSHIP EDUCATION

Anthony Borgese  
City University of New York at  
Kingsborough Community College

### **Abstract**

At the City University of New York, recent immigrants and minorities are engaged in entrepreneurship education through a program called the Virtual Enterprise. Virtual Enterprise (VE) is a technology driven business simulation program in which students conceive, create and operate enterprises that utilize web-based and other technologies to trade products and services in a global, e-commerce network of more than 4,000 firms in 40 countries around the world. The Institute for Virtual Enterprise (IVE) is a CUNY Special Initiative whose mission is to bring the VE method of experiential learning to various student cohorts throughout the CUNY system.

This paper is an introduction to the Virtual Enterprise program and its effect on these student populations with regard to entrepreneurship education. The paper reports the results of the VE-CLIP program over the last three years since its implementation at CUNY. The data from qualitative and quantitative studies reveal that the recent immigrant/minority student becomes more engaged with learning because they see a link between academic and practical learning.

Most recent immigrants to the United States need to learn the American way of doing business. These students will, hopefully, eventually start their own businesses in the U.S. The VE program gives these students a taste of what it is like to do business in the U.S. without the risks associated with being a real entrepreneur and having to make payroll. Students learn the way of creating, owning and operating a business, and VE gives them the entrepreneurial tools to be successful.

## INTRODUCTION

*“Small business is the vehicle by which millions access the American Dream by creating opportunities for women, minorities and immigrants.”* (Acs, Tarpley and Phillips, 1998)

The above statement is a fact that many entrepreneurship educators have become quite familiar with. Correspondingly, academic curricula must be developed that attracts, retains, and ultimately provides those student groups with the entrepreneurial skills that allows them to achieve their financial dreams. Arguably, those students groups are among the most challenging student cohorts to educate in entrepreneurial activities. It's even more difficult to teach those student cohorts when they lack the English language skills that are necessary to be successful in academics or in entrepreneurial endeavors.

*“Sometimes the only thing standing between a foreigner and the American dream is the perplexing language, with its fast-changing slang and impossible pronunciations.”* (Huffman, 1997, 3). Entrepreneurship education is not limited to English speaking students in the United States. Arguably, college student populations in most large, U.S. cities are more diverse than in rural areas. How can entrepreneurship educators engage these student cohorts? To these student populations, at the City University of New York, (CUNY) entrepreneurship education is administered through the Virtual Enterprise method of instruction.

Virtual Enterprise (VE) is a technology driven business simulation program in which students conceive, create and operate enterprises that utilize web-based and other technologies to trade products and services in a global, e-commerce network of more than 4,000 firms in 40 countries around the world. The Institute for Virtual Enterprise (IVE) is a CUNY Special Initiative whose mission is to bring the VE method of experiential learning to college students throughout the United States.

Engaging English as a Second Language students (ESL) in college programs, let alone entrepreneurship courses, can be a very difficult task. More often than not, colleges do not allow ESL students to matriculate in credit bearing courses. ESL students are forced to pass their various ESL courses before being admitted into credit bearing courses. Kingsborough Community College, a CUNY school, and Shoreline Community College, in Washington State, have both utilized Virtual Enterprise methodology in ESL courses. Initial evidence shows that these students become more engaged with their studies because business is a “universal language,” and they can see the link between academics and financial success in the business-world. At Kingsborough Community College, (KCC) ESL students are enrolled in the VE-CUNY Language Immersion Program (VE-CLIP).

This paper studies the effects of Virtual Enterprise on ESL students with regard to entrepreneurship education. The paper has a three-pronged research methodology. First, it reports the qualitative results of a survey of students in the VE-CLIP program over the last two years since its implementation at KCC. Second, it reports the CUNY/ACT testing scores of VE-CLIP students who seek to become matriculated students. Finally, the paper reports the findings of an independent investigation by the Center for Advanced

Studies in Education. (CASE) CASE studied the Virtual Enterprise Program as a teaching methodology and assessed student outcomes with regard to the skill sets VE students received in entrepreneurship and other business-related skills.

## **History of Virtual Enterprise**

The original Virtual Enterprise (VE) concept was originated in Europe, where Virtual Enterprises are known as practice firms. The earliest practice firms were created "...to provide practical commercial education in the form of realistic exercises," (Korbmacher, 1989) and date back to at least the 17<sup>th</sup> century. In Vienna, a *Musterkonto*, an educational enterprise, or practice firm, was integrated into the curriculum of the Commercial College. These firms originated as a part of the apprenticeship movement in the German speaking countries of Europe. Educators of the time felt that it was better to have students apply their acquired academic knowledge before going out into the "real-world." (Borgese, p.3)

In the United States, the higher education VE was started by a FIPSIE grant that included various partners, one of which was the City University of New York (CUNY). Kingsborough Community College and their FIPSIE partners adopted this method of instruction, named it Virtual Enterprise, and added to the curriculum to provide a construct that offers an entrepreneurial business experience for college students.

## **How Virtual Enterprise Works**

The VE curriculum is not a simulation whereby you can put a CD into a computer and gain access to all components. VE is equivalent to open source code in computer programming; it is available for free to everyone. Once a college adopts the curriculum, students go to "work" to learn various entrepreneurial and business skills. The first steps in their new VE course are: learning about the VE global marketplace to identify entrepreneurial opportunities, creating an idea for an enterprise, naming the firm, creating its logo, and business plan. Subsequent lessons include: identifying and utilizing small business start-up resources, oral presentations for venture capital, creating budgets and other financial reports, marketing, pricing, payroll, understanding corporate tax structures, and business software and technology.

Every Virtual Enterprise firm and practice firm is assigned to a regional headquarters. In Europe, the regional headquarters for European practice firms is European. ([www.europen.de](http://www.europen.de)) In the United States, the Institute for Virtual Enterprise, a CUNY Special Initiative, ([www.ive.cuny.edu](http://www.ive.cuny.edu)) is the regional headquarters for U.S. based college VE firms. VE students must create and present a business plan to representatives of the regional headquarters in order to receive capital to start their businesses. The firms are awarded money, in virtual funds, based on their presentation and their ability to pay back the loan.

After each VE firm is provided with virtual money, they receive a bank account at the IVE Bank that forms the foundation to function within the simulation and carry out transactions. The IVE Bank is part of a major financial literacy program within the VE simulation known as the MarketMaker. VE curriculum designers feel that it is very important for immigrant entrepreneurs to understand the financing involved with business activities. In a report by Bates and Bradford, minority owned businesses outperformed the Standard and Poors 500 in 2003. (Bates and Bradford, 2003) This performance cannot occur without understanding the financial intricacies of a business. The MarketMaker provides that financial instruction to VE students. In addition to financial reports, the MarketMaker project includes a virtual stock market that matches the stock price of real corporations with similar VE firms. The MarketMaker also includes personal and corporate credit cards, whereby students learn the credit nuances of an entrepreneurial start-up.

One advantage of the Virtual Enterprise program is that it provides students with a worldwide, global, VE economy in which to try out ideas for their businesses. Implementation of their ideas comes from their own creativity and by performing in the VE course. The safety net provided by VE takes into account that if student business ideas fail, they have the luxury of making those mistakes within the simulation and not in the real world where the financial burden would have much greater costs. Other academic entrepreneurial simulations can only go so far and cannot offer the total package of entrepreneurial activities that Virtual Enterprise does.

### **Virtual Enterprise and the CUNY Language Immersion Program**

Virtual Enterprise started at Kingsborough Community College in 1997. The VE method of instruction has been used with various student cohorts including: at-risk students, honors students, students who have been academically dismissed from senior CUNY colleges and have been given a second chance, and workforce development students. In the 2002 academic year, CUNY decided to adopt VE methodology as part of the CUNY Language Immersion Program (CLIP) at KCC. (VE-CLIP)

The credit-bearing student population at Kingsborough Community College mirrors most large-city college populations. KCC has 17,000 students where 80% have immigrated to the United States within the past five years. The statistics for VE-CLIP students are, as one could imagine, comprised of 100% newly arrived immigrants into the United States. Additionally, they lack the English language skills necessary to be admitted to CUNY as matriculated students. It is the goal of the CLIP program to bring the English skills of these students to acceptable CUNY levels in order for these students to matriculate into CUNY colleges.

*“...the demand for training in business English will continue to grow as the population increases, immigrants settle in English speaking countries, and businesses become increasingly globalized.”* (Sarty and Gerdeman, 2004) Many college administrators believe that it is important to teach business skills to recently arrived immigrants. Also,

Gartner found that minorities with more education are more likely to start businesses. (Gartner, 2001) In addition to the matriculation of these students into CUNY colleges, CUNY administrators thought that the VE method of instruction would be a good intervention to teach English language skills, from a business perspective, in order to get these students to believe that there is not only academic success, but also financial success in learning English.

## **PROJECT DESIGN AND METHODOLOGY**

The research methodology of this paper is multifaceted, employing qualitative, quantitative and independent methodologies. First, the researcher reports the results of a qualitative study of a questionnaire administered to VE-CLIP students with regard to their own progress. The questionnaire the researchers utilized is a derivative of a questionnaire employed by Graziano in his doctoral dissertation. The questionnaire asked CLIP-VE students how they felt about their progress in a variety of entrepreneurial activities including: technology and software utilization, verbal and written communication, operations and teamwork, leadership and creativity, and other general business activities such as marketing.

The subjects in the quantitative piece are Kingsborough Community College VE-CLIP students who already have taken at least one semester of language instruction, but did not pass the CUNY/ACT entrance exams. The paper reports the results of the effects of VE on these VE-CLIP students after taking a VE course. The results take into consideration the students populations of women, minorities and immigrants.

Finally, the paper discusses the results of an outside investigation of the Virtual Enterprise methodology. The Center for Advanced Studies in Education (CASE) conducted an in-depth assessment of VE as a methodology in general. The CASE study did not focus on ESL students, but rather on Virtual Enterprise as a teaching methodology for various student cohorts.

### **Qualitative Results**

A questionnaire soliciting the opinions and feelings of VE-CLIP students was administered in the 2003/2004 academic year. The questionnaire was given to two VE-CLIP cohorts, one in fall 2003 and the other in spring 2004. The VE-CLIP courses had 15 students each for a total population of 30 students. Of the 30 students surveyed, 100% were recently arrived immigrants, all from identifiable minority groups. 100% listed English as their second language. 70% of the students surveyed were female, with 30% male.

The questionnaire asked 20 questions, on a Lickert-like scale, directly related to what IVE administrators believe students should be learning in a VE-CLIP course, specifically: technology and software utilization, verbal and written communication, business

operations and teamwork, leadership and creativity. These skills are similar to what the Consortium for Entrepreneurship Education has defined as some of the standards for entrepreneurship education. ([http://www.entre-ed.org/Standards\\_Toolkit/standards\\_summary.htm](http://www.entre-ed.org/Standards_Toolkit/standards_summary.htm)) Students were asked to identify if they made no, little, moderate great or very great progress in the above categories. The following are the results of the questionnaire in category and the percentage of respondents choosing moderate to very great progress:

| <u>Category</u>         | <u>Percentage</u> |
|-------------------------|-------------------|
| • Technology            | 65%               |
| • Software              | 58%               |
| • Verbal Communication  | 65%               |
| • Written Communication | 43%               |
| • Business Operations   | 86%               |
| • Teamwork              | 72%               |
| • Leadership            | 57%               |
| • Creativity            | 71%               |

In addition to the above questionnaire, there has been other qualitative research conducted on Virtual Enterprise students who are also within the women, minorities and immigrant categories. The previously mentioned dissertation of Graziano reasoned for VE methodology as a tool for teaching ESL. (Graziano, p155) Graziano’s dissertation discussed a focus group he convened with various VE students. One of the students from his focus group put VE methodology into perspective for students struggling with English.

*“I was always afraid to speak up because I thought I had an accent. I still have one. I had this feeling that whenever I began to speak, people would look at me differently, thinking, “Oh she must be from a different country.” So sometimes, even though I knew the answer, I was afraid to speak up. Coming to this class, for the first time it gave me the opportunity to express my opinions.”* (Graziano, p.154-155) While Graziano’s study was not specifically convened for ESL students, his findings speak directly to the Hunt quote mentioned previously about the importance of English to achieve the American Dream for foreigners/immigrants.

## **Quantitative Results**

The quantitative research for this paper is based on the scores of VE-CLIP students on the CUNY/ACT test. The CUNY/ACT test is a test that all students who desire to be full-time, matriculated, CUNY students have to take to assess their competency levels in, Reading, Writing, and Mathematics.

(<http://portal.cuny.edu/cms/id/cuny/documents/informationpage/002155.htm>)

The following results are based on VE-CLIP populations from the fall 2002 to fall 2004 semesters. All of these students are recent immigrants and minorities. The results are given in semester and percentage of students improving their scores on the CUNY/ACT. All students took the CUNY/ACT previously, and failed, and then retested after taking a Virtual Enterprise course.

| <u>Semester</u> | <u>Percentage of Students Improving their CUNY/ACT Scores</u> |
|-----------------|---|
| Fall 2002       | 79%   |
| Spring 2003     | 65%   |
| Fall 2003       | 65%   |
| Spring 2004     | 70%   |
| Fall 2004       | 93%   |

### **Center for Advanced Studies in Education (CASE) Assessment**

The Center for Advanced Studies in Education (CASE), an independent research institute of CUNY, conducted an assessment of the Virtual Enterprise Program at Kingsborough Community College as a teaching methodology. The CASE study was an in-depth study of the overall VE program at KCC, specifically with regard to student outcomes.

CASE compared the student learning outcomes in Virtual Enterprise with the 21<sup>st</sup> Century Core Skills. The 21<sup>st</sup> Century Core Skills were created in 2000 after research conducted with the aid of a Pew Charitable Trust grant. The following table shows the 21<sup>st</sup> Century Core Skills on the left and the VE Learning Outcomes on the right.

| <u>21<sup>st</sup> Century Core Skills</u>  | <u>VE Learning Outcome</u>  |
|---|---|
| <b>Communication Skills</b> (reading, writing, speaking and listening)  | <b>Communication Skills</b> (reading, writing, speaking and listening)  |
| <b>Community Skills</b> (citizenship; diversity/pluralism; local, community, global, environmental awareness)             | <b>Global Awareness</b> (understanding the global marketplace, culture and diversity)                                     |
| <b>Critical Thinking and Problem Solving Skills</b> (analysis, synthesis, evaluation, decision-making, creative thinking) | <b>Critical Thinking and Problem Solving Skills</b> (analysis, synthesis, evaluation, decision-making, creative thinking) |
| <b>Information Management Skills</b> (collecting, analyzing, and organizing information from a variety of sources)        | <b>Information Management Skills</b> (collecting, analyzing, and organizing information from a variety of sources)        |
| <b>Technology Skills</b> (computer literacy,  | <b>Technology Skills</b> (computer literacy,  |

|   |  |
|---|--|
| <p>Internet skills, retrieving and managing information via technology)</p> <p><b>Interpersonal Skills</b> (teamwork, relationship management, conflict resolution, workplace skills)</p> <p><b>Personal Skills</b> (ability to understand and manage self, management of change, learning to learn, personal responsibility, aesthetic responsiveness, wellness)</p> | <p>Internet skills, retrieving and managing information via technology)</p> <p><b>Interpersonal Skills</b> (teamwork, relationship management, conflict resolution)</p> <p><b>Intrapersonal Skills</b> (ability to understand and manage self, management of change, learning to learn, personal responsibility)</p> <p><b>Entrepreneurship/Business Knowledge</b> (developing business plans, developing marketing and sales strategies, financial literacy and accounting skills, etc.)</p> <p><b>Motivational Outcomes</b> (understanding the connection between academic skills and attainment of career goals, career self-efficacy expectations)</p> <p><b>Faculty Outcomes</b> (shifting roles from instructor to advisor-coach-facilitator, functioning in cross-disciplinary teams)</p> |
|---|--|

As indicated by the results, VE Learning Outcomes match up with the 21<sup>st</sup> Century Core Skills in various entrepreneurial activities such as: communication skills, global awareness, critical thinking and problem solving skills, and interpersonal skills. In addition, CASE found that VE student outcomes produce specific entrepreneurship and business skills such as: developing business plans, marketing strategies and financial literacy. CASE also found that VE students also gained motivational outcomes specifically within the area of linking academic skills to career goals. Upon completion of the program, VE students feel that they can take the skills they learned and become entrepreneurs.

### SUGGESTIONS FOR FURTHER RESEARCH

Due to the adaptability of Virtual Enterprise as a teaching methodology to various student populations, further research can occur in a variety of areas. First, the author believes that the most appropriate research should be conducted on the ESL students who are taking Virtual Enterprise at Shoreline Community College in Washington State. The VE program at Shoreline is in its infancy, but further research on their students should be conducted and compared to the research within this study to improve validation of VE as a method of entrepreneurship education that benefits non-English speaking immigrants.

Second, other student populations should be studied to see if the Virtual Enterprise method of instruction is providing benefits to those specific students with regard to entrepreneurship education. Limited research has already been conducted on academically challenged students who take Virtual Enterprise, but other student populations can, and should be studied. Specifically, women who take VE courses in order to gain entrepreneurial skills should be studied. Finally, minority students in, non-ESL populations should be studied as well. Although these student populations are part of this study, they were all grouped together. Academics could benefit from further, individual research on these student populations.

## SUMMARY AND CONCLUSION

Engaging recent United States immigrants and minorities in entrepreneurship education is not an easy task. For recent immigrants with a lack of English language skills the task is even harder. Most entrepreneurship academics agree that having a thorough understanding of English is the cornerstone to being a successful entrepreneur. It is up to college administrators and professors to devise curricula that meets the objectives of not only teaching English, but engaging immigrants to believe that they too can become entrepreneurs and achieve their American Dream.

Virtual Enterprise is a teaching methodology that personifies entrepreneurship education. VE has been used as a vehicle for teaching entrepreneurship education to various student populations, including ESL students. Accordingly, VE methodology has been scrutinized and assessed in a variety of ways. First, there is qualitative research that shows that VE students like the program and feel that they gain a variety of entrepreneurial and academic skills. Second, quantitative research, via the CUNY entrance exam testing results, indicates that CLIP-VE students improved their CUNY/ACT scores after taking a VE course. Finally, research conducted by an independent researcher shows that Virtual Enterprise gives students not only the 21<sup>st</sup> Century Core Skills, but motivational and entrepreneurship skills as well.

## INVESTMENT OPPORTUNITIES IN WEST AFRICA

Don B. Bradley III  
University of Central Arkansas  
Tchiko Ngbichi  
University of Central Arkansas

In this research, the resources that make this region a great target not only for big international companies, but also for any small businesses, will be explained. The reasons why this relationship should increase not only with the United States, but also with the rest of the world, will also be explored. Most importantly reasons why, from the viewpoint of some foreign companies, investments in West Africa seem to be more profitable than in most other regions. The procedures for acquiring the investment loans, as well as barriers to the development of investments in West Africa will be studied. For instance, why, despite the apparent advantages is this part of the world not economically developed? Finally, in the last part of this research, some recommendations will be suggested to improve the economic climate.

For many investors in other parts of the world, the mention of Africa evokes images of civil unrest, war, poverty, disease, and mounting social problems. Even though it might be true and that these images might reflect the dire reality in some African countries, they are certainly not in all countries, nor is the entire continent plagued as it was reported during the United Nations Conference on Trade and Development that was held in New York in 1999. At this conference on trade and investment, a particular concern to help promote investment, domestic as well as foreign, as a means of strengthening the supply side of the African economy was discussed. The Secretary General of the United Nations, Mr. Kofi Aman, brought this topic to the conference and has recognized a disregard of the continent despite its potential. To achieve this investment promotion, Mr. Aman explained that it is essential to mobilize private capital flow, as well as to reverse the shameful decline in official development aid.

While the problems many African countries face are widely known and dominate the perceptions of the continent as a whole, there are a number of positive aspects that, although highly relevant for foreign investors, are little known. As in other continents, there are profitable investment opportunities to be found in most African countries that have a lot of resources that would greatly benefit any foreign companies.

Foreign direct investment (FDI) is welcomed and, indeed, actively sought by virtually all African countries. The contribution that FDI can make to their economic development and integration into the world economy is widely recognized. For this reason, African countries have made considerable efforts over the past decade to improve their investment climate. They have liberalized their investment regulations and have offered incentives to foreign investors. More importantly, the economic performance of the continent has substantially improved from the mid-1990s.

# PERCEIVED SUCCESS FACTORS IN START UP AND GROWTH STRATEGIES: A COMPARATIVE STUDY OF ENTREPRENEURS, MANAGERS, AND STUDENTS

## ABSTRACT

This paper reports on a comparative quasi-experiment of how perceptions of entrepreneurial growth strategies differ between students, managers and technology entrepreneurs. The differences in perceptions as to what critical factors drive three strategies: no growth, market share growth and annual profit growth across to stages: start-up and take-off are measured. The ranks of the critical success factors are the dependent measures and the strategies and the phases the independent variables. Results show that experience impacts the ability to distinguish between strategies. Results also show that the perceptions of the critical success factors significantly differ between the groups. Hence even experience will yield quite different cognitive maps.

## INTRODUCTION

Recently it has been argued that management training alone will do little good if managers, or entrepreneurs, lack hands-on experience (Mintzberg, 2004). It has also been argued that technology entrepreneurs in particular, who may be excellent scientists and technologists, fail as entrepreneurs because they lack appropriate business management training and experience. Specifically it has been said that technology entrepreneurs do not understand the importance of their specific markets and how firm grow therefore failing to make appropriate managerial decisions with respect to appropriate critical success factors (CSFs) needed to implement pursued growth strategies. Recently Shane (2003) pointed out that we do not yet understand the relationship between the choice of entrepreneurial strategy and the opportunity exploited, which essentially points at this very same problem.

These claims are serious against the reality that entrepreneurial firms are expected to grow. Large firms dominate economically when measured by assets, but small firms undoubtedly dominate when measured by number. Most firms start small and if they can overcome the high failure rate, they are expected to grow. Technology firms in particular are perceived as high growth firms and the literature often provides Silicon Valley as the prime example of how technology firms grow rapidly and provide employment for large

amounts of people and therein generate regional wealth (Saxenian, 1994). Hence there is a notion of that growth means at least growth in employment. But, the growth concept is actually a highly complex cognitive framework based on several factors, and it is far from obvious what growth really means to the entrepreneur; is it annual profit growth; is it increased market share? Is sustainability or mere survival the entrepreneur's target? What kinds of growth strategies do entrepreneurs employ (Shane, 2003)? How are growth strategies conceptualized by entrepreneurs in terms of the critical success factors (CSFs) that drive them?

We have since the mid 1990's seen an exceptionally high rate of new technology-based firms, where the founder many times has had little if any prior business experience. Within the field of, for example, biotechnology the founder has often been a successful scientist and researcher holding a Ph.D. and within information technology (IT) the founder has many times had no degree at all. It has been shown that those scientists which work in close proximity to firms have a lower failure rate than those who do not (Zucker et al., 1998). Hence are there differences in perception of growth that can be related to prior experience (or absence thereof)?

Growth is by definition a dynamic concept and the life cycle concept has been used to describe how firms transcend different stages of growth, and that different sets of assets and skills or CSFs are needed at each stage in order to ensure success (Churchill and Lewis, 1983, Moore, 1995, Koberg et al, 1996). CSFs are perceived to be important and fundamental to business, but few studies exist where CSFs are analyzed across the stages in the life cycle of a firm. Additionally, few studies actually demonstrate the link between firm growth and entrepreneurial perceptions as conceptualized by CSFs. Finally, few studies show how prior experience impact the perception of growth. Therefore, we find it necessary to study CSFs and entrepreneurial growth in the context of dynamic business life cycle via a controlled quasi-experiment in order to deepen our understanding of the mental models of entrepreneurs in comparison with managers and students who lack managerial experience.

## **PREVIOUS RESEARCH AND HYPOTHESES**

Previous research show that CSFs are strategically important and a firm's competitive success depend on them. They are industry specific and even business unit specific and dependent on managerial perception and managerial experience (Daniel, 1961, Anthony et al, 1972, Rockart (1979).

H1: CFSs are different due to managerial experience

CSFs have implicitly been linked to the life cycle (LC) concept by concluding that CSFs will depend on the situation of the firm, i.e. in what stage the firm is and therefore change over time (Rockart, 1979). Similar conclusions regarding differences across stages have been found by other studies using the LC concept (Churchill and Lewis, 1983, Quinn and Cameron, 1983, Tushman and Nadler, 1986, Van de Ven, 1986, Walsh and Dewar, 1987, Kazanjian, 1988, Pinto and Prescott, 1988). Studies focusing on critical issues in one or two stages in relation to entrepreneurial growth have been extensively researched, often

focusing on foundation and growth (Katz and Gartner, 1988, Davidson, 1989, Covin, et al, 1990, Reynolds and Miller, 1992).

The cognitive framework of growth tends to be that of an S-form life cycle curve corresponding with Roger's (1962) model of diffusion of innovations describing consumer's perception and adoption of innovations. This curve was re-conceptualized into another cognitive framework for describing entrepreneurial growth over different stages. Churchill and Lewis (1983) identified five stages; (i) existence, (ii) survival, (iii) success, (iv) take-off, and (v) resource maturity. Kazanjian (1988) distinguished between four stages: conception, development and commercialization, growth, and stability. Later, Kazanjian and Drazin (1989) showed, although previously questioned by Miller and Friesen (1984), that firms progress sequentially across those stages and Moore (1995) showed that the shape (or steepness) of that curve may differ depending on chosen strategy.

H2: CSFs are different in different stages of the firm's life cycle

H3: CSFs are different depending on growth strategy

Finally, with respect to growth studies there appears to be two main categories, one concerned with large organizations and several products where growth is a sum of many. This has been labelled *corporate growth* whereas the other category has been concerned with small business growth labelled *entrepreneurial growth*. The difference between these two categories seems to come from the fact that growth in small companies can be attributed to one single product or innovation (Moore, 1995). A study by Sousa de Vasconcellos and Hambrick (1989) showed that CSFs could be deduced from knowledge of basic technology and market attributes.

H4: CSFs are different depending on product technology

## DESIGN

In order to acquire a deeper understanding of growth and CSFs and their relationship and how they are perceived we conducted a controlled experiment. A quasi-experimental design was chosen to control for the growth strategy, product technology, and the CSFs.

In this study we have taken the view by Drucker (1985) on entrepreneurship and thus entrepreneurial growth can mean anything from starting a brand new business, creating a new strategic business unit within a corporation, or launching a new product on existing markets or entirely new markets.

In order to study the role of experience in perceptions of growth strategies we had three groups of respondents:

- (i) management naïve undergraduates (Group 1) who were book-learned but lacked any business experience,

- (ii) experienced managers (Group 2) who were assumed to have some basic training but first and foremost business experience,
- (iii) experienced technology-based entrepreneurs (Group 3) who were assumed to have some basic training, technology-based experience, and business experience.

There were two kinds of products:

- (i) organic pasta (500g) sold at a 20% price premium (Product 1), and
- (ii) functional food pasta (500g) sold at a 20% price premium (Product 2).

These products can also be characterized as low technology (Product 1) and high technology (Product 2). For both, the element of technology, either its absence or its presence is used in the claim of the product's superiority. Functional food<sup>1</sup> is a sub-category of the life science sector. The third group of respondents possessed experience from another life science sector, biomaterials. Despite clear differences between functional foods and biomaterial, there are similarities in the fundamental science of these two sectors (e.g. biology, biochemistry, chemistry and medicine). Thus, it was assumed that Group 3 had technology-based experience that would enable them to understand the products and the markets in order to assess growth strategies. Group 2 consisted of managers who were all from the same food processing company, but from different business units although in such positions that they were judged as highly experienced. The company is a large food processing company, which has in recent years brought innovative products, functional foods, to the market. Recently, the company had launched a functional food pasta on the market and is market leader in several served target markets. Group 1 were business school students in their third year and had no managerial experience, but could be seen to have consumer experience of ordinary pasta.

Finally there were three different growth strategies:

- (i) no growth (control) (Strategy 1),
- (ii) 20% annual market share growth over a period of five years regardless of profitability (Strategy 2), and
- (iii) 20% annual profit growth over a period of five years (Strategy 3).

Each respondent was given a task based on *one* product and *one* strategy. Thus, we had six different growth scenarios. Each respondent was given a list of 21 CSFs based on Aaker's (1989) original list of 31 CSFs. These were based on application to the given products. To ensure randomness we listed the CSFs in alphabetic order as opposed to Aaker's list, which was based on perceived importance. The respondent was to choose five CSFs out of 21 and rank only these five factors in order of importance to their particular task scenario. To capture the cognitive framework of the life cycle the respondents were asked to repeat the choice in two phases:

---

<sup>1</sup> Functional food contain an ingredient, a micro-nutrient or a natural chemical product for which we have scientific results either showing significant and beneficial interactions with the bodily functions or a reduced risk of developing certain diseases. Functional food must remain foods and must demonstrate their effects in amount that can normally be expected to be consumed in the diet: they are not pills or capsules, but part of a normal food pattern

- (i) start-up, and
- (ii) take-off.

The ranks were the dependent measures, and the strategy as well as the product the independent variables.

Table 1 about here

### **The CSFs**

CSFs have previously been empirically studied primarily in mature and large companies (Aaker, 1989, Sousa de Vasconcellos and Hambrick, 1989). Aaker conducted a study among 248 strategic business units covering service companies, high technology firms and manufacturing and raw materials firms in Northern California by Aaker (1989). He used the concept of assets and skills as those which are sources of sustainable competitive advantage (SCA), i.e. sources of success factors or CSFs. He concluded that there were on average of 4.65 factors which were critical. Daniel (1961) argued that they were between three and six and Anthony et al (1972) held six as a good rule of thumb. To ensure that there were real choices we wanted the respondents to choose from a list which also contained potential CSFs with no relevance what so ever. We did not include only obviously relevant CSFs. Hence as shown in Table 1 *reputation for quality* was #1 in our as well as in Aaker's study, but since 10 CSFs of Aaker's list were left out we have *enterprising/entrepreneurial* as #27 in Aaker's list and #19 in our list and *good distributor relations* as #31 in Aaker's list and #21 in our. Aaker's list reflects a relative measure of importance. Our ranks express the ordered rank of Aaker's list. Placed in an alphabetical order *continuing product innovation* is labelled CSF1, *customer orientation* CSF2, etc. These labels are used in the analysis and ultimately the respondents' ranks are compared with Aaker's rank.

### **The sample**

Initially 156 questionnaires were distributed, 88 undergraduate students, 41 experienced managers, and 24 technology entrepreneurs. Two student questionnaires had to be discarded giving a total of 86 participants and a response rate of 98% among students given the questionnaires in their classes in two business schools in Finland. In the company a call for volunteers was sent out and 41 managers expressed an interest in participating in the experiment. Thirty three (33) completed the task giving a response rate of 80% among managers. Twenty four (24) technology entrepreneurs were participating in a executive training course out of which 19 returned the questionnaire giving a response rate of 79%. Hence a total of 138 responses were used for the final analysis. The students completed the task as a class assignment.

Group 1 consisted of 86 undergraduate business school students and

Group 2 consisted of 33 experienced managers.

Group 3 consisted of 19 technology entrepreneurs

Table 2 about here

The respondents were randomly assigned a product and a strategy however we aimed at equal distribution of gender in the groups. However, due to the large number of female managers in Group 2 we were only able to ensure that each cell contained at least one male respondent and the low number of respondents in Group 3 made that aim impossible. Nevertheless, a test on the gender effect among students showed no significant effect ( $\chi^2_{(20)} = 26.43$   $p = 0.1522$ ). The distribution of respondents in each cell is shown in Table 2. The cells in Group 1 are almost equal size ranging from 13-16 persons. However, for Group 2 and 3 the cells are uneven. This bias is due to the fact that some of the volunteers did not complete the experiment. This is particularly problematic in Group 3 where one cell contains only one observation and impacts the interpretation of the results.

### **The Data Analysis**

The data was analyzed based on the *exploded logit model* (Allison and Christakis, 1994) using the rank order logit-procedure in the software package STATA 8.2. The model is a generalization of conditional logit regression. In the economics literature it has been named rank-order logit model. However, in the marketing literature it has been used as the exploded logit model. The model allows us to estimate and test for differences among items in respondents for them and the model allows for ties in the ranking. The exploded logit model offers several design and analysis possibilities. The model allows for ranking only the first few ranks treating the remaining ranks as ties or unordered. This may be preferred when there is reason to believe that the remaining ranks are “noisier”. Thus, one can, as we did, ask respondents to rank only the top five items. The model also allows for different choice sets for different respondents. The item that people are asked to rank may be sets of characteristics rather than named items. The CSFs that were asked to be ranked were such and in such a design the idea is to minimize collinearity and maximize variability. The model allows for subjective ratings of item dimensions, i.e. measured effects for each respondent’s perception of the item characteristics rather than some consensus rating. This analysis allowed participants to express their individual cognitive maps of CSFs for their respective scenario.

## **RESULTS**

Based on the literature we had reason to assume that there would be differences among the ranked CSFs across the different phases of the life cycle (Hypothesis 2). The differences between the factors was significant in each group (Group 1,  $\chi^2_{(40)} = 226.36$   $p = 0.000$ ; Group 2,  $\chi^2_{(33)} = 180000$   $p = 0.000$ ; Group 3  $\chi^2_{(33)} = 19103.18$   $p = 0.000$ ). Our conclusion is that hypothesis 2 was supported and at this point managerial experience did not seem to impact (hypothesis 1).

Hypothesis 3 assumed that strategy would impact the rankings of the CSFs. Here results were mixed. For the student group we found that the students were able to significantly distinguish between no growth strategy and market share growth strategy ( $\chi^2_{(20)} = 50.19$   $p = 0.000$ ). A lower significance was also found between no growth strategy and annual profit growth, i.e. it was only significant at the 5% level ( $\chi^2_{(20)} = 33.87$   $p = 0.027$ ).

Perhaps most interesting was that there was no significant difference in rankings by students between market share growth strategy and annual profit growth strategy ( $\chi^2_{(20)} = 30.04$   $p = 0.069$ ). For Group 2 the differences were significant in every respect (strategy 1 vs. 2  $\chi^2_{(19)} = 11990.22$   $p = 0.000$ ; strategy 1 vs. 3  $\chi^2_{(19)} = 9546.64$   $p = 0.000$ ; strategy 2 vs. 3  $\chi^2_{(20)} = 18240.72$ ). The same result was obtained from Group 3 (strategy 1 vs. 2  $\chi^2_{(16)} = 6354.63$   $p = 0.000$ ; strategy 1 vs. 3  $\chi^2_{(17)} = 10976.73$   $p = 0.000$ ; strategy 2 vs. 3  $\chi^2_{(17)} = 20090.96$   $p = 0.000$ ). The number of degrees of freedom is lower than the theoretical maximums due to the fact that some parameters were not estimable from the data. Given the fact that we have three groups out of which two were able to distinguish between strategy as reflected in ranking of CSFs we may conclude that Hypothesis 3 is supported. However, that fact that the student group was unable to make such a distinction supports Hypothesis 1, i.e. difference in perceptions relating to experience.

Table 3 about here

The support for hypothesis 4 was also mixed. The students were unable to distinguish between the products ( $\chi^2_{(20)} = 25.91$   $p = 0.1689$ ), whereas the managers were quite capable ( $\chi^2_{(19)} = 1990.45$   $p = 0.000$ ) as were the technology entrepreneurs ( $\chi^2_{(15)} = 387.51$   $p = 0.000$ ). This enforces the support for hypothesis 1, and it also supports the result from the study by Sousa de Vasconcellos and Hambrick (1989) and Covin et al, (1990). However, the factors that the technology entrepreneurs perceived as important show considerable differences in the cognitive maps of managers and technology entrepreneurs (Table 3). For the student group the products remain uncategorized as they were not able to distinguish between them.

## DISCUSSION AND CONCLUSIONS

Out of three hypotheses two provided support for the argument that prior experience will impact perceptions of what factors drives growth (Hypothesis 1). Hypothesis 3 specifically targeted growth, whereas Hypothesis 4 captured the issue with respect to a product technology. The results are initial, and it is important to note that both Group 2 and 3 should have been larger in order to allow for generalizations. Nevertheless, the results support the earlier mentioned observation by Shane (2004). Our results partially confirm findings in previous studies, but raise a number of issues, which are significant for entrepreneurship and perception of growth but also for marketing management, management education

### The Product

One of our fundamental assumptions was that the ranking of CSFs would be dependent on the product, i.e. there would be significant differences in rankings between the products with respect to group and strategy. The underlying rationale for this assumption is based on previous studies, which state that CSFs are contextual as well as firm-specific (Rockart, 1979, Sousa de Vasconcellos and Hambrick, 1989), which showed that CSFs could be deduced from knowledge of basic technology and market attributes. Moreover, a

study by Covin et al, (1990) shows that product related issues are very important in high technology industries.

While high technology attracts the attention of policy makers and investors because of the quite explicit assumption that success involves high growth, low technology is implicitly assumed to be the opposite to high technology and also associated with low or no growth. It is also apparent that low technology rarely involves product development but is mostly concerned with services and/or marketing.

In the experiment the choice of organic pasta on one end and functional food pasta on the other was *a priori* assumed to represent examples of low technology and high technology within a given product category. Since both product types exist on the market it was assumed that respondents were familiar with these products, especially our expert manager group. Frequently, in popular press organic foods are portrayed as non-technology foods and functional foods as high technology foods. Both product categories are positioned on the market based on this categorization, and the claims used in marketing carry these notions.

Although the managers and the technology entrepreneurs were able to distinguish between the products we find that the factors that drive growth are perceived to be very different, which will be discussed in more detail below. From a marketing perspective the results raise the question whether the concept of functional food is very well understood by others than those closely involved with the product. This point also raises issues of concern for market penetration and launching of new products.

### **Growth Strategy**

In our study the managers and the technology entrepreneurs were apparently better in envisioning the growth strategies as if they had already been accomplished, whereas they remained open-ended possibilities with no anchor or frame, i.e. reality based on hands-on experience (Russo and Schoemaker, 1989) for the students. Hence the students completed the task as if creating some, or any, order out there, whereas the task was aimed at creating a specific order relating to a growth strategy. This becomes particularly obvious through the fact that students had problems in distinguishing between no growth and annual profit growth strategy (it was significant on a 5% level but not on a 1% level) and could not at all distinguish between market share growth and annual profit growth. In other words, they cannot envision what impacts revenues and what profits.

In a seminar for Group 2 this issue was subject to a lengthy discussion, where it was pointed out that although the managers had been able to distinguish between the strategies this rationale does not reflect the reality of the managers' reasoning. We were told that when launching a product, annual profit growth is not the target – although admitting it ought to be so. The actual target is market share growth (regardless of profit target). Profits are monitored by senior executives and owners, not primarily by operating managers! For students there are thus apparent problems in conceptualising what generates revenues and profits (as if they are not necessarily different concepts). The

results raise some concerns with respect to nascent technology entrepreneurs and their perceptions of growth as it could be assumed that the students could represent proxies for nascent technology entrepreneurs. This perhaps reflects the fact that strategies become more useful with experience and that mere education alone will not prove sufficient. “Strategies that encourage rewriting and increase involvement are likely to be those strategies that call forth the most relevant experience. And those strategies most likely to do this are those whose outcomes can be envisioned most clearly (Weick, 1990, p. 8).”

## CSFs

Our study confirms that CSFs are different depending on which stage the firm is in currently. However, the cognitive framework, which links growth to life cycle stages, remains unclear as can be seen upon closer analysis. This is particularly visible in the student group, which lack managerial experience. This perhaps reflects the fact that cognitive maps become more useful from experience and that mere education alone will not prove sufficient. “Strategies that encourage rewriting and increase involvement are likely to be those strategies that call forth the most relevant experience. And those strategies most likely to do this are those whose outcomes can be envisioned most clearly (Weick, 1990, p. 8).” Clearly relative naïve students have not such maps to fall back on from their experience.

In ranking the factors the students chose every factor at least once whereas the managers group appears much more homogeneous in the rankings as there are three factors in each phase which are not ranked at all. In the start-up phase these are *location*, *market share*, and *size/location of distribution*. In the take-off phase these are *enterprising/entrepreneurial*, *location*, and *pioneer early entrant*. The technology entrepreneurs never ranked *low price/high value offering* and *market share* in the start-up phase and *location* in the take-off phase. It may seem surprising that enterprising/entrepreneurship was not a CSF for managers in the take off phase, but that could likewise be based on cognitive maps from their past experience. Moreover, the technology entrepreneurs ranked this factor for product 1 in all strategies very high in the start-up phase. Again it is somewhat surprising that this factor is not associated with the high technology version, i.e. product 2. But, there are more interesting features.

In the student group we find one factor which is ranked among the top five in all phases and all strategies; *good distributor relations* (factor 7). The manager’s include this factor in both phases for two strategies and both products; no growth and annual profit growth. In market share growth strategy it is only included in phase 1 and for product 1. The technology entrepreneurs are concerned with distribution in the take-off phase, for all strategies and both products. This factor was the last factor (least important) on Aaker’s list from his Northern California sample. The explanation for this can be found by the fact that the experiment was done in Finland, which is both a small domestic market and far away from any market, whereas Aaker’s study was conducted in California where 50% of the world market is right in front of you.

Another interesting observation is that factor 10, *low price/high value offering* places high among the students with the annual profit growth strategy in take-off phases. The managers ranked this product in both phases and for both products, but not very high. The technology entrepreneurs did not include this factor at all in the start-up phase. We have to recall that both products were described as selling at a 20% price premium. Generally, organic foods and functional foods are priced on the high end because they claim high value, i.e. they have never been regarded as low price products. This could, in the students' case, reflect the cognitive maps of in-experience where there is no prior experience on which to call (Weick, 1990). The text books teach that low price can lead to profit growth. That is, some prior experience exists, or as described by Weick (1985, p. 127): "The important feature of a cause map [or any map] is that it leads people to anticipate some order 'out there'. It matters less what particular order is portrayed than an order of *some* kind is portrayed." Yet, this does not explain the obvious contradiction with the announced price premium.

Overall marketing skills (factor 14) is seen as important by the managers in both phases in two strategies for both products; market share growth and annual profit growth. The technology entrepreneurs find this factor important only for functional foods and annual profit growth, whereas this factor is not at all found important by the students. The technology entrepreneurs rank *financial resources* (factor 6) as important in both phases for product 2 regardless of strategy, as well as for product 1 albeit no growth. Students also rate this factor as very important in the start-up phase regardless of strategy, whereas the managers find this important only in the start-up phase and no growth strategy for both products and for product 1 in the take-off phase of annual profit growth strategy (a complete mirror of the managers' perceptions). One would have expected to find financial resources important for high technology products instead.

Students and managers find *knowledge of business* as very important in the start-up phase. The technology entrepreneurs find this factor important only in the start-up phase and for no growth strategy and annual profit growth. The managers also consider it important through out the take-off phase and functional foods. Students find *name recognition/high profile* important in take-off, whereas the managers find it important only for organic pasta, and the technology entrepreneurs do not find the factor important. This factor was the third most important in Aaker's study. Students find *reputation for quality* important in the take-off phase for all strategies, whereas this factor is regarded as important by the managers in these phases but only for organic pasta and for functional foods only for a no growth strategy, and the technology entrepreneurs find it important only for market share growth strategy. This factor was perceived as the most important CSF in Aaker's study.

Interestingly, clusters of CSFs that one would expect do not appear. For example, to have a low price/high value offering (our CSF 10) would assume a low-cost production CSF (our CSF 11). This does not occur with our student or manager group. Perhaps groups use one CSF as a short-hand for all related CSFs within their cognitive maps. The technology entrepreneurs does rank low-cost production for product 1 for no growth strategy, when

one would have assumed it to appear in the annual profit growth strategy, as conventional wisdom holds that low cost production increases profits.

Finally, the technology entrepreneurs appear more goal-oriented, as they rank factor 21, *strategic goals*, as important in the start-up phase for both products in all strategies but annual profit growth. Also, factor 19, *short term planning* is ranked high in the start-up phase for product 1 in no growth and market share growth.

### **Managerial Experience and Perceptions of Growth**

In the introduction we argued that growth strategies are conceptualized and obviously perceived differently. We also argued that managerial experience is central in the perception of growth. Previous studies show that one particular concept of growth—the life cycle—appears to play an important role in relation to perceptions of growth. However, as our results show the function remains unclear in terms of what factors are critical to achieve growth. One of our key arguments here is that it reflects differences in cognitive maps, which themselves are reflections of experience. This is supported by Karl Weick (1990) who provides some insights into the role of entrepreneurial experience of management and the perceptions of growth.

“Clear outcomes are most likely to occur when the strategy is conceived in the future perfect tense as if it had already accomplished, rather than in the future tense where it is *visualized* simply an open-ended possibility, one of many possibilities. (italics added by authors).” Weick, 1990, p 8.

The managers in this study actually had experience with a science based functional food product and the two stages of start-up and take-off. Whereas, students experience with the products were simply as consumers of food products. Experienced life science entrepreneurs had experience with developing technology and bringing it to market rather than the specific product experience of the manager group. Thus we had naïve or un-experienced students, experienced technology entrepreneurs, and product-specific experienced large firm managers.

Our results indicate that education alone is not sufficient to develop an ability to purposefully coordinate actions. Experience appears to significantly impact perceptions of what results certain critical success factors or combination of factors may lead to. This is not to say that only experienced persons can become entrepreneurs or successful ones, as our results also show that there are differences in perceptions with respect to experience as such. Therefore, a mentor, network of advisors, advisory boards, etc. possessing a variety of experience and the cognitive maps, which a management naïve person lacks, can be instrumental in entrepreneurship.

Different kinds of industry or product experience produce different kinds of strategic decision making frameworks for future use. General industry experience and/or experience in developing technology do not translate well into specific product differentiation strategies. For example, technology experience may not generalize across

specific technology based products, which may explain why a manager with technology experience from one industry may not be able to utilize that experience in another related industry with different products, let alone entirely different unrelated industries. The study also suggests that these skills may not transfer perfectly to a different orientation. It also means that a manager may lack sufficient entrepreneurial experience needed to successfully start-up and grow a venture despite product or industry experience. Perhaps most interestingly managerial experience may not transfer effectively to entrepreneurs as often assumed. This may explain why successful managers in one industry may not succeed as entrepreneurs even in the same industry. It may also explain why successful entrepreneurs may not always be successful managers of firms once they are established. Next, there is the implication that simply providing would-be technology entrepreneurs with general management education will not provide the kind of perspectives needed by technology entrepreneurs who perceive CSFs very differently from experienced managers.

## CONCLUSIONS

Our study show that perception of growth and perceptions of what factors are critical to growth is connected to managerial experience. Our study also shows that managerial concepts become meaningful when practiced. From an entrepreneurial perspective this is important as entrepreneurship most often is connected to growth and technology entrepreneurs many times start without any or little formal business training. Although it is not possible to make far reaching generalization based on the experimental study it does call for additional studies around several topics, where perception of growth clearly is one. How do start-up entrepreneurs perceive growth and how are these perceptions different from, e.g. nascent entrepreneurs? How do these groups envision *rapid* growth? Is it understood what drives growth?

Furthermore, the results encourage studies on how consumers perceive high technology products. Finally, the results should prove useful for management educators with respect to enable students to conceptualise complex technological products as well as to conceptualise complex cognitive framework. Finally, it means we have to as educators; pay a good deal more attention to specific past experience or practicum experience of participants in management education. It is clear from this study that entrepreneurship is certainly different from management. It is a unique experience and phenomena of its own.

## ABSTRACT

Is entrepreneurship seen as a viable opportunity? To understand what makes people recognize entrepreneurship as an opportunity is important for educators as well as policymakers. Perceptions of entrepreneurship and the impact of education is studied by identifying what factors drive perceptions of entrepreneurial intentionality, perceived personal desirability, and perceived personal feasibility among a sample from two Finnish business schools. Additionally, the role of education on differences in perceptions is analyzed. Results show that there is a clear difference between how the two groups perceive entrepreneurship. In both groups the probability of starting a firm is low, i.e. entrepreneurship is not attractive. However, the groups who had participated in entrepreneurship education had a clear opportunistic view whereas the other saw entrepreneurship as a necessary last alternative. Entrepreneurial lifestyle seemed to excite respondents in both groups, but again the excitement was generated by quite different factors

## INTRODUCTION

Finland has recently been rated the most competitive nation in the world. National investment in R&D in 2003 was 3.4% of GDP. Yet, entrepreneurial activity is low despite increasing efforts by policymakers to support and improve the situation for start-up entrepreneurs. Based on the GEM data from 2003 the total entrepreneurial activity was 6.9%. Of these, 5.8% are opportunistic and only 0.6% necessity entrepreneurs. Previous studies have also shown a low (10%) entrepreneurial activity among Finnish engineering students.

The measures taken by policymakers have mostly focused on helping entrepreneurs getting started, ranging from serious and quite extensive measures by the National Technology Agency (TEKES), the foundation of regional development centers for supporting regional development through support for starting firms to increasing public endorsement by policymakers that entrepreneurship is good for the economy and

something which is highly welcomed by society. Most of the measures have meant developing financial instruments, i.e. financial support, or the lack of financial support has been identified as the fundamental reason for low entrepreneurial activity. It is true, that starting a firm requires money. But, whether it requires some, more or a lot of it depends on the opportunity the entrepreneur decides to pursue. Moreover, actions have been taken to increase the entrepreneurial skills among start-up entrepreneurs taking the form of business plan writing courses, education on how to manage intellectual property, etc.

However, there is one step prior to stretching out the hand and ask for funding. That is when the would-be entrepreneur recognizes an opportunity and/or decides to become an entrepreneur. Very little has been done to improve opportunity recognition or to generate the spark that ignites entrepreneurial activity. This is odd, to say the least, as opportunity recognition is the most distinctive and fundamental entrepreneurial behavior (Bird, 1988, Katz and Gartner, 1988, Gaglio and Katz, 2001). The literature on opportunity recognition is extensive (Kirzner, 1997, Venkataraman, 1997, Krueger, 1998, Shane, 2000, 2003, Shane and Venkataraman, 2000, Gaglio and Katz, 2001, Eckhart and Shane, 2003). However, few studies have addressed the problem of seeing entrepreneurship as an opportunity in itself.

Entrepreneurial intentionality studies (Bird, 1988, Carsrud et al, 1987, Krueger and Carsrud, 1993, Krueger et al, 2000) have analyzed a variety of factors impacting intentions, drawing on Ajzen (1987) and Shapero (1982) among others. Attitudes, traits, mentors and networks have proved to impact entrepreneurial behavior, i.e. social norm plays a key role. Krueger (1998) argues for the necessity for individuals to perceive a prospective new course of action as a credible opportunity, which requires the opportunity to not just be viable, but to be perceived as viable.

We have conducted a study in two Finnish schools among under-graduate students. In A 237 questionnaires were distributed and 191 returned, i.e. 80.6% response rate. In B 74 questionnaires were distributed and 72 returned, i.e. 97% response rate. Based on the results we will argue that in addition to recognizing an opportunity it is important for the would-be entrepreneur to first and foremost perceive entrepreneurship as an opportunity in it self, i.e., as an alternative employment route that also can be understood as a life-style decision. We will argue that although society sees entrepreneurship as good both in the form of espoused values and supporting measures for starting entrepreneurs it is highly unlikely to lead to the actual increase of entrepreneurial activity if entrepreneurship is not seen as an opportunity or if, for example there is a social norm which encourages other type of behavior. Additionally, we will argue that the social norm may fertilize the development of a misperception of who would be most suitable as an entrepreneur, a mistaken role identity.

Our study seeks to provide insights to the following research questions: To what degree is entrepreneurship seen as an opportunity? To what degree does education impact the ability to regard entrepreneurship as an opportunity? Are there mental prototypes of what

being an entrepreneur entails? Does a mental model impact the students' ability to see entrepreneurship as an opportunity?

## **OPPORTUNITY RECOGNITION AND ENTREPRENEURIAL INTENT - HYPOTHESES**

Opportunity recognition as an area within entrepreneurship research has recently attracted much attention in fact there are already a number of schools of thought (Shane, 2000). The Equilibrium School assumes that everyone can recognize all entrepreneurial opportunities and that whether this actually takes place is dependent on fundamental attributes of people. In other words, it is possible to identify individuals who want to become entrepreneurs and that these are less risk averse than those who choose to become employees. Hence we can formulate our first hypothesis:

H1: It is possible to identify a mental prototype of who is more suitable to become an entrepreneur

The Psychological School argues that fundamental attributes of people, rather than information about opportunities determine who becomes an entrepreneur and this again depends on a person's willingness and ability to take action (Krueger et al, 2001). Much attention within this school of thought has been given entrepreneurial intentionality studies and it has been argued and shown that attitude towards behavior, social norm, and perceived behavioral control influence a person's intentions to act, although social norm has also been shown not to have a significant impact (Ajzen, 1987, Krueger et al, 2001). Intentions reflect critical underlying attitudes and manifest themselves in three perception: (i) perceived personally desirable, (ii) perceived supported by social norm, and (iii) perceived as feasible. Expected values are a prerequisite for what is perceived as personally desirable, normative beliefs for social norm, and self-efficacy for perceived feasibility.

H2: There is a significant relationship between perceived personal desirability and entrepreneurial intent

H3: There is a significant relationship between perceived personal feasibility and entrepreneurial intent

H4: Perceived supporting social norm will impact entrepreneurial intent

Moreover, studies have shown that perceived role identity impact on attitudes and intentions towards entrepreneurship and that they can be changed significantly through education (Fiet, 2000a, 2000b, Klofsten, 2000, Gibb, 2002). Role identity is here understood to be influenced by the perception of the existence of a particular educational basis and level of education that would be more suitable for an entrepreneur. It reflects the perception *who* becomes an entrepreneur and who does not. Role identity also includes the existence of role models either within the family or close friend(s).

H5: Role models in within the family will impact entrepreneurial intent

The Austrian School builds on the idea of information asymmetry as the driving force. People cannot recognize all entrepreneurial opportunities, and that information about opportunities will drive entrepreneurial opportunity recognition rather than a willingness to take action (Kirzner, 1997, Shane 2000). However, the Austrian school does not indicate what kind of information would generate a higher ability to opportunity recognition, but it does carry the notion of more information. Finally, this school of thought does not tie information asymmetry to success, i.e. if information is the trigger, will it result in more successful firms.

The idea of information asymmetry as the driving force is tempting in particular with respect to high technology entrepreneurship as it implicitly indicates that higher educated persons would be more prone to recognize entrepreneurial opportunities. To elaborate on that notion would mean that a country with a high proportion of the adult population having a university degree should show a high rate of entrepreneurial activity. Thus, in Finland, where 38,5% of the adult population aged 24-35 years having a university degree should show a high rate of entrepreneurial activity. The reality is quite the opposite with a total entrepreneurial activity of 6.9%, which gives a strong indication of that there are other factors than having knowledge and skills involved, e.g. willingness to act.

H6: There is a relationship between knowledge and skills and entrepreneurial intent

## **THE STUDY**

### **The sample**

The study was conducted in two Finnish business schools in the same city in the fall 2004. The questionnaire was constructed in accordance with previous studies (Krueger et al, 2001, Autio et al, 2001). What makes this study different from others is that we target business school students. The other interesting issue is that the two business school represent the two official languages in Finland; in A the teaching language is Finnish and the school recruits primarily from the Finnish speaking population; in B the teaching language is Swedish and recruits primarily its students from the country's 6% minority. Thus, the students have a different linguistic background, which also means that they have a different cultural background and they have different regional backgrounds. In this paper we have not analyzed further these issues, but let the two schools represent proxies for them.

Insert Table 1 about here

Initially 313 questionnaires were distributed, 237 in A and 74 in B, a total of 2263 were returned (total response rate 84%. Thus we had two groups:

A: 191 respondents and a response rate of 80.6%

B: 72 respondents and a response rate of 97%

The gender distribution for the total sample differs significantly ( $\chi^2=3.510$ ,  $p=.061$ ) (Table 1). In Table 1 the number of respondents differ ( $n=183$ ) from the real sample size as there were 8 persons who failed to indicate their gender.

## **Data and Measures**

### The dependent variables

Entrepreneurial intent: How probable is it that you will start a firm within 5 years? (scale 0-100)

Perceived personal desirability: How attractive would it be for you to start a firm? (scale 0-100)

Perceived personal feasibility: How easy would it be for you to start a firm? (scale 0-100)

### The independent variables

The respondents were then given a battery of 17 statements which they were to rank on a 5-point scale.

1. I would be more independent as an entrepreneur as an employee
2. I would be constantly overworked as an entrepreneur
3. I could reach my goal in life as an entrepreneur
4. I could earn more money as an entrepreneur than if an employee
5. It requires too much money to start a firm
6. I would be less appreciated as an entrepreneur
7. Only if I don't get a job will I become an entrepreneur
8. It would be the best way to benefit from my education
9. I'm precisely the kind of person who would become an entrepreneur
10. The lifestyle of an entrepreneur excites me
11. I know of a good market opportunity
12. I have a good business idea
13. I have skills and knowledge to become an entrepreneur
14. The example of family and relatives encourages me
15. The example of friends encourages me
16. I'd be interested to join with others as an owner/founder
17. Starting a firm is difficult for me

The role of family (parents and grand-parents, sisters) and friends were also controlled for. Finally, the respondents were asked to indicate what educational basis and level of education would be most suitable for becoming an entrepreneur.

The data was analyzed using step-wise regression analysis as well as the statistical significance of the strength of association through cross-tabulation was analyzed.

## **RESULTS**

### **Entrepreneurial Intent**

13.5% of the total sample regards the probability to become an entrepreneur higher than 50%, but only 4.6% (18 persons) give it an 80% or higher probability. In A the corresponding frequencies are 14.4% and 4.8% and in B 11.1% and 4.2%.

Our study confirms the results from previous studies and show that entrepreneurial intent ( $R^2=.45$ ) is significantly dependent on perceived personal desirability ( $\beta=.50$ ,  $p=.000$ ) and perceived personal feasibility ( $\beta=.26$ ,  $p=.000$ ). In a path analysis ( $R^2=.52$ ) results also show that there are two other factors directly linked to entrepreneurial intent, with the  $\beta$ -value lower for desirability ( $\beta=.27$ ,  $p=.001$ ) and feasibility ( $\beta=.34$ ,  $p=.000$ ). These factors are *the lifestyle of an entrepreneur excites me* ( $\beta=.22$ ,  $p=.004$ ) and *only if I don't get a job* ( $\beta=.13$ ,  $p=.014$ ).

There is a significant difference in perceived personal desirability ( $t=.015$ ) between A ( $n=191$ ; mean 49.37) and B ( $n=72$ ; mean 49.88) but not in perceived personal feasibility ( $t=.071$ ) between A ( $n=191$ ; mean 55.03) and B ( $n=72$ ; mean 49.29). There is a significant difference in perceived personal desirability ( $t=.006$ ) between women ( $n=132$ ; mean 47.12) and men ( $n=123$ ; mean 64.97) and in perceived personal feasibility ( $t=.001$ ) between women ( $n=132$ ; mean 48.79) and men ( $n=123$ ; mean 58.04).

When analyzing the groups separately we find that for A ( $R^2=.50$ ) entrepreneurial intent is dependent on perceived personal desirability ( $\beta=.24$ ,  $p=.016$ ), perceived personal feasibility ( $\beta=.26$ ,  $p=.001$ ), *I know of a market opportunity* ( $\beta=.16$ ,  $p=.04$ ), and *The lifestyle excites me* ( $\beta=.22$ ,  $p=.03$ ). For B ( $R^2=.68$ ) we find that entrepreneurial intent is dependent on perceived personal feasibility ( $\beta=.45$ ,  $p=.000$ ) and *Only if I don't get a job* ( $\beta=.42$ ,  $p=.000$ ). There is no significant link between perceived personal desirability and intent.

Hence we find a mixed support for Hypothesis 2, i.e. despite overall support we find that this is true only for group A whereas there is no significant link between perceived personal desirability and entrepreneurial intent in group B. However, Hypothesis 3 is fully supported. However, as we found we when studying the relationship of the 17 statements to entrepreneurial intent (Table 2), perceived personal desirability (Table 3), and perceived personal feasibility (Table 4) using step-wise regression analysis for the groups together and separately, we found that the groups have quite different mental maps of entrepreneurial intent, desirability and feasibility.

Insert Table 2 about here

Insert Table 3 about here

Insert Table 4 about here

### **Entrepreneurial mental prototype**

Research has for a long time tried to draw a picture of the typical entrepreneur with very little luck. As already indicated above we see that the cognitive maps of the two groups as to what drives entrepreneurial intent, perceived desirability, and feasibility are quite

different. A rough estimate would suggest that group A is far more opportunistic, whereas group B sees entrepreneurship in terms of necessity. Therefore, additional analysis was conducted by comparing the rating of the factors on a five-point scale of the 17 statements supplemented with questions concerning what kind of educational background and level of education would be suitable for entrepreneurs.

Out of 17 statements 12 showed a significant ( $p < .05$ ) difference between A and B (Table 5). As the respondents from both groups found the entrepreneurial lifestyle exciting it is possible to assume that some kind of mental prototype must exist despite the differences shown in Table 5. Thus, with lifestyle as dependent variable we ran a step-wise regression analysis through the statements and are able to draw the following picture (Table 6).

Insert Table 5 about here

Insert Table 6 about here

Finally, the respondents were asked what type of educational background and what level of education is most suitable for an entrepreneur. Both groups completely agreed that a business education on the college or polytechnic level is by far the best combination. Interestingly medical education, or law and technology were not perceived suitable. Not surprisingly arts, fine arts or crafts were considered very unsuitable, although reality is quite the opposite. In conclusion, we argue that it is not possible to identify a mental prototype of an entrepreneur, i.e. we do not find support for Hypothesis 1.

### **Role of family and friends and social norm**

Evidence from the impact of social norms on entrepreneurial intent is mixed. Krueger et al (2001) conducted a study in the US and found no significant link between social norm and entrepreneurial link whereas Grunsten (2004) conducted a study among Finnish technology entrepreneurs and found a weak but significant link between social norm and entrepreneurial intent and a somewhat stronger link to perceived personal desirability. Our study does not provide a significant direct link between social norms and entrepreneurial intent. However, as we have seen in the previous sections the role of family, relatives and friends appear to be linked to the perception of entrepreneurial lifestyle. Moreover, there seems to be in group A the understanding that one is less appreciated as an employee and this is why the entrepreneurial lifestyle seems exciting. However, we cannot claim that our results provide any support for Hypothesis 4 and 5.

### **The issue of information asymmetry**

The Austrian School assumes that opportunity recognition is tied to the fact that the potential entrepreneur has information, knowledge or skills that enables the person to recognize opportunities better than those who do not. We find that *I have skills and knowledge* is a significant factor in entrepreneurial intent and perceived personal desirability for the total sample and for group A in particular. The strongest link we find with respect to perceived personal feasibility for both groups. This would indicate that

perception of possessing skills and knowledge is important but at the same time we find that there are many other factors that play a significant role as well. Hence our results provide support for Hypothesis 6.

## **DISCUSSION**

We will discuss the results in terms of the research questions of this paper.

### **Entrepreneurship as an opportunity**

In the introduction we raised the concern that entrepreneurship is not seen as a viable opportunity in itself and that this may be a primary reason for the low entrepreneurial activity in Finland. Hence our first research question was to analyze to what degree entrepreneurship is seen as an opportunity.

Drawing on the extant research body of entrepreneurial intentionality studies the research question was operationalized with three questions: (i) what is the probability that you will start a firm in five years, (ii) how desirable would it be for you to start a firm, and (iii) how feasible would it be for you to start a firm? Furthermore two hypotheses were formulated (Hypothesis 2 and 3).

We find that there is a very small number of the respondents who rate the probability to become an entrepreneur greater than 50% and an even smaller number who indicate a high probability (<80%); 4.8% for A and 4.2% for B. Thus, entrepreneurship is not seen as an attractive opportunity.

Based on our survey we found for the total sample a direct link between entrepreneurial intent and perceived personal desirability and perceived personal feasibility. However, when analysing the two groups separately we found fundamental differences in perceptions of what factors contribute to entrepreneurial intent, perceived personal desirability and perceived personal feasibility, but also that there were other factors with direct links to entrepreneurial intentionality and that again these differed between the groups. Hypothesis 3 was fully supported, but the support for Hypothesis 2 was mixed. Thus, when we look at the factors which showed a significant link to the perceptions we see that the cognitive maps are very different for the two groups. Group A appears to have an opportunistic view, whereas B is very much tuned towards a necessity-based view. In fact, B seemed to have the impression that entrepreneurship is something one does when there is nothing better around and only if it does not require too much effort. There is at least one thing that the body of literature on entrepreneurship, whether academic studies or biographies, seem to fully agree upon, and that is that starting a firm, rarely if ever is perceived as *easy* by the entrepreneur.

### **The role of education**

The two groups have different background factors, which may partially explain the different cognitive maps. First, they represent two groups with a different linguistic and cultural background. This may be a partial explanation, but in this paper we did not delve

into this issue further since we think that the difference really is rooted in educational differences. Despite the fact that both groups are formed by business school students who also happen to be in the same city – in fact roughly 500 yards apart there are differences. School A has had compulsory courses in entrepreneurship since 1999, i.e. every student has to take two courses in entrepreneurship. In 2004 entrepreneurship became a major subject and furthermore, a Small Business Research and Development Center has existed within the school for over 10 years. In school B there has been one optional course given in the fall 2003 and 2004, with a total of 30 participants. Hence in A entrepreneurship is present and real, whereas in B it is to many non-existent or at least highly distant.

The data from group A was conducted during the exam from an entrepreneurship course whereas B filled in the questionnaires during a compulsory course in research methods. We argue, that part of the differences is due to education. As such, we find support for Shane's (2000) argument that the ability to recognize opportunities is due to information asymmetry. In this case, group A could be assumed to have a perception of entrepreneurship which was more likely to be based on facts, whereas group B was left to rely on facts that seem to be based more on myth.

We know from the entrepreneurial intentionality literature and cognitive science that attitudes are linked to action, and that education can influence attitudes. It is clear from our study that the two groups have different cognitive maps regarding entrepreneurship and the fact that education has been provided for one of the groups we argue that education makes a difference.

### **Mental prototype**

When we look at the factors we find that *entrepreneurial lifestyle excites me* is strongly present in group A but absent in B. Much to our surprise we then find that *I'm precisely the type to become an entrepreneur* as a significant factor for group B, but not A. Apparently, there seems to exist some kind of mental prototype of what an entrepreneur is, but it is far from clear what that is. As the factors perceived to be linked to intentionality, desirability and feasibility as so very different between the groups and since one of the groups has participated in entrepreneurship education and the other has not it is possible to argue that education will impact the mental prototype. However, there does not appear to be a link to how probable it will be that the student decides to become an entrepreneur since the probabilities are very low for both groups and the difference is not statistically significant.

In his criticism of the Equilibrium school, Shane (2000) questions the assumption that there exists a particular type of person who becomes an entrepreneur. Moreover, despite the large body of research it has yet not been possible to identify this *homo entrepreneuriens* (Brockhaus, 1982, Gartner, 1988, Baron, 1998, Hytti, 2003). Our study, shows that the two groups again have very different perceptions of what would be so exciting about the entrepreneurial lifestyle. In fact, when we look at the significant factors for both groups (Table 6), we find two factors: *starting a firm is the best way to benefit from my education* and *I know a good market opportunity* that perhaps not intuitively

would be regarded as lifestyle factors. However, assuming that they impact the perception of an exciting lifestyle, we may arrive at the notion that entrepreneurial intentionality is not necessarily just an opportunistic or a necessity decision, but a lifestyle decision.

### **Social norm and role of family and friends**

Research on whether social norm is linked to entrepreneurial intentionality is mixed. Krueger et al (2001) found no link, but Grunsten (2004) in a study conducted on a Finnish sample showed a link although a weak one. In our study the issue of social norm was addressed as how the respondents perceived themselves to be appreciated more, i.e. as an employee or an entrepreneur and how they perceived to benefit from their education. The perceived utility has a significant link to perceived personal desirability for the total sample (Table 3), but recalling that perceived personal desirability had no link to intentionality for group B it can be assumed that the link is next to none. Interestingly, the perceived appreciation is linked to lifestyle (group A). Hence, social norm understood in terms of appreciation does not have an impact on intentionality other than in terms of lifestyle.

The role of family and friends does not seem to be important in general. However, again these factors seem to be linked to entrepreneurial lifestyle. Thus, if there is a connection between social norm, family and friends it is indirect and embedded in other factors.

## **CONCLUSIONS AND ISSUES FOR FUTURE RESEARCH**

Our study has addressed the impact of education on perceptions of entrepreneurship. We have anchored our study into the conceptual framework of entrepreneurial intentionality used in numerous previous studies. The assumption has been that by understanding what factors drive - or the differences in perceptions of these factors - entrepreneurial intentionality, perceived personal desirability, and perceived personal feasibility we may draw important insights with implications for education and policy makers.

Our sample consisted of Finnish business school students and is therein different from previous studies. Krueger et al (2001) sampled US business students, and Autio et al (2001) sampled Scandinavian technology students and Grunsten (2004) sampled Finnish technology- students and start-up technology entrepreneurs. Our sample consisted of two groups where one had been participating in compulsory entrepreneurship education and the other group had not had any systematic entrepreneurship education.

Our results show that the cognitive maps of the two groups are very different. The groups that had participated in education seemed to have an opportunistic view whereas the other groups saw entrepreneurship as a necessary last alternative. Although the probability that the respondents would start a firm within five years was very low in both groups, it is possible to conclude that education will have an impact on how entrepreneurship as an opportunity in itself is perceived. Both groups shared the view that the lifestyle of an

entrepreneur seemed exciting. Yet, there seemed to be quite different aspects of lifestyle that excited them.

The impact of family and friends seems indirect and social norm was not found to significantly impact perceived personal desirability or perceived personal feasibility. It is not possible to say from our study at this stage to what degree education will increase the probability of starting a firm, only that education appears to impact the perception of entrepreneurship. However, since attitudes can be influenced via education it is likely that education can increase the probability. Therefore, the content of entrepreneurship education becomes critical. For students with academic education it would be important to provide more examples of successful academic entrepreneurs and to first and foremost demystify entrepreneurship.

Also, given the different perceptions of entrepreneurship it is obvious that there are other factors than financial means and knowledge and skills, which trigger personal perceived desirability and personal perceived feasibility and therein entrepreneurial intentionality. Policymakers should observe this, and take increasing measures in increasing the attractiveness of entrepreneurship. Entrepreneurship is not attractive at this moment.

Our results mandate additional research. In order to understand the role education, it would be necessary to collect data from students who are entering university, i.e. freshmen and then compare the data. This way we can understand how management studies impact perceptions of entrepreneurship, which in turn will enable us to a more targeted design of education. Also, it would be necessary to study the issues among graduated students, whereupon the role of experience would emerge.

## **ABSTRACT**

Disability cuts across all socio-economic backgrounds, geographic areas and demographic characteristics. For too long it has been assumed that entrepreneurs with disabilities was an oxymoron. This paper will attempt to dispel such myths and assert instead that the experience of living with a disability may in fact actually contribute to business success. The experience of living with a disability may teach valuable skills and lessons which contribute positively to business success. This research paper seeks to question and explore the key barriers experienced by disabled entrepreneurs and influence policy makers in the promotion of alternative paradigms to embrace and embed an entrepreneurial ethos amongst the disabled .

The EU stated economic objective is to encourage **entrepreneurial activity** in Europe by helping to create favourable framework conditions for businesses. At the Lisbon European Council on 23 and 24 March 2000, the European Union set itself as its goal for the next decade to become the most competitive and dynamic knowledge-based economy in the world, which will be capable of developing sustainable economic growth with more and better jobs and greater social cohesion. Equally, the International Labour Office has promoted its stated objective of improving decent work and fostering and encouraging entrepreneurship in its most recent discussion paper on the global employment agenda.

This paper seeks to explore and question why so little progress and attention has been made to date in relation to entrepreneurial education and promotion for those with a disability.

According to the US Department of labor, entrepreneurship presents benefits and disadvantages for people with disabilities. Benefits of operating a small business include the freedom, flexibility and independence associated with self employment and freedom from access related obstacles such as transportation, fatigue, inaccessible work environments and the need for personal assistance. Potential disadvantages cited include the loss of cash benefits from Social Security or supplemental disability programmes inability to access venture capital due to poor credit ratings, and lack of assets to use as collateral. Surely, entrepreneurship can pose an attractive route to economic self sufficiency. Self employment may offer the individual unrivalled flexibility to work around a disabling condition. The effects of the condition may be mitigated without any loss in productivity when an individual has the latitude to work around medical routines. Equally, entrepreneurship may enable people with

disabilities to circumvent artificial barriers to career progression which may be prevalent in the labour market. To date disability research has not focused on this subject matter of entrepreneurship despite all the rhetoric from Europe and nationally to encourage and foster social inclusion and similarly an entrepreneurial ethos.

It is seldom seen that employment programmes tailored to people with disabilities often do not support entrepreneurship training. This paper will explore this phenomena and make recommendations for key supports for inclusion and mechanisms to enhance opportunity for this marginalized group. It has been noted in the literature (Schriner and Scotch 2001) that that the below than average educational attainment of people with disabilities may also make them more vulnerable to current trends in the labour market in particular in relation to the knowledge based economy which tend to prefer high levels of educational attainment and technical training. Equally the issue of assistive technologies, usability and human computer interaction (HCI) are significant areas worthy of research to promote and enhance technical expertise and educational attainment and ultimately labour market potential. This paper will explore these issues and identify mechanisms to tackle them at a policy level.

In spite of recent efforts to reduce unemployment amongst the disabled, labour market participation rates remain stubbornly high. In the United States for example, it is currently estimated that unemployment amongst the disabled hovers at around 70%. This is despite the fact that 67% of those with disabilities in the United States have expressed a desire to work. This begs the question that factors which impede economic participation need exploration. An equally related point is that income and earnings are chronically affected and linked by relatively low levels of labour market participation. In the past most attention has emphasized “getting back to work” rather than attempting to enhance entrepreneurial spirit and encourage those with disability to explore alternatives which may be more appropriate to their circumstances. This paper will focus on this dimension.

This research paper will seek to develop a new inclusive framework which values diversity and difference for entrepreneurs with disability and policy makers alike.

**Main Research Question(s):** This research paper will explore three questions:

1. What are the barriers to effective business development experienced by physically disabled entrepreneurs?
2. What types of business development support are required to facilitate disabled entrepreneurs?
3. How can policy development support greater diversity to encourage entrepreneurship amongst the physically disabled?

This paper will uniquely explore the issues associated with income adequacy, social inclusion and exclusion, education and training through the framework of entrepreneurship and disability. The overall aim of the paper is to promote a new issue in the entrepreneurial debate – disability and entrepreneurship. The paper will refer to research and fieldwork currently being carried out in Ireland by the authors.

## **Abstract**

This paper seeks to highlight and discuss three related issues pertaining to European and Irish economic development policy and the impact on female entrepreneurs. The paper consists of three strands of related argument. The first strand of the argument seeks to critically evaluate the impact of European and Irish economic policy on female entrepreneurs. The central theme of this discussion is that both sets of policies, which are interrelated, impact negatively on female entrepreneurs based on the economic policy aspiration of becoming the most competitive and dynamic knowledge-based economy in the world within a decade. The stated aspiration of *moving up the value chain* involves the development of more technologically orientated industries with women minority stakeholders, clearly marginalising the participation of female entrepreneurs.

The second strand argues that the EU Directive on services in the Internal Market provides new opportunities for female entrepreneurs in Europe, with its emphasis on the provision and delivery of services across borders within Europe.

The third strand scopes the opportunities created by the EU Directive and argues these may produce a new business species in Europe – the *eurofemmepreneur*. This paper will define the *eurofemmepreneur* and draws on recent Irish and European research to develop *eurofemmepreneur* profile. The main conclusions drawn in the paper is that the business and growth opportunities available for the new *eurofemmepreneur* are significant.

## **Introduction**

This paper is based on three inter-related lines of argument, which explore the rationale for developing a business case for the promotion of the European Union's Draft Directive on Services with the potential of providing new opportunities for female entrepreneurs in Europe. The first section the paper argues that the Lisbon strategy which is the driver of current European Union economic policy, with its emphasis on the knowledge-based economy, risks marginalizing a significant group of entrepreneurs, e.g. females. The E.U. economic policy objective of 'becoming the most competitive and dynamic knowledge based economy in the world within a decade' is very ambitious with the implicit assumption that all E.U. economic participants will be in a position to participate and share in the achievement of this objective. The '*one size fits all*' approach risks marginalizing some groups. This paper argues that a significant proportion of female entrepreneurs operating in the E.U. risk becoming one such marginalized group.

A second line of argument explored in this paper is the benefits accruing from the introduction of the E.U. Draft Directive on Services as a vehicle for the promotion female entrepreneurs in Europe. This paper argues the Draft Directive provides the potential for creating new opportunities for female entrepreneurs in the E.U. and, when fully operational, could reverse the marginalization effects of the Lisbon strategy.

A third issue addressed in this paper introduces, for the first time, the concept of the *eurofempreneur* and argues that the draft Directive on Services will create new business opportunities for female entrepreneurs in Europe, through the removal of trade barriers and the simplification of business regulations. This paper predicts that the female entrepreneur profile will greatly improve with the delivery of services elevated to become the '*new ICT*' of Europe. The introduction of the 'eurofempreneur' as the child of the Directive on Services – or perhaps more accurately *the precarious toddler* - brings a new dimension to the European entrepreneurial narratives. International and European literature on entrepreneurship has placed female entrepreneurs firmly within the service sector, where low turnover, low profit margins and limited growth opportunities are the norm. This paper argues that the female entrepreneur profile will improve significantly

following the introduction of Service Directive. The birth of the *Eurofempreneur*, breathes new life and aspirations into services delivery with the prospect of high growth potential, and will contribute to Europe's economic vision of competitiveness.

### **The Lisbon Strategy**

The Lisbon Strategy (2000) is a commitment to bring about economic, social and environmental renewal in the EU. In March 2000 the European Council in Lisbon agreed a ten year plan, aiming to position Europe as *'the most competitive and dynamic knowledge-based economy in the world capable of sustaining economic growth with more and better jobs and greater social cohesion'*. The Council recognized the need for a radical transformation of the economy in order to create some 15 million new jobs by 2010. The Commission recognize the importance of entrepreneurship for the development of the European Union and it has recognized that entrepreneurship can deliver important benefits, both economically and socially. Not only is entrepreneurship a driving force for the creation of jobs, competitiveness and growth, it also contributes to personal fulfilment and the achievement of social objectives.

Evidence of the E.U's commitment to supports for women entrepreneurs is reflected in *'Challenges for Enterprise Policy in the Knowledge-Driven Economy' (2000)* which argues that "enterprise policy will aim at improving the start-up rate among women, young and unemployed, encouraging networks and customer orientation".

To further the aims of the Lisbon Charter, the EU Commission published an "Action Plan – the European Agenda for Entrepreneurship" (2003). The key priorities of the plan refer to:

- Fuelling entrepreneurial mindsets
- Encouraging more people to become entrepreneurs
- Gearing entrepreneurs for growth and competitiveness
- Improving the flow of finance
- Creating a more SME-friendly regulatory and administrative framework.

The OECD (1996) definition of the knowledge based economy refers to 'an economy in which the production, distribution and use of knowledge is the main driver of growth, wealth creation and employment across all industries – not only those industries classified as high tech or knowledge intensive'.

Reservations have been expressed regarding the knowledge based economy and its potential to create inequality, referred to by some as the digital divide. Cullen's (2001) review of a number of research and policy papers which address the issue of the digital divide, identifies specific groups of people as being especially disadvantaged in their uptake of ICTs. In particular Cullen identifies such groups as consisting of: underdeveloped areas, ethnic minorities, disabled, unemployed and women. According to Cullen such groups risk being disadvantaged with the advent of the digital divide in terms of equal participation as European citizens with regard to: access to information, access to business processes and access to on-line services. The digital divide also threatens to define a new economic order, where some groups are assigned and isolated within the lower rungs of the new economic order. This paper argues that female entrepreneurs currently operate within the lower economic groups. The Draft Directive on Services provides real and substantive opportunities to grow and expand beyond national boundaries through the provision and delivery of a variety of services across the European Union.

The Lisbon Council has highlighted the importance of services in the economy in the context of their potential for growth and employment creation. The importance of the services sector is justified by its sheer weight in the economy (around 70% of EU 15 GDP)

### **New Opportunities for Female Entrepreneurs: EU Draft Directive on Services**

In December 2000, in response to the Lisbon Summit, the Commission set out "An Internal Market Strategy for Services". The proposal for a directive on services is part of the process of economic reform launched by the Lisbon European Council, with a view to making the EU the most competitive and dynamic knowledge-based economy in the

world by 2010. The European Parliament and the Council have emphasized that the removal of legal barriers to the establishment of a genuine internal market is a matter of priority for achieving the goal set by the Lisbon Economic Strategy. The removal of internal barriers is recognized as an essential requirement for the rejuvenation and growth of the European economy.

This arrival of *eurofemmepreneur* has created a unique window of opportunity for female entrepreneurs in the services sector, and failure to respond positively may jeopardize the opportunity to escape from world of low turnover, low profit and limited growth potential. The objective of the proposed Directive on Services is to provide a legal framework that eliminates the obstacles to the freedom of establishment for service providers and the free movement of services between the Member States, giving both the providers and recipients of services the legal certainty they need in order to exercise these two fundamental freedoms enshrined in the Treaty. The proposed Directive offers significant opportunities for female entrepreneurs on two levels. In the first instance, the proposed Directive covers a wide variety of economic service activities - with some exceptions, such as financial services. Second the proposed Directive applies only to service providers established in a Member State.

A recent E.U. report (2004) identified the users of services within the EU as comprising mainly of consumers and SMEs and used the term “victims “ in referring to the lack of a genuine internal market in services. The report stresses that these groups cannot currently benefit from a wide variety of competitively priced services. They are deprived of the chance of a better quality of life which they might expect due to current restrictive barriers to the operation of a free internal market.

An underlying rationale of the Directive is that by creating the conditions and legal certainty necessary for the development of service activities between Member States, and extending the range of services available, the Directive will be of direct benefit to the recipients of services, including SMEs. Furthermore, when the Directive becomes operational in the E.U. it will guarantee better quality in the services by enabling ( at

European Community level), an increase in the efficiency of the supervision of service activities. This paper argues the new draft Directive offers unique business opportunities for entrepreneurs operating in the E.U. particularly for female entrepreneurs.

The current profile emerging from the research on female entrepreneurs locates them in the services sector, with low turnover, low profit margins, limited opportunities for growth, business networking and limited access to credit. This Draft Directive on services, offers significant business development opportunities for service sector participants to trade across national boundaries within the E.U., and provide opportunities to explore innovative strategic alliances with other EU partners. In addition, the Directive simplifies business processes within Europe, for example:

- Simplifies the administrative procedures and formalities to which service activities are subject (Sections 1 and 2 of Chapter II), particularly by means of single points of contact (Article 6), the use of electronic procedures (Article 8) and simplification of the authorisation procedures for access to and the exercise of service activities (Articles 10-13); it should be noted that the obligations to communicate information (Article 7) and to make available electronic procedures (Article 8) do not prevent Member States from maintaining other procedures and methods of communication in parallel;
- Eliminates from national legislation a number of requirements listed in the Directive that hamper access to and the exercise of service activities (Articles 14, 21, 29);
- Guarantees the free movement of services from other Member States and consequently adapt any rules that would hamper such movement (Articles 16, 20, 23 and 25);
- Evaluates the justification and proportionality of a number of requirements listed in the Directive which, where they exist in their regulations, may significantly restrict the development of service activities

### ***Enter the Eurofemmepreneur***

The new opportunities provided in the draft Directive on Services in the Internal Market have escaped the attention of European and national business women's networks. The lack of engagement with the potential gains from the Directive is disappointing. This paper argues that the proposed Directive will introduce a new genre and narrative to current entrepreneur discourse – the '*eurofemmepreneur*' defined as a female entrepreneur operating in the services sector on a trans European basis.

A wide variety of services are included in the draft Directive, most of which are mainly carried out by women. For example, included in the draft Directive are business services such as management consultancy, certification and testing; facilities management, including office maintenance and security; advertising; recruitment services, including employment agencies; and the services of commercial agents. The definition of services can be extended also to include services provided both to businesses and to consumers, such as legal or fiscal advice; real estate services such as estate agencies; construction, including the services of architects; transport; distributive trades; the organisation of trade fairs; car rental; travel agencies; and security services. Consumer services are also include, such as those in the field of tourism, including tour guides; audio-visual services; leisure services, sports centres and amusement parks; health and health care services; and household support services, such as help for the elderly. Those activities may involve services requiring the proximity of provider and recipient, services requiring travel by the recipient or the provider and services which may be provided at a distance, including via the Internet. The era of the *eurofemmepreneur* has arrived. Based on the list of potential services included under the new Directive, a new era of entrepreneurship is about to unfold for women. To fully gain from the opportunities offered by the Directive call for a proactive response from female entrepreneurs if they are to claim and inhabit the niche of the *eurofemmepreneurs*.

### **Evidence from Ireland**

Female self –employment is still predominantly located in the low-tech service sector. Of the working women in Europe, 73 per cent are employed in the service sector in part-time

and temporary employment. Marlow and Carter (2003:4) comment that even in the “new economy” sectors, initially believed to offer gender neutral opportunities for entrepreneurship, the number of firms owned by men significantly outnumber those owned by women and traditional patterns of gender representation and stereotyping would appear to persist (Wilkinson, 2001). Ireland boasts one of the fastest growth rates of women’s workplace participation in the EU over the last decade. CSO Labour market statistics for the period (March to May 2004) show that 49.4% of women participate in the labor force in Ireland.

From the Irish perspective, research conducted by the Gender Equality Unit (2003) concurs with the international findings and shows that those enterprises set up by women in Ireland tend to be in the services sector, are smaller, and their owner managers have fewer growth aspirations and are less often engaged in exports. Market saturation is a major problem for small and micro enterprises related to a lack of access to higher value markets and a lack of innovation (Dawson 1997; MacIsaac 1996). Many entrepreneurs, particularly women, are located in low value markets which tend to be crowded leading to saturated markets and little room for growth. Without innovation through new product development and access to higher value markets, the potential for success for small and micro enterprises in these sectors is low. This paper argues the Directive on Services presents Irish female entrepreneurs with the opportunity to participate and trade in a free European market for services. Not only does the draft Directive open up a vast new market in services, it also removes the barriers to trade. Doing business in the E.U. will be effortless and rewarding.

## **Conclusions**

This paper presents a broad overview of the new opportunities for female entrepreneurs through the operation of the Directive on Services, and introduces a new genre to the entrepreneur discourse – the new *eurofemmepreneur*. It should be noted, not everyone shares the vision presented in this paper regarding the positive spin offs from the Directive. There is evidence that the debate had become polarized, and ideological positions are now being formed. For example, some of the European trade unions are strongly opposed of the draft Directive on the basis that it is a direct threat to the

'European social model' without taking account of democratic rules. Some trade unions are convinced that the quality of public services will diminish if the Directive achieves its aim of removing as many regulations as possible. The European Commissioner for the Internal Market and Services, Commissioner McCreevy, responding to these concerns has assured Europeans that conditions and standards for workers will not be affected in any way and rebutted the prospect that 'social dumping' and the end to the Social Model could result from the introduction of the Directive.

To-date the European and national business women's networks have been slow to articulate a view regarding the Directive's potential for business development or otherwise. This view is awaited with interest. This paper commends the draft Directive on Services to female entrepreneurs in Europe and seeks to bring to their attention the considerable opportunities this Directive can deliver – from a business and citizenship perspective. We commend the *Eurofemmepreneur* – may she have a long, rewarding and fulfilling life.

## **Abstract**

**Social exchange theory and the visual artist:** Network theory, or social exchange theory, contends that interdependent relationships, comprised of proactive social actors, are the appropriate organizational system for the entrepreneurial process. The use of network theory has been prominent in attempts to understand entrepreneurship within small and medium enterprises (SMEs) (Granovetter 1985; Johannisson, Alexanderson, and Senneseth 1994). Social exchange theory does not claim to have the key to understanding entrepreneurship, Johannisson (1998), for example, criticizes the theoretical models used to study entrepreneurial networking for using vague definitions of key constructs. He proposes that "social" networks would be more appropriately labelled "personal" networks, a category that he further divides into "social" and "business" (Johannisson 1998).

It is widely accepted anecdotally that the arts and crafts sector (like most of the cultural sector) relies heavily on alliances, networks, and networking. Commissions are the key to an artist's survival. There is limited empirical research to-date on this phenomenon, and limited scholarly attention has been paid to social exchange theory applied to the arts and crafts sector, in particular the visual artist. The aim of this paper is to critically evaluate the validity of social exchange theory applied to the visual artist in Ireland. This paper will argue that social action theory plays a major role in business promotion for the cultural sector. This paper will further argue that social exchange, when harnessed successfully can make a major contribution to the success of artist as entrepreneur. A further aim of the paper is to encourage debate on social action theory and its application to the artist as an entrepreneur and to advance knowledge and identify issues for further research.

### **Introduction: Social exchange theory and the visual artist**

Network theory, or social exchange theory, contends that interdependent relationships, comprised of proactive social actors, are the appropriate organizational system for the entrepreneurial process. The use of network theory has been prominent in attempts to understand entrepreneurship within small and medium enterprises (SMEs) (Granovetter 1985; Johannisson, Alexanderson, and Senneseth 1994). Social exchange theory does not claim to have the key to understanding entrepreneurship, Johannisson (1998), for example, criticizes the theoretical models used to study entrepreneurial networking for using vague definitions of key constructs. He proposes that "social" networks would be more appropriately labelled "personal" networks, a category that he further divides into "social" and "business" (Johannisson 1998).

It is widely accepted anecdotally that the arts and crafts sector (like most of the cultural sector) relies heavily on alliances, networks, and networking. Commissions are the key to an artist's survival. There is limited empirical research to-date on this phenomenon, and limited scholarly attention has been paid to social exchange theory applied to the arts and crafts sector, in particular the visual artist. The aim of this paper is to critically evaluate the validity of social exchange theory applied to the visual artist in Ireland. This paper will argue that social exchange theory plays a major role in business promotion for the cultural sector. This paper will further argue that social exchange, when harnessed successfully can make a major contribution to the success of artist as entrepreneur. A further aim of the paper is to encourage debate on social exchange theory and its application to the artist as an entrepreneur and to advance knowledge and identify issues for further research.

### **Entrepreneurship and enterprise policy**

In Ireland as in other EU countries, entrepreneurship and enterprise policy are informed by EU policy. Current EU enterprise policy, referred to as the Lisbon Strategy, has set itself the goal over the next decade of becoming the most competitive and dynamic

knowledge-based economy in the world, which will be capable of developing sustainable economic growth with more and better jobs and greater social cohesion. In order to achieve this goal, entrepreneurship and innovation need to be developed by small and medium-sized enterprises (SMEs) in particular. For Ireland, the technological and creative industries sectors are predicted to play a significant part in the next phase of Ireland's economic growth. The National Development Plan (NDP) is the blueprint for Ireland's continuing economic progress and provides for the investment of EUR57 billion over seven years in infrastructure, productive investment, education and training, regional development and social inclusion. Digital content in Ireland has been identified as a new economic sector with tremendous enterprise and creative potential. This new area of economic activity has been brought about through the convergence of previously distinct areas such as traditional content, media and entertainment, software and multimedia, and electronic hardware and telecommunications. Broadly, it encompasses the creation, design, management and distribution of digital products and services and the technologies that underpin them. Worldwide, the market was estimated at over \$178 billion in 2001 (PwC, 2002).

For Ireland a key economic vision expressed in the national economic strategy is “to develop a world-class Digital Content industry based on the targeted development of a number of ‘clusters’ at the ‘intellectual property’ end of the market, namely enabling technology and high-value content and applications.” This vision promotes creativity as a key skill requirement for this new emerging sector. The future for the visual artist in Ireland looks positive, based on the findings of the PwC report (2002).

This paper seeks to investigate the extent to which visual artists will participate in Ireland's economic vision and the extent to which social exchange theory will facilitate this participation.

Art is a global business. However in comparison to other products, limited effort is invested in promoting and developing the key business skills (enterprise, technology and creativity) and business acumen of artists. In particular there is limited evidence that

artists are encouraged to define their approach to business within an entrepreneurial frame of reference. Key business skills are rarely shared with artists as part of their professional practice development. Artists rarely define themselves as entrepreneurs.

**The research question:** The main research question this paper seeks to answer is: does social exchange theory contribute to the promotion and development of an artist's work more so than the artist individual output and peer review? The paper approaches the problem in three ways: First it deconstructs and analyses the value chain operating in this sector. Through studies of different visual artists within the creative industry in Ireland, it examines and evaluates how artists initially engage and negotiate with key stakeholders – public as well as patrons (corporate and private) to purchase, consume and seek further exposure and consumption of the cultural product.

Second, in evaluating this business model, it asks to what extent practicing artists engage with their potential customers and publics and whether they see their users as customers or as citizens, and to what extent do they see themselves, in the full sense of the word, as 'an artist' or as an entrepreneur. To what extent, if at all, is this related to the approach adopted by an artist in the promotion and sale of works of art. For the artist, what role does social exchange theory play, and what role does the entrepreneur play in identifying and exploiting a business opportunity. Finally, for the art educational policy makers: to what extent should art education and professional practice incorporate social exchange theory and entrepreneurial skills. How can an arts education syllabus be de-constructed and re-constructed to reflect social exchange theory and entrepreneurship.

### **The Business of Art and the Art of business**

The predominant approach adopted by artists in the promotion of their work and product emerging from the international literature (Bains and Robson, 200; Wilson and Stokes, 2004) suggests that social network theory is the dominant business promotion tool used by the creative sector and 'cultural entrepreneurs'. This research has attempted to investigate the extent to which practicing artists in Ireland rely on social network theory to promote and develop their business. A survey of 30 artists living and working in

Dublin, Ireland was undertaken for this purpose. The methodology consisted of both qualitative and quantitative research, based on the diverging views emerging from the current literature on methodology. A pre-coded questionnaire was used as well as in depth interviews with key informant practicing artists. The following tables provides interesting insights into the strategies used by artists in growing their business, and prompts interesting questions about the artist as entrepreneur.

**Table 1: Main source of income**

|                | Percent | Valid Percent | Cumulative Percent |
|----------------|---------|---------------|--------------------|
| Valid Business | 22.2    | 22.2          | 22.2               |
| Demonstrations | 5.6     | 5.6           | 27.8               |
| Commissions    | 50.0    | 50.0          | 77.8               |
| other          | 22.2    | 22.2          | 100.0              |
| Total          | 100.0   | 100.0         |                    |

Over half the survey respondents indicated their main source of income was generated through commissions (private and corporate). Reference to ‘business’ implies they use some form of retail outlet (gallery etc).

**Table 2: Social Networks and business.**

Respondents were invited to respond to a list of statements about networking. For each statement they were asked to indicate whether they ‘strongly agreed, ‘agreed’ ‘neither agreed nor disagreed’ ‘disagree’ or ‘strongly disagree’. The statements were developed from the international literature on key themes emerging.

*“People in my business rely on social networks to promote their business”*

|                            | Percent | Valid Percent | Cumulative Percent |
|----------------------------|---------|---------------|--------------------|
| Valid strongly agree       | 38.9    | 38.9          | 38.9               |
| agree                      | 44.4    | 44.4          | 83.3               |
| neither agree nor disagree | 16.7    | 16.7          | 100.0              |
| Total                      | 100.0   | 100.0         |                    |

Consistent with international literature in the field of cultural enterprise, survey respondents indicated they either strongly agreed or agreed (83.3%) that they rely on social networks to promote their business. The only surprising aspect of this finding is that nearly 17% did not hold a view on this matter. However, the finding supports the importance of social network theory for this group of self employed.

**Table 3: "Most of my business is generated by my own personal contacts"**

|                            | Percent | Valid Percent | Cumulative Percent |
|----------------------------|---------|---------------|--------------------|
| Valid strongly agree       | 27.8    | 27.8          | 27.8               |
| agree                      | 61.1    | 61.1          | 88.9               |
| neither agree nor disagree | 5.6     | 5.6           | 94.4               |
| disagree                   | 5.6     | 5.6           | 100.0              |
| Total                      | 100.0   | 100.0         |                    |

The above table further supports the international evidence that the creative sector, and artists in particular, are dependent on personal contacts to generate business. A similar finding was reported by Baines and Robson (2001) who reported in their survey of self employed in the media sector that usually their collaborators were with people they knew extremely well. The current study suggests that social networking is heavily relied on by artists to generate business. Baines and Robson describe this relationship as the 'colleague employers' relationships, and argue that they are the most likely to describe their selfemployment in terms of freedom and opportunity. However, they add that it is unclear how sustainable their way of working will be in the longer term, particularly in relation to the development of skills. This is an interesting point when we refer to the question raised in this paper: for the artist generating business, what role does the entrepreneur play in identifying and exploiting a business opportunity. The international literature implies this sector lacks the critical business acumen and their entrepreneurial talents have yet to be discovered.

Further evidence of their entrepreneurial ethos can be found from the following table.

**Table 4: "I rely totally on outside advice to promote and develop my business"**

|                            | Percent | Valid Percent | Cumulative Percent |
|----------------------------|---------|---------------|--------------------|
| Valid strongly agree       | 5.6     | 5.6           | 5.6                |
| agree                      | 16.7    | 16.7          | 22.2               |
| neither agree nor disagree | 16.7    | 16.7          | 38.9               |
| disagree                   | 55.6    | 55.6          | 94.4               |
| strongly disagree          | 5.6     | 5.6           | 100.0              |
| Total                      | 100.0   | 100.0         |                    |

Clearly, this group of respondents did not feel the need to consult with external agencies, e.g. enterprise support agencies to promote their business with almost a quarter of respondents expressing this view. This finding raised questions about the longer term viability of their businesses, as shared by Baines and Robson (2001) with respect how sustainable their way of working will be in the longer term, particularly in relation to the development of skills (in relation to the creative sector).

Evidence of the lack of business acumen amongst artists can be found in the following table. Clearly this finding illuminates the portrait of the artist as an entrepreneur as one who relies heavily on social networks to generate sales.

**Table 5: "I rely on my business plan rather than relying on social networks for sales"**

|                            | Percent | Valid Percent | Cumulative Percent |
|----------------------------|---------|---------------|--------------------|
| Valid agree                | 22.2    | 22.2          | 22.2               |
| neither agree nor disagree | 27.8    | 27.8          | 50.0               |
| disagree                   | 50.0    | 50.0          | 100.0              |
| Total                      | 100.0   | 100.0         |                    |

The above table shows that artist respondents indicated a preference for relying on social networks for sales rather than on a business plan, and prompts questions regarding the need for basic business skills in their professional development and training.

**Table 6: "My previous purchased work has been a great asset in generating business for me"**

|       |                            | Percent | Valid Percent | Cumulative Percent |
|-------|----------------------------|---------|---------------|--------------------|
| Valid | strongly agree             | 11.1    | 11.1          | 11.1               |
|       | agree                      | 55.6    | 55.6          | 66.7               |
|       | neither agree nor disagree | 16.7    | 16.7          | 83.3               |
|       | disagree                   | 11.1    | 11.1          | 94.4               |
|       | strongly disagree          | 5.6     | 5.6           | 100.0              |
|       | Total                      | 100.0   | 100.0         |                    |

The extent and importance in social network theory is evidenced in respondents' attitude to the importance of previous work in generating business., with almost 67% agreeing that their previous purchased work has been a great asset in generating further business.

### **Conclusions**

This paper set out to explore three questions in relation to portrait of an artist as entrepreneur: first, does social exchange theory contribute to the promotion and development of an artist' work more so than the artist individual output and peer review? Second, to what extent do they see themselves, in the full sense of the word, as 'an artist' or as an entrepreneur and third, to what extent should art education and professional practice incorporate social exchange theory and business entrepreneurial skills. From the current exploratory study, the following points emerge: first: social exchange theory is a major determinant in business development for artists. Second, in keeping with international literature findings, the current study suggests that artists do not see themselves as entrepreneurs despite the fact they use of social networks to promote obtain and promote business. They appear not to have made the link between social networking and entrepreneurship. Third, in the light of the latter finding, a strong case can be supported for the development and inclusion of appropriate business entrepreneurial modules and discourses within an artist's training. Further research is required in this area, to illuminate existing knowledge on the application of social exchange theory to the visual artist and its impact on the promotion of the artist as an entrepreneur.

## **ABSTRACT**

The emergence of an aging population in Canada and its impact on the economic growth and social policy development such as health care has been a focal point of public policy research. However, one key aspect that has been overlooked is the impact of an aging small and medium-sized enterprise (SME) sector in Canada. Given that the vast majority of Canada's business population is comprised of SMEs, there is a clear need for in-depth examination into the aging of SME owners and their preparedness for business succession. Using results from a 2004 survey of independent business owners, the paper reveals much insight into SME succession, both from the family and non-family business perspective, as well as from those SME owners who recently acquired their business through succession. There are four major research gaps in the current literature pertaining to succession planning: the motivation of business owners to plan ahead of time for succession; an analysis of the net overall impact of failed business succession in the Canadian economy; the role of government and the financial community in promoting and facilitating business succession; and lastly, there is remarkably little research on the perspective of future successors of businesses.

## INTRODUCTION

Significant research in recent years highlights the influence of Canada's aging demographic composition. The largest cohort in the population, the baby-boomers, will continue to exert influence on the economy as well as the direction of public policy. Next to health care issues, the decline in labour force participation, mainly due to retirements, is of growing concern. Governments, employers and educational institutions have studied the implications of the pending "exodus" from the labour force and the implications for public policy. Clearly, the concern of an aging population extends far beyond health care.

Despite efforts to examine the aging workforce in recent years, there is a lack of research with respect to the aging of small and medium-sized enterprise (SME) owners in Canada. Recent data suggest that most SME owners are between the ages of 45 and 70, creating considerable concern over the effects of their retirement on the economy, the survival of their businesses and the people they employ.<sup>i</sup> Minimizing uncertainties, however, can be achieved through adequate business transition planning.

Focus on SMEs is pivotal in assessing the effects of succession planning. Seventy-five per cent of all businesses in Canada employ fewer than 5 employees and almost 60 per cent of employed Canadians work in for a small or medium-sized business. Moreover, of the self-employed in Canada, 40 percent are businesses with employees.<sup>ii</sup> In addition, the SME sector contributes approximately 45 per cent of Canada's economic output and is the catalyst of innovative products and services.

Among large corporations, planning for the succession of senior officers is an integral component of their overall strategy. However, the very nature of small business and

entrepreneurship is often a constraint to adequate succession planning. Moreover, the additional dimension of operating a family business often exacerbates these obstacles.

## **THE SUCCESSION PLAN**

Succession is not a single event, but rather a process in which leadership and, eventually, ownership is transferred to the successor. The succession plan formally outlines this process. More importantly, it selects and puts in place the tools required to attain the goals and objectives of all parties involved.

The plan involves several steps that require time, often years, for it to be effective, which is why one must start planning well in advance. Moreover, the legal, tax, and financial aspects of the plan come to play at different stages of the transition and are the tools by which the business owner's goals and objectives are attained. Identifying these objectives, however, is a prerequisite to prescribing the appropriate tools.

According to Landsberg (1988), the failure to address business succession can be termed the "Succession Conspiracy". He cites four barriers to succession planning: the business founder, the family, the employees, and the business environment (see Box 1). Barriers to choosing a successor, according to a survey of business owners, include the intention to sell the business outright, the owner's children being too young, and the lack of trained candidates (see Figure 3).

### **Strategic Plan**

The strategic plan involves a long-term assessment and identification of the goals and objectives of the business owner and, in the case of a family business, the family's goals. In addition, it charts out a clear, and shared, vision for the business and may include a formal mission statement.

The process involves asking questions such as: Where do I/we want the business be in the future? Who will run the business? Should the business remain in the family? What is the role of the family in the business?

***“Developing a common vision for the future is vital to the long-term success of any plan. Otherwise there is not one plan but many plans that are probably in competition with each other – a sure recipe for failure”. (Barnett, 2000)***

Often, business owners do not have clearly defined goals and objectives. Barnett (2000) finds it effective to provide business owners with generic objectives that can be customized. Such objectives include, but are not limited to the following:

1. Provide for the family
2. Maintain the value of the business over the transition
3. Prepare for the future
4. Maintain family harmony
5. Minimize tax liability

The formal discussion and setting of goals and objectives is a prerequisite to succession planning. As will be illustrated below, a succession plan encompasses the tools to attain these goals and objectives.

The strategic plan allows the family, the business owner, and the successor(s) an opportunity to chart out the future course for the firm. Collectively setting the business goals will ensure that everyone has a clear picture within the business. The plan may consist of written policies that determine the entry and exit criteria of family members, or outsiders, into the business; or the

necessary criteria required to manage the business. A strategic plan will also assist in dealing with and avoiding conflicts regarding compensation, ownership, and management control.<sup>iii</sup>

### **Elements of a Succession Plan**

According to the European Federation of Accountants (FEE), a succession plan should contain the following ten elements:<sup>iv</sup>

1. A statement of the distribution of ownership
2. The identity of the new leader or leaders
3. How the new leaders are to be trained for their roles
4. A definition of the roles of other key members of the business during the transition
5. Mechanics for the purchase or sale of stakes in business
6. Taxation and legal considerations
7. Financial considerations
8. Retirement considerations
9. A procedure for monitoring the process and dealing with disputes and problems
10. A timetable.

In addition to the above ten elements, Upton-Bowman (1999) and Barnett (2000) recommend a formal process of finding a successor, as well as a formal financial valuation of the business.

Several steps are required in order to satisfy the above ten (or twelve in this case) elements. Listing out common steps for the average business, however, is a futile exercise. Every business has a unique structure; a unique relationship with family, suppliers, and customers; a unique history with the community; and, above all, unique goals and objectives of the current owners.

Simply put, there are too many uncommon factors involved in succession planning to formulate a common set of specific steps.

As a result, not surprisingly, the efforts of consultants, accountants, and researchers have focussed on a common framework to succession planning; emphasizing the need to discuss and formalize the goals and objectives of all stakeholders involved. Once accomplished, the common elements of a succession plan, as listed above, can be satisfied with the use of specific steps involving financial and legal tools. These steps are ultimately guided by the unique circumstances of each business as well as the established goals and objective.

### **Key to Successful Succession**

According to Morris (1996) there are three general categories of factors that play a vital role in effective business transitions (see Box 1). Assuming that the process of selecting the successor has occurred, the study cites the preparation level of the business heirs, the relationships among family and business members, and planning and control activities as the primary factors to successful business transitions.

The key finding of Morris' study is that successful heirs to businesses were reasonably well prepared, in both educational attainment and general work experience – the latter including the undertaking of various positions within the business. Moreover, successful transitions were apparent in those situations where there were shared vision and values among stakeholders involved and minimal rivalry. Finally, despite the extensive tax planning involved, the planning and control activities surrounding succession planning were informal.

## Box 1: Underlying determinants of successful transitions

### **Preparation level of heirs:**

- Formal education, training, and work experience (outside firm);
- Entry-level position
- Year(s) working within firm (and/or industry);
- Motivation to joining firm;
- Self-perception of preparation.

### **Relationships among family and business members:**

- Communication;
- Trust, commitment, and loyalty;
- Family turmoil and sibling rivalry;
- Jealousy/resentment;
- Conflict;
- Shared values and traditions.

### **Planning and control activities:**

- Succession planning;
- Tax planning;
- Use of outside board;
- Use of family business consultants/advisors;
- Creation of a family council.

Source: Morris et al. (1996)

At a higher level, however, the findings by Morris et al. (1996) demonstrate the importance of the steps preceding the actual succession plan. That is, appropriate strategic planning (family and/or business) well in advance of succession will enhance the success of any transition plan whether they are informal or not.

## **SURVEY FINDINGS**

To assess the risks and opportunities for Canada's economy, CFIB carried out an extensive survey focused on SME succession. The survey was completed by 4,311 CFIB members during the period May 1 to 26, 2004. Responses are accurate  $\pm 1.5$  percentage points, 19 times out of 20. The survey focused on several key issues including: when do owners expect to exit their business; how are they preparing for succession—if at all; and what barriers do they

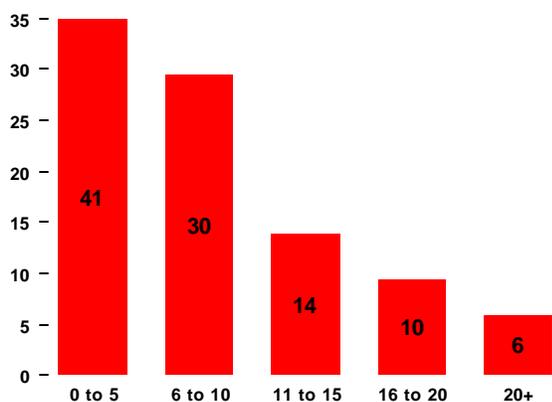

face in implementing their succession plans. To obtain another perspective unique to the CFIB survey, questions were asked of those owners who recently acquired a business through succession.

Major survey findings are as follows:

### **Business Exit Timeline**

The majority of business owners (71 per cent) plan to exit ownership or transfer control of their businesses within 10 years (Figure 1). These figures complement those found by the 1999 Deloitte and Touche study where 56 per cent of business owners expected to exit within 10 years<sup>1</sup>. Five years later the CFIB results clearly indicate that issues surrounding aging business owners have not dissipated. In fact the results justify greater concern on the issue as 41 per cent of SME owners surveyed intend to leave within the next five years.

Figure 1:  
When SME Owners Plan to Exit Business  
(% response, years)

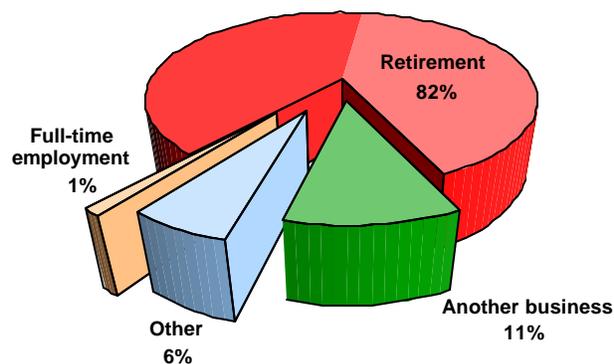

Retirement is the number one reason for business owners planning to exit their business, as indicated by 82 per cent of respondents (Figure 2). An interesting observation, however, is

---

<sup>1</sup> "Are Canadian Family Businesses an Endangered Species?", Deloitte & Touche Centre for Tax Education and Research, University of Waterloo, 1999.

that 11 per cent of respondents indicated that they plan to move to another venture. Though small, this fact is particularly important as they represent the natural “churning” of businesses whereby business resources are shifted to more productive purposes. Returning to full-time employment, for the most part, is not a consideration for small business owners. This is likely due to the characteristics of entrepreneurs—most do not want full-time work after being self-employed.

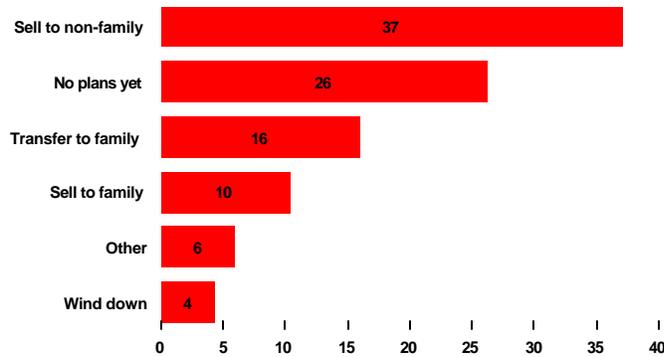

Figure 2:  
Reasons for Anticipated Exit from business  
(% response)

## Transition

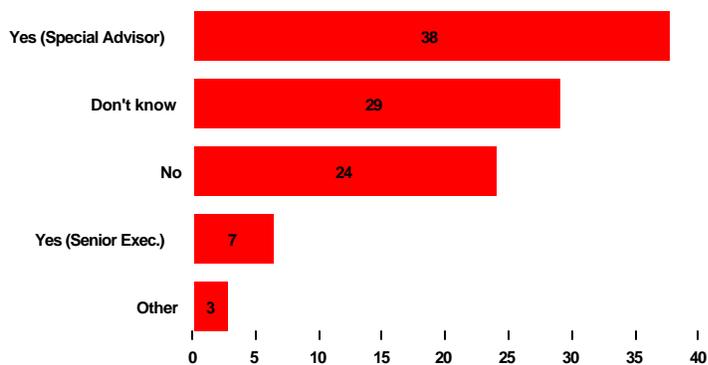

The most common method among SME owners of exiting their businesses is to sell outright to non-family members (37 per cent). This is surprising given the large presence of family businesses in the economy. One in four (26 per cent) business owners indicated that they intend to sell or transfer their businesses to a family member in the future, while a similar share do not currently have plans (Figure 3).

Figure 3:  
How SME Owners Plan to Exit Businesses  
(% response)

A significant portion of business owners intend to participate in the business after the transition of their business. This planned approach is very common among entrepreneurs, especially if preparing for succession proves to be a personal challenge for the owner. Thirty-eight per cent of owners plan to continue as special advisors (Figure 4). Seven per cent expect to remain as senior executives, while more than half (53 per cent) either don't know or plan to fully exit the business.

Figure 4:  
Planned role of Owner after Succession  
(% response)

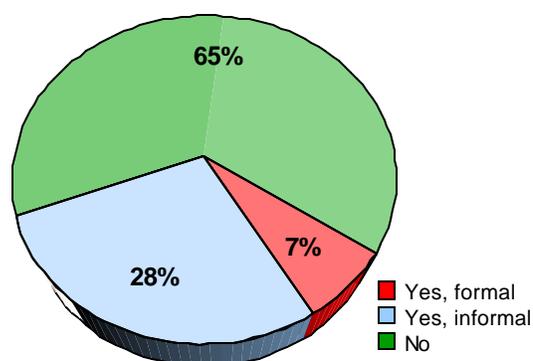

Owners of larger businesses are more likely to plan for a future role. In addition, the longer an entrepreneur is at the helm of their business the more likely they are to express a desire to have a role after succession—evidence of personal attachments between owners and their ventures. In fact, 44 per cent cited personal attachment as to why they plan to have a role after succession. The number one reason given (60 per cent), however, is to gradually reduce the business' dependence on the current owner.

### Succession Planning

Only one third (35 per cent) of SMEs have a plan to sell, transfer, or wind down their business in the future (Figure). Among these it is more likely to be an unwritten, informal plan (28 per cent) as opposed to one that is formal (7 per cent).

Figure 5:  
Existence of a Succession Plan  
(% respondents)

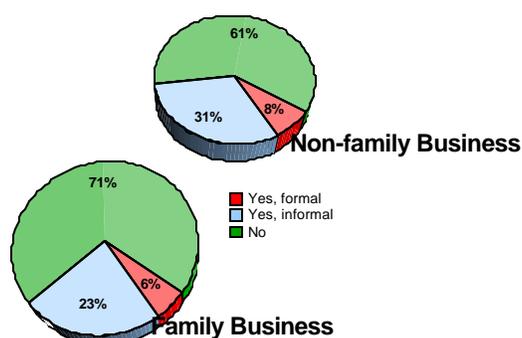

As Figure 6 illustrates, non-family businesses are slightly more likely to have a succession plan relative to family businesses (39 per cent vs. 29 per cent). However, these family

businesses are less likely to have a formal succession plan (23 per cent vs. 31 per cent). Lower formal plans in family businesses may occur as owners assume that they are “on the same page” as their successor.

Figure 6:

Existence of a Succession Plan: Family and Non-family Businesses

(% respondents)

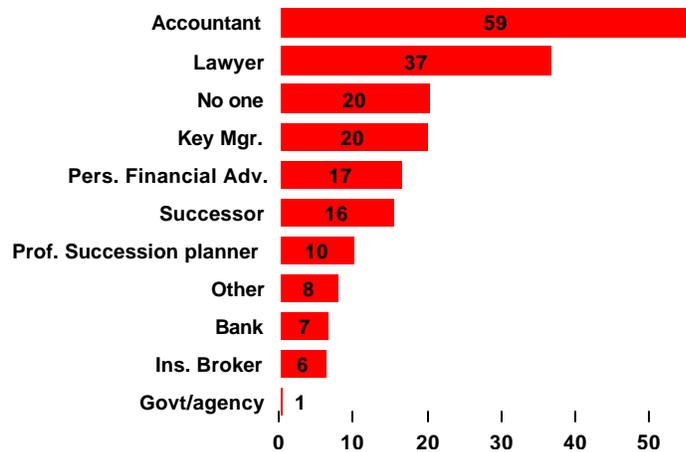

The earlier one expects to exit the business, the more likely that he or she will have a succession plan. Although this finding is intuitive, the issue is the degree at which owners are planning. Among those respondents planning to exit within 10 years, 41 per cent have a succession plan, while those planning to exit within 5 years, only 48 per cent have a succession plan.

### Succession Plan Development

The development of a succession plan often requires the input and services of various professionals such as accountants and lawyers; internal stakeholders in the business, such as key managers and employees; as well as family members and the successor(s) if already chosen.

The most common types of professional assistance used in developing a succession plan are accountants and lawyers (Figure 7). Use of other professional services is significantly lower.

Figure 7:  
Developing the Succession Plan: Who Helped?  
(% response)

Of particular concern is the fact that only 16 per cent of small business owners are seeking the input of their successors in the development of their plan. Those employing family are slightly more likely to have the input of successors (18 per cent) relative to those who don't employ family (11 per cent). Input from successors, however, is difficult if the owner has yet to choose one. Excluding owners who have not chosen a successor 28 per cent had the input of their heirs in the succession plan. Although higher than the figures presented above, the result illustrates a need for owners to develop and share their succession plans with family, key employees and their successors. Such input helps to minimize conflict among these stakeholders and to maintain stability within the business.

## **What is Being Planned?**

The most commonly cited components of a succession plan are considered to deal with “technical issues” and include: the legal transfer of business ownership, tax implications of disposing the business, the financing of the successor, and the division of future profits after the transition. However, seldom cited are “soft” issues, such as identifying long-term personal and family goals, the communication of each stakeholder’s vision for the business (employees, family, successor) and their anticipated role in the business after succession, as well as the processes foreseen for selecting and training their successor.

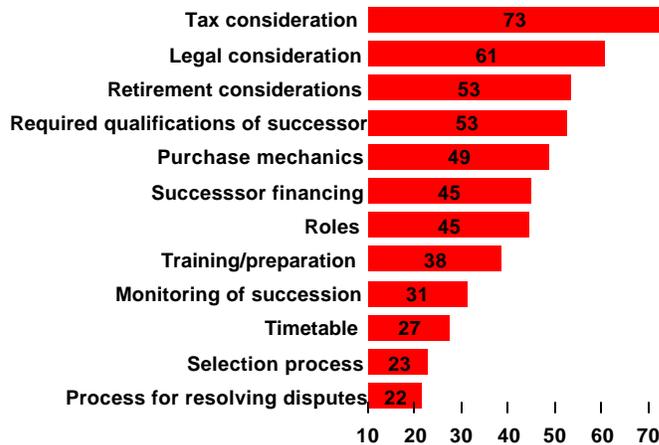

SME owners place significant emphasis on the technical components such as tax and legal considerations (73 and 61 percent respectively) when planning for succession. This is not surprising given that accountants and lawyers are the two main advisors in developing succession plans. The planning to deal with the “soft” issues lags behind (Figure 8).

Considerations for resolving disputes, for example, play a relatively minor role for most SME succession plans—only 22 per cent of respondents with a succession plan stated that such a process is in place. Moreover, only 27 per cent of succession plans state an official timeline for the transfer of ownership and/or control of the business. Finally, only 23 and 38 per cent, respectively, of succession plans incorporate processes for selecting and training successors.

Figure 8:

The Succession Plan: What's in it?

(% response)

Family businesses are less likely to incorporate a successor selection process in their succession plan than non-family (20 per cent for family businesses vs. 30 per cent for non-family). Conversely, family businesses are more likely to have the financing of their successors in their plans (48 vs. 39 per cent for non-family businesses). These findings, however, are intuitive in that many family business owners expect their heirs to take over the business. However, as indicated above, the majority of family-owned or operated businesses do not have the input of their successors in the succession plan. For a small business owner, to assume that a child, sibling, or relative wants to take over the business may be a serious risk with respect to planning succession.

### Succession Barriers

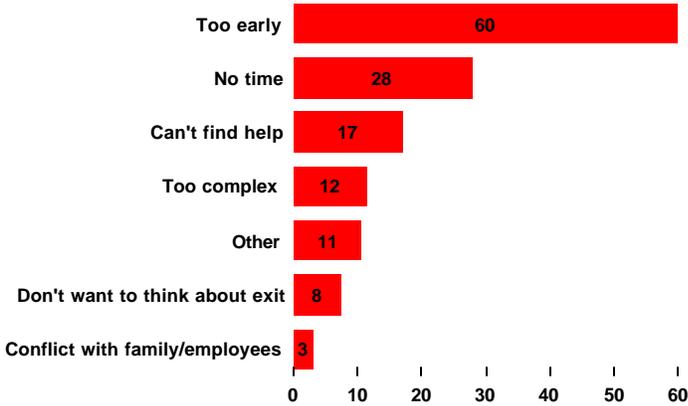

Most barriers identified by professional advisors are, as previously mentioned, commonly considered “soft” in nature. Such is the case when the owner avoids dealing with succession due to his or her strong personal sense of attachment with the business. In other instances, succession

is difficult due to conflict with family members or key employees. Technical barriers include legal, financial, and legislative restrictions to planning or executing a succession. The CFIB survey sought to identify both soft and technical barriers faced by current SMEs who are planning their succession as well as those who recently took over a business through succession. However, the single largest barrier to succession can be identified as those who do not have a succession plan altogether.

**No Succession Plan**

Among those business owners who do not have a succession plan, the majority (60 per cent) indicated that it is too early to plan (Figure 9). However, professional advisors indicate that it is never too early to start planning. The lack of adequate time to plan and execute succession is significant contributor to failed successions. The perception that succession can occur over a relatively short period of time is a significant barrier to overcome.

Figure 9:  
Why SMEs do not have Succession Plans  
(% respondents)

The lack of time on the part of small business owners (28 per cent) is another reason commonly cited for not planning. Small businesses operate in a very different environment than

their larger counterparts. Most owners are actively involved in all aspects of the business, making it difficult to dedicate significant time and attention towards planning for succession. In such cases, seeking professional advice may be the most appropriate course of action. However, 17 per cent of SME owners cite the lack of such assistance for not having a succession plan. Nonetheless, the largest barrier to successful small business succession is the perception that planning can wait.

### Barriers For Current Owners

According to current owners, the number one barrier to succession planning and execution (46 per cent) is the financing of their successors (Figure 10). Finding a suitable leader or buyer comes in a close second with 42 per cent of owners citing it as a barrier. Those businesses with at least one family member employed, however, are less likely to cite finding a successor as a barrier relative to those who do not employ family (35.1 vs. 57.9 per cent respectively). Among the “soft” issues, 39 per cent of owners indicated that the dependence of the business on their active involvement is an obstacle to succession.

Figure 10:  
Barriers to Succession: Current Owners  
(% respondents)

Although owners are often advised to seek professional assistance, 12 per cent identified the availability of cost-effective planning and professional advice as a barrier. This gap between service providers and business owners may be a primary cause to other barriers, which include the formal valuation of the business (32 per cent). The valuation of the business can also result from the dependence on the business owner's involvement, which accounts for "goodwill". Conflict among family members was ranked relatively low as a barrier and significantly differs in family and non-family businesses. Among family businesses 17 per cent of their owners cited conflict with family as a barrier; this compares to 4.3 per cent for non-family businesses.

Although the primary barriers identified by current SME owners are relate very little with the "soft" issues considerable care should be exerted in analyzing the above. As indicated, those SME owners who are planning for succession have placed relatively small importance on dealing with these "soft" issues in advance (transfer timeline, a family or successor dispute resolution process, a successor selection process, etc.). These issues easily become barriers to effective succession. As such, similar to those who do not have a succession plan, awareness is another key barrier—awareness that planning for "soft" issues is as important, if not more so than technical ones.

### **Barriers For Successors**

The most commonly identified barrier to succession, according to recent successors (44 per cent), is the financing of the purchase or transfer (Figure 11). Only 29 per cent of successors obtained business loans from any financial institution or bank; twenty-one per cent obtained personal loans from lenders (Figure 12). These figures are slightly higher from the expected sources of financing identified by current owners. Of greater contrast, however, is that half of successors actually invested their own personal equity to purchase their businesses. Nonetheless,

approximately 30 per cent still obtained financing from the previous owner and the majority, as expected, did not obtain funding from venture capital, government sponsored programs, or the Business Development Bank of Canada.

Figure 11  
 Barriers to Succession: Successors  
 (% respondents)

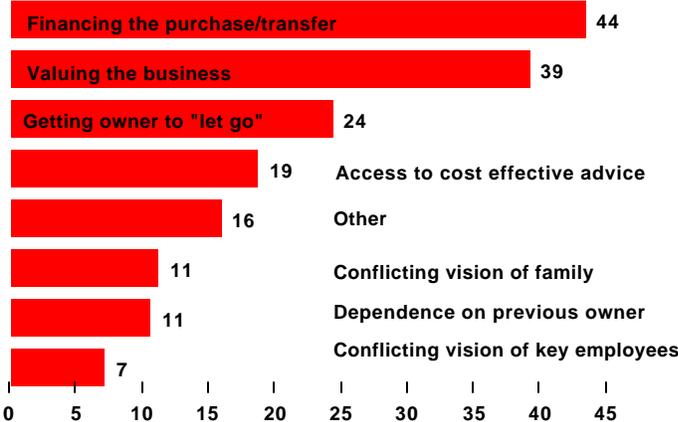

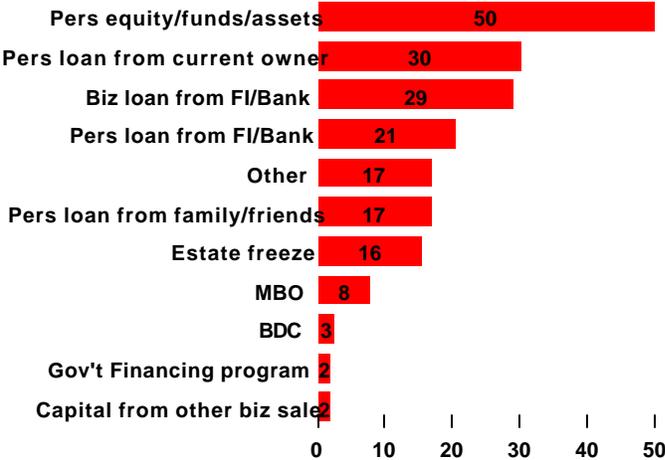

Figure 12:  
 Actual Sources of Financing for Successors  
 (% respondents)

Next to successor financing, the valuation of the business, according to successors, was a significant barrier (39 per cent). The difficulty in valuing a business is in itself a barrier to

obtaining adequate financing and in assessing future profitability. Nineteen per cent of recent SME successors indicated that this lack of professional advice was a significant barrier to their succession. Getting the previous owner to “let go” was cited by 24 per cent of successors as a barrier to their succession. Of those businesses where the previous owner remained actively involved after succession, 43 per cent, according to their successors, stayed on due to a personal sense of attachment. This barrier is the most significant “soft” issue identified by successors, relative to other issues such as family conflict.

### **RESEARCH GAPS**

There are four major research gaps in the current literature pertaining to succession planning. The first is a mapping of what motivates business owners to plan ahead of time for succession. The second is an analysis of the net overall impact of failed business succession in the Canadian economy. The third research gap is the role of government and the financial community in promoting and facilitating business succession in Canada. Lastly, there is remarkably little research on the perspective of future successors of businesses.

#### **Motivation to Planning**

As noted by many surveys, business owners in general are not planning for the succession of their businesses. There are many reasons why this may be the case: the psychological issues surrounding the thought of “letting-go”, the entrepreneurial characteristics of business owners as well as small business, or family related issues and tensions just to name a few.

Nevertheless, business owners should plan well in advance. What factors motivate them to plan, however, is a topic that has not been addressed. Flooding business owners with

succession related material, as has undoubtedly been done by professional service providers in the past, will yield little success if particular attention to the motivating factors is not addressed.

To promote effectively the issue to businesses and obtain the interest and the participation of other stakeholders, substantial research on the factors that motivate entrepreneurs to plan for succession is required.

### **Economic Impact of Failed Succession**

The economy as whole is a major stakeholder with respect to the successful transfer of businesses. Given the current demographics of business owners, a high failure rate of their businesses, post-succession, will exert great impact on employment, economic output, and business formation in the future.

Nevertheless, there exists very little research on the total economic impact of succession failure. Those who have addressed the consequences do so in a simplistic and myopic fashion. One cannot simply observe the loss of employment and business income that is lost. Rather, at the expense of using technical jargon, a general equilibrium approach is required. That is, evaluating the “net economic effect” on employment and income, as failed businesses also yield employment and business opportunities elsewhere.

The difficulty of performing such an analysis, however, is likely the cause of the research gap. Nevertheless, an attempt to measure net economic effect of failed successions will greatly promote the significance and importance of the issue.

### **Role of Governments and the Financial Community**

Given the complexities of succession planning, the large role of small businesses in the economy and the impacts of succession failure, there is a need to investigate what role

governments can play in facilitating succession planning. A significant role, not just by governments, but also by all stakeholders alike, is to promote the issue of planning in advance.

In addition, access to timely, useful information, special funding programs and tools should be explored. Whether governments are involved or not, financial institutions have a critical interest in fostering smooth business transitions. Failure of transitions may result in loan losses as well as lost business customers. Alternatively, those institutions that have traditionally distanced themselves from financing business successions may profit from better planning on the part of owners and the greater success rates of the transitions. The Baby Boomer *Owner* is currently an un-tapped market.

How governments and financial institutions can effectively promote succession planning, provide information and efficiently assist in transfer funding remains a research gap in Canada. Such research on initiatives in other countries and their effectiveness would be a good start.

### **Views of Successors and Potential Successors**

When referring to succession planning, there is a tendency to focus on the issues relevant to the business owner. However, given the structure of most business successions and the dependence of the current owner on the success of the business after succession, research on the issues faced by successors is pivotal. Nevertheless, little work has occurred in this domain apart from the study by Fiedgener (1996), who looked at the views of successors after the transition.

As noted above, a large issue faced by successors is the financing of the business acquisition. Sources of funding should be explored as well as the options available through private financial institutions.

## CONCLUSION

The message, it would seem, is relatively clear. Business owners are not planning, for the most part, for the future—and this is of no real surprise. Small businesses and entrepreneurs are unique in that their very nature serves as the ultimate barrier to succession planning. Nonetheless, succession planning must occur well in advance.

The main finding of this literature review is that the key issues related to succession planning are not the technical ones, such as tax, insurance, estate, and specific legislation. These are complicated issues that are all involved in a complete and effective succession plan. However, they are merely the tools required to achieve the goals and objectives of the business owner, his or her family, and successor(s). These goals and objectives are sorted, discussed, and shared in the steps preceding the actual succession plan. For the most part, business owners are not sharing a common vision for the business with all stakeholders. They are not sorting through the many “soft-issues” which are laid out in a complete strategic plan. As result, even those businesses with a succession plan seldom succeed because the soft issues were not addressed in advance.

Now the question remains: Where do we go from here? As expressed in the previous section there are four major research gaps. First, what factors motivate business owners to plan ahead? The key, it would seem, rests with the entrepreneurial characteristics of business owners. Second, what is the true economic impact of business succession failure? Such a study would greatly influence efforts by governments and financial institutions in addressing the issue. Third, what is the role of governments and financial institutions? Finally, what is the perspective of the successors of businesses?

**Abstract**

Business format franchising in the real estate agency sector (real estate brokerage industry) in New Zealand is a recent phenomenon. Beginning in the early 1990s, it has taken firm hold. This paper reports on an ongoing study, initially focusing on the franchisor perspective. It identifies elements for franchise growth and competitive advantage in the industry. These include market share; direct office ownership; novel notions of acculturation and parallelism and focus, as well as brand affiliation and internationalisation. These issues are discussed in the paper. The paper delineates progression through stages based on the tentative findings of New Zealand's real

estate franchises. Reporting on the internationalisation stage of growth includes mention of market penetration into emerging regional markets. Future phases of the study are detailed and new perspectives and issues signalled for future research.

## **INTRODUCTION**

In the real estate agency business (real estate brokerage industry) franchising, or more accurately, business format franchising, is becoming increasingly important. This is in line with the overall world-wide trend in the growth of franchising. Franchised businesses generate jobs for more than 18 million Americans or 8% of the private sector workforce (International Franchise Association [IFA] Report 2004). The latest franchising figures in New Zealand (NZ) indicate involvement by 5% or 40,195 of the private sector workforce (Lord, n.d). As a collaborative business alliance, franchising is an important entrepreneurial tool. It offers both a growth path for the franchisor and a small business opportunity, with apparent less risk for the franchisee (Knight, 1984, 1986; Kaufmann and Stanworth, 1995).

In NZ the advent of modern business format franchising is a relatively recent phenomenon which commenced in the early 1980s. Despite this late start, NZ now has the highest number of franchise systems per capita in the world. Franchising in the real estate agency sector in NZ is even more recent, having its beginnings in the late 1980's. Following a period of strong growth in the property market, there are now approximately 572 franchisee businesses accounting for around 29% of all real estate agency businesses.<sup>1</sup>

This paper aims to explore the reasons why franchising has been successful as a growth mechanism and source of competitive advantage for real estate organisations and to uncover some industry elements that affect its growth and operationalisation. It reports on an ongoing NZ study of the sector, with specific reference to the franchisor perspective. In examining franchisor motivations and strategies, the discussion centres on the application of extant theoretical arguments to the NZ context. Two novel notions of acculturation and parallelism are also hypothesized. These ideas are dealt with in dedicated sections of the paper to follow. The paper poses the question as to whether franchising growth follows distinct stages. Limitations of a stages approach are similarly highlighted. The paper concludes with an outline of the next phases of the study and signals new areas of interest for the future.

## **FRANCHISING IN THE NEW ZEALAND REAL ESTATE AGENCY INDUSTRY: BACKGROUND**

Real estate agency in New Zealand has traditionally been a small independent business often family owned and operated. Over the last twenty years there has been a growth of network groupings including franchising and now, in the 21<sup>st</sup> century these types of inter-organisational relationships and especially franchising are prominent in the sector. Network organisations like The Professionals Real Estate Group and First National are technically not franchises but co-operate or network under a recognised brand and build joint marketing systems. Regionally distributed offices are independently owned. If this network or ‘umbrella’ group is added to the franchise category in NZ, as is done in Australia by the Bureau of Statistics, there are effectively around 12 real estate franchise groups in NZ.

Most real estate franchises began with a single office and then developed a group of company owned units with employees as branch managers. Such a branch growth option was usually regionally concentrated. The development of franchise organisations became a further growth strategy for some of these companies. Thus for instance Barfoot and Thompson Ltd, the leading real estate agency in the Auckland region, has remained a family owned business with a branch network. This business currently retains an Auckland regional emphasis in line with family origins and the company's area of greatest brand awareness. By contrast, the Harcourts Group reached what appeared to be a critical mass of branches in its Wellington birthplace, but then chose franchising as a method of expanding its operations nationwide. Now the Group has moved beyond a purely NZ focus with the addition of franchisees and a full international corporate support structure in Australia, Indonesia and the Pacific Island region. The strategy for growth was essentially to divest the branch network by offering opportunity for suitably qualified<sup>2</sup> branch managers to convert to independently owned and operated franchises. Thus began a process of rationalisation with branch mergers and takeovers by franchisee operators, followed by new growth through a process of 'greenfielding'. The latter process involved the promotion of the brand and the franchisee concept to existing independent agencies or other group agencies. Greenfielding has become a standard mode of expansion for most franchisors and is applied in new geographic areas targeted for expansion.

## **ASPECTS OF FRANCHISING IN THE REAL ESTATE AGENCY INDUSTRY**

Franchising in the real estate agency industry can be advantageous for firms as well as consumers. Competitive advantage of real estate firms is enhanced through the franchise process of growing a large network of independently owned real estate offices in geographically diverse locations. The highly competitive nature of the industry, presents owners of small independent firms with many pressures. Real estate services are becoming increasingly specialised and delivered in differing, sophisticated modes. Advances in technology that allow industry participants to market property and company services, refer clients and instantly disseminate information via the Internet, are blurring national and international market boundaries. Up to date market information and analysis is an essential part of everyday real estate work and access to this material can present the independent real estate office owner with time consuming extra work. Lack of knowledge or ability in these areas can lead to business failure or at least only allow a business to achieve marginal profitability. In order to maintain competitive advantage and 'reinvent' themselves real estate businesses must develop a sophisticated web presence (Hamilton and Selen 2002: 2). Where there is a franchisor to drive technological advances, individual business owners will be less constrained by the need to gather the complex skills needed to adequately fulfil this challenge and more able to focus on core business competencies and profit generation.

Real estate franchise systems comprise a franchisor corporate structure that provides educational and training assistance, business development, personal development and all operational manuals, including office practice, sales and listing, management and motivational manuals.

Furthermore franchisee owners are offered assistance with sales staff recruitment and retention and corporate re locations and inter-city referral networks. Individual business owner are given access to proven business systems and ongoing service team assistance from the franchisor. The franchise group corporate events management plus active promotion of company pride and culture creates an atmosphere where teamwork and co-operation prevail. It is difficult for independent real estate businesses to compete on this level.

From the consumer perspective, buyers and sellers of property usually enter the market infrequently and face increasing complexity at transaction time. The cost of information is high and they are faced with difficulties in sourcing an appropriate property, understanding local market conditions, quantifying market value, ensuring resource compliance and structural soundness of the property, as well as negotiating a complex legal contract. In such circumstances the professional advice and assistance provided by real estate agents can be useful. Information asymmetry results in real estate agents often featuring as the 'gatekeepers' of critical market information. Additionally consumers may have difficulty evaluating the quality of information or the services offered by a multitude of different real estate agents. Given these circumstances, consumers may find the assurance of a franchise brand name particularly beneficial.

At a generalised level, theoretical support for franchising rests on two classic positions: the agency view and the resource scarcity view. The agency view suggests that franchising overcomes the need to closely monitor the work and standards of a chain of dispersed business units and that lowered monitoring costs are seen as an antecedent to franchising across industries. (see e.g. Rubin 1978). Although franchising does not totally remove the moral hazard

dilemma, it can be controlled by the franchise contract. Since franchisees invest their own capital and are residual claimants or owners of the business with the ability to profit from the reversionary sale, their business effort is better assured. The franchisor benefits as well and overall costs associated with this benefit are lower than those where corporate employees are used (Hoy & Stanworth, 2003). Jensen and Meckling (1976) point out that the moral hazard dilemma of shirking and prerequisite taking is more likely to occur amongst company owned units as managers have less to lose. In the real estate sector, however, there has been some disagreement with this view. It is claimed that franchising has a negative effect on efficiency (Anderson & Fok 1998). Although franchised real estate firms were found to be more efficient in allocating resources, non franchised firms achieved greater scale and technical efficiency. Conversely, Lewis and Anderson (1999) found that in competitive market conditions, franchised businesses are substantially more cost efficient than their independent counterparts.

The agency approach considers the possibility that the selection of non-owner managers could be sub optimal in terms of managerial talent and business acumen. Where there are problems between the parties, delays in contract renegotiation could impair profitability. Franchising serves to ease these possible problems because as the franchisee benefits from the residual profits of their businesses, they are provided with considerable incentive to work hard (Norton, 1988; Rubin, 1978). When the franchisee risks losing invested capital, he/she may be less cavalier in taking on the role in the first place, thus the quality of the management will be higher. Hold-up problems are reduced because the franchisee risks losing his/her contract for reasons of non compliance and thus risks losing a major investment. In this way franchising enables better alignment of the needs of both parties, even to the point where the co-dependent relationship has

been likened metaphorically to a symbiotic alliance (Dana et al., 2001). The profit stream anticipated by the franchisor depends on the performance of the franchisee and vice versa.

Other researchers examining agency theory have sought an answer to the effect of monitoring costs where there is wide geographical spread into unfamiliar markets (Carney & Gedajloviv, 1991) and where evaluation of local decision making presents a problem for the franchisor (Minkler, 1990). Both situations have relevance in the real estate context as systems spread domestically and then move to internationalise.

Hoy and Stanworth discuss 'post contractual opportunistic behaviour' (2003: 66). On the one hand franchisees are assumed to be subject to a risk that franchisors will not adequately promote the brand name. On the other hand, franchisors run the risk of franchisees cutting corners or letting the name down in some way. If potential franchisees perceive significant opportunism risk, it may be difficult to recruit them into the system. In real estate, franchisor risk is controlled by the quality support and training systems and franchisee risk is controlled by recruiting franchisee owners who have been acculturated. Similarly brand affiliation mitigates risk. (see later sections).

The resource scarcity view maintains franchising overcomes resource constraints to growth. These include human, financial and organisational capital. The latter may comprise management talent or trained management. Accessing resources, however, may be an antecedent to franchising. Dant et al. (1992) suggest that success of an organisation was dependent on human, intellectual, informational and financial resources but that these were hard to gather at an early

stage. Franchising therefore provides a ready and relatively quick means of obtaining these critical resources through the franchisee. Financial capital is required for a successful launch campaign and for underpinning start up costs and providing working capital. The franchise organisation also requires knowledge of specific desirable locations for the franchise businesses to be established, as well as access to available labour. Finally the franchisor needs site managers able to implement the proven business format in separate geographic locations. Well chosen franchisees fulfil these requirements by being added to the chain. In the real estate sector franchisees provide specialist, local knowledge to assist customers and enhance system effectiveness. In this way franchisee businesses are the local arm to the global brand – parallel and co-dependent businesses, as discussed later.

The resource scarcity model finds favour in some empirical evidence showing that immature franchisors (those less than 10 years old) are affected by commercial credit market conditions in establishing franchisee units (Martin and Justis 1993). Combs and Ketchen (1999) illustrate that financially strong franchise organisations were more likely to have company owned units. Thus the argument that financial resource scarcity underpins the move to franchise is contentious. Factors related to age, system size and the desire to grow rapidly found no support in the meta-analysis of Combs and Ketchen (2003). Furthermore, Hoy and Stanworth (2003) largely refute capital resources scarcity and in their emphasis on agency issues support the earlier work of Rubin (1978). The conclusion negating the lack of capital resources as an antecedent to franchising concurs with information gleaned from the real estate franchisors in this study.

Brickley and Dark (1987) broached the issue of informational resource scarcity amongst franchisors and found that where there was uncertainty about locations, there were more likely to be franchisee units established. In the real estate industry this can be seen when franchisors expanding nationally and internationally, take over outside agency groups. In this way local knowledge and locally trusted companies are added to the system. It has also been suggested that franchising enables managerial growth (Thompson, 1994; Shane, 1996). In real estate, there is a steady stream of entrepreneurial people who are ready to become managers and potential franchisees once they are professionally qualified. This is part of what we term the acculturation process as discussed later in the paper.

## **RESEARCH APPROACH**

The exploratory study reported in this paper draws on face-to-face in-depth interviews with key decision makers in six major NZ real estate franchise groups. These interviews were conducted over a period between November 2004 and early 2005, using a semi structured interview guide. The franchise organisations chosen had high value brand recognition yet had diverse origins. Three were organisations that originated in NZ, one in Australia and another in the USA. Eight people were interviewed from these six organisations, with three coming from a single organisation as it was the biggest franchise of NZ origin. This franchise is also intended to be the subject of a separate case study in the ongoing research.

The interviewees were encouraged to give their personal stories and experiences. Three of the interviewees had been with their organisations from the time the decision to follow the franchise

pathway was made and the others were also acquainted with the initial franchising or internationalisation decision process and were now in controlling managerial or ownership positions. All the interviews lasted for between 45 and 60 minutes. Each conversation was taped, transcribed and then analysed to reveal the main themes, using conversation analysis techniques (e.g. ten Have, 1998; Silverman, 2001).

## **RESEARCH FINDINGS AND DISCUSSION**

Initial analysis of the data collected in the interviews revealed broad elements of franchising strategy in the real estate agency industry. These issues related to market share; ownership; acculturation; focus and parallelism and brand affiliation and internalisation. They were considered to deliver competitive advantage in the highly competitive real estate industry sector and were often aligned to various stages of growth as discussed in the following sub-sections of the paper.

### **Market Share**

Franchising was seen as a way to increase market share because it enabled the growth of a widespread network of businesses, at first nationally and then outside the national borders. Once the brand was sufficiently recognisable, the developed business format could be cloned in independently owned agencies. One franchisor organisation stressed that the move to franchise was a natural development resulting from ownership changes in early years. The intention was to develop into a large single brand company different from any existing real estate operation in NZ at the time. Franchising allowed company managers to take ownership and develop their own

entrepreneurial ventures under the company brand. Financial backing was strong. Loyal, capable and experienced people were in place to take over franchised offices. The initial move was made possible by leveraging established brand awareness, developed through trading since 1888.

Consequently franchisees felt confident about ownership. The pre condition to franchising was company maturity and an established track record. Later at the internationalisation growth stage, the same brand awareness enabled further system expansion. The trust developed amongst consumers, plus quality systems ensured other groups were eager to join the system.

Strong links, both business and training related, built with individual company managers proved invaluable and have become the core values of this franchisor:

*... I suppose in our case because we've had such a large company owned operation we had very strong links with our business owners and I think we had a strong training ethic and those ethics those basic values have determined the type of company we are today.*

The aim of another franchise organisation was to be the biggest real estate franchise group in the Asian Pacific region. This meant a need to focus on rapid gains in market share with franchising a means to that end:

*...other reasons for expansion and looking into Asian markets were to see where these markets cross over with Australia, NZ and Indonesia. In the property market its only feasible for an agency to achieve 25% market share...there are no business models higher than that – so we work towards market share rather than actual office numbers...*

A director expressed a belief that quality was based on market share:

*...each office has a geographical area that is monitored for market share purposes...there are benchmarks for all offices, measured in the number of salespeople to cover the area. The...system as we call it is essentially...we have the number of salespeople to cover the area, the number of sales appropriate to the market place...we ask that each franchisee has that requirement in place...*

Reaching a level of administrative efficiency enabled geographical expansion across national boundaries. It was argued that a larger market share would also provide investment security for the franchisees and enable faster system expansion. As one director explained, in NZ, for example, there is still about 40% growth capacity and towards that end, during 2004 two new real estate offices per week joined the group. On the international scene, capacity was thought to be unlimited. Two franchisors had already made inroads into Indonesia. The emerging Chinese market has also been pinpointed as presenting vast potential for franchising growth.

## **Ownership**

Franchisee ownership was linked to resource access and mitigating moral hazard. One of the franchisors placed strong emphasis on growing and developing company people who had entrepreneurial abilities. Direct office ownership was perceived as offering extra incentive to a pool of managerial talent and was an instrument for ongoing growth. As one interviewee phrased it:

*... a share of the pie (creating independently owned offices) would increase the organisation greatly.*

He expressed an individual viewpoint in support of agency theory by relating:

*I think any company owned business when you've got a large number of outlets, the outlets are never going to do as well with paid employees running them as they are when the people running them actually having a share in the business, and their name on the bank account. My great, great granddad was a butcher and he always told my dad if you want to run a successful butcher shop you need to have the owner behind the counter because otherwise a kilo mince weighs more. So you have to have the person who is responsible for paying the bills running it. And equally if you don't give the people in your business the chance to expand and have ownership of what they're doing they will leave and go somewhere that they can.*

Overall it was clear from the interview data that the directors of the franchise groups saw ownership as a pull to franchising in real estate, rather than a push response to negative issues associated with moral hazard described in past research across industries.

Contrasting motivations for franchising emerged. For some interviewees franchising was a means of empowering people and prioritising individual growth. For others, a franchised empire was seen more as a way of ensuring ongoing company and market share expansion. In the latter case, the move to franchise was clearly profit driven. Franchising was regarded as being similar to a company public offering:

*...we looked at franchising a little bit like putting the company up for public offering without actually doing that per se ... giving people a vested interest in a name for their business – like a public offering but to people who are industry based...*

Creating a lifestyle was also seen as part of the ownership advantage, along with the challenge of running a successful business and creating an asset. Monitoring issues were generally not foremost in the motives of the franchisors because established systems had been designed to ensure quality. These involved groups of business advisors, educational and motivational programmes and regular monthly audits of business activities.

### **Acculturation**

Acculturation is central to the real estate franchise industry. It involves the process of adopting and adapting - assimilation into the culture of first the industry and then that of the franchisor. Individual franchisee business owners are usually drawn from industry ranks where they have operated as independently contracted salespeople and through undertaking further education, have attained Associate status. After experiencing sales contract work, and becoming acculturated within the industry and firm, suitable, potential franchisees are ready to operate their own franchisee businesses. They might also be brought into the system by conversion methods including mergers and takeovers ranging from greenfielding to group buyouts. With greenfielding, when acculturation is complete, the system brand is fully accepted into the new locality.

The franchised form is ready made to allow real estate franchisees who are experienced in the business to make substantial contribution to the franchise system. It is this supply of franchisees produced in the real estate agency business that ensures the franchise systems benefit from an ongoing flow of new blood. As a result of acculturation, the franchisor is confident in giving

franchisees considerable leeway in business operation and the entire system stands to benefit from the development of innovative practices that may result. The franchisors have mechanisms in place, mainly in the form of targeted meetings and discussion groups, to capture any innovative developments that might increase the competitive advantage of the system.

In real estate, the franchisor constantly grows franchisees by encouraging further education and providing in house training courses. For example, one franchisor has a real estate academy which trains suitable people, who are part of the organisation, to become franchisees. A director commented:

*(We have our training academy) ... to grow people into business ownership, that is a unique feature of franchising, growing to a degree that goes on. I think you need to grow your own people because if you don't they just leave, that's why we franchise and they become part of the culture, they are part of the culture. It is a lot easier having someone who's been with (our company) for some time in a variety of roles, you know a sales role, becoming a franchisee because they already are part of the culture. They know what (our company) stands for. If you get someone coming in from another brand it can be quite hard for them sometimes.*

Another organisation had a similar future leaders group. These people either start new offices or buy existing franchises where the owner is retiring or selling. Such internal acculturation means that real estate franchise systems have a constant source of new entrepreneurs ready and waiting to enter the system as business owners. Furthermore where the franchisor offers prospects like this salespeople have a clear career path to pursue if they are interested.

A further arm of acculturation reaches into the wider real estate environment outside the organisation when the franchisors seek to acquire or merge with other real estate groups. Here existing real estate industry companies, already part of the industry culture, are 'acculturated' into the new parent franchise system. The real estate acculturation process encourages the growth of franchising as a business form by providing an assured supply of qualified franchisee owners. The franchisee selection process is an integral part of this growth. A director explained:

*We will franchise to talented people who have one or two years experience in selling, the system is strong enough to support them through the transition to management, ownership and expansion, so we are always on the lookout for talent. We just focus on the Jim Collins idea of getting the right people on the bus and the wrong people off. So we are always looking for the right people to get on our bus.*

### **Parallelism and Focus**

At the heart of franchising lies an interlinked relationship, one that fundamentally changes the character of traditional small and medium enterprise (SME) ownership. Individuals involved in interlinked business forms, are partners in an entity bigger than 'self'. The franchisee business owner is a cog in a larger machine and an integral part of an organisation built on the concept of co-dependency. There is an inherent ability to learn and develop by drawing on and adding to the skills and competencies of others. Co-dependency, however does not dilute the separate identity of each of the parallel entrepreneurial ventures. We term this characteristic parallelism.

Parallelism describes two separate business identities that exist side by side in real estate franchise groups. The franchisor business endorses the service quality of a series of independently owned, locally bound franchisees, enabling them to tap into a client base by positioning themselves in the local market more quickly than they could do single-handedly. The franchisee endorses the brand. Thus two entrepreneurial ventures exist parallel to each other, operating in a co-dependent manner. For example a visible expression of this parallelism might be the retention of a franchisees original name but with the franchisor brand name added to it. Another illustration is with the international operations of real estate franchise groups where two brands are recognisable. Franchised businesses are able 'to draw on the strength of a globally recognised brand name, but are also faced with the challenge of managing two brands: the embraced global brand and the local one' (Yakhlef and Maubourguet, 2004: 193). Real estate franchises allow parallel business venturing, where the sum of the whole is greater than the parts.

'Focus' refers to the fact that the franchise relationship gives each party – franchisor and franchisee - the opportunity to concentrate on core individual competencies, thus each becomes expert in a separate set of skills. There is a clear belief held by all interviewees that the system success and growth is based on a need to divide responsibilities. The franchisors in the sample are focused on creating strong, value added franchise business systems and establishing the trade mark. They are in the business of franchising, not real estate. Both regard the quality of the system as paramount for growth because only a system of exceptional quality, that can deliver tangible advantage to franchisees in the form of a strong brand and proven business system, will attract outside agencies and new franchisee owners (Litz and Stewart, 1998). The franchisor shares computer systems, added products like insurance and mortgage facilities, and large

databases with the franchisees. The franchisees seek to manage their business risk by aligning with a strong named service, leaving them able to focus on increasing the turnover of their businesses through dealings in a range of property services. One director felt that to have company owned and franchise businesses in the same group would create competition that would be unfair:

*... that company owned offices could be seen as unfair and we are not competing with our business owners – we are not in the real estate business, rather in the business of franchising.*

Although division of responsibilities is a feature of franchising in general, the degree of separation in the real estate industry is particularly defined. Furthermore real estate franchisors rarely have any company owned franchise offices, for any length of time. The ability to focus on core activities is fundamental to real estate franchise systems because focus builds performance; assures quality; builds business assets; builds brand; ensures renewal through attracting others to join the group and enables inter firm learning to occur. Real estate companies can therefore achieve competitive advantage through creating a situation that allows for the parallel growth of businesses:

*We just keep working on the system that will develop our people and to do that we have to give them the best tools to do the job. So it just all goes round and round and round.*

### **Stages of Growth?**

Franchising strategies might be viewed within a stages of growth framework. We however, signal the caveat that application of a stages of growth theory can be considered too deterministic

and that an imperatives viewpoint may be more appropriate (Miller 1987). Miller's argument that an organisation's growth is determined by four basic imperatives found some resonance in our study. Thus the need to adapt to a changing environment has a powerful influence on strategy. We would argue that since the real estate industry is characterised by intense competition and uncertainty, small firms are particularly susceptible to the environmental imperative. Belonging to a franchise group can build critical mass, resources and stability. The environment imperative is a key influence during the early growth phase according to Miller (1987). In later growth and maturity stages, structural imperatives become important. Leadership and strategy are also important influences depending on the life cycle of an organisation.

While stressing that a standard sequencing of stages is not a prerequisite and stage skipping is a possibility, a stages approach does have validity when coupled with the imperatives perspective. Franchise systems in our study reach a pre condition to franchising stage where the franchisor expanded within a defined geographic region through several company owned offices to reach a point when it was believed franchising was the preferred strategy for continued growth. A transition stage follows when the company divests its offices to franchisee owners. The next stage involves further domestic market penetration through a process of acculturation. This involves bringing other real estate firms into the group as well as training future franchise business owners identified from within the company ranks. Finally the internationalisation stage is reached. For NZ companies, the move to internationalise meant establishing a corporate presence outside NZ, in the first instance in Australia – akin to Australian companies making their first move to New Zealand, and then replicating the business format in more diverse cultural settings such as Indonesia and China.

Oxenfeldt and Kelly (1968/69) argue that the value of franchising to franchisors is dynamic and changes over time. They consider franchising most advantageous in the early growth stages when the demand to achieve economies of scale requires rapid expansion, and progresses to being useful at later stages for the purpose of exploiting marginal locations. After a critical mass was achieved the firm's focus would shift to maximisation of each unit's profitability. The parent firm would then move to purchase the franchisee company so that ultimately a mature franchise system would return to a majority of company owned units. There is, however, no evidence of this reversionary process in the sample studied.

There is evidence that real estate firms in NZ see franchising as a means of expansion outside the original geographic area and then eventually outside the domestic market. Nevertheless, where geographic spread is contained and family value retention important, as is the case with Auckland's major real estate group, Barfoot and Thompson, company owned units currently remain the preferred organisational form.

Internationalisation and brand affiliation as a mode of internationalisation is another facet of franchise operations. Our interviewees indicated that international expansion had already taken place or was firmly on the agenda for the future. In all cases this internationalisation process was conceived as a mature stage growth strategy. Nevertheless, although internationalisation is more likely to occur once there is consolidation and growth in the domestic market, the stage of business growth when internationalisation occurs is not universal. Brand affiliation means that the offerings of a local business take on the global features associated with the global brand. The

global brand in effect vouches for the locally bound business, thereby providing it with recognition and reach (Yakhlef and Maubourguet, 2004). So it is in the interests of both parties to work efficiently and thereby to minimise risk.

## **CONCLUSION AND FUTURE RESEARCH**

This paper presents exploratory research on franchising from the perspective of franchisors in the NZ real estate agency sector. It is the first lens of focus on franchising in a specific industry context. Past research in franchising has been across industry sectors and largely quantitative in nature. In the current phase of the study, several elements emerged as important strands in the discussion. Of particular interest are new notions of acculturation and parallelism.

An overall objective of the ongoing study is to obtain and interpret fine-grained information in order to mitigate the research gap on franchising in the sector. Future phases of the study will include the franchisee perspective, an exploration of the creation of mini-chains within franchise groups and the internationalisation experience. The notion of psychic distance could be examined in relation to this experience. In depth, individual case studies of the organisations, archival documents, intranet material and observation will also supplement the semi-structured interviews material in the initial phase.

New issues are earmarked as areas for fruitful future research. These include issues of reputation, for example the individual agent's reputational career versus the firm's reputation. The interface between perceptions and beliefs of real estate market participants and the value of

a good name of the franchisor is another connected future research area. These issues are yet to be explored in the real estate agency sector. Likewise, departures from standard agency modes, especially involving brokerage fees and sales person remuneration also pose future research challenges.

## ENDNOTES

1. Statistics gathered from The Real Estate Institute of New Zealand [Inc], *List of Licensed Real Estate Agents*, August, 2004. These totals represent all agency businesses that are currently trading under a franchise group name and are on the Institute's records.
2. Directors or franchisee owners of real estate businesses are required to be associate members of the Real Estate Institute of New Zealand (A.R.E.I.N.Z.). In Australia people who attain the required education level set down in state legislature can become principal officers and owners of a real estate business.

## ABSTRACT

This paper provides an ethnographic account of the conflict of taking credit between the groups of Venture Growth<sup>1</sup>, Inc. (VGI - incubator) staff and entrepreneurs, where VGI seeks to increase its power through community recognition and control of resources and entrepreneurs try to run their companies independently but rely on VGI for space, counseling, contacts and services. Charles Perrow's (1986) concept of goal displacement and Alvin W. Gouldner's (1960) concept of reciprocity are combined to understand the conflicting, yet symbiotic relationship between the two groups. Exchanges between VGI staff and entrepreneurs are governed by the norm of reciprocity. These exchanges promote a number of subgoals that are different from the official goals of the VGI incubator.

## INTRODUCTION

The nurturing of entrepreneurs by an incubator is a complex process that involves a conflicting interaction of individuals with different motivations. The incubation process seeks to increase chances of new venture survival by maintaining favorable controlled conditions. This paper explores a specific case of one incubator's relationship with its entrepreneurs. VGI was established as a facility that offers a broad range of services to emerging companies and has a clearly identifiable organizational structure. VGI mainly relies on governmental grants and private donations for its existence and therefore must write frequent and extensive reports to maintain its financing. This organization is an established structure with roles, habits and routines, whereas entrepreneurs embody the destruction of previously existing structures. The conflict that arises from these disparate structures is maintained at a sustainable level by a form of integration called reciprocity. The relationship between the incubator and its entrepreneurs is maintained since each receives something in exchange for their participation in the arrangement. Based on these exchanged benefits, reciprocity replaces authority as a governing mechanism in the organization. The entrepreneur companies receive low cost space and services, while VGI receives increased visibility (e.g., the best incubator award), increased access to resources and consequently increased power.

## CONCEPTUAL FRAMEWORK

### Reciprocity

Gouldner (1960) defined reciprocity as “a generalized moral norm, which defines certain actions and obligations as repayments for benefits received” (p. 171). Gouldner argued that we owe other people because of what they have previously done for us and that reciprocity processes “mobilize egoistic motivations and channel them into the maintenance of the social system” (p. 173). Gouldner also indicated the disruptive potentialities of power differences. Given significant power differences, egoistic motivations may seek to get benefits without returning them. The norm of reciprocity, however, generates motives for returning benefits even when power differences might invite exploitation, because “emergence of exploitative relations would undermine the social system and the very power arrangements which had made exploitation possible” (Gouldner, 1960, p. 174). The problem with this and other conceptualizations of reciprocity is that they assume cooperative behavior and solidarity among actors. I argue that these reciprocal relationships are rather characterized by the conflict and instability, because obligations for repayment of benefits received mobilize egoistic motivations.

### Goal Displacement

The conflict between the individual and system was explored by Argyris (1957). To the extent that the requirements of the individual and of the formal organization are not congruent, the individual will tend to feel frustration, conflict and feelings of failure. There are instances in the organizational life, however, where individuals are able to further their personal interest using formal organization. Perrow (1961, 1986) conceptualized this phenomenon as goal displacement and challenged a number of assumptions about goals in organizations in previous theoretical approaches. One assumption was that organizations are oriented toward a specific goal. Perrow (1986) argued for multiplicity of conflicting goals that force firms to develop organizational mechanisms to deal with conflict.

## LITERATURE REVIEW

Since their initial development, there has been great interest in both concepts and a number of further conceptualizations and applications have been developed. Attewell and Gerstein (1979) explained the failures of government policy on methadone treatment for heroin addiction by applying a concept of goal displacement to understand the practices of local agencies, which were administering the directives of federal agencies. The dependence on the external financing shifted the focus of methadone clinics from therapeutic aims and toward an increasing concern with the self-presentation in order to look good to funding and regulatory agencies.

Yan (1996) examined the norm of reciprocity in the system of gift exchange in a north China village. Yan observed several incidents of conflict in gift exchange behavior, but he explained them as cases of ‘breaking the rules’ (p. 214). Von Reden (1998) defined reciprocity as “a local concept of order, peace, and social cohesion”. She argued that the confrontation of reciprocity and commodity exchange in Menander’s plays was “a metaphorical confrontation of order and disorder, civic community and its corrosion” (p. 255). While reciprocity is characterized by the

indeterminacy of both timing and value of the return, making it an element of social cohesion, the commodity exchange sets an end to this indeterminacy.

## **RESEARCH METHODOLOGY**

Over the period of five months I used structured and unstructured in-depth interviews as well as observation to collect data for the ethnographic study of the local incubator. At certain points I was also a participant observer: I had to evaluate business plans and discuss them with VGI staff. There were two very distinctive groups of actors in the field site: VGI staff and entrepreneurs of tenant companies.

Venture Growth Inc. was established in 1983 as one of the programs for turnaround of the economically troubled Midwestern city. In the beginning it only had two employees and was operating as an 'incubator without walls', providing a number of activities of classical incubator. Today, it performs several activities, which can be grouped into four categories: technology transfer, building public awareness, entrepreneurial education and client assistance; and it is now affiliated with a local university.

## **INTERPRETATION**

### **Control of Resources and Information**

In the previous section I have given a short description of VGI, whereas in this and the following sections I will try to interpret the nature of the relationship between VGI and entrepreneurs of tenant companies. An incubator is an organization, where traditional governance mechanisms may apply only to a limited extent. Even though VGI assumes the controlling position in the incubator, it has to deal with a number of organizations, whose primary motivation is independence. VGI is able to maintain a managing role in the incubator primarily through control of financial resources. It has access to those who make donations and has control over the systems for fund raising. Through financial control, they are able to impose the rules on the entrepreneurs; rules like entrance criteria, rules of conduct, the tenancy, and graduation terms.

VGI itself, on the other hand, is quite independent and without constraints from inside or outside of the organization. The president of VGI reports to the board of trustees, which is active primarily through its Incubator Committee. This committee meets on a quarterly basis to discuss strategic questions of incubator's operations. VGI makes an effort to diminish the role of the board of trustees. Caricatures of board members on the way to VGI offices are grotesque representations of individual's distinctive features with intent to ridicule the authority that they symbolize. Increasingly, VGI has been able to find alternative funding sources beyond the range of the current board thus reducing board's power. Additionally, VGI seems to be efficient in controlling the information flows among the actors in the organization. Due to their limited role in the incubator, members of the board rely on VGI's quarterly reports for the information about tenant companies. Under such conditions "trustees are likely to find that their legal power becomes nominal" (Perrow, 1961, p. 858).

External control from state or federal departments is at best unthorough. VGI reports about its incubator activities to State Department of Development (SDOD) through quarterly status reports. Copies of the report summary are also sent to the State Committee, which supervises operations of similar incubators statewide, and to governor's advisor for technology. These institutions do not have standards by which they could evaluate work of different incubators. As one of the VGI directors described: "*SDOD does not differentiate among incubators and it doesn't matter if incubator xyz did much better than incubator abc, funding would still be the same*".

Thus there is sufficient means for power by VGI and sufficient interest in power. Entrepreneurs, on the other hand, can undermine this power by simply choosing not to enter or remain in the incubator. One of the entrepreneurs in Biotechnology Incubator claimed that "*the only thing that VGI is helpful for them is space, which is somewhat oriented to more technical companies*", however "*it is not hard to find space somewhere else*".

### **Making Favors**

The precariousness of the relationship between VGI and entrepreneurs raises the question about the forces, which ensure minimum of consensus among these two groups. As discussed earlier, the three forms of integration are reciprocity, exchange and redistribution. To a certain extent the relationship between VGI and tenant companies can be seen as exchange relationship, since VGI sells some of the services and rents the space to entrepreneurs. However, most of the services for incubator companies are free or subsidized. For example, business consulting services and the majority of office services are free of charge. Rent is 25 percent below the comparable market prices for the same area. These privileges are attractive enough for entrepreneurs to seek admission to the incubator.

The process of initiation of entrepreneurs into the organization sets the basis for reciprocal relationship between VGI staff and entrepreneurs. Although entrance criteria, like high-technology/biotechnology orientation, high growth potential, and incorporation in State, are predetermined, there is still a great deal of arbitrariness in this process. It is at VGI's discretion, which companies will it allow to enter the incubator (usually one out of ten companies that apply). Sometimes these companies are admitted even if they do not match the entrance criteria. Melanie, a corporate history writer, admits that "*her connections with the University helped her to get into the VGI even though her business is not high-tech or biotech*". Additionally, VGI allows some companies to make modifications to facility. For example, Stanheath Inc. was able to break the wall to get a connection between their offices. Special cases aside, cheap rental space and free services are benefits for which many companies are grateful and feel that they are "*very lucky to be in*".

The norm of reciprocity generates motives for returning benefits over time and, according to Gouldner, maintains the social system through egoistic motivations. Entrepreneurs return favors in various ways. They frequently act as guest speakers at VGI's seminars and courses. More importantly, entrepreneurs willingly (and sometimes unwillingly) participate in promotional activities organized by VGI, which are intended to advertise young companies, but also to justify and recognize VGI's role in the 'incubation' process. There are several ways in which VGI

promotes itself and tenant companies. The quarterly Magazine features incubator success stories with a broad reach among local business community. VGI organizes and places its name on the awards endorsing regional fastest growing firms. In its quarterly report to SDOD and State's governor, VGI provides significant tenant news (mostly success stories). It also includes news about the companies that have graduated from incubator years ago. Through these and other activities VGI builds its own reputation on the achievements of other companies regardless of its contribution to the success of these companies. Entrepreneurs receive low cost space and services, while VGI receives increased visibility, increased access to resources and consequently increased power.

A characteristic not previously observed or discussed by the theorists of reciprocity in multi-group arrangements is that each group will observe and evaluate relationships among all other groups in the social system. This is even truer when these entities are supposed to have qualitatively similar reciprocal relationship with another entity. VGI claims that it will provide support to all tenant companies, but several entrepreneurs complained that they didn't receive the assistance that other companies did because "*there is nothing to brag about*" their companies or because their "*business is not exactly in line with VGI's preferences*". Although this observation does not oppose the quid pro quo nature of the relations in the incubator, it counters Gouldner's assumption of system stabilizing function of time period and comparative indeterminacy under the norm of reciprocity. Instead, as I will discuss in the following section, reciprocal relationships are characterized by the conflict and instability.

## **Conflict**

Gouldner argued that the norm of reciprocity mobilizes egoistic motivations, and channels them into the maintenance of the social system. However, I believe that these egoistic motivations focus on the fairness of the reciprocal exchange and whenever there are perceived inequalities, there is a potential for tension and conflict. The conflict between VGI and entrepreneurs is latent, but still quite easily observable. There were only a few open confrontations that subjects in my study referenced to or I was able to observe, but especially entrepreneurs were very eager to point out the deficiencies in the incubator. One source of conflict is that incubator companies do not get as much from VGI as they expect or as much as they are led to believe when they enter the incubator. Specifically, entrepreneurs complained about a lack of quality advice, a lack of networking, and a lack of financial sources from VGI. Several accounts from entrepreneurs make the point:

*"People (VGI) are nice but they do not take time to breathe with the new entrepreneur, to really know our problems and help us with them. Lack of business advice can be explained by the lack of hands-on experience. There are some people in VGI that were closely involved with small businesses but majority has worked for non-profits."* (Ruben, an entrepreneur)

*"Eight months ago I could have applied for an SBA loan, but I didn't know about it. So I was late. I lack the time to search for such information but the problem is that I can not get such information from VGI."* (Joe, tenant)

*"VGI organized this short seminar on financing. On that seminar they told me that it is very hard to get money from banks or angels, so my first source of financing should be my*

*rich relatives. I drove downtown to listen to somebody telling me that I should borrow money from my aunt or grandpa.” (Harry, former tenant)*

Another, more profound, conflict is the one of taking credit for the success of young companies. Entrepreneurs believe that they are solely responsible for the progress of their companies. They try to maintain their independence and hide details about their operations. Entrepreneurs fear the disclosure of sensitive data because of their vulnerability to competitor’s attacks. VGI, on the other hand, relies on governmental grants and private donations for its existence and therefore must write frequent and extensive reports to maintain this financing. For this reason VGI collects detailed data about the development and growth of incubator companies. The mandatory reporting of information by tenant companies is included as a stipulation in the Memo of Understanding. The information is then used for various promotional activities and publications in which VGI praises its own role in the incubation process. Comments from entrepreneurs are a good indication of this situation:

*“VGI likes to collect information for their newsletter and different reports. We provide them as little as possible. They want to know a little too much, so that they can claim credit for what our company does. I don’t really like this because it seems that VGI wants to feel that they have in a significant way contributed to the success of our company. They think of us, the companies, as being their children.” (Dave, an entrepreneur)*

*“If you succeed it is OK, if you fail so be it. They (VGI) should be more active: if you fail, we fail also.” (Mukul, a tenant)*

Another controversial issue in the incubator is the long-term success fee. It is designed to bring additional revenues to the incubator, but its introduction and implementation are frequently being disputed. The fee is initially mentioned in the Memorandum of Understanding, which is to be signed by an entrepreneur upon moving in the incubator. Memo only specifies a time period in which a long-term success fee agreement should be negotiated. A closer look at the fee formula shows that a company leaving the incubator would have to pay for the most, if not all, of the difference between the market and incubator rent, and for supposedly free services of consulting, conference rooms, and furniture for the whole ‘incubation’ period. VGI effectively changes ex post the nature of its relationship with entrepreneurs from reciprocal to exchange. The fact that companies have to negotiate to which extent the services and rent will be free of charge increases the visibility of VGI’s ‘favor’. Entrepreneurs view that these benefits are comparatively much smaller than what they give to VGI and therefore are very eager to voice their dissatisfaction with the incubator personnel and services.

VGI downplays the conflict. By the words of Linda, one of the incubator’s directors, VGI is a “benevolent landlord” and that “tenants also have to show some effort”. Clark, a project manager in VGI, described the relationship:

*“The prevailing philosophy in VGI is that companies (tenants) should come and ask VGI personnel for help. This is supposed to help them become independent. Some companies come and ask for help and others don’t. I don’t know if this approach is good. I am not sure if tenants know what are all the services that VGI offers.”*

This stands in a stark contrast to claims in the Annual Report and other publications where VGI is presented as a major contributor to the success of incubator companies. Conflict is maintained

at the sustainable level, because of the stipulation that companies have to leave the incubator in 24-48 months. Even though this may be an appropriate 'incubation' period, it also has a rather subtle function: it gives VGI the power to dismiss any of the companies that would complain too much and on the other hand, to regard any extension of tenancy as a reward to the companies that comply. The built-in high turnover of tenant companies prevents the conflict from growing out of proportion and helps VGI to maintain its role in the incubator.

The situation in the incubator is quite different from Gouldner's theoretical expectations about the norm of reciprocity and the disruptive potentialities of power differences. Gouldner claimed that the norm of reciprocity would keep off exploitative relations, because they would undermine the very social system that enabled them. VGI, however, uses its power not only to get benefits without returning them, but also to take back some of the favors it has supposedly given in the first place. By the institution of the limited tenancy, VGI is able to keep the conflict at the sustainable level.

Entrepreneurs react either by actively seeking benefits from VGI or by avoiding any contacts with VGI whatsoever. One example is the idea of an 'open space' incubator, where VGI tries to blur the boundaries between VGI office space and offices of tenant companies. Some entrepreneurs play along, while others introduce extreme security procedures. On one occasion when I helped a VGI employee deliver memos about a publicity event to tenant companies, I was able to observe that many of the companies had their doors open and were generally very welcoming. This was not the case with one of the tenant companies. Obeying the specific request of the president of the company, we had to knock on the closed door and wait until we were admitted into their offices. Several other companies were also reluctant to participate in the event that would praise VGI's role in the economic revival of the City. The widespread reluctance among entrepreneurs to participate in VGI rituals evokes frustration among VGI staff and focuses their attention to various unofficial goals.

### **Self-interest and Community Recognition**

All formal organizations are shaped by forces that are tangential to the official goals and procedures of these organizations (Selznick, 1949). As Perrow (1986) pointed out, the group conflict revolves around the question of conflict of goals in organizations. The official goal of VGI is to "*stimulate entrepreneurial activity and the creation and growth of early stage businesses*". In the absence of social supervision and constraint, many other unofficial goals are being pursued by VGI, such as community recognition (e.g., events/awards), extracurricular activities (e.g. golfing), and fringe benefits (e.g., free education at the university).

I discussed earlier the role of frequent and extensive reports that VGI has to write. The main purpose of these reports and publicity events is to obtain governmental grants and private donations, but also to gain community recognition. As one entrepreneur describes it: "*They (VGI staff) many times have to do things to look good for their financial supporters and that are not essential for early stage companies*". A large number of people in VGI are involved in the preparation of reports and organization of publicity events. Community recognition has become one of the unofficial goals of the organization, directly feeding into the ambitions of the senior vice president for operations, technology transfer and client assistance. On several occasions, she

talked about the development of a large technology park in the City area, where VGI would have a leading role.

The president and both senior vice presidents received the awards for the Entrepreneur of the Year in the past years. Some of the entrepreneurs see this as a “*bad joke*”, since none of these people “*has ever really started a company*”. The majority of the VGI staff only worked for non-profits or large organizations. The president had a business career for 27 years with a big steel company, where “*money went into drainage*”. He is the only one featured in the previously mentioned caricatures, where he wears a golfers outfit and is preparing to strike a ball. There is also a stack of books in the picture with clearly readable titles: *The Golfers’ Guide to Business*; *BMW Reparaturleitung*; *How to Manage Women in Business Vol. I.*; *Without Them Trying to Manage You Vol. II.* President and senior V. P. for recognition events and educational programs are frequently involved in golf outings, which are officially fund raising events, but unofficially a pleasant extracurricular activity.

Senior V. P. for recognition events is one of the founders of VGI. His attitude towards entrepreneurs can be sensed through jokes and quotes that are pasted on the visitor’s table in his office. The first one is a definition of an entrepreneur from Willey’s Dictionary (a comic strip): “a person who does everything he can think to keep from getting a job”. The second one is a quote from Prof. Abraham Zaleznich (Harvard Business School): “I think if we want to understand the entrepreneur, we should look at the juvenile delinquent”. This attitude does not seem to represent the broader culture in the organization, but rather an attitude of an individual that has become disinterested in the formal activities of the organization. He has no contacts with entrepreneurs and is “*just a name*” to many of them.

One member of the board of trustees maintained that “because salaries paid are usually lower, a president should have the ability to manage people that could make more money in other positions”. Instead, VGI allocated practically all the increase in the funds available in the previous year (15 percent increase) to the increase in salaries and related expenses. Free education at the university is the most important fringe benefit that employees of the incubator receive quite frequently. Motivation of VGI staff centers on their self-interest as manifested in extracurricular activities, community recognition, material gains, and long-term gains in power.

## CONCLUSION

VGI is an organization that was established to nurture and develop small companies, but has instead become a vehicle to pursue personal goals. The displacement of goals takes place because certain activities accrue increasing internal relevance, instead of having a direct relationship with the ultimate goals of the organization. VGI’s top administrators are able to pursue their self-interest, because there is no adequate system of control in existence. The external control is limited to a general type of supervision, which concentrates on the financial constraints and the internal control, exercised through board of trustees, is done routinely and with little interest.

The relationship between VGI staff and entrepreneurs is governed by the norm of reciprocity, despite some attempts from VGI to change this relationship retroactively into exchange

relationship. Previous researchers conceptualized the norm of reciprocity as “a local concept of order and peace” (Von Reden, 1998) with “system stabilizing function” (Gouldner, 1960), where conflict is only an instance of “breaking the rules” (Yan, 1996). Alternatively, I argue that reciprocal relationships are characterized by the conflict and instability. Two attributes of reciprocity (Gouldner), time period and comparative indeterminacy, do not perform their system-stabilizing functions.

The entrepreneur companies receive low cost space and services, while VGI receives increased visibility and access to resources. The central conflict in their reciprocal relationship is the one of taking credit for the success of young companies. VGI builds its own reputation on the achievements of incubator companies, while entrepreneurs believe that they are solely responsible for the success of their companies. As a result, the two groups of actors avoid each other and center their motivation on the self-interest.

### **Introduction:**

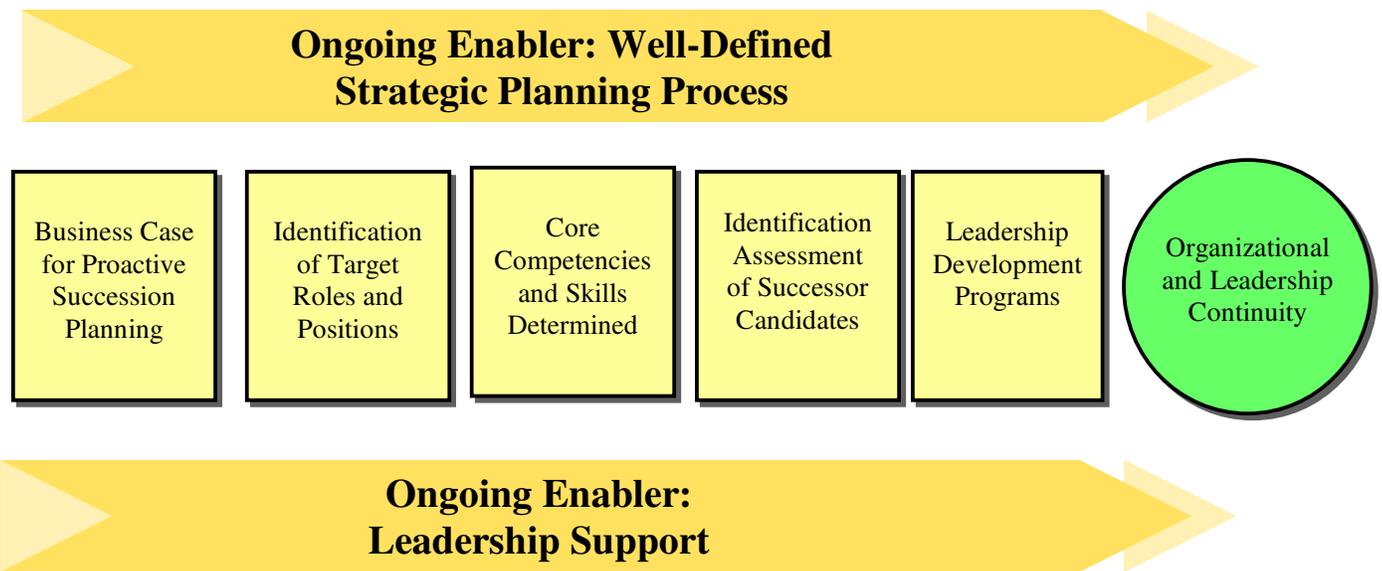

Many entrepreneurs view their business ventures as extensions of themselves, encompassing their vision and passions from both their personal and professional lives. For the most part, they welcome their children into the business based on trust and a belief that they have or will develop the same level of passion as they have. They believe the business will automatically transfer to their children when they are unable to carry on and so feel that planning this transition is not required. Perhaps it is the fear of facing that point in time when they are unable or unfit to carry on. Statistics indicate that less than half of viable small- and medium-sized businesses are able to survive past the first generation and, of these, very few are successfully passed on to the second and third generations, often due to a lack of an agreed upon strategic vision and ineffective succession planning.

There are many similarities in the way owners of large and small to medium size entrepreneurial organizations manage their companies effectively, primarily to pass them on to the next generation of family members. In fact, most of the large privately run companies were at one time, successful small businesses. By accepting and following an effective succession plan, these entrepreneurial owners will protect the company's culture and enable the implementation of a long-term business strategy that will smooth the transition phase necessary to pass control to the next generation.

The goal of this paper is to present a succession planning model that describes the key elements and challenges of an effective succession plan, focusing on the concerns of small family-run businesses. In addition, a well- defined succession plan must be supported by appropriate estate and tax planning.

## A SUCCESSION PLANNING MODEL

In the diagram below, the enclosed squares represent the five principal stages of a succession planning model. Above and below these are thick arrows showing ongoing enablers: a well-defined strategic planning process, and leadership support, which includes competitive compensation and access to high-level performance management tools and processes. The combination of these key enablers will drive organizational and leadership continuity—necessary elements of organizational success.

### Ongoing Enabler: Well-Defined Strategic Planning Process

The need for a formal strategic planning process and succession plan are integrated elements of family business success. Formalizing a mission statement is a key first step in order for the owners to clearly articulate and communicate the vision, culture and values desired throughout the organization. Many entrepreneurs will suggest that a written mission and value statement is not necessary; however, completing this task ultimately commits the entire organization, including family members, to accept and implement that vision. In the end, the strength of the strategic planning process has a direct impact on the future transition of the business to the next generation: assuming a healthy, structured, and analytical debate in the preparation of a business plan, the risk of family differences arising as to what direction the business strategy should go is either eliminated or, at worst, greatly reduced.

### **Stage One: Business Case for Proactive Succession Planning**

Stage one requires the entrepreneur to develop a business case that includes succession planning. This requires the entrepreneur to articulate the clear vision and company mission encompassing the business culture and values. The mission statement is the foundation for developing a strong strategic planning process that incorporates the development of a longer term business plan. Requiring the entrepreneur to envision where the business will be in the next five, ten, and twenty years requires decisions about organizational structure and effective leadership. In turn, this focuses creative debate around assessing the degree to which the owner's retirement and attrition issues will impact on the management of the controlling interests of the business in future, and leads, ultimately, to a decision to either carry on the business in perpetuity or to divest at a strategic time in order to obtain maximum value for the shareholders.

There are numerous considerations to take into account in developing a business case that works for each owner, but when including a succession plan, it is especially critical to fully understand the long-term impact of the following five factors:

1. Industry sector, market share, competition and barriers to growth
2. Long term business strategy for growth and required return on capital investments
3. Independent business valuation and the potential to increase brand equity over time
4. Timeframe for implementing a succession plan (relative ages of family members)
5. Commitment, ability, and leadership potential of family members

For successful organizations a formal strategic planning process is an ongoing business activity. Developing a business case is a total company effort, involving all family members and senior management who assist in identifying key roles, responsibilities and organizational structure. The business plan is reviewed annually, modified if necessary, and validated against the long term vision and values of the company's owners. The business case for succession planning differs from the ongoing planning activities in that it occurs at certain points in time when the family business has either reached a critical mass or family members become interested in working in the business and express a desire to develop their careers with the organization. These situations necessitate consideration of organizational and leadership continuity. Analysis of all aspects of the business plan strategy is necessary in order to develop a realistic business case for succession planning.

### **Stage Two: Identification of Target Roles and Positions**

The second stage of the model is aimed at identifying the critical workforce segments within the business. It is important to recognize that this should not be based on merely slotting people into specific roles or responsibilities (i.e., developing roles for current employees or family members), rather it is an assessment of the key positions required to achieve business targets at various stages of the business plan. This analysis serves to set priorities among the various key or “at risk” positions identified, as these are the positions that will support or drive growth initiatives which may or may not exist at the time of planning.

### **On-going Enabler: Role of the Board of Directors, and Other Advisors**

Developing and implementing a succession plan strategy generates a number of emotional issues in most family businesses, and the process is most effective when it is facilitated by independent counseling from a number of sources. The earlier external management expertise is introduced into the succession planning process, the more likely it will be that the plan will fit with the business vision. An independent viewpoint acts as a steering mechanism or “reality check” to ensure that the appropriate organizational structure is in place to enhance the likelihood that the business will survive through the transition phase. This independent viewpoint also reinforces the need for timely succession planning, and ensures that owners understand the significance of structured estate and tax planning.

### **Stage Three: Core Competencies and Skills**

Once key and “at risk” positions are identified in the business plan, core competencies and skill-sets for the target roles must be determined. This will provide a baseline for assessing performance that will identify gaps within the current workforce—including those in the owner and family members—and serve as a framework for recruiting the talent required to meet strategic goals and key objectives. By focusing on the broader organizational requirements of the business, it will become much clearer for the entrepreneur and family members to assess where developmental “gaps” exist and, if there is interest from family members, motivate them to gain the necessary skills and competencies required to fill those key positions.

### **On-going Enabler: Balancing Business and Personal needs within the Family Business**

A major element of the succession planning process is the identification of individual family members' outside/personal needs and activities in relation to those of the organization. In order for family members to be considered for key positions or as "successor candidates" there must be an inherent commitment to developing the necessary skills and competencies to meet future business needs. This is a complex area involving a number of interrelated issues, including trust and confidence in the ability of others to assume leadership roles, empowerment to make key decisions, delegation or resolution of conflicting duties and the ability to make ongoing personal sacrifices required in order to "learn the business."

Family members must be fully informed, involved, and have access to opportunities to best develop an effective succession strategy. They must be treated as equal employees in order to gain respect from non-family staff members; however, they have other responsibilities over and above executing the business vision: they must maintain the vision over time and changing circumstances. They must develop new and innovative ways of working together. They must transition into new and different roles in order to gain a broad business sense, and get involved in corporate policy and strategy as integral members of the board of directors or advisory team. In this way, they become acutely aware of the business needs and competencies required in the key positions.

### **Stage Four: Identification Assessment of Successor Candidates**

Stage four involves the development and implementation of a rigorous, competency-based performance-management process to identify high potential candidates within the organization. If internal candidates do not meet the set criteria, then a reliable and fair selection process for locating external qualified candidates may be necessary.

It is imperative that the family work with an outside expert during this stage in developing the business plan, as members will benefit greatly from the expertise of a communication facilitator who can control family emotions and act as a sounding board. Sharing information with all family members openly is important to ensure that they fully understand there is no "free pass" as the successor candidate, and that each must possess the necessary business and educational qualifications, just like any other applicant.

### **On-going Enabler: The Importance of a Positive Work Environment**

The culture of an organization must be well defined and consistently reinforced. It must recognize and reward employees and family members equally, train and promote from within while attracting new talent and knowledge to the organization based on an accepted business strategy. Determining whether one or any of the family members has the ability or interest to acquire the necessary skills and competencies to lead the organization is a key outcome of the succession plan. There is a strong argument that leaders are not born; rather, they develop over time by learning new skills and competencies. Family members can be given the opportunity to discover their “natural” management styles and understand the differences in their personalities and business philosophies. A family member may be identified as a potential successor candidate but may not want the responsibility, whereas another may desire to be the leader, but does not want to invest the time to develop the skills and competencies necessary in order to be effective.

### **Stage Five: Leadership Developmental Programs**

The final stage of the succession planning model consists of a review of current and required training and development practices. The objectives focus on ensuring that potential successors are receiving sufficient development opportunities on a regular basis. This training should involve a mentoring program, job development opportunities, special assignments and projects, and formal evaluations of progress, as well as independent feedback through external training.

As part of the ongoing training and development activities, the successor candidate should accept positions outside the family organization. A variety of practical, first hand experience is invaluable to the candidate who is able to develop business experiences outside the comforting environment of the family business. The identified successor can assess different cultures and values, new mentors and innovative ideas, and eventually incorporate those experiences back to the family organization.

### **Ongoing Enabler: Personal and Inter-personal Development**

In addition to in-house training, external team-building exercises and regularly scheduled “family retreats” become critical in developing a succession strategy. The knowledge gained from a retreat session can teach family members how to successfully manage the delicate relationship between family and business. The education and learning experiences should be very broad, ranging from

general management and leadership instruction, assessment of diversification opportunities and specific evaluation of business practices, to wealth management, family investment strategies and even parenting skills. Through these ongoing interactive sessions, participants understand better what their needs and desires are versus those of non-family employees and the business itself. They also have a better opportunity to identify the skills and competencies of a successor candidate and can evaluate whether that person is a qualified family member or if it would be in the best interests of the business to hire an external candidate.

### **The Desired Outcome: Organizational Continuity and Leadership Capability**

If the succession strategy suggests that control of the business should transfer to a chosen family member, this may necessitate a longer transition period before the leadership role is actually assumed. In many cases the outcome of stages two and three of the succession planning model will determine that key positions will be filled by external talented non-family executives, while allowing family members to develop and grow in the interim period. Therefore, the actual succession planning process is initiated well before the owner is contemplating retirement.

In other cases, the succession strategy process may determine that non-family members desire to remain actively involved in the business after the entrepreneur retires or begins to transition out of active leadership. This suggests a number of options, either to hire talented external management to run the operation on the family's behalf and generate ongoing income or dividend streams, or to divest of the business at a strategic time in order to obtain maximum value for the shareholders. It is best not to force family members to choose the family business as their vocation. They must make their own decisions. They must feel the passion for involvement and if they choose to enter the business after developing their own talents and exploring other business opportunities, then the company will greatly benefit from their outside perspective.

In either instance, the decision will have resulted from a well thought out business case that has considered all aspects of organizational continuity. Business ownership has always been about creating wealth and value for shareholders, and if this is accomplished without the transition of leadership to the next generation then the owner can be confident that the right decision has been made.

### **Concluding Remarks**

Succession planning is most likely one of the most complex and emotional issues family businesses will face. Involvement of all family members who are directly involved in the day-to-

day operations of the company, even at a minimum level, is critically important as the succession plan is implemented.

A successful strategy involves acceptance of an agreed upon process and effective board governance throughout the lifetime of the company. The underlying business strategy is determined through a formal vision and mission statement which is reinforced through a strong, well-defined culture and via organizational values. Each stage of the succession planning model must be fully analyzed and debated. The strategy must be developed in conjunction with an acceptable business case and needs to be balanced with constant, organization-wide planning. Input from independent sources, either board advisors or experienced facilitators, is absolutely necessary so that family members can gain an understanding of the necessary qualifications required of a successor candidate and share openly, to express their willingness and desire for continued involvement and commitment to the family business. The end result of this strategy setting is clear communication and the mobilization of all employees to create synergy and organizational continuity.

## Abstract

Previous analysis of venture capital activity in Silicon Valley has highlighted the role of venture capital syndication as a mechanism through which venture capitalists (VCs) build trusting relationships within the investment venture capital community. This paper analyzes the dynamics aspects of syndicated deals in technology sectors. The paper suggests the existence of 'persistence' in the patterns of collaboration among venture capitalists who participate in the same syndicated deal. VCs work more with those VCs with whom they have worked in the past, even after controlling for geography and investment activity effects. In order to honor the syndicate agreement, VCs must add new capital when required by the lead investor. It was found that those syndicate members who decide to 'stay' for the second round will collaborate, later on, more intensively among themselves (will participate together in more syndicated deals), than those who do not add new capital to the startup. The conditions under which the second round takes place are found to moderate the importance of honoring the syndicate agreement, and yield some insights into VCs' incentives to form syndicates.

## Introduction

The availability of capital has been shown to have strong effects on the intensity of innovation (Fazzari et al., [1988], Himmelberg et al. [1994], Lerner and Tsai [2002]). Young startups in innovative sectors, like IT and biotechnology, do not have the financial resources to bootstrap their growth, which exposes them to fluctuations in capital markets (Baker et al. [2003], Berk et al. [2004], Bhidé [1992], Carpenter and Petersen [1988], Davila et al. [2000], Hotz-Eakin et al. [1994]). The question that I aim to answer in this paper is: does the existence of VC syndication ensure the young technology startup a smoother 'ride' through the ups and downs of the capital market?

VC syndication has been a topic of active research in the last decade. Syndication has been considered a mechanism employed by VCs to achieve risk sharing and portfolio diversification. Lerner (1994) finds that, in earlier rounds, established VCs syndicate with each other, while in later rounds, they consider also syndication with less established players, which leads to 'improved-selection' as the main driver of VC syndication. By contrast, Brander et al. (2002) analyze a sample of Canadian biotechnology startups and conclude that the driver is the 'value added' by members of the syndicate (industry knowledge, experience with a particular type of security, etc.). For basic references and further discussion see also Bygrave (1988), Sorenson and Stuart (1999) or Manigart et al. (2002).

---

<sup>1</sup> This research was partly funded by Caja de Ahorros y Pensiones de Barcelona Fellowship program.

Due to uncertainty, information asymmetry, and the possibility of opportunistic behavior by the entrepreneur, VCs stage their investments (Gompers [1995]). In the case of a syndicated investment, the members of the syndicate usually sign a legally binding document known as syndication agreement. The syndication agreement specifies (1) required information disclosures between syndicate members, (2) parties' rights, and (3) funding commitments in future rounds (Hopp and Rieder [2004]). However, as Wright and Lockett (2003) point out, it is not the threat of legal enforcement that legitimates the agreement. Rather, the agreement works because of the impact on reputation that results from infringement of some of its clauses.

Greif (1993) describes the existence of an economic institution, the coalition, which allowed Maghribi traders in the 11th century to employ overseas agents, despite extreme uncertainty and risk of opportunistic behavior. The coalition was 'an economic institution in which expectations, implicit contractual relations, and a specific information-transmission mechanism supported the operation of a reputation mechanism'.

When VCs sign a syndicate agreement, they know in advance that it will be challenging to legally enforce the terms of the agreement. In the same fashion that Maghribi traders in the 11<sup>th</sup> century relied on reputation as an enforcing mechanism, the venture capital community relies on members' incentives to keep reputation in order to facilitate collaboration with other members. If a VC signs a syndicate agreement and does not honor it, for example because she refuses to commit new funds when required by the syndicate lead member, then we should observe a decrease in the propensity to work with the member that infringed the agreement. In other words, the VC would suffer a disconnect from the 'deal flow'

This paper explores the temporal dynamic aspects of venture capital syndication to ascertain whether the logic behind the decision to repeatedly fund a startup is consistent with the value-added hypothesis, or whether the syndicate structure arises endogenously as an economic institution that incentivizes syndicate members to participate in multiple rounds of financing.

### **Hypothesis Development**

Previous analysis of the effects of VC syndicate properties on startup performance yielded two interesting results, only summarized here because of space constraints (Campo-Rembado [2004]). First, it was found that the size of the syndicated first round (number of members), has a positive and significant effect on the propensity to go through new VC rounds, but no effect on the propensity to go public (conditional on the occurrence of new VC funding rounds). Second, the continuity of syndicate members between first and second rounds, has negative effects on the propensity to go public, even after controlling for the size of the second syndicated round; furthermore, it has positive effects on the propensity to fail.

Assuming that the control variables effectively control for the startup intrinsic quality, these results are then not solely driven by startup intrinsic value; they are also driven by (1) the effects that VC activity has on the startup's intrinsic quality (the 'value-added' hypothesis), and (2) the effects that VC syndication has on the startup's ability to raise new capital.

The results are easily explained using the 'value-added' hypothesis. As Brander et al. (2002) suggest, the addition of members to a syndicate increases the pool of intangible capital that is

accessible by the startup. Therefore, syndicate size helps the young startup to build an organization and a technological project, helping it to attract future funding. Similarly, the addition of 'new' investors in second round (investors that did not participate in the first round) helps the startup to mature and build an IPO ready company.

Alternatively, this paper conjectures that the size of the syndicate increases the effectiveness of the syndicate as an economic institution and the threat of punishment in case of infringement, thus facilitating the occurrence of new rounds of financing. Participation of first round syndicate members in a second round of financing is driven not only by the attractiveness of the investment, but also by the threat of punishment by the other syndicate members. By contrast, new members in a second round are driven uniquely by investment attractiveness. Therefore, one could argue that the higher the continuity of syndicate members between first and second round, the worse the chances of the company to go public: if the company were attractive, new members would bid high to participate, and the first round lead member would waive first round members' commitment to participate in the second round.

In principle, both alternatives are possible. The second alternative, however, is based on building trust, social embeddedness, and reciprocation (Ferrary [2003]). Under this second alternative, a VC will have additional incentives to honor a syndicate agreement in order to build a trusting relationship with other VCs. If the participation of VCs in a second round helps them establish a reputation as trustable partners, then we should observe that the decision to honor the syndicate agreement should be positively correlated with the ex-post intensity of joint collaboration among those VC.

The importance of honoring the syndicate agreement will depend on the previously established reputation of the VC. For example, when two big VC partnerships work together, it should not matter too much whether they honor the syndicate agreement or not. Due to their size, none of the parties needs of the other party to run a profitable practice. A similar argument leads us to conclude that the importance of honoring the syndicate agreement between two small VC partnerships should not be decisive neither. Both parties lack the power to incentive the other party to do so. The following hypothesis follows

***H1: Size asymmetry among parties in a syndicate agreement will magnify the importance of honoring the syndicate agreement as a predictive factor of ex-post intensity of joint collaboration.***

When the number of second round participants is high enough, the importance of honoring the agreement should diminish. First, the VC partnership that did not honor the agreement can be easily 'forgiven' because its capital was not so urgently needed. Second, the allocation of trust and liabilities should become more and more complex as the number of syndicate members increase. Therefore:

***H2: The number of participants in the second round of financing should ameliorate the importance of honoring the syndicate agreement as a predictive factor of ex-post intensity of joint collaboration.***

## Methodology and Data

The sample population is the set of dyads of VC partnerships that satisfy the following conditions: (1) both VCs participate together in a first round syndicated deal in IT or biotechnology in the period 1976-2004; (2) the startup they fund in first round goes through a second round of financing. An example helps to illustrate. A given company CO goes through rounds 1 and 2. The size of the syndicate in first round is  $N_1$ . The  $N_1(N_1-1)/2$  possible different dyads formed by first round participants will be included in the sample population. Data on VC rounds is retrieved from SDC Platinum VentureXpert.

The dyad of VC partnerships is the unit of analysis. When the dyad F1/F2 of VC partnerships (or F2/F1) appears in different syndicated deals, only the ‘earliest deal’ is considered in the final sample population. Therefore, there are no repeated dyads. The ‘earliest deal’ is defined as the one with an earliest first round, but other criteria are also possible. One might argue, for example, that the ‘earliest deal’ is the one with the earliest second round, because it is the second round which defines the independent variable.

The dependent variable (INTENSITY OF JOINT SYNDICATION AFTER THE SECOND ROUND), is defined as the log ratio of the number of joint deals by the dyad members, and the time elapsed between second round and July 2004. The dependent variable captures the average number of joint deals per month, where a ‘joint deal’ is a syndicated deal in which the two members of the dyad participate.

The dichotomous independent variable (JOINT SECOND ROUND) registers the participation of the dyad members F1/F2 (or F2/F1) in the second round of the ‘earliest deal’. It takes the value of 1 when both members participate. The independent variable captures whether both dyad members ‘stay’ for the second round or not. The independent variable is intended to capture the decision of the dyad members to stay, but it also captures the decision of the lead syndicate member to invite the non-lead syndicate members in a second round, or the decision of the company to invite the non-lead syndicate members.

As control variables, I include (log) SYNDICATE SIZE in first and second rounds, SYNDICATE CONTINUITY, measured as the ratio of ‘repeaters’ in second round over the total number of unique participants between 1<sup>st</sup> and 2<sup>nd</sup> rounds; (log) AGGREGATE INVESTING INTENSITY, defined as the sum of the log investing intensity of both parties; (log) DIFFERENCE IN INVESTING INTENSITY, measured as the absolute log difference of investing intensities; FIRMS IN SAME STATE dummy; and FIRM AND COMPANY IN SAME STATE dummy, which takes the value 1 when at least one of the partnerships in the dyad F1/F2 is in the same state as the target portfolio company. Summary statistics and correlations are displayed in tables II and III below.

---

Table II about here

---

Table III about here

---

The econometric specification is a random COMPANY effects, fixed YEAR effects, fixed SUBSECTOR effects model. For a given dyad of VC partnerships f1-f2 that has the earliest registered first joint round in company CO, the specification reads as

$$\begin{aligned}
 & [\text{INTENSITY OF JOINT SYNDICATION AFTER THE SECOND ROUND}]_{f1-f2} = \\
 & \alpha_1 [\text{JOINTT SECOND ROUND DUMMIE}]_{f1-f2} + \\
 & \alpha_2 [\text{SYNDICATE SIZE 1}^{\text{st}} \text{ round}]_{CO} + \\
 & \alpha_3 [\text{SYNDICATE SIZE 2}^{\text{nd}} \text{ round}]_{CO} + \\
 & \alpha_4 [\text{SYNDICATE CONTINUITY}]_{CO} + \\
 & \alpha_5 [\text{AGGREGATE INVESTING INTENSITY}]_{f1-f2} + \\
 & \alpha_6 [\text{DIFFERENCE IN INVESTING INTENSITY}]_{f1-f2} + \\
 & \alpha_7 [\text{FIRMS IN SAME STATE}]_{f1-f2} + \\
 & \alpha_8 [\text{FIRM AND COMPANY IN SAME STATE}]_{f1-f2} + \\
 & \alpha_9 [\text{COMPANY RANDOM EFFECT}]_{CO} + \\
 & \alpha_{10} [\text{YEAR FIXED EFFECT}]_{CO} + \\
 & \alpha_{11} [\text{SUBSECTOR FIXED EFFECT}]_{CO} + \varepsilon_{f1-f2}
 \end{aligned}$$

## Results

Results are displayed in table I

---

Table I about here

---

Model I is the baseline model without interaction terms. The baseline model shows the existence of a strong relationship between joint participation in the second round, and future collaboration. This result suggests that the formation of syndicate networks is characterized by structural ‘persistence’. Those VCs who have the chance to work together beyond the first round of financing show higher levels of cooperation among themselves than those VCs who do not commit further funds. The simplest story behind these result is that those VCs who commit beyond the first round are ‘deep pocket’ partnerships, and henceforth it is only natural that these VCs work more together. In this case, the relationship found would be spurious.

Model II and IV display the effect of the interaction terms. Model II suggests that both null hypotheses can be rejected. On the one hand, size asymmetry between VC partnerships magnifies the relevance of honoring the syndicate agreement. On the other hand, the size of the second syndicated round (number of syndicate members) diminishes the relevance of honoring the agreement. The analysis of the interaction terms yields a deeper level of complexity than the ‘deep pockets’ story above. In particular, we observe that participation in the second round of financing has the biggest effect when the interaction is between a ‘deep pockets’ VC and a small VC.

Model III suggest some industry heterogeneity. In particular, it must be remarked the difference between biotechnology and software (base case), being the importance of honoring the agreement less relevant in the former than in the later.

In addition to the main results, the control variables yield also interesting observations. In particular, Model III reveals that while the aggregate level of activity is positively correlated with the ex-post intensity of joint syndication, the difference in the level of activity is negatively correlated with ex-post intensity of joint syndication. The first result is trivial, the more deals the members of the dyad subscribe, the higher the average number of joint syndicated deals. The second result highlights the fact that homophily drives the structure of relations within the VC community. In conclusion, big VCs tend to work with big VCs (Lerner [1994]).

VC partnerships registered in the same state collaborate more; when at least one VC partnership and the company are registered (incorporated) in the same state, the intensity of ex-post joint collaboration diminishes. Again, the first result is trivial (Sorenson&Stuart [1999]). The second result is somewhat intriguing; it suggests that VC partnerships invest in out-of-state first round deals, but not necessarily in successive rounds.

Notably, from models I, II, III and IV, we can deduct a ‘regression to the mean’ phenomenon in the behavior of VC partnerships. A high level of investing activity during the time that elapses between 1<sup>st</sup> and 2<sup>nd</sup> round is related with a diminished level of ex-post joint collaboration.

### **Conclusions**

The decision to repeatedly participate in successive rounds of financing must consider a variety of factors, such as the attractiveness of the venture, the portfolio diversification disadvantage, the sequence and capitalization of funds raised by the VC partnership, the investment climate, etc. Even in the case in which the venture promises to yield above average risk adjusted returns, the VC might decide not to participate in new rounds of financing because of liquidity constraints. The VC might also be legally forbidden from participating if the VC’s investment memorandum specifies explicitly that successive funds cannot participate in the same company (otherwise VCs might be tempted to throw ‘good money after bad money’)

The results presented here suggest that, in order to decide whether to participate in a second round or not, VCs consider, also, the effect that their decision will have on the other VCs with whom they are trying to build a trusting relationship.

The implications derived from these results are ambiguous. On the one hand, if VCs consider other factors in addition to project profitability, then the aggregate level of investment may differ from the first best level of investment. On the other hand, if, once a first round is sunk, VCs have incentives to pour more capital into the company even if the project does not yield the required stand alone returns, then an unintended outcome could be that technology startups backed up by a syndicate grow faster than those startups supported by a single VC. The ‘value added’ by the VCs would be the value of assuring a network of future capital resources to the young company.

**Table I: Intensity of Joint Syndication After 2nd Round**

The table displays coefficient estimates for five different specifications. t-ratios are shown in parenthesis. In the case of random effect variance estimates, Wald statistics is shown in parenthesis.

## **THE MULTI-FACETS OF FEMALE ENTREPRENEURSHIP: THEIR DREAMS AND THEIR REALITIES**

JoAnn C. Carland, Western Carolina University

### **ABSTRACT**

While females are starting businesses at an increasingly high level, many of the assistance programs have not kept pace. Yet women are finding alternative approaches to entrepreneurship and success. They are learning to balance multiple demands upon their time very well. They are learning that there is strength in numbers in collaboration efforts and they are becoming very successful in doing so.

We have surveyed more than 200 females who have started their own businesses and have asked them for the purposes in starting as well as their long term goals. We have also examined their drives, attitudes and cognitive styles.

We have determined that there are multiple levels of entrepreneurship and females predominantly make up the first level. Suggestions will be given as to how the females might advance to the higher levels and what practical solutions might result from public policy recognition of the potential for female entrepreneurs.

### **EXTENDED ABSTRACT**

Business women have been discriminated against in the workplace in terms of dollars as well as the potential for success. However, women made up 44.4% of the total civilian labor force over the age of 20 in 1986 (*Monthly Labor Review*, 1986) and in 1984, 31% of all women employed were in managerial or professional specialties (Mellor & Haugen, 1986). Further, 55.5% of women were working in 1986 (*Monthly Labor Review*, 1986). Women are clearly a significant force in business. These numbers are rising steadily as more women enter the job market from necessity, interest or desire.

In a study conducted by Robert Fairlie for the Small Business Administration in 2004, the rate of female business starts have risen significantly as compared to males. In his report Fairlie (2004) indicated that women have increased self-employment from 1,741,1000 in 1979 to 3,839,000 in 2003, a change rate of 5.1 to 6.8 percent.

While it has been argued that female owned firms have difficulty in finding funding, some from our sample started with owner financing which while small gives an opportunity for startup which might not otherwise exist in many rural areas or small urban areas.

Kalleberg and Leicht (1991) hypothesize that businesses owned and operated by women are less likely to survive and are less successful than those headed by men, yet they are unable to show that small firm survival rates are influenced by the gender of the proprietor. Rather they find that the key influences upon survival/non-survival are the age of the firm and the managerial confidence of the owner (Storey, 2000).

Brush (1992) concluded that business and family are closely knit together where the business owner is female and that in economic terms, the objective function of women business owners is much more likely to include striking a balance between family and work...rather than exceptional growth rates (Storey, 2000).

## **METHODOLOGY**

### **Instrumentation**

Three attributes from the literature were selected for study: the need for achievement, risk taking propensity, and preference for innovation. Although these factors clearly do not include all recognized or proposed characteristics of people who start businesses, they are among the most frequently encountered. To these factors we added a fourth attribute, entrepreneurial drive (Carland & Carland, 1984, 1988, 1997).

Questionnaires were developed which incorporated instruments to measure these attributes as well as obtaining demographic data about the respondent. The questionnaire also included questions about the motivations for founding the firm and questions about planning activities, goals and objectives, and the strategies employed in the management of the firm. In 1997, Carland and Carland proposed the following to distinguish between the various aspects of entrepreneurs. They suggested the points described in Table 1.

---

Table 1 about here

---

### **Sample**

Using a subset of fifty female business owners out of a sample of 291, female respondents were queried as to their purposes in starting their ventures as well as their long term goals. Also examined were their drives, attitudes and cognitive styles.

This is a convenience sample employing a survey developed for the purposes of ascertaining a profile of female entrepreneurs in the area. The sample is primarily from the Southeast and the majority are from small, rural, disadvantaged areas in the Mountains of North Carolina. Although there are a number of surveys from outside the region and state, the vast majority of the respondents come from areas designated as disadvantaged by the Regional Economic

Development Centers of the state. Most have lost any manufacturing which previously existed as well as farm income from the growth of tobacco. The profile of our respondents is found in Table 2.

---

Table 2 about here

---

Table 2 displays the demographic information about our sample subset. It indicates that most of our female entrepreneurs are involved in proprietorships (54%) or corporations (38%) and either in retail (42%) or service (50%) industries as one might expect. Fifty percent (50%) of the female entrepreneurs were in the smallest of businesses with ninety percent (90%) having fewer than 10 employees. Therefore, this sample subset included the smallest of the small and they were mostly in their middle age and undereducated

---

Table 3 about here

---

The ventures established in this sample go back to 1934 with one in the 1940s and two in the 1950s. These ventures were inherited (3) and bought (1) by the respondents. Seventy-four percent (74%) of the ventures have existed and continue to survive while the other twenty-six percent were established prior to 2004 so are somewhat untested.

As demonstrated in Table 3, most of the ventures, seventy-eight percent, were started by the respondent as opposed to purchase or inheritance, indicating the females are willing and able to begin ventures. Thirty-five of the respondents were nascent entrepreneurs, while 15 indicated that this was not their first venture.

As expected from the Brush(1992) article and the commentary by Storey (2000), the majority of the female respondents (68%) indicated that their principal reason for establishing their venture was to provide income for the family, while only thirty-two percent (32%) indicated profit and growth as their principal rationale.

Since only eight percent (8%) indicated that they had written plans to assist them in guiding their companies, and ninety-two percent (92%) indicated that they had no distinctive competency in their ventures, the researchers must conclude that from this subsample, the respondents may be undertrained and not as aware of resources needed for success.

---

Table 4 about here

---

The results in Table 4 indicate that our female respondents are just slightly above the mean in Innovation (11.6, expected mean 10) and well below the mean in risk taking propensity (6.8, expected mean 10). The respondents are well above the mean in the area of Need for Achievement (11.46, expected mean 8).

The entrepreneurial drive index was 14 on the average for the respondents with the expected mean of 16.5. This result was a bit of a surprise considering the profile expected and drawn by the data. The expectation was that considering the region from which most of the respondents were derived, that they would be predominantly microentrepreneurs, not entrepreneurs according to the definition espoused by Carland and Carland (1997).

## **CONCLUSIONS**

The sample subset because of its region of draw presents several unique possibilities. The needs, dreams and desires of this subset may well be different from that of the traditional female entrepreneur profile in that many of the businesses have been started and are continuing to be started out of necessity. The region is economically depressed and has no other future for those wishing to remain in the area. Education may be a solution to the issues of survival and success. More may be accomplished to create a better working environment for the nascent entrepreneurs as well as a source for the networks which can result in staying power. Perhaps further research could elucidate the disadvantaged entrepreneur or even the reluctant entrepreneur, regardless of gender.

Table 1  
Entrepreneurial Dreams as a Paradigm

| Classification    | Dreams   | Behavior    | Outcomes  | Consistency                                |
|-------------------|--|-------------|---|--|
| Macroentrepreneur | Dreams of revolutionary change                   | Innovative  | New markets, services, products and industries      | Never stops striving for dominance         |
| Entrepreneur      | Dreams of personal success, wealth and accolades | Ingenious   | Enhanced markets, services, products and industries | Shifts interest at perceived success level |
| Microentrepreneur | Dreams of personal freedom                       | Traditional | Small, stable, slowly changing, family businesses   | Shifts interest at perceived comfort level |

## **ABSTRACT**

"Never underestimate the power of the Dark Side!" Luke Skywalker learned that lesson well in a galaxy far, far away and long, long ago, but modern entrepreneurship theorists may be less well informed than the characters in *Star Wars*. Like the "Force," Entrepreneurship is a tremendous power for good. But, like the "Force," Entrepreneurship does have a Dark Side and it is powerful, indeed.

With rare exceptions, the literature about entrepreneurship is positive and supportive and implies that uniform benefits accrue to the economy, to businesses, and to individuals as a result of entrepreneurship. This is only half the story. A small number of researchers have examined the dysfunctional aspects of entrepreneurship and pointed out that a dark side definitely exists.

This paper will look at those who turned to the darkside for their very existence. The authors have surveyed prisoners who have been convicted of a felony and who are serving sentences in a Federal Prison in the Midwest. The participants were enrolled in a continuing education course involving entrepreneurship and small business startup ideas and they all espoused a desire to "go straight" when their sentences had been served. How did they become criminals? Did they view their criminal activities as entrepreneurial ventures? Will they become legitimate entrepreneurs in the future? These were the questions which drove our research.

## **EXTENDED ABSTRACT**

Can criminal ventures be entrepreneurial in nature? Do criminals think of themselves as entrepreneurs? These issues have apparently not found wide acceptance in our literature. An extensive database study preformed for this paper found no articles involving criminal entrepreneurs, or entrepreneurial ventures classified as criminal enterprises in entrepreneurship or business journals or in the criminal justice literature. Our experience suggests that criminals do indeed frequently think of themselves as entrepreneurs. Drug dealers are comfortable talking about sources of supply, channels of distribution, the effect of supply and demand on price, market share, the impact of location, etc. In fact, we have seen that many organized drug dealers even understand the value of a brand identity and actively seek to establish that identity to obtain competitive advantage. They clearly understand first mover advantage and they have a firm grasp of the value of working capital.

It is equally clear that the organized crime families prevalent in the U.S. during the 1980s thought of themselves as businesses. Former FBI agents, Joseph O'Brien and Andris Kurins (1991) reported that many of these families were diversified in their holdings and activities and engaged in strategic planning to enhance the growth potential of their enterprises.

In our view, individuals who establish and manage ventures providing illegal or illegitimate products or services are entrepreneurs in every sense of the word. They are dark side entrepreneurs and their activities are destructive to the fabric of our society in direct proportion to the success of their ventures. What makes them turn to the dark side? If they have the skill and ability to launch and grow an illegitimate venture, why can't they focus their energies on legitimate businesses? How are they different from the entrepreneurs who are so beneficial to the economic well being of our society? Before we can tackle these issues, we need to explore entrepreneurial personality traits.

### **PERSONALITY TRAITS**

Personality traits of entrepreneurs have been examined by many researchers citing such attributes as a need for power (Peay & Dyer, 1989); the pursuit of freedom of expression and of spirit (Cole, 1989). Entrepreneurs have been characterized as confident, optimistic, not prone to take great risks or to be reckless, unwilling to have their performance judged by others, especially willing to be independent and self-reliant, and, as more than non-conformist, in fact, mildly sociopathic (Solomon & Winslow, 1988; Winslow & Solomon, 1987; 1989). At least one author has posited that entrepreneurship can be hazardous to one's health (Buttner, 1988).

Many characteristics of entrepreneurs such as risk taking propensity (Mill, 1848; McClelland, 1961; Mancuso, 1975; Timmons, 1978; Brockhaus, 1982; Watts, 1989; Carland & Carland, 1991) have been explored. Innovation has also oft been cited as a central characteristic of the entrepreneurial endeavor (Schumpeter, 1934; McClelland, 1961; Williams, 1981; Martin, 1982; Drucker, 1985; Carland & Carland, 1991). Other researchers have studied the need for achievement in entrepreneurs (Hornaday & Aboud, 1971; Liles, 1974; DeCarlo & Lyons, 1978; Carland & Carland, 1991) and cognitive influences have been examined as well (Carland & Carland, 1983, 1987, 1991, 1992; Barbato & Durlabhji, 1989). In most of the literature in which a portrait of the entrepreneur is drawn, only the positive aspects are vigorously outlined; and yet for every burst of brilliance, there is a negative or dark aspect.

Few have examined the aspects of the dark side of entrepreneurship. Osbourne (1991) identified the dark side as the "corrupting power of ownership" and cited examples of situations in which the power of ownership corrupted the organization. Cole (1989) described the entrepreneurial self and alluded to the reality that often entrepreneurs are 'displaced persons' who are entering the pursuit of ownership for less than sterling goals.

From whence does this dark side emanate? What is its source and can it be understood? For answers to these questions, many have turned to a study of cognitive temperament.

Keirsey and Bates (1984) felt that different types of cognition could be explained in a more straight-forward fashion than the 16 different groupings of typology which result from the better known Myers-Briggs Type Indicator (Myers & Briggs, 1962). Their conclusions are based on the works of Jung, Kretschmer, Freud, Adler, Sullivan, Maslow, and Spranger as well as Isabel Briggs Myers and Katherine Briggs (Keirsey & Bates, 1984). They modified Jung's theory dramatically by postulating that temperament emerges by way of differentiation rather than as a combination of attitudes, preferences, types or functions. That is, an individual displays a particular temperament rather than integrating Jung's attitudes.

They identify four major cognitive temperaments which can be described in MBTI terms as: SP or sensation-perceptive; SJ or sensation-judging; NF or intuitive-feeling; and, NT or intuitive-thinking. They stressed that temperament is not the result of a combination of the various MBTI functions. Rather, Keirsey and Bates (1984) observed the temperaments in individuals, classified and built up portraits of the temperaments and their potential for explaining individual behavior and used MBTI terminology to describe the result. Primary characteristics of the four temperaments are described in Table 1.

---

Table 1 about here

---

The four temperaments may be identified by use of the Keirsey Temperament Sorter which is presented and explained in *Please Understand Me* (Keirsey & Bates, 1984), or, the temperament may be identified by administering the MBTI (Myers & Briggs, 1962) and choosing the classification by comparing scores on the Sensing versus iNtuition scale, the Thinking versus Feeling scale, and the Judging versus Perceiving scale.

As Table 1 makes clear, each of the four temperaments has strengths, but each also has weaknesses. In fact, these weaknesses, when exacerbated by the pressures of business ownership can blossom into dysfunctional behavior. Carland and Carland (1992) examined these temperaments in a study involving more than 650 owners of businesses classified as small according to the U.S. Small Business Administration criteria. They also administered the Carland Entrepreneurship Index to the participants (Carland, Carland & Hoy, 1992) to determine the strength of their entrepreneurial drive.

SPs are individuals who have a lust for action with no thought for the consequences. While they are excellent problem solvers, they become quickly bored with routine and must perforce change directions. Since they are not goal-oriented, they tend to skip from task to task without completion. Carland and Carland (1993) found them under represented in their study, when compared to the general population, but they found that SPs displayed the highest tendency for launching multiple businesses. An interesting observation and one which begs the question of whether the serial SP entrepreneur was driven by a loss of interest in the existing business, or because their ventures tended to fail as a result of a lack of attention to detail.

In the SJ typology, one finds individuals who work very well with details and are most

comfortable with routine, however, they tend to resist change and may have problems in anticipating the shifts of the industry in which they find themselves. Carland and Carland (1993) found them over represented in their study, when compared to the general population, suggesting that they tended to be content in small business environments and successful, at least with regard to their own definition of success.

NFs are strongly people oriented and do not like stress. Carland and Carland (1993) found them present in their study at their normal level in the population, but, interestingly, they displayed higher entrepreneurial drive than SPs or SJs. This strong drive, coupled with a natural aversion to stress, could bode ill for personal health and mental well being.

NTs are the non-conformists, individualistic, seemingly arrogant group of people who seem to have the drive to start businesses based on growth and profit motives (Carland, Hoy, Boulton & Carland, 1984). They tend to pursue goals after others have lost sight of the possibilities and are always aware of the future implications of their actions and those of others. Their vision and creativity are strong supports for the growth and success of their ventures. However, their single-mindedness is often seen as a negative. Their dislike for routine and their pursuit of their own individual goals often make them pariahs in their own businesses. Coupled with the fact that they are harsh task masters, these problems can result in problems with Boards of Directors who prefer the stabilization of the management SJ types. Carland and Carland (1993) found NTs to be over represented in their study, in comparison to their distribution in the normal population. They also found them to display the highest entrepreneurial drive among the temperaments.

## **CRIMINAL ENTREPRENEURS**

Are dark side entrepreneurs different? To explore this question, we administered the MBTI (Myers & Briggs, 1962) and the Carland Entrepreneurship Index (Carland, Carland & Hoy, 1992) to a convenience sample of convicted felons incarcerated in a Federal Prison in the Midwest. All of the participants were male, and all were participating in a continuing education course involving entrepreneurship. Every participant in the course, 34 men, agreed to participate in the study. The instrumentation included demographic questions dealing with the traditional data, but including questions about the participant's criminal activities and criminal history. We also wanted to know whether any of the participants was actually involved in ownership of a legitimate business prior to incarceration, and we specifically addressed whether the participant considered his criminal activities to be a business.

We examined the personality temperaments of the participants, as classified by the MBTI and the entrepreneurial drive, as measured by the CEI. The results of our study and the conclusions which we drew from this exploratory research are described in the full version of our paper, copies of which are available from the authors.

**TABLE 1**  
**THE FOUR TEMPERAMENTS**

SP

The SP negotiates well; is good in a crisis; is a trouble-shooter and good in situations where one company takes over another; goes into everything at full speed; has a sharp nose for opportunity and feels that everything is negotiable and nothing sacred; can get cooperation from warring factions, is flexible, excited, open-minded, enthusiastic; is a risk taker; is practical, has acute observation powers; causes things to happen with an economy of motion; is flexible; is a good decision maker; but, does not like theory or routine and lives for the moment.

SJ

The SJ is a traditionalist or stabilizer; likes to establish policies, rules, schedules, and standards and create company rituals; is patient, thorough, steady, reliable, orderly; has a strong sense of social responsibility; has a need to serve, to be needed, and to do one's duty; is resistant to change; is decisive; has common sense; is a hard and steady worker; is thorough and loyal; but, is known to be pessimistic, may preserve useless rules and be critical of others.

NF

The NF is personal and personable; draws out the best in people; focuses on individuals; is naturally democratic and participative; has verbal fluency; can subordinate personal wishes to those of others; is idealistic, empathic, and charismatic; has a silver tongue; sees possibilities; works well with people; can turn liabilities into assets; shows appreciation; but, is generous with time to others so may neglect obligations; makes decisions based on personal likes and dislikes and feels responsible for others.

NT

The NT is visionary and an architect of change; takes pride in technical knowledge; demands a high level of personal performance; is skeptical; avoids redundancy and stating the obvious; hungers for competency, knowledge and mastery; sees both long and short term interactions and implications; focuses on possibility and is technologically ingenious; but, does not communicate well; may lose interest in a task before completion; be insensitive and may appear arrogant.

## **Customer Service-Orientation of Small Retail Business Owners in Austria, Hungary, Slovenia, Ukraine, and the United States of America**

### **Abstract**

Hogan, Hogan, and Busch (1984) defined service-orientation as "the disposition to be helpful, thoughtful, considerate, and cooperative" (p. 167). The purpose of this study was to test whether or not a biodata inventory could be used to measure the service-orientation construct across cultures with samples of small business owners from Austria, Hungary, Slovenia, Ukraine, and the United States of America. Subjects were given the inventory in order to predict their on-the-job service-oriented performance. Within the samples, the service-orientation ratings were highly correlated with Extroversion and Openness to Experience in all five countries, and Agreeableness & Conscientiousness in four countries. The correlations of these scales with service-orientation were as high or higher than those generally obtained with measures of service-orientation with customer service representatives. Thus, it has been concluded that service-orientation may be effectively measured by biodata within small organizations across multiple cultures.

## INTRODUCTION/LITERATURE REVIEW

To the extent that an organization's success depends on effective customer relations, the customer service employees play a vital boundary spanning role for the organization (Robertson, 1995).

Consistent with this, firms often attempt to shape their image with customers by managing the types of behaviors employees display (Becherer & Maurer, 1999; Hipkin, 2000; Martin, 2000; O'Gorman & Doran, 1999). This is especially important in small and medium sized businesses where nearly all employees have contact with both external and internal customers on a daily basis (O'Gorman & Doran, 1999; Parnell, Carraher, & Odom, 2000; Zinger, LeBrasseur, & Zanibbi, 2001). For instance, Wright, Pearce, and Busbin (1997) found that firms which emphasize customer service report higher profitability, return on sales, return on investments, return on assets, and profit growth than those reporting less of an emphasis on customer service by the individual employees - - outcomes desirable by organizations both small and large.

### Service-Orientation

Among the most significant works to date in the area of service-orientation have been those of Hogan, Hogan, and Busch (1984). To measure the traits from their definition of service-orientation, they developed the Service-orientation Index (SOI). The SOI consisted of 87 true-false items covering issues of agreeableness, adjustment, conscientiousness, and sociability. Validation of the SOI on a group of healthcare workers revealed a correlation of  $r = .31$ , ( $p < .05$ ) between SOI scores and service-orientation ratings (Hogan & Hogan, 1992; Hogan et al., 1984).

Since Hogan et al. (1984) performed their work, several consulting companies such as Personnel Decisions, Questar Data Systems, and CORE Corporation have developed their own instruments to measure service-orientation. These instruments are based on measures of attitudes and/or behaviorally-based personality questions, but research published in peer refereed journals performed by individuals not employed by the consulting companies has yet to be presented on the efficacy of these instruments. Bowen, Siehl, & Schneider (1989), on the other hand, have recommended the use of more "behaviorally based selection procedures" (p. 83) - such as biographical information blanks – also called biodata (Schneider, 1997).

### Biographical Data

Credit for the first use of biographical information in employee selection dates back to 1894 when T. L. Peters used biographical information for the selection of insurance agents (Ferguson, 1962). Research using biographical questionnaires in multiple-choice formats blossomed during World War II, and much research was performed demonstrating that biodata could predict success in the military (Parish & Drucker, 1957). Reviews of further work support the empirical validity of biographical data in predicting various criteria including job placement success (Harvey-Cook & Taffler, 2000), turnover (Brush & Owens, 1979), and performance for service employees in large organizations (Allworth & Hesketh, 2000).

Biodata typically differ from measures of values, attitudes, moods, interests, personality, and abilities but can seek to assess constructs in all of these domains (Stokes, 1999). Biodata questions are often presented in a standardized self-report questionnaire with a multiple choice format that asks individuals to describe their past experiences, behaviors, and/or attitudes (Gatewood & Feild, 2001).

For example “in high school, how easy were your math classes?” and “in comparison with most people you know, how often do your friends come to you for advice or guidance” are biodata questions which could be reflections of perceived cognitive abilities and the personality construct of agreeableness, respectively (Stokes, 1999). Researchers use biodata with the assumption that often the best predictor of future behavior is past and present behaviors, attitudes, interests, and intentions (Owens, 1976; Stokes, 1999).

Based upon the work of Hogan et al. (1984), Parasuraman, Zeithaml, and Berry (1985), and Schoenfeldt (1999), McBride (1988, 1997, McBride, Mendoza, & Carraher, 1997) used samples of students in order to create a parsimonious biodata inventory purported to measure constructs related to service-orientation. He developed a 39-item biodata inventory hypothesized to contain the following seven topical scales: Life Satisfaction, Sociability, Agreeableness, Resistance to Stress, Responsibility, Need for Achievement, and desire to make Good Impressions on others. It was found that the Sociability and Good Impressions scales were significantly related to estimates of service-orientation.

Carraher, Mendoza, Buckley, Schoenfeldt, and Carraher (1998) used four samples with a combined sample size of 861 in order to examine whether or not a modified version of the 39 item biodata instrument developed by McBride (1988, 1997; McBride et al., 1997) could be used to measure the service-orientation construct. Using limited information factor analysis, Carraher et al (1998) found support for an eight-factor solution (Agreeableness split in to two factors - Helpfulness and Agreeableness) as well as finding that service-orientation ratings were consistently related with three of the scales: Good Impression, Sociability, and Helpfulness.

Two years later, Chait, Carraher, and Buckley (2000) used 605 job applicants to reexamine the relationship the biodata measure. Using principal components analysis, they found support for a five-

factor model with McBride's biodata instrument and further found that this five-factor model was similar to the Big Five Personality Factors of Extroversion, Conscientiousness, Emotional Stability, Agreeableness, and Openness to Experience. Interestingly, the results from this five-factor model had a similar multiple R (.46) to that from the originally hypothesized seven-factor solution suggested by McBride (1988, 1997; McBride et al., 1997).

Carraher, Buckley, Scott, Parnell, and Carraher (2002) used samples of 704 job applicants from three countries (the USA, Canada, and United Kingdom) in order to extend the work of Chait et al. (2000) across borders and 50 American students in order to examine the test-retest reliabilities for the biodata instrument. They found that across countries the service-orientation ratings were significantly correlated with Extroversion, Openness to Experience and Agreeableness, and they were also significantly correlated with Conscientiousness in both non-American samples but not in the American sample. The six-month, test-retest reliability estimates were found to range from .73 (Openness to Experience) to .84 (Extroversion).

In this study, we seek to extend the work of Carraher et al. (2002) and examine if McBride's biodata instrument is useful within small organizations in non-English and English-speaking countries. Specifically, the 39-item inventory developed by McBride (1988, 1997; McBride et al., 1997) is utilized in order to assess individuals' levels of service-orientation and compare these assessments to those determined through actual on-the-job performance.

## METHOD

### Subjects

Subjects included 321 small retail business owners in Austria, 183 in Hungary, 222 in Slovenia, 173 in Ukraine, and 202 in the USA. The gender composition of the samples was 51 to 60% males for the samples. There were no noticeable differences in service-orientation levels.

### Instruments

The primary instrument was the biodata inventory developed by McBride (1988, 1997; McBride et al., 1997) [all items are listed by McBride et al.]. Using full-profile principal components analysis (as was used by Chait et al., 2000), we found support for the five-factor models so we are going them with scales calculated using regressed factor scores. Due to problems with the use of coefficient alpha reliability estimates (Sethi & Carraher, 1993) and the admonition that commonly used internal consistency estimations of reliabilities are "generally inappropriate for biodata" (p. 492, Mitchell, 1994), we did not calculate them but supported the internal consistency of the scales using limited information factor analysis as suggested by Schoenfeldt and Mendoza (1994) and Mitchell (1994). Carraher et al. (2002) found the 6-month, test-retest reliability estimates to range from .73 (Openness to Experience) to .84 (Extroversion).

In terms of item content, in addition to covering basic demographics (age, sex, etc.), many of the questions contained in the inventory consisted of experiential, attitudinal, and behaviorally-based items (e.g. "When you were a member of a small group, how much do you participate?" and "How comfortable are you in new places and situations?"). The response formats for all questions except for age and gender had five response categories.

### Customer Interaction

The customer service interactions took place at the work sites of the small business owners. All

were self-employed business people in large cities within each country. Previous research has shown that business ventures in Central and Eastern Europe are often operated in a different manner than how they are run in the West. However, the motivations of the entrepreneurs tend to be similar and it is expected that this would be true as well in the Far East (Abetti, 1995; Abetti, Hirvensalo, & Kapij, 2001). Thus, this environment allows a variation in the organization system in terms of organization – but with similar underlying motivations. It is interesting to note that the individual business people were multi-lingual with each speaking at least two languages – with four or five languages being more typical. The actual customer interactions were observed over the course of two weekends in each location.

#### Criterion: Ratings of Service

Three observers rated the performance of the subjects in order to allow a comparison in the ratings. Each of the raters had been trained in order to accurately and consistently identify differing levels of service-orientation. After observing 6-30 actual customer service interactions, raters would rate each of the subjects. Service-orientation was measured using a 17-item rater evaluation form designed by Schoenfeldt (1999).

#### Results

Pearson product-moment correlations between the criterion (the average composite measure of service-orientation from the raters) and each of the scales are presented in Table 1. The multiple  $R$ 's regressing all five of the scales on the criterion are also presented in Table 1. Turning to the results of the correlations, we see that Extroversion, Agreeableness, and Openness to Experience have the highest correlations with ratings on service-orientation for the American sample. In the Ukrainian, Hungarian, and Austrian samples, Extroversion, Agreeableness, Openness to Experience, and Conscientiousness are the four that are consistently correlated with service-orientation ratings. In Slovenia, Extraversion,

Openness to Experience, and Conscientiousness were related to the service-orientation ratings for the small business owners. It is interesting to note that while all of the relationships are similar to or higher than those typically received with other service-orientation instruments, we were able to explain about half of the variance in service-orientation in Hungary and Austria than in Ukraine, with the American and Slovenian samples being in the middle range. Thus, while an instrument such as this one could potentially provide great utility for organizations seeking to use a questionnaire for selection or developmental purposes, we strongly suggest that additional cross cultural research be performed on the construct of service-orientation itself in order to ascertain its meaning between, within, and across cultures.

---

## CONCLUSIONS

These findings suggest that service-orientation can be effectively identified using a biodata inventory such as the one used in this study. It should be noted that the coefficients found here are similar to those found by Hogan et al. (1984), Personnel Decisions, (Paajanen, 1995), and CORE Corporation (Fogli, 1995) with other measures of service-orientation. For example, CORE Corporation reports that their measures of service-orientation have validity coefficients in the range of .19 to .36 for the service-oriented performance of tellers in the banking industry (undated), and Personnel Decisions reports validity coefficients in the range of .19 to .32 across a variety of occupations for their measure of service-orientation (McLellan & Paajanen, 1994). These findings are

also consistent with those found by previous researchers (Carragher et al. 1998; 2002) with this instrument for job applicants in the United States, United Kingdom, and Canada suggesting that this instrument may be useful for developmental purposes in order to provide feedback to small business owners across cultures so that they may seek to increase their service oriented behaviors. In fact, O’Gorman and Doran (1999) have reported that it is through the focus on serving the customer well that small and medium sized businesses may more effectively compete with larger organizations that may have a cost advantage.

The results of the current study clearly show service-orientation to be reflective of extroverted individuals who make a conscious effort to actively help others and seek out new ways to satisfy the needs of customers. As a consequence, it does appear that inventories such as the one developed by McBride may be useful for identifying individuals with the tendency to exhibit strong service-oriented behaviors for both developmental and selection purposes. We suggest that additional research be performed in order to confirm our findings.

While the identification of proactive, considerate employees may be important to any organization, it is especially crucial in ones in which customer service may be a major part of the job for most of the positions within the organization as is increasingly becoming the case in the United States and around much of the world. This is especially important in small businesses where most employees may be called upon on a consistent basis to interact with both internal and external customers. Moreover, the generalizability of the instruments used to tap the construct are enhanced by the concept of service-orientation itself in that it is not occupation specific and as shown here may be used across all levels of an organization.

This research has served to shed light on those areas of service-orientation that may be most important in the identification of individuals likely to behave in a service-oriented manner within small businesses. Therefore, we believe that this type of an instrument can make an important contribution in the identification of individuals across cultures likely to exhibit high levels of service-oriented behaviors and that additional cross cultural research be performed on the construct of service-orientation.

## **ABSTRACT**

In general, this research addresses the measurement of organizational financial performance to provide researchers and managers a better understanding of the implications of selecting variables for use in empirical studies and management practice where organizational financial performance is the criterion of interest. Since no prior research has empirically established the domain of organizational financial performance, this research is by necessity exploratory in nature. A two part approach is adopted to address this problem. First, a model of overall organizational performance is inferred from empirical data that includes the primary constructs of an organization's financial performance and empirical measures of these constructs. Next, the validity and reliability of the constructs and measures are tested.

This is the first study that has undertaken to empirically identify both distinct dimensions of organizational financial performance and the measures that represent those dimensions. The identification of different dimensions and measures of financial performance for annual and three-year timeframes are unique contributions of this research.

Another significant contribution of this research is the identification of financial variables that discriminate between high and low performing companies. These measures should receive the primary attention of researchers, management and users of financial statements. Those companies that attain and sustain competitive advantage in the market do not strive to be average. Therefore, the metrics they use to gauge performance should focus on outcomes that set them apart from the competition.

## INTRODUCTION

There is little dispute that one of the core purposes of both entrepreneurship and strategic management theory and research is the improvement of organizational performance (Eisenhardt & Zbaracki, 1992; Venkatraman & Ramanujam, 1986). However, there seems to be no consensus regarding the best, or even sufficient, measures of organizational performance. This is in no small part due to the many varied views on the most desirable outcomes of organizational effectiveness and because performance has often been characterized by the theory and purposes of the research being performed. Researchers further confound the problem by confusing determinants of performance with measures of performance (Cameron, 1986).

It has long been reported that different measures of organizational effectiveness and performance have been used in entrepreneurship and management studies with little or no thoughtful discussion of why the measures used in the studies were chosen. Little attention has been paid to the limitations that these measures may impose on the interpretation or generalizability of the results of the research, and most have concluded that organizational performance is multi-dimensional in character. The most frequently used measures of organizational performance are financial; however, no study has successfully proposed and empirically tested a generalizable multi-dimensional model of organizational financial performance. This is a particularly challenging issue since changing environmental conditions may dictate that different performance dimension priorities exist at different times. For instance, during economic recessions, liquidity may be more crucial than profitability, while during economic booms, profitability and growth may take precedence. This research examines the multi-dimensional structure of organizational financial performance and seeks to empirically identify distinct financial performance constructs and appropriate measures of those constructs.

The development of valid operationalizations of the key concepts and constructs used to form of both independent and dependent variables in the models used in entrepreneurship and strategic management research is fundamental to the description and corroboration of theoretical relationships being tested in research, and is the essence of the measurement stream of research. Put differently, the validity of research studies that use arbitrary dependent measures to represent overall organizational performance is highly questionable. Researchers need to know that the effects they are studying will reasonably be represented by the changes in the dependent variables. The use of different measures as proxies for “performance” makes extension from one study to the next dubious. Peter clearly summed up the importance of construct measurement as follows:

Valid measurement is the *sine qua non* of science. In a general sense, validity refers to the degree to which instruments truly measure the constructs which they are intended to measure. If the measures used in a discipline have not been demonstrated to have a high degree of validity, that discipline is not a science (1979:6).

Measurement is the “careful, deliberate, observations of the real world for the purpose of describing objects and events in terms of the attributes composing a variable” (Babbie, 1998:116). For a variable to be clearly and equally understood by many different individuals, it must be accurate, precise, quasi-invariant across observers, provide discrimination from other

variables, and be stable over time. As a result, it is problematic that overall organization performance has been “measured” in scores of research studies by dozens of variables that are generally not strongly correlated over time.

Part of this research involved an analysis of 1,045 articles published in the leading entrepreneurship and management journals between 1996 and 2001. Of these 1,045 articles, 138 purported to use overall organizational performance as the dependent variable. Over 70% of these 138 articles used a financial performance measure as the dependent variable. Further, 46% of these 138 articles used only a single measure, 25% used two measures, and 18% used three measures to represent organizational performance. Overall, a total of 88 different dependent measures were used to represent overall organizational performance in these 138 articles, generally without any support for the validity of the measures utilized. Consequently, it can be inferred from these statistics that there is no consensus in the entrepreneurship and strategic management research conducted over the 5 years with respect to valid measures of organizational performance.

The topic of this research is particularly important for several reasons. First, a multi-dimensional model of organizational performance has not been explicitly studied before. Murphy, Trailer and Hill (1996) examined the dependent measures used in entrepreneurship research and through exploratory factor analysis found nine distinct performance constructs among the more than 50 different dependent variables reported upon. Venkatraman and Ramanujam (1987) empirically demonstrated that growth and profitability were distinctly different measures of performance, but did not attempt to propose a specific model for financial performance measurement. Robinson (1998) empirically tested the relationship between four separate independent variables (stage of the life cycle, industry concentration, entry barriers, and product differentiation) with eight different measures of performance in new venture research and found significantly different results between each independent variable and the eight dependent variables. This further demonstrated the existence of multiple dimensions of performance.

Second, a generalizable and more powerful measurement model of organizational financial performance has significant implications for future research and for reexamining the findings of prior research where less powerful dependent variable measurement models were used. Such a model can help resolve multiple inconsistent theories where differing dependent variables were used.

Finally, a multi-dimensional model of organizational financial performance can significantly improve organizational stakeholders’ understanding of the effectiveness of management. It allows for the measurement of value creation and for reasonable comparison across companies that have chosen different routes to creating value.

Therefore, the objective of this research is to develop a model of organizational financial performance. The model demonstrates that organizational financial performance is a multi-dimensional construct. In addition, it shows that the simultaneous consideration of these multiple dimensions is more appropriate for drawing conclusions about the effectiveness of managerial actions than considering each performance dimension separately.

## SELECTED PRIOR STUDIES OF ORGANIZATIONAL PERFORMANCE

Despite the importance of accurately measuring organizational financial performance, there have been very few studies that have directly addressed the question of how organizational financial performance is or should be measured. Perhaps more importantly, none of these studies seem to have significantly influenced how organizational financial performance is actually measured in most of the empirical research that uses this construct as a dependent measure.

In 1985, Rawley & Lipson examined the relationships among several combinations of performance measures to demonstrate that different common measures of financial performance did not represent the same attributes. Of these comparisons, the only overall performance measures that they found to be related to each other at statistically significant levels were the Q ratio versus cash flow return on investment (“CFROI”) adjusted for the Capital Asset Pricing Model (“CAPM”) discount rate, and market-to-book value versus return on investment adjusted for inflation. The Q ratio was proposed by Callard & Kleinman (1985) as a substitute for Tobin’s Q, and is calculated as the ratio of the value of individual business units divided by the inflation adjusted purchase cost of assets. The other measures that they compared were clearly discriminant and do not measure the same construct. Table 1 summarizes their findings for the S&P 400 companies for the period 1982 through 1984.

---

Table 1 about here

---

Chakravarthy’s 1986 comparative study of seven “exemplar” firms with seven “maladapted” firms in the computer industry developed an eight variable discriminant function for the two groups. None of the individual profitability measures tested in this research was capable of discriminating between the two groups. The discriminant function developed included multiple dimensions of performance, once again indicating the importance of multivariate measures of organizational performance.

Using confirmatory factor analysis (“CFA”), Venkatraman and Ramanujam (1987) empirically examined the degree of convergence across methods of measuring organizational financial performance and in so doing, demonstrated that sales growth, profit growth, and profitability were discriminate measures of different dimensions of organizational financial performance. They selected these measures based upon a review of the different performance dimensions typically used by different disciplines done by Hofer (1983) and Woo and Willard’s (1983) findings of key dimensions of performance based upon an analysis of PIMS data. The implication of this finding is that in isolation, none of the three variables individually measure the organizational financial performance construct. Consequently, the findings from a study that uses sales growth to represent organizational financial performance should not be equated to findings from a study that uses either profit growth or profitability to represent business economic performance.

Brush and VanderWerf (1992) examined thirty-four different studies in the entrepreneurship literature that explicitly used firm performance as the dependent variable. They found that

thirty-five different measures of performance were used in those studies indicating that researchers perceived many different dimensions of performance, and that there was no agreement on what measures actually represent organizational performance. The most frequently used measures of performance were changes in sales, organizational survival, changes in number of employees, and profitability. Brush and VanderWerf state that they did not attempt to sort out the problem of which performance measures to use. However, they note that the fact that 35 different performance measures were used in just 34 studies indicates that more work needs to be done to identify measures that make sense for use across studies.

Robinson (1995) examined ten different new venture performance measures to determine which individual measure was the most effective in accurately assessing long-term economic value creation. The ten measures studied were change in sales, sales level, return on sales, return on invested capital, return on equity, return on assets, net profit, earnings before interest and taxes, earnings multiples, and shareholder value created. All ten performance measures were tested individually for their relationship with multiple independent variables that had been found in prior literature to have positive relationships to new venture performance. The shareholder value created measure (also commonly known as return to shareholders) was determined to be the most effective measure for effectively differentiating among new venture strategies, the second most effective measure for differentiating among the structure of the new venture's entered industry, and the most effective measure in differentiating among the interactions between new venture strategies and the structure of the industry the new venture entered. The fact that the different performance measures of overall new venture performance resulted in significantly different r-squares implies that the variables do not measure the same things.

Murphy, Trailer and Hill (1996) examined the variables used to measure organizational performance in entrepreneurship research in the years 1987 through 1993. They identified 51 articles published in the top entrepreneurship and strategic management journals that explicitly used firm performance as a dependent variable. They found, consistent with Brush & VanderWerf (1992) and Cooper (1993), that there was no consistency in the variables used to measure new venture performance. In total, they identified 71 different dependent variables used to measure performance in the 51 articles.

Murphy et al. then examined 19 financial variables from a sample of 995 public firms with 500 or fewer employees. They found that less than half of the intercorrelations between performance measures were significant, indicating that these variables measured different dimensions of performance. More than 25% of the significant correlations of performance measures were negative. Murphy, et al. concluded that the "...relationship between a given independent variable and performance is likely to depend upon the particular performance measure used." They further concluded "...research finding support for an effect on one performance variable cannot justify the assumption that the effect is similar across other measures of performance (1996: 21)." Their study also found that the performance measures tested failed to meet the requirements of convergent and discriminant validity necessary to validate a one-dimensional performance construct (Campbell & Fiske, 1959).

Next, Murphy et al. performed an exploratory factor analysis on the 19 variables, which yielded 9 factors that explained over 70% of the variance in the performance measures. In an attempt to more fully examine the results obtained by Murphy et al., we performed a confirmatory factor

analysis of the nine factors identified in their research, using LISREL 8.12 as suggested by Bollen (1989). The covariance data reported in the 1996 study was as the basis for the analysis.

The results of this CFA analysis indicated that the factors determined by Murphy et al. did not fit the data. The model yielded Chi-square = 1292 with 127 degrees of freedom ( $p < 0.0001$ ), Bentler and Bonnet normed fit index of .727 and a non-normed fit index of .657. This indicates that while the variables did load into factors, these factors may not be supported by the data. This is possible since exploratory factor analysis will force variables into the number of factors specified, even though the factors may not have the best possible fit for the data. Even if the data had fit the model, because the analysis was an exploratory factor analysis, there was no theoretical support for the identified constructs. Consequently, the variables within each factor, as determined by the exploratory factor analysis, fail the test for convergent validity using confirmatory factor analysis, and they also did not have any face validity.

It is clear from the prior empirical studies that there has been no consistency in the measures used to represent the construct of overall organizational performance in strategic management or entrepreneurship research. Further, prior empirical research has demonstrated that there are multiple dimensions to the performance construct. While Robinson (1995) found that return to shareholders was the most powerful individual performance with respect to new venture performance among companies that have undergone initial public offerings, these findings cannot be reasonably generalized to studies that use different samples. In short, there continues to be no conclusive research that has identified a “best” measure of overall organizational performance, nor has a measurement model that accurately represents the construct yet been developed.

## **METHODOLOGY FOR DEVELOPING & TESTING A MODEL OF ORGANIZATIONAL FINANCIAL PERFORMANCE**

Since no prior research empirically established the domain of organizational financial performance, this research was by necessity exploratory in nature. The process employed in this research for inferring a model of financial performance included four phases. First, a sample of public companies was segregated into high, medium, and low performers based upon both annual and three-year financial performance, as indicated by their return to shareholders over the specified period of time. Return to shareholders was previously found by Robinson (1995) to be the most powerful measure of organizational performance. Second, the high and low performing groups were compared using the financial measures most commonly used in past research and/or discussed in the entrepreneurship and strategic management literatures, for the purpose of identifying the specific measures that differentiated the two groups. Third, the variables identified that differentiated between high and low performing companies were grouped into constructs. Finally, the validity of these constructs was tested.

### **Developing a Sample**

The companies in the Standard and Poor's 1500 at December 31, 2002 (a combination of the Standard and Poor's 500, Standard and Poor's Mid Cap 400, and the Standard and Poor's Small Cap 600 indices) was the population of public companies used for this research. These companies include a wide cross-section of industries, organizational sizes, and organizational

ages. Four years of financial data was collected from the Standard and Poor's Compustat<sup>®</sup> database. One and three-year performance information was calculated from this data and any firm-year of data that was incomplete or contained significant outliers was eliminated from the final sample. The final sample included 2,894 individual firm-years of data and 925 three-year periods of data.

### **Developing a Sample of High and Low Financial Performing Companies**

The individual annual firm year and three-year periods in the sample were classified as high, medium, or low financial performance based upon return to shareholders. A firm was classified as high performing if its standardized value of return to shareholders was one or greater. A firm was classified as low performing if its standardized value of return to shareholders was negative one or greater. All other firms were classified as medium performing.

A total of 309 firm years were classified as "high", 321 firm years were classified as "low", and the remaining 2,264 firm years were classified as "medium". In the case of three-year period data, a total of 124 three-year periods were classified as "high", 143 three-year periods were classified as "low", and the remaining 658 three-year periods were classified as "medium".

### **Comparing the High and Low Financial Performing Companies**

The two samples of high and low performing companies were compared with respect to 20 of the financial measures most commonly used in past entrepreneurship and strategic management research and from the literatures of these fields. These measures were compared using *t* tests to determine if there was a statistically significant difference between the high and low performing companies with respect to each measure.

Those measures that indicated a statistically significant difference between the groups were retained for further evaluation in this research. Variables that did not discriminate between high and low financial performing companies were not utilized further. Each variable that was included in this research was evaluated both as a static value and for the change in the value over the period of interest to examine the relative information content of static vs. change scores.

### **Testing a Model of Overall Organizational Financial Performance**

Based upon the comparison of variables for their ability to discriminate between high, medium, and low performing companies, a set of variables was selected to measure each financial construct. The grouping of variables into financial constructs was based upon a review of accounting and finance literature (see Breley, Myers & Marcus, 2001; Copeland, Koller & Murrin, 2000; Penman, 2001). The combination of theoretical constructs and the variables used to represent the constructs became the model of organizational financial performance tested in the next stage of this research.

The validity of the constructs was tested using confirmatory factor analysis ("CFA") through the use of AMOS 5.0 structural equation modeling software (Bollen, 1989; Venkatraman & Ramanujam, 1987). The CFA framework uses a maximum likelihood approach to providing a statistical analysis of the entire validity of a construct and a decomposition of the measurement variance into its constituent components (Bagozzi, Yi, & Phillips, 1991). The proposed

constructs and their measures were tested for both discriminant and convergent validity. Those constructs or measures that were not found to be valid were eliminated from the model of organizational financial performance and a revised model was proposed.

## RESULTS

### Financial Measures That Discriminate Between High and Low Performing Companies

This research found that, for annual periods, thirty five of the forty financial performance measures tested discriminated between high and low performing companies at  $p < .10$ , using market adjusted return to shareholders as the basis for classification. For three-year periods, thirty two of the forty financial performance measures tested discriminated between high and low performing companies at  $p < .10$ . Table 2 summarizes the results of the  $t$  tests for the variables that did and did not discriminate between high and low performing companies for both annual and three-year periods.

---

Table 2 about here

---

One paradox of management research described by Cameron (1986) was that most empirical studies tend use measures and methods that explain average performance, while the primary focus should be on understanding what makes firms either very successful or very unsuccessful. It is, therefore, essential to select performance metrics that can discriminate sufficiently among companies that perform at different levels of performance. This study identified thirty two annual and twenty seven three-year financial performance measures that discriminated between high and low performing companies at  $p < .01$  with respect to market adjusted return to shareholders. Of these measures, those that provided the most information about the return to shareholders referent with respect to the sample of all companies, not just high and low performing companies, should provide the most statistical power for research where shareholder value creation is the phenomenon of interest.

### Tests of an Annual Model of Organizational Financial Performance

Figure 1 depicts the initial set of constructs that was tested for both convergent and discriminant validity for annual data. AMOS 5.0 software was used to test whether the annual data fit the proposed model. Constructs with only one observed measure were constrained to exactly equal the value of the measure, as suggested by Bollen (1989). The variance of each construct was constrained to unity so that the parameters for each observed variable could be freely estimated.

---

Figure 1 about here

---

The assumptions of structural equation modeling require that the estimated variance of each measure must be positive and the covariance matrices must be positive definite. Three fit indices, as recommended by Arbuckle and Wothke (1999), were chosen to determine if the data fit the model. The three indices included the comparative fit index (CFI; Bentler, 1990), the Tucker-Lewis coefficient (TLI; Bentler & Bonnet, 1980), which is also known as the Bentler and Bonnet non-normed fit index (NNFI), and the root mean square error of approximation (RMSEA; Browne & Cudeck, 1993). Arbuckle and Wothke (1999) suggest that a value of .90 or greater for both the CFI and the TLI indicates a reasonable fit of the data with a model and, an RMSEA value of about .08 or lower, but certainly no greater than .10 indicates an acceptable error rate for a model. Accordingly, a model that met all three criteria was considered to have an acceptable fit.

A random sample of 150 high performing firms and 150 low performing firms was used to test the model. This annual data did not fit the model as proposed in Figure 1, since the covariance matrix for the constructs that comprise the model was not positive definite. This indicates that there was a specification error in the model or that the sample size was too small (Jöreskog & Sörbom, 1996). As the sample in this case had 300 observations, it is reasonable to conclude that the model had a specification error.

An examination of the correlations between variables across constructs revealed that residual income return on investment (“RI ROI”) was more highly correlated with the profitability construct than with residual income (“RI”) in the economic value construct. The model specification error was eliminated by moving the RI ROI measure to the profitability construct. The revised model had  $\chi^2 = 2213.4$  with  $df = 334$  and  $n = 300$ . The CFI for the model was .83, the TLI was .78, and the RMSEA was .14. All three measures indicated that the data did not acceptably fit the model. Accordingly, the measures included in the model were reexamined to determine which should be kept and which should be excluded from a revised model.

---

Figure 2 about here

---

Figure 2 depicts the revised annual model of organizational financial performance that met the test for convergent validity of the measures with the separate constructs. As a result of these changes in the specification of the model, the data fit the revised ten-construct model. The model had  $\chi^2 = 405.4$  with  $df = 130$  and  $n = 300$ . The CFI for the revised model was .95, the TLI was .93, and the RMSEA was .08. All three measures indicate that the data fits the model. Accordingly, the model met the requirements of convergent validity (Arbuckle and Wothke, 1999; Bollen, 1989; Jöreskog & Sörbom 1996).

Using a confirmatory factor analysis framework, discriminant validity is achieved when the correlations between the separate constructs are statistically significantly lower than unity (1.0) (Bollen, 1989). Any correlations that appeared “high” were tested by setting the correlation between the two constructs equal to unity, and then testing the statistical significance of the change in  $\chi^2$  between the two models.

For the revised model, only two constructs, growth and growth change, were correlated in excess of 0.60. Accordingly, the correlation between the two constructs was constrained to unity and the model was retested. The result was  $\chi^2 = 414.0$  with  $df = 131$ . The change in  $\chi^2$  was 8.6 with  $df = 1$  and  $p < .01$ . Accordingly, for the revised model the constructs were found to be discriminant. All other combinations of constructs had correlations below 0.52, which indicates that all constructs met the requirements for discriminant validity.

In summary, ten of the original thirteen constructs and twenty of the original thirty measures were retained in the annual financial performance measurement model. It was also demonstrated that these constructs were discriminant and that the measures of the constructs met the test for convergent validity.

### **Tests of a Three-Year Model of Organizational Financial Performance**

Figure 3 presents a diagram of the initial set of financial performance constructs and their corresponding measures, for three-year data. The convergent validity of the measures for each construct was tested using confirmatory factor analysis, as was done with the annual data model.

---

Figure 3 about here

---

The three-year data did not fit the proposed model. The model had  $\chi^2 = 1013.2$  with  $df = 307$  and  $n = 120$ . The fit indices were  $CFI = .81$ ,  $TLI = .74$ , and  $RMSEA = .14$ . There were specification errors in the model, as indicated by estimated negative residuals for four measures including ROI, CROI, GR Sales, and COC. Consequently, adjustments to the base model were necessary, as was the case with the annual data model. Accordingly, the measures included in the three-year model were reexamined in order to determine which should be retained in a revised model.

As a result of the changes in the model specification, the data fit the revised, ten-construct model depicted in Figure 4. The model had  $\chi^2 = 212.1$  with  $df = 137$  and  $n = 120$ . The fit indices were  $CFI = .93$ ,  $TLI = .91$ , and  $RMSEA = .07$ . All three measures indicate that the data fits the model. Further, modification indices do not indicate any significant improvement in fit would be achieved by including a measure with an additional construct. Accordingly, the measures meet the requirements for convergent validity (Arbuckle and Wothke, 1999; Bollen, 1989; Jöreskog & Sörbom, 1996).

---

Figure 4 about here

---

As with the testing of the measurement model for annual data, any correlations between constructs that appeared “high” were tested by setting the correlation between the two constructs equal to unity, and then testing the statistical significance of the change in  $\chi^2$  between the two models. Two pairs of constructs appeared to possibly be “highly” correlated. They were the (1) change in profitability and the change in survival and (2) the cost of equity capital and the change in survival.

First, the correlation between the change in profitability and the change in survival was constrained to unity, and the model was retested. The result was  $\chi^2 = 251.1$  with  $df = 138$ . The change in  $\chi^2$  was 39 with  $df = 1$  and  $p < .001$ . Accordingly, the constructs were deemed to be discriminant. Next, the correlation between the cost of equity capital and the change in survival was constrained to unity and the model was retested. The result was  $\chi^2 = 230.0$  with  $df = 138$ . The change in  $\chi^2$  was 17.9 with  $df = 1$  and  $p < .001$ . Accordingly, for the revised model, the constructs were deemed to be discriminant.

In summary, ten of the original thirteen constructs and twenty of the original twenty nine measures were retained in the measurement model. It was demonstrated that these ten constructs were discriminant and that the revised set of measures of the constructs met the test for convergent validity.

### **Limitations of this Research**

Overall organizational performance is a multi-dimensional construct. This research only focused on one of the primary dimensions, namely financial performance. Operational and stakeholder dimensions were not examined. As a consequence, the relative importance of financial performance to the two other performance dimensions was not examined. A model of overall organizational performance that includes all major performance dimensions might require a different set of financial dimensions or different measures of the identified dimensions due to overlapping information across the higher order constructs.

An additional limitation of the research design was the selection of only two timeframes, one and three years. While these two timeframes are those most frequently used in entrepreneurship and strategic management research, 21% of the empirical studies summarized in this research used other timeframes, most notably single point in time measures and five-year measures. Also, the annual and three-year models of financial performance developed in this research were not the same, implying that different dimensions of financial performance are more or less important at different times. Accordingly, the generalization of the results of this research to other timeframes requires additional testing.

A final limitation of the research design of the study was the omission of risk from consideration in financial performance model. While financial risk is indirectly included through the calculation of the cost of equity capital, strategic risk was not calculated. Bromiley (1990) suggested that risk should be a component of the analysis of organizational performance. However, it should be up to the discretion of the researcher whether it is appropriate to capture the effects of risk as an independent measure or as a component of the dependent measure.

The sample utilized in this study limits the generalization of the findings in several ways. These limitations include: (a) only U.S. companies were included in the sample; (b) only publicly traded companies were included; (c) financial services firms such as banks and insurance companies were disproportionately eliminated from the sample because they did not report sufficient information to calculate the measures tested in this research; (d) only one three-year period was used to develop and test the three-year financial performance model; (e) the annual data was from the same timeframe as the three-year data; (f) one primary source was used to gather most of the financial data; and (g) the three-year sample did not include any companies that went out of business during the three-year period.

## **SUMMARY AND CONCLUSIONS**

For over fifty years, management scholars have suggested that organizational performance is a multi-dimensional construct. However, this is the first study that has undertaken to empirically identify both distinct dimensions of organizational financial performance and the measures that represent those dimensions. The identification of different dimensions and measures of financial performance for annual and three-year timeframes is also a unique contribution of this research.

### **Implications for Future Research**

This research empirically demonstrated that organizational financial performance is a multi-dimensional construct. Consequently, if the unit of analysis for a study is the entire organization, and if the phenomenon of interest is organizational financial performance, it is incumbent upon the researcher to consider the effects of the independent variable on multiple performance dimensions simultaneously.

However, if only one dimension of organizational performance is examined in a study, then it is inappropriate to claim to be studying the effects of the independent variables on “overall organizational performance”. In such situations, it would be more appropriate to specify the specific dimensions of organizational performance being studied, which would provide better context and understanding to readers of the research.

This research identified ten separate performance dimensions for both annual and three-year timeframes as well as multiple measures of these constructs. The theory being tested should help guide the researcher in selecting the dimensions of organizational performance to examine. Specifically, those dimensions of organizational performance that are hypothesized to create value for the constituents of interest should be used as the dependent variables. In general, dependent measures representing the phenomenon of interest should be selected with great care and a full explanation for the selection criteria should be provided for users of the research.

### **Implications for Management Practice**

Potentially the most important finding for practitioners is the fact that the changes in performance metrics are separate constructs from the static measures. Top management already places some emphasis on changes in performance metrics as demonstrated by the content of management discussion and analysis (MD&A) sections in annual reports and SEC filings. Typically, the change in performance period-over-period is the focus of MD&A. However, while changes may

be explained post hoc, management planning should focus on actions that accomplish organizational change.

Those performance metrics that have been shown in this research to discriminate between high and low performing companies should receive the primary attention of management and users of financial statements. Those companies that attain and sustain competitive advantage in the market do not strive to be average. Therefore, the metrics they use to gauge performance should focus on outcomes that set them apart from the competition.

**Abstract**

The aim of this research was to explore and identify the underlying dynamics of the women in business in the Sydney region. With the main focus on challenges and barriers, women in business face, in general and specifically with obtaining resources in the form of funding and support services as entrepreneurs.

This research spoke to 150 women entrepreneurs in the Sydney metropolitan area from August 2004 to November 2004 with the assistance of Australian Business Women's network.

The findings stated that the main challenge women entrepreneurs in Sydney faced were getting funding to start or grow their business. Access to capital was a serious issue for them and they have a hard time getting credit.

Another challenge was the conflict between work and family and they found it extremely difficult to obtain a balance and the commitment was huge. Managing business growth successfully, obtaining training and developing skills, finding and keeping qualified employees and keeping up with technology and other marketplace changes were the other challenges.

This unique paper presents the profiles of three women entrepreneurship in practice from amongst the 150 respondents. Based on the analysis and findings of this survey this paper puts forward "A Best Practice Business Support Model" for women entrepreneurs to launch and grow their own small business. This paper also recommends a public policy for its adaptation through local councils.

## **Abstract**

The aim of this research was to explore and identify the underlying dynamics of the women in business in the Sydney region. With the main focus on challenges and barriers, women in business face, in general and specifically with obtaining resources in the form of funding and support services as entrepreneurs.

This research spoke to 150 women entrepreneurs in the Sydney metropolitan area from August 2004 to November 2004 with the assistance of Australian Business Women's network.

The findings stated that the main challenge women entrepreneurs in Sydney faced were getting funding to start or grow their business. Access to capital was a serious issue for them and they have a hard time getting credit.

Another challenge was the conflict between work and family and they found it extremely difficult to obtain a balance and the commitment was huge. Managing business growth successfully, obtaining training and developing skills, finding and keeping qualified employees and keeping up with technology and other marketplace changes were the other challenges.

This is a unique paper that presents the profiles of three women entrepreneurship in practice from amongst the 150 respondents. Based on the analysis and findings of this survey this paper puts forward "A Best Practice Business Support Model" for women entrepreneurs to launch and grow their own small business. This paper also recommends a public policy for its adaptation through local councils.

## **Background**

Since its election to office in March 1996 the Howard government has suggested that policies designed to promote growth in the small business sector provide women with particular benefits and opportunities.

In March 1997 the Prime Minister stated that small business is the engine room of the Australian economy and a source of economic opportunity for women business. (Timms & Still, 1997)

Since then there has been a change in the women small business scene, as today Australian women constitute almost a third of people working in their business and have also outnumbered their male counterparts. (ABS, 2002)

Female participation in entrepreneurial activity rose sharply from 5.6 per cent to 9.6 per cent, not far below the 2001 level of 10.6 per cent. The proportion of female entrepreneurs to male entrepreneurs rose from 48 per cent to 71 per cent - the highest proportion in four year's of participation in GEM. (GEM, 2003).

More than 250,000 women are now running their business from home, an increase of more than 20% in the past five years according to Federal Government figures

Their contribution to the economy is estimated to be worth tens of billions of dollar. (Markson, 2004).

There can be little doubt that the women business community in Australia is making and will continue to make, unique and vital contributions to the nation's economic and social welfare. They are making a significant contribution to our national and local economy. Women in the Sydney region in Australia are a growing sector of the population, increasingly well educated and entrepreneurial against market norms, with a growing share of overall small business stock.

## **Introduction**

Throughout the world, women make a significant contribution to the entrepreneurial advantage of nations and women-owned businesses are critical to economic prosperity. A higher level of participation by women in the economic arena is associated with higher standards of living (Reynolds, Bygrave & Autio, 2004). Women in the USA are starting businesses at twice the rate of men (Delaney, 2003; Coleman, 2002). From 1987-1999 the number of women-owned businesses in the United States increased by 103 percent nationwide (Gundry et al, 2002). "Women's entrepreneurship is growing in OECD Member countries and around the world, with start-up rates outpacing the national average in several OECD member and non-member countries" (Koreen, 2000,). In Brazil, Ireland and Spain women are beginning new businesses at a faster rate than men, and are also expanding their share of business ownership. The OECD recognised the value to national economic growth of growing the female entrepreneurial sector, very often by identifying and removing barriers (Koreen, 2000).

New Zealand and Australian data are consistent with the growth of women's entrepreneurship. In New Zealand the number of female employers and self-employed has doubled over the last 30 years (Ministry for Economic Development, 2004). In Australia,

the participation rates for men have declined, while the rates for women have been on the increase. In 1971, 89% of mature age men (aged 45-64 years) were participating in the labour force, i.e. were either employed or unemployed, decreasing to 77% in 2001. At the same time, the rate for mature age women increased from 32% to 58%. This increase for women reflects changes in society and the economy such as a general acceptance of women in the work force, and an increase in the availability of flexible and part-time work, influenced by the growth of service industries such as finance and tourism, allowing women to participate in paid work while raising children. (Bureau of Statistics, 2003)<sup>1</sup>

Women entrepreneurs are under-researched in the entrepreneurship literature, in general. A 1982 to 1995 review found only .007% of articles (22 out of 3206) focused on women entrepreneurs (Baker et al., 1997). A second 1995 to 1997/98 review found .06% of articles (28 out of 435), across 6 journals and one proceeding, focused to some extent on women entrepreneurs (Brush & Edelman, 2000).

Notwithstanding the limited number of research studies on women entrepreneurs, there are many “myths” relating to women entrepreneurs. The US Diana project (Brush, Carter, Gatewood, Green, Hart, 2001) examined 8 myths relating to women entrepreneurs. These myths are being explored all around the world. Recently a similar study was undertaken in Canada (Menezies, Brenner & Jacques, 2003) the same study was also undertaken in Belgium. (Cornet & Constantinidis, 2003). This research was part of a wider research project on women's entrepreneurship in Belgium. This project, called “The Diane Project”, took place within the framework of an equal opportunity action and aims to enquire whether there are any specificities in female entrepreneurship and if necessary to point them out.

To enhance the growth of entrepreneurship we need to improve knowledge about women entrepreneurship, by gathering and analysing a range of statistical information across a range of sectors. (OECD, 2000)

Besides acquiring data and statistical information it is crucial to understand these women in business through qualitative researches as each individual case tells her own story and gives researches an insight into the unique situation and problems faced by the women in business.

## **Research methodology**

Research methodology included two parts. First, a qualitative research concerning the targeted public- women entrepreneurs operating in the Sydney region has been conducted. In this phase 40 individual semi structured face-to-face interviews were conducted with existing businesses, operating in areas such as Liverpool, Bankstown, Parramatta, Hills and other business districts in Sydney. Telephone interviews were conducted with bank managers and support agency staff where applicable to get information on the differences if any in the number of loans granted to male entrepreneurs and female entrepreneurs and also

---

provision of service to male and female businesses. In the second phase a detailed questionnaire was sent to a diversified sample of 150 women entrepreneurs in Western Sydney.

In the last phase, again focus group discussions were conducted to ascertain that findings are not generalized. Assistance was provided by the “Australian Business women’s network” <http://www.abn.org.au/default2.htm> and the Chambers of Commerce for obtaining respondents data.

Research papers on women entrepreneurs at conferences present data analysis without giving a real picture of the real women in real businesses. This qualitative paper aims to put forth the case studies of these real women in real business in their own words to understand the real problems and presents some real solutions, which can be implemented by policies through the local councils.

## **CASE STUDY**

The existence of women entrepreneurs or even women in the workplace is an idea that once was not common. Many women including at least one of the women which we interviewed faced much resistance and the often heard of glass ceiling while trying to further their career. As times changed, the idea of women entrepreneurs became more recognized and accepted, although it is still a problem within some countries. Fortunately, we live in a society now that promotes women having a career, and in some cases such as those discussed within this report, very successful businesses of their own.

Businesses within multiple industries were contacted for this survey ranging from smaller retail outlets, to restaurants, mechanics shops and even privately owned hostels. It was at this point contact was made with three women entrepreneurs, June Hibbard, a real estate agent who now owns and operates her own agency, Karen Makin, an optometrist who after years of working as a fill in doctor for many organizations purchased her own practice, and Marina O’Neill, a creative woman with a storied background who stumbled across an entrepreneurial opportunity by accident while renovating her own kitchen and has turned this into a growing successful business. These women provided great insights into some of the trials and tribulations of starting and operating their own business.

### **CASE 1: KAREN MAKIN**

Karen has a rather interesting story to tell about how she came to choose the career path she did. As a high school student Karen didn’t really have any idea in relation to where she wanted to go after she graduated high school. Having done exceptionally well in all of her classes it left a lot of doors open for her in regards to universities. When it was time for Karen to choose what sort of course she wanted to take her exact words were: “I just sort of fell into optometry”. She didn’t really have much more of an explanation than that other than it was something that she thought she might enjoy it.

After graduating from university Karen went to work at a couple of different jobs locally before packing up and heading off to England and worked in the optometry area there for a

couple of years. When she finally returned home she had no plan and no idea of what to do. So she went back to work just doing some small jobs locally again. Things started to come together for her when after she started working at OPSM. She was working part time there but she was putting her education to use, by doing eye tests and things like that. She's wasn't sure whether or not it has changed since she worked at the OPSM, but when she was working optometrists weren't hired, they were licensed. She didn't like it there very much because she wasn't involved enough in the entire business.

### **Makin - Optometry**

So when she heard about an optometrists business coming up for sale from a friend of hers in the industry she went and checked it out. This was an already fairly well established business that the current owner was just getting out of. It took some financial support from her parents but she bought the business in early June of 2001. After she purchased the business she moved it to a better location and changed the name. She didn't move it very far because it was already close to the area where she lives and that was one of the main reasons she bought it in the first place. She changed the store when she moved and made it look more appealing and tried to get the business more widely known to get more people through the door. Karen's sister is also in the business with her putting the glasses together and dealing with the accountants. Karen is the sole optometrist in her business, which makes her presence at the store crucial. She bought another store close by after her first one was established. She made it very clear that she was not buying any more as she had a great difficulty obtaining finances for buying the second one as the bank kept asking her to add her husband as a partner in the business to obtain more funds.

Karen is also a single mother and it's made it difficult for her to divide up her time between her kids and her business. Having a family that she was the sole provider for made it even more crucial for her new business to be successful. Being a single mother Karen said does take up a lot of her time so she doesn't have time for herself. Karen told us that it took roughly two and a half years before her business started to pay off financially but now it's hard for her to take time off. When she's sick or goes on vacation she needs to find a replacement optometrist and according to her that's not an easy task. She does really enjoy owning her own business though, she mentioned how she enjoys the flexibility of being her own boss and the control over where you want your business to go, and there's a much greater sense of achievement at the end of the day as well. Karen also likes the fact that she's making money for herself and not making money for someone else. She also added that one should have their head checked before entering into a business like hers where you end up doing a lot more work for not that much extra money. The parts of her business she doesn't overly enjoy are the 46 to 48 hours a week she puts in, the extra responsibilities, not to mention all the paper work and book keeping she needs to do. There's also the dealing of staffing issues, and as mentioned before the fact that she's the only optometrist and has to find a replacement when ever she can't be there. Karen also went into a bad-staffing issue she had not that long ago. It was a young woman she had hired to work the front counter and it was just by chance Karen discovered how this young woman was acting when none of the other employees were around.

Karen said that when she first opened the business she had no strategies for evaluating their success and that was one big failing they now see. She told us that they had a business plan but didn't follow it, they sort of set up some basic practice management, and with the

computer system they have now they can track their sales and things like that, but they really had no direction and no idea as to where they needed to be.

Then last December her company joined a student business program of some sort that involved five other optometry practices. These optometry practices get together once in a month to discuss problems and ideas. Karen says it's really got them back on track, they're tracking things, and they know where they're going. She also told us they now have budgets and goals and can compare themselves with other businesses.

Karen also gave us a bit of insight to what she thought she could have improved upon in running her business. She first talked about how she would have liked to learn more about business. Karen feels very strongly that there should be somewhat of a business course offered along with the optometry course. She says since there are so many optometrists that go into business for themselves' it would be a good idea, or at least those who plan to go into business for themselves should take a business course first. In regards to running her business she mentioned, if she could do it over again she would go back and make sure to have a good business plan and stick to it. She said she would also pay better attention to budget, and would learn more about employing and keeping staff.

Karen feels comfortable now with how her business is being run, and she happy with the staff that help her run it. Expanding the business is something she implied but isn't putting too much thought into, because of the difficulty of obtaining funds and she enjoys being a smaller business. It allows her to be better oriented towards the people in her community, family and friends and that's the way she wants to keep it.

## **CASE 2: MARINAL O'NEILL**

Marina Isles - Unique Architectural Hardware is a small, family operated business located in the industrial district of Castle Hill. Originally founded in 1993, it remains a small establishment, however substantially larger than its humble beginnings being operated from the home of Marina O'Neill. The story of the business and how it has developed is an interesting one, although an equally intriguing story is how Marina O'Neill herself came to be a small business entrepreneur.

### **Background**

Marina comes from a strong Italian up bringing; from this she gained a set of values and views all to her own, and her strong interest in horticultural activities became more evident. But she describes her life as being pre-determined by her parents, father in particular. Belonging to the very traditional Italian background, it was believed that women did not need education, nor to work, however she began to work in the banking business, the industry in which her father worked. She slowly began to climb the corporate ladder, picking up education and valuable training along the way, proving she was a capable person in this industry. She says that as bad as it sounds, there was a glass ceiling, a level within a company that women could reach and go no further. She finally was fed up with the politics and realized she did not enjoy where her career was taking her, so simply left. At this point her life took a sharp turn, she began pursuing an acting career, which she describes as being very difficult in Australia, so when her husband was transferred to New York, she and her children moved as well, this gave Marina the opportunity to expand her acting credentials to levels difficult to reach in Australia. It was at this point that acting began to take more and

more of her time, which meant her children were suffering the most, being left with caregivers for much of the day while she and her husband worked... She chose her children and says she has no regrets whatsoever regarding this. Following this she returned to Australia with her family and briefly contemplated the idea of opening a restaurant, realizing this would quickly be a seven day a week job, she realized again where her true interest laid, horticulture. Wondering why she never thought of working in this industry before, she quickly began earning her way with this business, while still having the time to spend with her children during their important years.

From this point she continued the horticultural business to some success, but inspiration comes from all around, and it was a home renovation project rebuilding their kitchen that gave her the inspiration to open the business she runs to this day. When building her cabinets the sometimes arduous task of choosing those small details, the handles and door-knobs. Wanting to have something unique to herself and not a mass produced product found in most stores, she proceeded to design her own and search for someone to produce it. From this point came the realization that if she wanted something unique and new, she was most likely not the only one. From this point door-to-door visits began to find people who were willing to either purchase, or display one of the products they designed and produced. Once she realized that there would be a demand for her handles she decided to put into motion the beginnings of what is now known as Marina Isles – Unique Architectural Hardware.

### **Marina Isles – Unique Architectural Hardware**

When the first order arrived to her local home she and her husband were ecstatic; they were excited that their business venture might be a success. They received two orders their first month of being open it was barely enough to pay for the expenses yet Marina and her husband found strength and the motivation to carry on. She has shown a great deal of resiliency in the past she did not feel it was going to be any different when she started this venture.

As business grew Marina, came across many obstacles; an initial problem was finding suppliers who would be willing to produce small batches. Many suppliers would only manufacture a minimum of 10,000 units; this was an unacceptable number for such a small family based company.

Another issue she faced when Marina started to produce more products and become more popular was with suppliers once again. She found it hard at first to identify the truthful and straightforward suppliers from the untrustworthy and misleading suppliers. The problem she was having was manufacturers were giving her lead times that were not consistent. This reflected poorly on her company and its reputation. With Marina Isles – Unique Architectural Hardware growths being slow yet steady they were able to iron out the supplier issue before it became an extreme problem. They were able to keep the suppliers that were accurate with their time frames and discard the suppliers who were unable to deliver the goods in a timely manner.

### **Goals and Objectives**

When Marina, started this company she really had no goals in mind. She did however, have hope, and she hoped people would like her product. This hope has fueled both her and her husband to go to great lengths to see the success of this company. They had an objective

when they started to not have a debt that was not manageable. They did not want any banks telling them what they had to do and they did not want to be forced to have any worries about paying their debtors. Their decision to sell their home to purchase their building in which the company operates shows a great deal of dedication to the company. Not many people would be willing to part with something as large as a house to see a vision to fruition. Marina and her husband both have the hearts of true entrepreneurs.

As the company has grown Marina, has reevaluated her company and has decided that she does want to become an international company, they have built a web site in which products can be ordered and shipped around the world. Marina would like to see some small operations start in North America along with Europe. The key with this would be to stick with the core philosophies of being a small company that deals with small quantities of products with little to no mass production and a product that is unique and specific for its design. She would like to expand, but only if she would be able retain the control she has now. A fear of having people tell her how to run her business is a fear she has always dealt with. People lose sight of their goals and values in the light of expansion and growth, which is why she has grown slowly since the birth of her business. However, realizing that growth is a by-product of a well-run company, she also is happy to grow slowly.

### **CASE 3: JUNE HIBBARD**

Baulkham Hills Real Estate is located on Seven Hills Road in Baulkham Hills, New South Wales. When the business first opened in 1998, Principal and Licensee June Hibbard wanted “to create a culture within the organization of trust and commitment” (Baulkham Hills PRD, 2004). It is a franchise of PRD nationwide, and is owned by June Hibbard in a partnership with her sister. While June is involved in the daily operation of the business, her sister has a weekly job elsewhere. Her involvement in the business is limited to helping out with open houses on the weekends and the business’ accounting. The rest is up to June and her staff.

#### **Background**

June Hibbard’s original plans for life after high school were to become a secretary. She also wanted to have a family, which may have originally influenced her career plans. Upon completion of high school, June enrolled in a TAFE secretarial course and began work for the PRD nationwide franchise in West Pennant Hills as their secretary. While June was happy working as a receptionist and secretary, she began to realize that as a secretary her income was going to always be limited. There was an urge to expand her skills and moneymaking ability and when the opportunity for going into sales came up, she jumped at the opportunity. After completing a real estate licensing course, she began selling real estate for the West Pennant Hills office. Due to her strong sales skills, developed from a previous job selling office supplies, she quickly excelled at real estate sales. After about ten years of experience in the real estate industry with West Pennant Hills PRD, she reached a point where she had become bored with what she was doing. Looking for a new challenge, June began to conjure up ideas of going into business for herself. After making the decision to go into business, June began researching where she would like the

business to be located. Baulkham Hills was the obvious choice as there was no PRD nationwide franchise currently there and she wanted to continue with the same franchise she had worked with in the past.

When the time came to open the business, she tried getting finances from banks but to had to face a lot of bureaucracy, so June and her sister provided all of the initial capital from their savings and from their paid mortgage for the startup. June had a chance to sit down with her previous boss and plan out the kind of budgets that were needed on a monthly basis. They also determined the goals the business needed to reach each month in order to keep the business going. June admitted that she did not do much planning for the business beyond the budget making.

When the business started out, June was working 12 to 14 hours a day and usually six or seven days a week. She quickly realized she was not going to have as much free time as she had thought. More recently, June works about 50 hours a week, and has more time to attend dancing and kickboxing classes in her spare time. After the business was on its feet, it took about six months to make a profit. The reality of the real estate business is that you may not make a sale for quite some time after the business has opened, possibly six weeks. Even after the first sale has been made, the sale still has to settle, so it could take three or four months before the business receives any money from the sale.

June found that being a new business owner was tougher than she imagined. She found it to be a struggle learning how to run the business on a day-to-day basis, including learning about taxes, payroll, and trust accounting. Trust accounting is the holding of other people's money when the business takes a deposit on a property. It requires the money to be deposited into a special account and there is a lot of software to go along with it that needs to be learned. Although June's sister looked after the accounting for the business, they also had an accountant that they called in to check the books when needed. June's franchise is involved in a group with other franchise owners who get together once a month to discuss things in the industry and talk about common problems everyone is facing. The group then discusses how they can overcome those problems. The franchise owners also give each other advice and explanations on how to run the business based on what they've done. Some of these meetings also include training sessions where franchise owners can learn how to do property auctions or property management for rental properties.

June believes that location is one of the business' strong points, as it is located at a very busy intersection in Baulkham Hills where plenty of people can browse her rental listings and see her signage. She meets and networks with the other bcal PRD franchises each Tuesday night to look at each other's properties that they have for sale that might fit one of her clients. Her business is a very small franchise, but the size of the business has not stopped June from achieving success in the real estate market. Among her notable achievements is an industry gold award, which recognizes a high level of sales for her office, and award she considers to be the reward for everyone's hard work.

### **June Hibbard's Management Ideals**

June was able to learn a lot of management ideas from one of her previous employers. The man she worked for was very tough in how he ran his business and June felt it was a good experience to learn both what to do and what not to do in situations. While she didn't agree with some of his ways, he was one of her stepping-stones to her becoming an entrepreneur. One of June's favorite parts about the real estate business is that she can put some of her

own ideas into practice and run the business the way she wants to run it. With her sister being more of a silent partner, it allows June to have the freedom to develop her own philosophies.

One of June's major on-going goals with the business is to be able to get the staffing to a level where she does not have to be at the office every day. She is currently still trying to find two or three people who she can feel comfortable with leaving at the business that she knows will be doing what they are supposed to be doing without her needing to check on them to see what's happening.

June believes that selling real estate is harder than other sales industries. Another problem with real estate sales is a lack of motivation. Many salespeople don't want to do prospecting, which consists of knocking on doors or making phone calls to try and find people who want to buy or sell a house.

June believes that attitude is the most important trait that an entrepreneur must have when starting a business. This statement also goes for her employees. If they have a poor attitude, they are hard to train because they think they know everything. It may also result in the employee being rude to the customers, which is not good for business in a sales environment. Beyond the few courses that must be completed before getting into real estate, June believes the knowledge and the experience will come with practice, and that attitude is still the most important. Her advice to aspiring entrepreneurs is that you need to work in and obtain experience in the industry that you are starting a business in. She has found that a lot of people, who have never worked in the industry that they are trying to start a business in, are normally the ones who go broke first. Those people don't know how to deal with the problems they encounter because they have never experienced them before.

The biggest reward for June has been the fact that she has owned and run her business successfully since its inception because she knows that most people don't make it that long in business. The profits over that time have also been very rewarding, as any entrepreneur would agree.

June has thoroughly enjoyed her experience as an entrepreneur and is very glad she went through with it. Over her time as an entrepreneur, she has learned a few lessons. Her greatest lesson has been how to communicate with other people. There have been times where she has blamed staff for a failure, but maybe she had played a more major part in the failure because she did not communicate to them what she wanted correctly.

### **Recommendations**

Some recommendations that we would have made to these entrepreneurs when they started their companies was to have apparent goals that were set within the birth of each organization and that they had better planned, for the beginning of their company.

Another recommendation would be to have a contingency plan in place when starting their business so that they would be more flexible. Through all three interviews, there was evidence of a lack of a structured business plan and contingency plans. We feel that those plans are integral parts of a successful business and should be the focus of an aspiring entrepreneur.

It is also advisable to get into a business at as early an age as possible. This allows time to learn and work toward success when you have fewer attachments and people dependant on you in your life, such as a spouse and children.

A critical factor that must be carefully considered before opening the business is capital. An entrepreneur must ensure that they have enough back-up cash to get them through the first year. Many businesses do not prepare for the lack of cash flow in the first few months and run out of money before the business gets off the ground. It was also noted by some of the entrepreneurs we interviewed that you must remain focused and smart with your money.

Businesses always go up and down, and it can be very easy during one of the 'up' phases to get caught up in it and start spending money, then the 'down' period will arrive and you will not have to capital to sustain yourself.

An issue raised by some of the entrepreneurs was staffing, this seemed to a universal problem for the business that had hired people outside their family. The ultimate goal is to hire good people, so one must evaluate the criteria in which they hire a person. It is one thing to be a good judge of character, but it is another to be able to pick a person on their skills and abilities.

These women have all done a very excellent job with their businesses thus far, and all have excellent outlooks on the way things are progressing. The keys points to a successful business are attitude and knowledge, be smart with decisions and you can be successful, just as these three women have proven. Obstacles will come along that need to be overcome; there will be the periods where you question whether it is all worth it. But the gratification, the freedom and the feeling of accomplishment when your business succeeds will make it all seem worthwhile.

During the survey, the respondents that would assist women to unlock their potential as entrepreneurs made many additional points. Recommendations include: (a) The establishment of support agencies and advisers; (b) the provision of accessible childcare facilities, (c) the removal of the discrimination against women in the Australian finance sector; (d) providing access to training specific to women and their needs, on-the-job training, the changing of community attitudes which work against women in business; (e) attempts to improve business networks small businesswomen and (f) conducting more research into women in small business (including immigrant small business women).

This paper found that difficulties facing the potential and the current small businesswomen can be divided into two areas: (a) barriers affecting women considering or planning a career in small business and (b) problems experienced by women managing their own business. We are now familiar with these problems, issues and challenges faced by the women in business... The question therefore is how we can overcome the issues highlighted above.

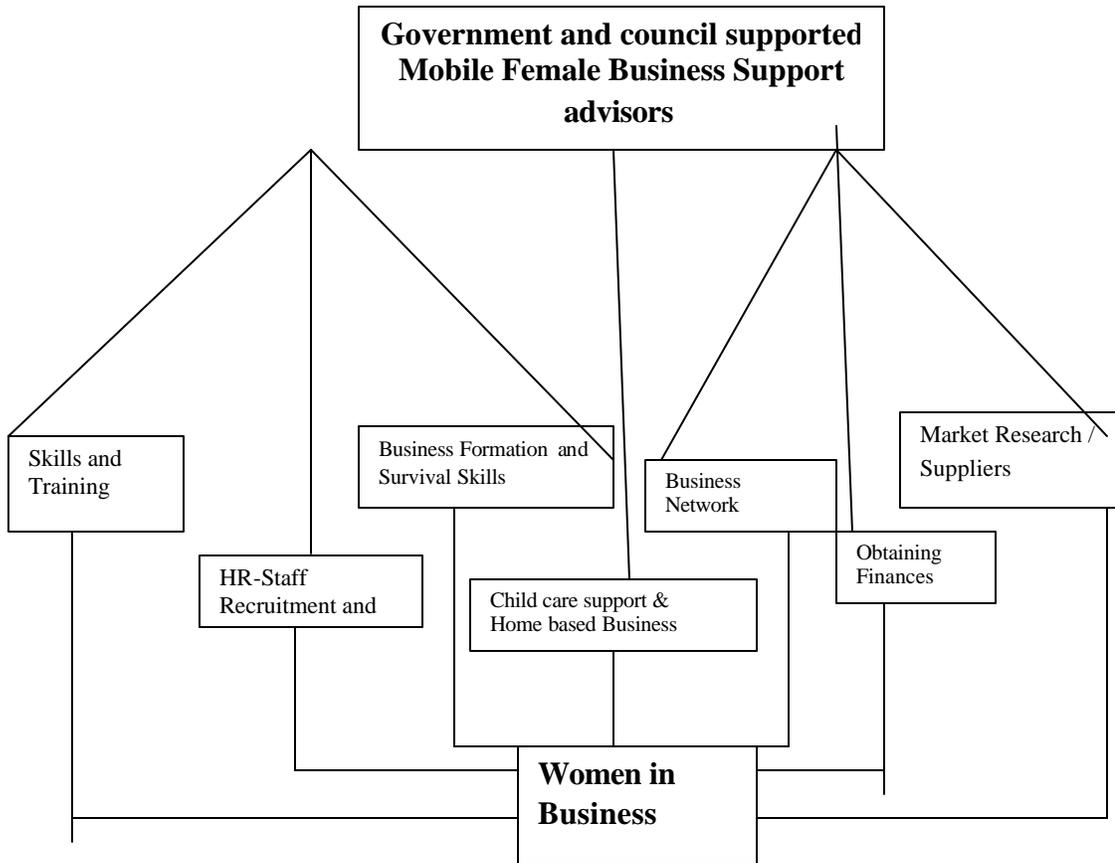

This paper recommends a unique best practice model through the appointment of "Mobile Female Business Support Angels" who will provide customized support to women in business and is also a partner in the mainstream support structure, thereby helping to inform policy and develop appropriate strategy enabling the development of this sector of businesses. These Angels will also play an important part in government policies by coming up with policy implications for the development of women in business.

Mobile, female, dedicated support business advisors who are sensitive, multiskilled business advisors with mainstream networks in place. These advisors will represent these women to banks for loans and assist with other support services.

These mobile female business support officers would provide support in the areas of obtaining skills and training, child care responsibilities, obtaining finances, business

formation and survival, business networks and mentoring and to home based business women.

### BEST PRACTISE MODEL - WOMEN IN BUSINESS

**PUBLIC POLICY FOR ADAPTATION BY THE LOCAL COUNCILS:**

## **Skills and Training Needs**

One of the major concerns raised by women in small business is the lack of appropriate and suitable training. One of the most common causes of business failure has been identified as poor business planning, lack of business plans or under-developed business plans and unclear goals. National and state industry training plans and Australian National Training Authority by Industry Training Advisory Bodies and State Governments should address the training needs of women employed in small business;

Providers of training should be encouraged to specifically design their training offerings in ways that will enable women to participate; Training designed for employees in small business be flexibly delivered to enable participation by all workers, including women with family responsibilities; and Programs should be marketed to women. Local councils should sponsor such training programs and provide them at subsidized rates.

## **Carer Responsibilities**

One of the concerns in both establishing and operating a small business, and as an employee in small business, is childcare and other carer responsibilities. The issue of available adequate and affordable childcare is, for many women, one of the reasons for setting up in business at home. Many industries are now setting up child minding facilities in the workplace and are adopting a more flexible approach to working hours. Investment in childcare is regarded as a benefit and not a cost and government through councils should provide adequate support services to women in business and also cash rebates to them.

## **Obtaining Finance**

Historically, women's access to finance has been an area of concern and is generally perceived to be one of the main barriers to be overcome by women in establishing and operating a small business. Recommendations are: Financial support for small business to obtain advice on financing options; and Improved availability of finance to women small business through council networks with banks for assistance to women in business.

As part of the White Paper initiatives, the Government in Australia also did expand the number of places in the New Enterprise Incentive Scheme (NEIS) available to unemployed women wanting to establish businesses. Participants selected for the scheme receive training and support to establish their businesses, policies likewise should be implemented by each individual council to improve the rate of women in business.

## **Business Formation and Survival**

Women are often not seen as 'real' business operators. Women generally tend to establish or operate small businesses in areas where they have worked and gained expertise as employees.

To assist women to make informed choices about small business ownership and to increase women's awareness of the financial and business services and support available to small business, the councils should undertake a public information campaign. The campaign should be specifically aimed at:

- a) Potential female small business owner/managers;
- b) Girls in schools, to assist them with career choices, including in nontraditional areas such as manufacturing; and
- c) Suppliers of financial and business services to small business to raise awareness of women's success in small business.

The campaign should utilise media which have a large following amongst the target audience.

### **Business Networks and Mentoring**

It has been observed from the 3 cases as well as from our survey that business networks and mentoring arrangements are widely regarded as effective, valuable sources of business advice and training and an important means by which business activities and practices are improved and developed leading to improved competitiveness and growth. Anecdotal evidence suggests that women are more prepared than men to take advice and learn from others, and in many cases actively seek such advice. However, it can be difficult to identify reliable channels and sources of advice. A major constraint to women's involvement in more formal networks is time.

Recommendations were that small business owner/managers work very long hours and are not able to access formal networks unless meetings, etc. are held at a suitable time, in an informal setting and possibly with childcare provided within their local councils at no cost. These factors need to be taken into consideration to encourage women to access networks and mentoring arrangements. There is a need to ensure that there are sufficient women involved in the operation and delivery aspect of these schemes so that other women are encouraged to participate in them, regional networks; common interest support networks (such as networks for rural women); support mechanisms for women making the transition from being employees to managing their own businesses; and related mentoring mechanisms. Appropriate other technologies should also be investigated to electronically link networks.

### **Home-Based Employment**

The reasons for women turning to home-based employment are similar to those reasons for entering small business generally. However, some specific reasons for women seeking home-based employment are: Ability to combine work and family care responsibilities; desire for flexibility; and desire to run business and avoid overheads involved in leasing premises; there is a need to promote the establishment and access of supportive networks, such as through existing women's associations, particularly for self-employed women operating home-based enterprises.

Some other recommendations for these women are an open learning program. This program should particularly assist the large numbers of women working from home.

A network should be formed specifically for these women as they have no chance of interacting with similar such women in business. A website can be dedicated to accessing support services for women working from home which would have its link on the local council's website.

### **Conclusions:**

This paper has focused on real women and real businesses and focused on real problems and tried to put forth real solutions to them via the analysis of the three case studies.

There still remains a great deal of confusion and contradiction about the factors that contributes to women's success in small business. Further research and study into the role of women, as employers and employees in small business and the documentation of effective models need to be conducted to understand that story.

In addressing the important issue of women and small business this paper hopes that it will encourage the pursuit in greater depth of the issues that have emerged as priorities. It is also hoped that it will act as a catalyst for the suppliers of financial and other business services to improve their marketing and targeting of programs.

**FACTORS OF E-COMMERCE ADOPTION IN MINORITY-OWNED  
VERY SMALL BUSINESSES**

by

## INTRODUCTION

The small business community has a significant impact on the American economy. According to the SBA (2002), small businesses represent 99.7 percent of all employer firms in the United States, employ half of private sector employees, generate 60 to 80 percent of new net jobs and are employers of 39 percent of high tech workers. Small businesses are the principle source of new jobs in this country, and they generate more than 50 percent of the private sector gross domestic product.

As we study the continued influence of small businesses, it is critical that we evaluate the impact of the technological revolution on these important enterprises. The Internet has changed the way we do business. Now, the small business owner can make the “playing field” more level through the use of e-commerce. But, how has the decision to adopt e-commerce been incorporated by the minority business community?

A recent search of the Infotrac Business Index ASAP, covering the last 20 years, identified 547 refereed journal articles on “electronic commerce and business,” six refereed journal articles on “electronic commerce and small business,” and no refereed journal articles on “electronic commerce and minority business.”

The Hudson Institute’s *Workforce 2000* (1987) study indicated that beginning in the year 2000, minorities would represent the largest group of new entrants into the workforce. Further, the growth of minority entrepreneurship has grown significantly over the last 20 years; minority share of U.S. businesses has increased to 15.8 percent from 14.6 percent just between 1997 and 2003 (Hisrich, 2004). Given the increase and expected continued increase of the minority population in the United States, according to the 1999 Global Entrepreneurship Monitor, (GEM,

1999) based at the Babson College, the development of minority-owned business is critical to the stability and growth of our economy.

Based on these crucial concerns about minority business development, its role in the minority communities, and its impact on the American economy, this study seeks to identify the factors that significantly influence the adoption of e-commerce in minority-owned small businesses (MOSB).

## **LITERATURE REVIEW**

Clearly e-commerce has changed the way commerce is conducted all over the world. Prior research has identified a number of factors affecting the adoption or growth of information technology (IT) in small businesses. Baker (1987) analyzed the factors that seemed to influence the implementation of IT in small businesses. His analysis indicated that lack of knowledge of new technology significantly hindered the adoption of information technology in both the manufacturing and professional service firms. Lees (1987) studied the development of information systems (IS) in small businesses. He found that availability of in-house IT expertise, good vendor support, and larger firm size are positively correlated with successful development of IS. His research is supported by the finding that company size and understanding of the potential of e-commerce are positively correlated with the adoption of e-commerce as a business strategy (Radovissky and Hedge, 2004).

Delone (1988) investigated the factors that affect the successful use of IS by small businesses. His principle findings showed that chief executive knowledge of computers and involvement in computerization leads to more successful computer use in small manufacturing firms. Montazemi (1988) surveyed the factors affecting IS satisfaction in the context of small

business environment and concluded that intensity of computer literacy, presence of a systems analyst, and end user involvement are related to IS success.

Palvia and Jackson (1990) examined the adoption and use of IS in very small businesses. Their findings showed that the most important factors related to IS in very small businesses include: size of the business, age of the business, general education of the owner/manager, and the computer knowledge of the owner/manager. Yap et al. (1992) conducted an empirical study of key factors associated with IS success in small businesses. They reported that IS success is positively associated with consultant effectiveness, level of vendor support, sufficiency of financial resources, level of CEO support, and level of user participation.

Cragg and King (1993) inspected IT growth in small firms and found that owner enthusiasm toward technology, relative advantage (savings in time and efforts, and economic benefits, etc.), consultant support, and competitive pressure motivate growth. Inadequate resources, particularly in the form of finance and managerial time, and limited internal expertise discourage growth. Lacovou et al. (1995) examined major factors that influence the adoption of electronic data interchange (EDI) in the small business context. The level of financial and technological resources of the firm, competitive pressure, imposition by trading partners and perceived benefits were identified as the major factors that influence small firms in adopting EDI. Igarria et al. (1997) analyzed the factors affecting the acceptance of personal computing in small firms. They found that perceived usefulness has a significant influence on system usage, while internal support and internal training do not. Prekumar and Roberts (1999) researched into the state of use of various communications technologies and the factors that influence the adoption of these technologies in small businesses located in rural communities. The results indicated that relative advantage, top management support, organizational size, external pressure

and competitive pressure are important determinants of adoption. Lee and Runge (2001) examined the drivers of IT adoption for small retailers and reported that the degree of Internet adoption was strongly related to the owner's perception of the relative advantages of using IT.

Based on the studies cited above, it was concluded that the factors that may affect the adoption of IT in a small business include (1) imposition by trading partners, (2) age of the business, (3) firm size, (4) general education of the CEO, (5) CEO's knowledge of IT, (6) CEO enthusiasm toward technology, (7) in-house IT expertise, (8) financial resources, (9) competitive pressure, (10) relative advantage, (11) vendor support, and (12) consultant effectiveness. But how do minority businesses respond to these factors? These twelve factors are examined for e-commerce adoption by MOSB firms in Northern Virginia .

## **METHODOLOGY AND FINDINGS**

### **Data**

In March 2004, four-hundred questionnaires were mailed to MOSB firms located in the Northern Virginia metropolitan area. The names and addresses of the firms were extracted from the Minority Vendor List maintained by the Department of Minority Business Enterprise, Commonwealth of Virginia.

The questionnaire asked the firms to answer questions on imposition by trading partners, the age of company, number of employees, and the CEO's Educational level. The firms were also requested to evaluate factors 5 through 12 using a seven point Likert-type scale ranging from very low (weakly, negatively) to very high (strongly, positively). A total of 68 questionnaires were answered and returned by the respondents. This is equivalent to a response rate of 17 percent. Five of the 68 questionnaires were incomplete. After discarding such

questionnaires, we had 63 usable questionnaires. Thirty nine (62 %) of these 63 companies had adopted e-commerce whereas 24 (38 %) had not.

### **Profile of Businesses**

The respondents to our survey are very small. The number of employees ranges from zero to forty and the median is six. They have been in business from two to thirty years and the median number of years in business is eight. In terms of type of business, professional services are the main business activity of 81% of the firms responding; followed by other services (16%), and trade (3%).

### **Findings**

The data concerning the trading-partner imposition and e-commerce adoption for each of the 63 respondents are given in Table 1. Since the measures are both dichotomous and since two cells have an expected frequency of less than five, the Fisher's exact probability test was employed to test the null hypothesis that the adoption of e-commerce is independent of the imposition by trading partners. Table 1 reveals that only six (9.5%) firms were pressured by their trading partners to adopt e-commerce, all of them, however, embraced e-commerce. The finding indicates that though imposition by trading partner is not a common phenomenon, it is a determinant of e-commerce adoption when it occurs. The Fisher's  $p$  of 0.048 confirms the validity of the inference.

The finding also reveals that despite the efforts of the federal government to reach out to small businesses, the small minority business community has not successfully taken advantage of business opportunities offered through government contracting. SOMB firms could be more successful were they to exploit government contract opportunities.

---

**Table 1 about here**

---

To begin the investigation of the influences of the other eleven factors on the adoption of e-commerce, univariate independent sample t-tests were conducted to determine if the means of the 11 other factors were significantly different between the adopters and non-adopters of e-commerce,. The results are shown in Table 2.

Table 2 shows that the mean age difference between adopters and non-adopters is minimal, indicating number of years in business is not related to the use of e-commerce. Financial resources were also found not to be significantly different between the two groups implying they are no longer an inhibitor for MOSB firms to adopt e-commerce. The possible causes include the availability of powerful computer hardware, the user friendliness of ready-to-use software, and the declining prices of both hardware and software (Palvia & Jackson, 1990). Vendor support and consultant effectiveness did not differ significantly either. While the findings concerning external support are contradictory to some studies (Lees, 1987; Yap et al, 1992), they are consistent with others (Delone, 1988; Raymond, 1985).

---

**Table 2 about here**

---

Seven factors were found to be significantly different between the two groups and are displayed in bold font. The seven factors are size of company, the CEO's educational level, the CEO's knowledge of IT, the CEO's enthusiasm, in-house IT expertise, competitive pressure, and relative advantage.

A shortcoming of the univariate t test (and other univariate approaches) is that it ignores the correlations among the variables. The multivariate approach takes correlation into account by incorporating the covariance matrix into the test statistic. The correlation matrix of the seven factors that may affect the adoption of e-commerce are shown in Table 3. Many of the correlation coefficients are significant at either 5% or 1% level of significance, indicating a multivariate approach should be employed to investigate the seven factors further.

-----  
**Table 3 about here**  
-----

Because Multivariate discriminant analysis is the appropriate statistical technique for testing the hypothesis that the group means of a set of independent variables for two (or more) groups are equal (Hair et al, 1998), it was selected to further analyze the seven factors. Discriminant analysis involves deriving a variate, the linear combination of multiple independent variables, that will maximize the separation between the group means relative to the within-group variation.

The suggested minimum ratio of observations to independent variables, and the minimum number of observations per group for discriminant analysis are 5 to 1 and 20, respectively (Hair et al, 1998). Our sample of 63 observations for 7 independent variables meets the suggested minimum ratio by providing a 9-to-1 ratio. Both groups also exceed the minimum size of 20 observations per group. A step-wise procedure, with the selection rule of maximizing the Mahalanobis  $D^2$  between groups and a maximum significance value of 0.05 to enter, was used to derive the discriminant function. Table 4 provides the overall stepwise discriminant analysis

results after all the significant variables have been included in the estimation of the discriminant function.

---

**Table 4 about here**

---

To assess the predictive accuracy of our discriminant function, the classification accuracy of our model was compared with two chance models: the proportional chance model and the maximum chance model. The formula for the proportional chance model is

$$C_{\text{pro}} = p^2 + (1 - p)^2$$

where

$$p = \text{proportions of firms in group 1}$$

The calculated proportional chance value is 0.528 ( $0.619^2 + 0.381^2 = 0.528$ ).

The maximum chance measure is simply the percentage correctly classified when all firms are placed in the larger group. Because 61.9 percent of the firms are adopters, the maximum chance value is 0.619. Because the maximum chance value is greater than the proportional chance value, our model should correctly classify substantially more than 61.9 percent of the cases.

Table 5 lists the cross-validated classification result of our model. In cross validation, each case is classified by the functions derived from all cases other than that case. The correct classification rate provided by the resubstitution method is not reported here because it has an upward bias. A *t* test ( $t = 2.599$ ,  $df = 62$ ,  $p < 0.01$ ) shows that the classification accuracy of 77.8 percent of the discriminant model was significantly higher than the maximum chance criterion of 61.9 percent and confirms the validity of our discriminant model.

---

**Table 5 about here**

---

The Wilks'  $\lambda$  shown in Table 4 was highly significant (0.000) indicating that the vectors of means of the three variables – relative advantage, in-house IT expertise, and CEO's educational level – differ significantly between the adopters and non-adopters. Multicollinearity precludes the other four variables from entering the model, but that does not necessarily mean that they do not have significant effects. This can be determined by evaluating their corresponding discriminant loadings. Discriminant loadings (also referred as structure correlations) are the simple correlations between the discriminant function and each of the independent variables. Loadings are considered relatively more valid than weights as a means of interpreting the discriminating power of independent variables, and any variables exhibiting a loading of  $\pm 0.30$  or higher are considered substantive (Hair et al., 1998). Table 4 shows that relative advantage is the most significant factor in determining the adoption of e-commerce.

A rational adoption decision would involve the evaluation of the relative advantage. The highly significant positive correlation between CEO's enthusiasm and relative advantage (see Table 3), and their substantive loadings confirming that the higher the relative advantage of e-commerce is perceived, the more enthusiastic the CEO is, and the more likely e-commerce will be adopted. The extremely high correlation (0.925) between competitive pressure and relative advantage indicating that the higher the relative advantage is, the higher the competitive pressure is, because relative advantage also applies to competitors.

It may become a strategic necessity to adopt e-commerce to compete in the market place. The CEO's knowledge in general and in IT is also found to be positively associated with the

adoption of e-commerce. The CEO is the key to perceive the relative advantage. External IT expertise is no substitute for the CEO's knowledge because the CEO is the person who understands the factors which are critical to the business' success and the areas where the IT will have the best payoff (DeLone, 1988). Moreover, The CEO's low level of knowledge may discourage others from exploring possibilities (Cragg & King, 1993). Our data also suggests internal IT expertise is an important factor in the adoption of e-commerce and is positively related to the CEO's IT knowledge, the CEO's enthusiasm, relative advantage, and competitive pressure. Internal IT expertise helps the CEO to perceive and realize the relative advantage as well as minimize the risk of adopting e-commerce. Firms that do not have the IT expertise may be unaware of new technologies or may not want to risk the adoption of new technologies (Premkumar & Roberts, 1999).

## **IMPLICATIONS**

The results of this study have important implications. The respondents to our survey are located in the Northern Virginia area which has been infused with high-technology firms over the last 20 years. They are the minority businesses that are more likely to adopt e-commerce and pursue government contracts than the other minority businesses. This study found that 62 percent of them use e-commerce which is only four percent higher than the SBA's finding that 58 percent of small businesses used e-commerce in 2002 (SBA, 2002). It is safe to conclude that the other minority businesses are possibly way behind. Moreover, the fact that only six out of 63 firms were pressured by their trading partners to adopt e-commerce indicates minority businesses have not successfully accessed government contract opportunities. A study developed by Innovation & Information Consultants, Inc. (2004), contracted by the SBA Office of Advocacy, concluded that policies should be developed to ease the interface process between small

businesses, and particularly small minority businesses, and government contracting. The government needs to reach out to the minority business community. Government employees could provide very specific training for small minority owned business and help them to understand the process and how to use it. Our findings support the conclusions of Innovation & Information Consultants.

The situation is not one-sided, however; we encourage small minority businesses to research *and persistently pursue* business opportunities with the government and other businesses. Student internships and coops can be a very strong source of identifying such opportunities. Through their entrepreneurship centers and small business development centers, local universities and colleges can provide a wealth of resources to small minority businesses. Small minority business owners need to be encouraged to join *and utilize* local and national organizations that provide access to business opportunities, e.g., the Minority Supplier Development Council.

Our data also suggest that CEO's knowledge in general and in IT, as well as internal IT expertise help the CEO to perceive the relative advantage, and the higher the relative advantage of e-commerce is perceived, the more enthusiastic the CEO is, and the more likely e-commerce will be adopted. Clearly education underlies the adoption of e-commerce. Chen et al. (2002) have suggested that to meet the computer training needs of minority businesses and the others, universities and colleges should offer courses in a short, intensive format with a duration of just one or two days, in addition to the evening-and-weekend format. In terms of meeting the needs of the small business firms for consulting, colleges should encourage the faculty to lend their expertise on a pro bono basis. As an incentive, colleges may recognize the consulting efforts of the faculty as a service to the community, by giving them credit at the time of annual

evaluations. Of course, if the colleges decide to charge the companies for their services, the rates must be affordable.

## **CONCLUSION**

This study has investigated the effects of twelve factors on the adoption of e-commerce by MOSB firms and has found significant results for seven of the twelve factors: imposition by trading partners, general education of the CEO, CEO's knowledge of IT, CEO enthusiasm toward technology, in-house IT expertise, competitive pressure, and relative advantage. The results suggest that MOSB firms have not successfully taken advantage of government contract opportunities and that education underlies the adoption of e-commerce. Policies need to be in place to ease the interface process between small businesses, and particularly small minority businesses, and government contracting. To meet the education and consulting needs of small businesses, universities and colleges should offer courses in a short, intensive format with a duration of just one or two days, in addition to the evening-and-weekend format, and offer professional services through their entrepreneurship centers and small business development centers.

## **ABSTRACT**

This paper examines the development patterns and performances of companies founded by Asian American entrepreneurs in Silicon Valley and compares them with those of companies founded by non-Asian Americans. We find that companies founded by Asian Americans tended to have more Asian Americans in the executive team than those founded by their counterparts. Asian American ventures were more likely to secure venture capital and strategic investments from Asia-based companies and less likely to obtain strategic investment from US-based corporations. In spite of the differences in management composition and financing patterns, the two groups show no systemic difference in founder equity share or company valuation at IPO. We also find little statistical difference in the time to IPO (time from company founding until reaching IPO) or post-IPO performances between the two groups.

Keywords: Asian American Entrepreneurs, Silicon Valley, Social Capital Theory

# **DEVELOPMENT PATTERNS AND PERFORMANCES OF ASIAN AMERICAN-FOUNDED VENTURES IN SILICON VALLEY**

## **INTRODUCTION**

Asian American entrepreneurs, particularly those in high technology, have made a significant contribution to the Silicon Valley economy over the last three decades. By the late 1990s, Chinese American and Indian American entrepreneurs were running 29% of technology firms in Silicon Valley, accounting for more than \$19.5 billion in sales and 72,839 jobs (Saxenian, 2002a). Furthermore, Asian-American entrepreneurs have been critical in building a bridge between the US and Asian economies, successfully managing otherwise culturally and linguistically complex business relationships (Saxenian, 2002b).

Nevertheless, extremely little research exists in management literature on the experiences of Asian American entrepreneurs or the performances of their companies. We know very little about their experiences on such key issues as access to venture funding, ability to recruit, and effectiveness in raising capital in the public market. We have virtually no information about their companies' growth patterns or performances. A better understanding of their experiences and strategies could provide useful insights for other minority entrepreneur groups and perhaps all entrepreneurs.

This paper examines the experiences and performances of Asian American-founded ventures by addressing the following questions:

- Do Asian American entrepreneurs exhibit significant differences in hiring patterns that may (or may not) impact company performance? For example, do they hire more Asian Americans than non-Asian American founders do?
- Do ventures founded by Asian Americans have access to the same level of venture capital and strategic investments as those founded by other entrepreneurs in Silicon Valley? If not, where and how do they obtain the needed venture financing?
- Do Asian American entrepreneurs maintain the same level of (equity) ownership as their counterparts at the time of their IPOs? Are there differences in ownership due to their inability to raise capital or any other challenges they face?
- Do Asian Americans take about the same amount of time to grow their companies (e.g., as measured by time to reach an IPO) or are their performances vastly different? At the time of IPO, are Asian American ventures as valuable as other companies?
- Do companies founded by Asian Americans exhibit the same level of short term or long term performance as those founded by non-Asian Americans?

## **LITERATURE REVIEW**

Extremely little research exists in management literature on the experiences of Asian American entrepreneurs or performances of their companies. In fact, Cheng and Thatchenkery (1997) note that "Asian Americans have hardly been studied by organizational science scholars." Most of the traditional work on Asian American entrepreneurs have been sociological or historical in nature and have explored such issues as exploitation or the impact of immigrant entrepreneurship on the broader society. (Portes & Bach, 1985; Light & Bhachu, 1993). Even the more recent entrepreneurship literature on Asian Americans mostly examines small businesses in low-skilled professions (Bates, 1999; Park, 2001).

A few researchers have compared entrepreneurial activities of different racial or ethnic groups from sociological and public policy perspectives. Bates (2000) conducts statistical analysis to compare and contrast the self-employment experiences of Asian immigrants to US-born African Americans. Fernandez and Kim (1998) analyze inter-group differences in self-employment rates and business activities of four different groups of Asian immigrants. While these publications present examples of successful inter-group comparisons, they measure and compare sociological variables.

Some regional studies have examined certain ethnic groups' entrepreneurial activities in a particular city or region. Halter (1995) presents a collection of essays on ethnic entrepreneurs in the Boston area, and Park (1996) and Saxenian (2002) study skilled Asian immigrant entrepreneurship in Silicon Valley. While both Park (1996) and Saxenian (2002) provide valuable demographic information and sociological insight, they do not examine the issues from a management viewpoint.

An area of research highly relevant to our paper, which has gained significant attention in management literature in recent years, is the social capital theory (Nahapiet and Ghoshal, 1998; Florin et al. 2003; Bosma et al. 2004). Social capital theory is founded on the premise that a network provides value to its members by allowing them access to the social resources that are embedded within the network (Bourdieu, 1985; Seibert, Kramer, & Linden, 2001). In the context of entrepreneurship, social capital is believed to be useful in the same way that financial capital is for initiating, creating and building a business (Lin, 1999). Indeed, there is growing evidence that social capital has a significant impact on the performances of entrepreneurial companies. It has been shown to play an important role in the survival of small businesses (Granovetter, 1984), growth of firms (Ostgaard & Birley, 1994), companies' ability to accumulate financial capital during its growth stages (Florin, 2003) and organizations' competitive advantage (Nahapiet and Ghoshal, 1998).

## **SOCIAL CAPITAL THEORY AND HYPOTHESES DEVELOPMENT**

Our core thesis is that Asian American entrepreneurs, many of whom are first or second generation immigrants, may not have access to the same level of social capital as non-Asian American or "mainstream" entrepreneurs in Silicon Valley.<sup>1</sup> Thus, although we are examining only those ventures that were entrepreneurially successful (as measured by reaching an IPO), we suspect that we may still observe notable differences in their development patterns and performances. We formalize our thesis in the next 6 sets of hypotheses.

First, Asian American entrepreneurs may differ from others in whom they found their companies with or whom they hire as executives. Granovetter (1973) and Seibert et al. (2001) find that people tend to hire others from their social and business networks. We posit that Asian American entrepreneurs have more other Asian Americans in their social network than non-Asian Americans, and vice versa. Thus, our first hypothesis:

H1: Companies founded by Asian American entrepreneurs have more Asian Americans on the executive team than do companies founded by non-Asian Americans.

Ventures accumulate financial capital during their pre-IPO growth stages to survive and fund development (Dean & Giglierano, 1990; Starr & MacMillan, 1990). Florin et al. (2003) show that social capital can affect a venture's ability to accumulate financial capital during its growth stages. Given their limited connection with the mainstream business community, Asian American entrepreneurs are likely to face greater difficulty in raising capital. As a result, Asian American entrepreneurs might be forced to surrender more of the equity stakes of their companies.

H2a: Asian American founders will have lower equity ownership at the time of IPO than their counterparts (non-Asian American founders).

H2b: Venture capital companies will have a larger share of the equity in companies founded by Asian Americans than in companies founded by their counterparts.

We conjecture that some of the Asian American entrepreneurs will be able to leverage their social capital to obtain financing from Asia-based venture capital firms or large corporations, which non-Asian entrepreneurs might not have access to. On the other hand, Asian American entrepreneurs may face more difficulty in raising venture capital and strategic investments from US-based firms:

H3a: Companies founded by Asian American entrepreneurs more commonly obtain venture capital/strategic investment from Asia-based firms/corporations than do companies founded by their counterparts (non-Asian American founders).

H3b: Companies founded by Asian American entrepreneurs less commonly obtain venture capital/strategic investment from US-based venture capital firms/corporations than do companies founded by their counterparts.

Zhao and Aram (1995) argue that businesses with less diverse networks may grow more slowly. Florin et al. (2003) in a study of 275 ventures that went public shows that social capital leverages the productivity of a venture's resource base and provides the venture with a durable source of competitive advantage. Based on such findings, we conjecture that companies with stronger social capital will grow more quickly and experience a shorter "time to IPO" – the time between the date of company founding and the date of its IPO.

H4. The time to IPO is longer for companies founded by Asian Americans than those founded by their counterparts (non-Asian Americans).

Companies with more social capital, and thus those with a stronger organizational competitive advantage and other aforementioned benefits, will likely be more valuable. Indeed, Florin et al. (2003) have shown that social capital can affect a venture's ability to accumulate financial capital in an IPO. Thus, our hypothesis:

H5. Company valuation at IPO is lower for companies founded by Asian Americans than those founded their counterparts (non-Asian Americans).

We hypothesize that companies with greater social capital will perform better even after the IPO. Companies with larger IPOs would leverage their expanded financial base to

fuel continued growth. In addition, Florin et al. (2003) show that social capital can affect a venture's performance two years after its IPO. Thus, our final hypothesis:  
H6. Post-IPO performances of companies founded by Asian American entrepreneurs are inferior to those of companies founded by their counterparts.

## RESEARCH METHOD

We obtained data from the Securities Data Corporation (SDC) database a list of 6,201 companies in the US that went public in the 10-year period from January 1, 1992 to December 31, 2001. We narrowed down the list of our sample using the criteria that the companies

- Were located inside the traditional definition of “Silicon Valley”(displayed in Table 1).
- Were in specific high tech areas, i.e., semiconductor, software, and computer components whose SIC codes are listed in Table 2.
- Had complete SEC S-1 filing documents available.<sup>2</sup>

Our final sample is composed of 214 Silicon Valley companies – 75 Asian American-founded and 139 comparable non-Asian American-founded ventures that fit the above mentioned criteria. We defined a company to be “Asian American” when one or more of their founders were Asian American. We defined companies as “non-Asian American” when none of the founding members were Asian American. In reality, very few companies had multi-ethnic founding teams consisting of both Asian Americans and non-Asian Americans.

---

Insert Table 2 here

---

## RESULTS

Table 3 organizes our sample into two groups, Asian American (AA) and non-Asian American (Non-AA), by the year of their IPOs. The share of Asian American IPOs appears to be on an upward trend from 20% in 1992 to more than 40% in 2001.

---

Insert Table 3 here

---

To test for hypothesis 1, we examine the composition of Asian Americans listed as executives in the S-1 filings. Table 4 shows that the percentage of Asian Americans in executive management was dramatically higher among Asian American-founded companies (34.48%) than in non-Asian American-founded companies (2.35%). Even excluding the founders, the composition of Asian Americans in management team was significantly higher for Asian American founded ventures (16.09 vs. 2.35%). Hypothesis 1 is supported.

---

Insert Table 4 here

---

Next, we examine the founders' ownership level of the company at the time of IPO. Our analysis suggests that the differences between the two groups are not significant, as shown in Table 5. We also measure the venture capitalists' share of the companies'

equity at IPO, also displayed in Table 5. Again, we find that the differences between the two groups are not statistically significant. Neither Hypothesis 2a nor 2b are supported.

---

Insert Table 5 here

---

Table 6 divides the major sources of funding into four categories, US strategic investors, Asian strategic investors, US venture capitalists and Asian venture capitalists. Interestingly, 30% of Asian American ventures received financing from Asian venture capital groups, while none (0%) of the non-Asian American ventures did. Some of the Asian American ventures obtained strategic investments from Asian corporations (12%), when very few non-Asian American companies did (1%). A slightly lower percentage of Asian American-founded companies obtained US venture capital (84% vs. 96%), although the difference was not statistically significant. On the other hand, Asian American founded companies were much less successful in receiving strategic investments from US corporations (26.0 % vs. 44.9%). Thus, Hypothesis 3a is supported and Hypothesis 3b is partially supported.

---

Insert Table 6 here

---

Our results in Table 7 show that the aggregate average time to IPO of 5.6 years for Asian American companies is lower, not larger, than that of the non-Asian founded companies of 6.2 years. The difference is not statistically significant. Hypothesis 5 is not supported.

---

Insert Table 7 here

---

Table 8 compares the valuations of companies at IPO for the two groups. While the t-tests do not produce any statistical differences, the Wilcoxon signed rank test identifies systematic differences in two of the ten years: In 1999, the non-Asian American firms had a higher valuation while in 2000 Asian American firms had a higher valuation. In total, it was the Asian American-founded ventures that had a higher valuation at IPO – mostly due to year 2001. Thus, our results do not support Hypothesis 6.

---

Insert Table 8 here

---

Table 9 examines the post-IPO performances of the 2 groups. Table 9 displays the short term (12-month) share price performances of the companies after going public. Data for the stock prices are obtained from a database provided by Center for Research on Stock Price (CRSP) of the University of Chicago. As reported in Tables 9, neither the t-test nor the Wilcoxon signed rank tests find any significant differences in short term share price performance. Overall, hypothesis 6 is not supported.

---

## **DISCUSSION AND CONCLUSION**

Our results show that there are distinct differences in terms of how companies founded by Asian American entrepreneurs in Silicon Valley develop in comparison to those founded

by non-Asian American entrepreneurs. We learn that Asian American founders were more likely to hire other Asian Americans as executives while it was almost impossible for Asian Americans to be recruited by companies not founded by Asian American entrepreneurs.

While the two groups exhibit notable differences in the acquisition patterns of human and financial resources, we find little systematic difference in the performance of the companies in terms of time to IPO, valuation at IPO or post-IPO performance. Our results indicate that social capital may indeed play an important role in recruiting and receiving financing - activities at the earlier stage of a company's development. However, social capital appears to have less impact on company performance as the company develops and grows. Among the ventures that are successful enough to go public, founders' ethnicities seem to make little difference.

Our findings raise additional interesting research questions with respect to the acquisition of human and financial resources. For example, it would be interesting to learn why and how our Asian American entrepreneurs received financing from Asia-based companies. We are not sure if Asian corporations provided better terms or whether they were the only source of investment for our Asian American entrepreneurs.

It should also be noted that we examined only a small subset of the Asian American companies in Silicon Valley – the ones that have successfully gone public. For example, we do not know for certain whether the financing patterns or relative performances would be similar among companies that were not able to reach IPO. Future research should include these firms as well as conduct a longitudinal study of ventures to understand the decision processes and growth patterns of Asian American entrepreneurs more closely.

## **ENDNOTES**

1. According to Statistics: Joint Venture's 2004 Index of Silicon Valley, the largest population in Silicon Valley is White, non-Hispanic with 44% followed by Asian Americans who are 26% of the population. We assume that most of the non-Asian American entrepreneurs are mostly “mainstream” in terms of ethnicity. We later question this assumption.
2. S-1 is a document filed with the Security Exchange Commission (SEC) in preparation for an IPO which reveals information about a private company. S-1 filings provided our research with important information, including who the founders were.

**Korea's Regional Industrial Promotion Projects(RIPPs)  
and Regional Innovation Agency(RIA)**

Choi, Yong-Ho and Hwang, Woo-Ik

**(Abstract)**

Korea has gone ahead with various regional industrial promotion policies for the nation's balanced development and strengthening national competitiveness through the development of regional industry. In Korea's regional economy, small & medium size enterprises (SMEs) are very important. Therefore one of the major regional industrial promotion policies in Korea to build up a foundation for SMEs-focused technological innovation is the regional industrial promotion project (RIPP) as an example. This project promotes the development of regional SMEs-focused industry by selecting a strategic industry which has great potential for growth in each region and then helping it form an industrial cluster. This study suggests the functions and roles of the Regional Innovation Agency (RIA) as an organization to promote the success of RIPPs in Korea. Korea's RIPPs, in the first stage, supported textile, shoes, optical, mechatronics industries in four provinces for five years from 1999 to 2003 with the funds of 1,897 billions won (US \$1,897 millions). In the second stage, they have carried out new projects in nine provinces from 2002, and further some follow-up projects in four provinces from 2004. This study suggests that the RIA should strengthen its role through overall management of RIPPs. In addition, the necessity of expanding it into the planning and adjusting organization of regional industrial policy is raised. For the RIA to accomplish this, the systematic accomplishment of several functions such as planning & adjusting, evaluating & managing, networking, and clustering is required.

## **I. Introduction**

Since the 1990's, Korea has pursued a knowledge-based economy on the basis of the foundation of globalization, localization, and information-ization. The government has set the goal of becoming one of four largest economic countries in the world by 2010, and for that, has set the goal of realizing annual 6% growth of GDP and GNI of 30,000 dollars. Korea's economy has secured its status as the 11th biggest power by the GDP standard in 2003 with a rapid development through compressed growth for the past 40 years. As an industrial development strategy to realize these visions, the government has converted its industrial vision from a factor-driven stage into an innovation-driven one.

One of the major problems in the Korean economy is the population concentration in the metropolitan area centering around Seoul. Inactivity of local economy in the industrial section has contributed to population concentration in the Seoul metropolitan area, and has become a primary factor detrimental to the heightening of national competitiveness. To solve these problems, the Korean government has enacted various policies for local industrial development; location support like developing industrial complex, financial support, technology-innovation support, human resources development support, and marketing support program for local small & medium size enterprises (SMEs) by central & local governments. One of the major regional industrial upbringing policies is the regional industrial promotion projects(RIPPs). The greatest problem in Korea's regional industrial policy may be the shortage of a planning project of local government itself due to the high weight of central government-leading projects. The second problem is that the system to adjust and evaluate various support policies for local enterprises by central government, which have been enforced in the various regions, is insufficient.

This study considers the performing situation and the problems of the RIPPs, one of major policies for promotion of local SMEs, and proposes a direction for the function expansion of the Regional Innovation Agency(RIA), a planning, adjusting, evaluating, and managing organization to guide these projects.

The purpose of Korea's RIPPs is to promote the growth of local SMEs-centered industry by choosing a strategic industry having high possibility of growth by each region and then providing a support to the formation of an industrial cluster by central government. This project has been carried out in 13 provinces, except for the capital area, among 16 metropolitan cities and provinces throughout the country. In 4 of the 13 provinces the project has entered its second stage; in the other 9 provinces the first stage project is still in progress.

RIPPs have not been rated very high in terms of their performance even though they have been carried out with the intention to provide support for an epoch-making growth of regional strategic industries by providing technology innovation and administrative support to regional enterprises. This critical evaluation is mainly based on the poor linkage system of the planning function and evaluation management in carrying out the project.

To solve this problem and to perform the function of planning & evaluating management of RIPPs in 9 regions which were initiated in 2002, RIA was established in each metropolitan city and province and is currently ongoing. However, there is still much criticism concerning the project performing system and the roles of the Agency, and a specific performance has not come out because its experience of operation is not long. The current study suggests a desirable operational system and the role of the Agency through literature and case study about clustering theory and a regional industrial adjusting organization. Especially, it would like to search for a scheme for strengthening the roles of the Agencies not only as simply a planning and managing organization of RIPPs but also as a synthetic planning and evaluating organization of regional

industrial innovation and technological innovation policies in preparation for decentralization in the long run.

## **II. A Theoretical Background of Regional Industrial Promotion and Case Study**

### **1. A Theoretical Background of Regional Industrial Promotion**

Korea's RIPPs initiated in 1999 are based on clustering-based, innovation-driven type, and industrial development strategy, which is focused on concentrating all-out efforts of the region for high-tech, high value added, high productivity. And Korea's RIPPs stresses a close partnership between enterprises and government, and the construction of a knowledge network in the Industry-University-Research Institute (KIET, 2003).

Clustering theory, as suggested by M. Porter and M. Enright et al., asserts that clustering has a significant influence on innovation-performing ability of enterprises. A regional industrial policy employing clustering approach concentrates specific value chain production bodies within the region and then constructs an industrial environment in which they can speed up innovation through learning by interaction, while correcting market and system failure.

For earlier studies concerning clustering strategy, see the theoretical discussion based on a flexible production method (Hwang, Woo-Ik, 2003). Theories about the clustering and enterprise environment for industrial growth after Fordism, include new industrial space theory, district theory, milieu innovator theory, clustering theory, regional innovation system theory, and learning region theory. These above theories have stressed these characteristics: against the concepts of traditional industrial complex, the clustering of a specialized industrial field, professional SMEs, a developed network among enterprises, and the mixture with various city

industrial activities. These flexible production system theories start from Marshall's industrial district theory.

Industrial district (or new industrial district, industrial clustering) refers to a close network constructed between the enterprises of a special industrial field and their related activities. This network involves not only professional enterprises but also the related universities, research institutes, producers' services, city infrastructures, etc. That is various related activities within a specific district provide support to multi-kind, small-amount production system through interaction and then create a clustering economy(Kwon, O-Hyuk, 2003).

Therefore, for the cultivation of SMEs and then, through it, for the development of local industry, new industrial districts or cluster construction is needed. The clustering is induced by markets; here the role of government is to promote this cluster-formation process through indirect support, not direct intervention: concretely, to help develop a self-regulating control structure and inducing system to reform the market & system failure detrimental to the formation of cluster(KDI, 2001). For the innovation of cluster and the revitalization of a network, an organization to conduct the planning and adjusting work of regional innovation in direct or to execute it as an agent should be established.

In a successful clustering, the roles of the major constituent members is clearly divided into a vision provider; a system organizer, and a specialized supplier (Bok, Deuk-Kyu et al. 2003). Here, a member in charge of the role of vision provider shows a difference according to the type of cluster; sometimes a university and research institute may take charge of the role or a large size enterprise or local government may do it. This study examines the role of the regional development agency (RDA), as a vision provider or a planning organization for clustering.

## **2. Regional Industrial Promotion and the Operational Cases of RDA**

For the formation and revitalization of an industrial cluster, the role of government and public organization as a facilitator for the formation of a cluster and network is needed. Because competition among districts has intensified and a rapid conversion into knowledge-based society occurred, the roles of a intermediating organization to plan, devise, carry out a policy have come to the fore as an important task. This intermediating organ is commonly called as a Regional Development Agency; RDA. Because its role in the construction and improvement of regional innovation system (RIS) has been stressed, it has received a great deal of attention recently from scholars and policy decision-makers. RDA can be defined as a intermediating organization that deal with the tasks concerning a specific industrial field or regional development (EURADA, 1999), and even though the purposes of its establishment show little difference according to political, social, and economic conditions by nation or region, it is generally the same on that point of raising intrinsic development ability of the region, and the agency has been mainly operated by local government. RDAs have become pivotal intermediating bodies for regional innovation structure in several nations in Europe including Italy, Austria, and Germany where decentralization of power have been successfully made (Lee, Chul-Woo et al. 2003).

Let us examine the operational cases of RDAs in England and of Emilia Romagna RDA in Italy to obtain some points of suggestion about the performing system and the roles for the cluster planning organization in Korea's RIPPs.

### **1) England's RDA**

England's RDAs were established in 8 provinces throughout the country in April 1999, and further in London in July 2000 (Webb & Collis, 2000). These bodies are not called RDAs

however, they can be called regional RDAs for convenience. The object of RDA is to facilitate regional development by conducting a mediating role so that the existing projects in local, central government level can be carried out consistently; that is, its purpose is to play the roles of the central body in devising, adjusting, and carrying out of a strategy and plan from the regional-level, overall viewpoint (Min, Kyung-Hwui, 2001).

The all-inclusive supervision agency for RDA is Department of the Environment, Transport and the Regions(see <Figure 1>). The Minister of Department of the Environment, Transport and the Regions(DETR) can give instructions and guide concerning the performance of the functions of RDA, which has a close connection with each local government. However, it is not placed under local government control. The GO (Government Office for the Regions) gives guidance and adjusts the activities of RDA to keep them in step with the central government's policies. GO corresponds to 'the regional window' of central government which performs the functions of effectively enforcing the central government's policy and the measures in the region. The highest legislative organ of RDA is the board of directors, whose daily work is in charge of the board of operation in which the highest responsible person is the chief executive.

The functions given to England's RDA are the activities directly related to industrial promotion and raising competitiveness of the region concerned, and cover a wide range including physical re-development of a vulnerable area within the region, providing business support service, and manpower education activities. RDA formulates regional innovation strategies as a part of regional development strategy, and plays many leading roles, for example, formulating support measures for facilitating the inducement of investment into the region.

## **2) Italy's RDA in Emilia Romagna (EARVET System)**

In 1972, Italy's local governments including Emilia Romagna received the authorities about regional industrial policies from central government. Soon after, in 1974 Emilia Romagna local government established ERVET SpA (Ente Regionale per la Valorizzazione Economica del Territorio) as a regional development agency to facilitate the industrial development of the region. ERVET SpA, founded by a joint investment of local government and private economic firms, is an organization which carries out a unified character project of raising the competitiveness of regional economy and of providing a support for it.

The operation system of this organization is closely connected with the Emilia Romagna government. That is, the local government performs a role as a planner of projects related with regional development and innovation in broad prospective, and ERVET SpA provides the information needed. By doing so, ERVET SpA fulfills a role not only as the main assistant for regional industrial policy-making of Emilia Romagna, but also as an executor which puts it into practice directly (Bellini & Pasquini, 1998). However, it seems that the relationship between the both is reciprocal in that they have a work performing procedure through feedback, rather than vertical.

ERVET SpA is in charge of comprehensive planning & executing works throughout the whole fields related to regional development in lieu of local government. After ERVET SpA was established the establishment of real service centers by industry began to follow. Centers such as Centro Ceramico, CITER, CESMA, and CERCAL were founded in the regions concerned (see <Figure 2>)

. From the middle 1980's, service centers to provide a support to all the enterprises in the Emilia Romagna region beyond a specialized industry were established. The ASTER (Technology Transfer Center) and CERMET (Quality Research and Qualificatory Center) were established as pan-industrial service centers to raise the technological innovative ability of

regional enterprises by facilitating the transfer of technology (Cooke & Morgan, 1998; DelNet & ASTER, 2002).

ERVET SpA in EARVET system, though fulfilling a role as an organization, keeps a horizontal relation structure with individual service centers which provide specialized service support to a specific field.

### **3) Suggestions from Oversea RDAs**

To promote regional industry effectively, various policies of the central government are needed that can be adjusted and that have a connection with each other at the regional level. In addition, for RIPPs to formulate an inter-business cluster and to construct regional innovation system, a revitalizing network and a vision provider are needed. In this respect, England's RDA is the one in which the central government's projects can be planned and adjusted at the regional level. The EARVET system, the RDA of the Emilia Romagna region in Italy, has contributed to the development of regional specialized industry by adjusting the operation of the pan-industrial service centers and the service centers by industry and connecting them with each other.

When considering the fact that the planning, adjusting, evaluating, and connecting functions among various policies of central and local government for regional industrial development and enterprise support are very vulnerable, Korea also, like England's RDA or Italy's EARVET system, feels keenly the necessity of operating an industrial policy planning organization at the regional level.

### **III. The Present State of RIPPs in Korea**

#### **1. RIPPs in 4 Districts**

Base direction of government support for Korea's RIPPs is focused on each project raising its innovation ability. Government's investment give priority to creating a foundation and indirect environment in which enterprises can raise their competitiveness, growing out of the former way of providing direct support to individual enterprises.

Korea's RIPPs began in 1999, as the first stage, in 4 districts including Daegu, Busan, Gyeongnam, and Gwangju provinces(see <Table 1> and <Figure 3>). The structural reform of the textile industry in Daegu and of the footwear industry in Busan, the high added value-ization of the machine industry in Gyeongnam, and the optical industry in Gwangju are included. Here, a total 1,897 billion won were invested for construction of public infrastructure, support for technology development, manpower education & training, and marketing support.

The evaluation results of the first stage projects carried out from 1999 to 2003 show that they have contributed to raising the competitiveness of regional industry and revitalizing the regional economy in terms of the following:

First, a foundation for a structural reform of regional industry focused on trial production facilities and research development equipments was constructed. Second, owing to the fruits of technology development, a sales increase is occurring.

Third, with the construction of a foundation and system for manpower cultivation which corresponds to the characteristics of regional industry, various needs of enterprises for manpower have been met.

In these 4 districts, the second stage projects have been carried out from the year 2004. In the second stage, an additional strategic industry by region is chosen which will then be promoted

by actively utilizing an innovative infrastructure constructed in the first stage. The performing direction of the second stage project, like that of the first stage, is focused on formulating and revitalizing an industrial cluster through the strengthening of the clustering and networking among the innovation subjects, giving priority to the regional strategic industry (MOCIE, 2004). For that, a total 2,266.9 billion won will be invested from 2004 to 2008.

## **2. RIPPs in 9 Districts**

In 2000 when the first-stage projects in 4 provinces had been carried out, the necessity of the carrying-out of RIPPs throughout the country in addition to the 4 provinces was raised. Therefore, after a feasibility study the projects were expanded into the 9 provinces of the non-capital area. The process period of the project in 9 districts is five years from 2002 to 2006, and with 9 provinces being divided into 3 circles, the development of a new specialized industry suitable to the characteristics of each district has been made. For these projects in 9 provinces, a total 1,547 billion won, including national, local expenditure, and private funds, will be invested(see <Table 2>).

Concerning the performance of RIPPs, in-depth analysis of the first-stage projects in 4 provinces was made. However, a concrete analysis of the second projects in 4 provinces and RIPPs in 9 provinces has not been made yet, because these projects are still in progress. Some problems pointed out in the first stage project in 4 provinces are as follows (KDI & KIET, 2003):

First, on the whole, mid-and long-term vision and strategies by regional strategic industry leave something to be desired.

Second, the outcomes in the unit program were not quite satisfactory due to not devising a systemic plan.

Third, in case of enterprise support service work including overseas marketing and the information-ization project, the general effect was limited due to poor investigation of the needs of enterprises within the region.

Fourth, an Industry-University-Research Institute (I-U-R) network construction and its practical cooperation leaves something to be desired. To solve these problems, RIAs have been founded from the year 2002.

### **3. The Operational Present State of RIA**

RIA, with the foundation object of managing the outcomes of RIPPs, have been established and operated in 13 provinces where the projects have been carried out. The major tasks of this organization are to conduct the planning and evaluating management function for the successful performance. Financial resources for the operation of this organization are provided by the government, so this organization is of a public character. Currently the number of professional research workers of each agency is about 10, and the operational budget amounts to about 6~8 billion won(US \$6~8million) for 5 years.

The major roles of RIA are planning and evaluating management for RIPPs including the following:

First, providing technology support, manpower training, devising a plan for management support and its adjusting are involved.

Second, the Agency proposes a direction of technological innovation through the drawing of regional technology road map (RTRM), and performs the roles of supplying and managing R&D funds.

Third, to raise the ability of regional innovation subjects (firms), it operates a council.

Fourth, it constructs an industrial information data base. In addition, it carries out a project to raise the planning and evaluation ability of the local government in devising mid- and long-term development strategies for the region.

However, because it has only been a short time since the RIA was founded and it does not have enough practical, institutional authority, it has not fulfilled the function of adjusting the projects adequately. In addition, by not securing an adjusting and evaluating authority based on institution for central and local government projects, it has experienced difficulty in growing into a regional development organization.

On the basis of a discussion of new industrial district theory, the cases of overseas regional development organization and the present status of RIPPs, the researchers would like to suggest a direction for RIA's development in section IV. Especially, in terms of the construction of strategic industry-focused industrial cluster and RIS, the operating system and right-functioning direction for RIA will be proposed.

#### **IV. The Operating System and Right-functioning Direction of RIA**

##### **1. The Direction for constructing a performing system.**

Korea's RIA was founded to perform the function of planning and evaluating management for increasing the performance of RIPPs, but it needs to strengthen its institutional function since it has been restricted in its function. Currently, the organization of RIA is under the supervision of the Ministry of Commerce, Industry, and Energy(MOCIE), and in addition to it, under the direction and support from local government. In addition RIA has carried out an evaluating management work jointly with ITEP, an organization of evaluation management under the influences of central government. It has not secured an independent legal authority in the

operation of the organization in each province, and currently assumes the form of the affiliated organization of an existing one such as Technopark.

For RIA to strengthen the right of self-regulation and independence as a planning and evaluating organization, it is necessary to convert it to an independent organ. Additionally it can actively conduct the outcome managing work by strengthening its mediating authority for the specialized center by industry, an executive organ for RIPPs.

As localization increases and a flexible production system of knowledge-based economy is strengthened, the security of planning and linkage policies and mediating function has become important. In this point of view, the researchers think that an institutional organizational system, by which RIA can conduct a planning and evaluating management work for central and local government's projects besides RIPPs, should be constructed.

When looking at some support programs for SMEs in Korea, they can be classified into 7 types: finances, technology, start-up, marketing, business administration, manpower, and location support. These programs have been executed in three forms by the central government or jointly by local government, or jointly by central and local government. However, most of the support programs for regional enterprises have been implemented in a central government-leading and local government-subsidiary form. The major central government-leading programs include Technopark(TP) construction project by the Ministry of Commerce, Industry and Energy; the software support center project by the Ministry of Information and Communication; the RRC project by the Ministry of Science and Technology; the New Business Center's operational program by the Small and Medium Business Administration; and diverse programs by the Small Business Corporation. There are very few support programs for regional enterprises developed by local government.

Even though there is synergistic effect when these programs are carried out collectively in the region and are closely connected, they have been executed individually, and no linkage has been made. Therefore, various regional support programs for regional SMEs are needed to be planned and adjusted synthetically of the regional level. Currently the most suitable organization for performing the function of planning and evaluating regional industrial policies is RIA, and it is expected that in the future this organization will be expanded into one which operates throughout the regional industry.

For the Korean RIA to make own way in this direction, it would be good to refer to England's RDA model and EARVET system, and the regional development organization of Emilia Romagna region in Italy. England's RDA has conducted the functions of collectively planning and adjusting the various policies for regional industrial development from several departments of the central government. We can also learn from the fact that the EARVET system has contributed to the development of a specialized industry at the district level by adjusting the operation of pan-industrial service centers and the centers by industry and then linking them.

For Korea's RIA to secure a status as a planning and adjusting organization, a vision and will for local government to promote it into a central organ for the planning and evaluation of regional industrial development are needed. Central government also would have to provide institutional supports while being fully aware of RIA as a window to link and adjust local and central industrial policies.

<Figure 4> shows a desirable structural system for Korea's RIA. When prior planning and adjusting various policies of central government being enforced in the region, supervision, and support are needed from both the central and local government, and on the basis of it, RIA should conduct the linkage function between them. In addition, it is necessary to secure the authority to link and adjust between the pan-industrial service centers and the regional service

centers by industry with the backup of an institutional framework. That is, the organization expansion of RIA should be made with the security of financial resources so that it can play a role in planning and evaluating organization not only for RIPPs but also for regional industry. And it would be good that under close cooperation relation with regional innovation council, a legislative organ for regional innovative projects of each district, RIA conducts a preliminary evaluation function for the matters for decision of regional innovation council according to the characteristics of the projects.

## **2. The Right-functioning Direction of RIA**

The MOCIE has proposed some points for reform in the future through the experience and evaluation of the first stage RIPPs in 4 provinces as follows(2004):

First, it is necessary to formulate a vision and strategy of mid- and long-term development by industry for the formation of industrial cluster.

Second, it is needed to construct an evaluation system for inducing the effective performance of the projects. That is, one should induce an effective attainment of the strategic industrial development vision by constructing a synthetic evaluation system.

Third, the systematic construction and effective carrying out of unit projects for substantial enterprise support and for strengthening I-U-R networking is needed; that is, it is necessary to develop various support programs for enterprises to encourage them to visualize their outcomes with the construction of infrastructure in which the propriety of scale and the industrial character are considered.

As noted in Chapter II and III, Korea's RIA should be able to perform a central role of planning and evaluating regional industrial policies. For that, it would have to faithfully conduct the functions of a planning and adjusting, evaluating and managing, linkage and cluster

formation. Given the short history of Korea's RIA these functions should be classified into short-term tasks and mid-term ones (5 years).

In terms of its short-term role, RIA should place its focus on providing a support for the successful performance of RIPPs. The planning and adjusting function is to design and adjust the specific programs for raising the performance of the projects(see <Table 3>). The evaluating and managing function is for raising the efficiency through the evaluation and management of the projects. It is necessary of maximize the fruits of the strategic industrial promotion projects through evaluating and managing programs which have been carried out in the center by industry of RIPPs. The linkage construction function is to plan a linkage scheme and carry out it between industrial innovation subjects and innovative projects. The cluster formation function helps create an environment for product market creation, raw material market expansion, strengthening enterprise strategies and competition circumstances, and support industry promotion.

Next, in terms of mid-term roles, the RIA must choose its approach method of expanding the planning and managing function into the whole of regional industry on the basis of a regional innovation ability accumulated so far. They can be summarized as follows:

First, the planning and adjusting function, the creation of a vision for regional industrial development should be made through the planning of industrial policies on the basis of analyzing a given circumstance for regional industry and a developmental environment at home and abroad in the future. It is important for the RIA to help conduct these tasks. The planning and evaluation of regional strategic industry, establishing mid- and long-term development strategies, and establishing a regional industrial promotion plan by local government.

Second, the RIA should conduct the function of evaluating and managing various programs for the support of regional industry. Through the evaluation of the selecting and performing

process of various industrial innovation projects of government including regional industrial promotion project and industrial technology foundation construction programs, the necessity of improving the conformity with regional industrial policies and securing the linking property among the projects is raised.

Third, the linkage construction function provides support to the revitalization of linkage among enterprises, main subjects of strategic industry promotion, and university and research organizations concerned. It is also important to raise the efficiency of policies' performance by various industrial promotion policies of central government so that they can faster regional industrial development.

Fourth, it is the function of encouraging an industrial clustering. RIA should play to propose a re-development scheme for deteriorated industrial complex to strengthen the strategic industry's clustering and of invite domestic and oversea promising enterprises in the strategic industrial field.

## **V. Conclusion**

Industrial policies in the knowledge-based economy of the 21C stress flexible production system and innovative environment. Especially, a clustering theory expects the elevation of the fruits of enterprises through the minimization of the costs and the revitalization of collective learning by clustering I-U-R resources. The Korean government has carried out various policies for providing support to enterprises for the development of regional economy since the 1960's. However, while the weight of regional industry having been shrunk in the high speed growth process of the Korean economy, national balanced development has come to the fore as a major task of national administration. The Korean government has carried out RIPPs based on a

cluster as one of major policies for the development of regional industry, and has operated RIA as a managing organization of these projects.

These projects are regional economic development policies focused on specialized industries having competitiveness in the region. The first stage projects began in 4 provinces in 1999. On the one hand, the first stage projects produced the effect of supporting technological innovation and manpower cultivation for enterprises in the region where the industrial foundation is fragile. Practically, they did not meet the needs of enterprises and produced problems of not satisfying them.

To make up for the problems in the performing process of the first stage projects in 4 provinces, the government established RIA in the performing process of the projects in 9 districts and of the second stage projects in 4 districts to make the tasks of planning, adjusting, evaluating, and linking performance. However, the institutional backup for the performance of the functions and roles of RIA has not been satisfactory, and the direction for its functions is not clear.

The current study suggested a performing system, function, and role of RIA to raise the performance of RIPPs. As a performing system of RIA, it is desirable that it be operated as a public corporation in which central and local government provide financial support when considering the publicity of the project operational objects. In addition, the necessity of establishing a long-term support system and institutionalizing it is raised so that it can perform the role of RIA. Concerning this matter, England's RDA model and Italy's EARVET system have given many points of suggestion. In the long run, it is necessary that RIA to grow into a regional development organization, beyond the evaluating and managing role of the projects, which adjusts and evaluates various policies of central and local government to be carried out in the region. Especially, an institutional foundation should be constructed to synthetically

adjust and link the support centers by industry and the pan-industrial support centers in each district. When this foundation is prepared, regional planning and evaluating capability in the future will be strengthened and an industrial development appropriate to the actual circumstances of the region will be fostered.

The 4 functions of RIA to raise the performance of RIPPs, are planning and adjusting, evaluation and management, linkage system construction, and cluster formation. These functions are classified into the short-term ones and the mid-term ones (after 5 years) when considering RIA's short history. The short-term functions are the roles as a planning and evaluating organization to raise the performance of RIPPs. In the long run, RIA should conduct the functions as a planning and adjusting organization for an industrial technology innovation and for providing support to enterprises throughout the district beyond the RIPPs.

As Korea's industrial development has been changed from the factor-driven development strategy into the innovation-driven one, the formation of industrial clusters and innovative systems has become very important. In this respect, it is expected that RIA's securing its status as a planning and adjusting organization for regional strategic industrial clustering and industrial innovative system will contribute to the localization of the Korean economy, because industrial policies of the central government will encourage the development of regional industry by being formulated through the performing of comprehensive planning & evaluating functions for regional industry by RIA.

The current study analyzed the performing system and roles of RIA as a planning and adjusting organization for the development of regional industry in terms of theories and the present situations. Future studies will examine the specific roles of RIA by analyzing the interrelation between a statistical performance of RIPPs and the functions of RIA.

**Abstract**

The relationship between lender and borrower can be contentious. The entrepreneurship literature contains countless anecdotes regarding mistrust and conflicting objectives between these stakeholders. Simultaneously, there is inescapable interdependence between these stakeholders. Capital is the lifeblood of the growing venture. No financing entity will survive without making loans.

In this paper, we examine the relationships between lenders, specifically micro-finance agencies, and borrowers, in this case new technology-based enterprises. The purpose of the paper is to develop a model to explain the exchange of tacit knowledge from one party to the other. The knowledge exchange is a precursor of cognitive trust, ultimately leading to a shared strategic vision. The result is better investment decisions by both the agencies and the enterprises.

Investigating the respective roles of the micro-lender and the technology-based entrepreneur, we develop a set of propositions regarding causal relationships among variables leading to a shared vision for the SME. Our model contends the following:

- There are identifiable factors contributing to interdependence of lending officers and high-tech entrepreneurs.
- There are identifiable processes for vision sharing between the lenders and the entrepreneurs.
- Interdependence impacts mutual risk assessment.
- Vision sharing processes impact risk assessment.

We examine the practices of micro-finance agencies in Australia and the United States to ascertain how shared vision develops and the decisions and results that follow. The study concludes with a typology of the management processes of micro-finance agencies based on interdependence and shared vision.

**Key words:** Micro-finance, knowledge management, technology-based SME, interdependence, sharing strategic vision

## INTRODUCTION

This paper contributes to a new area of research, namely: institutional preparedness of economic development agencies for developing technology-based small and medium-sized enterprises' (SMEs). It explores the institutional preparedness of micro-finance agencies (Woolcock 1999). Micro-finance is often associated with lending to the poor with transactions that are based on a group of borrowers, such as rotating loans (Auwal 1996). Existing literature focuses on debates about financial management credit analysis (for example Howorth 2001; Hutchinson & Ray 1985; Holmes, Dunstan & Dwyer 1994; McMahon, 2001 and 2003; Ray & Hutchison 1985), finance gaps (for example, Hamilton & Fox 1998; McMahon 2003) and demand and supply of micro-credit (for example, Deakins & Hussain 1994; Gibbs 2000; Kotey 1999).

This paper examines the role of the micro-finance agency that lends to high-technology based SMEs operating under complex conditions (Hamilton & Fox 1998). Complexity is the number of elements in an organization's environment (Dess & Beard 1984). To meet the challenge of developing new industries that operate under complex conditions, governments are increasing their efforts to provide assistance to new and emerging technology-based SMEs (Hall 2003), particularly those in bio-technology and information technology (Sprigings 2002). This complexity makes it important to better understand how the nature of the lender/ borrower relationship allows for better investment decisions.

Though access to micro-finance is important for all SMEs, it has become highly critical for technology-based firms when initial sales are being carried out and equity investments have been maximized. Despite the fact that equity investments are available in the pre- and sales stages of technology-based SMEs, little is known of the processes involved with micro-debt finance for these firms. Unlike the different types of equity finance in the forms of sweat equity, owner, partner, silent, angel and venture capital, the nature of the repayments structure of micro-debt finance requires that the high technology firm is carrying out sales. This means that the micro-loan is best utilized when initial sales are being made in the start-up phase (Roberts 1991) where equity finance may not be appropriate and micro-funds are required to develop the business further.

If technology-based firms are characterized by longer lead times to initial sales, the typical cash flow problems experienced by SMEs will be compounded for these firms. The primary cause of cash flow problems reported by firms in the United States is collecting money due to them (Dennis 2001). Thus, SMEs that are cash starved at the start of sales are likely to become even more desperate when customers delay payments. According to the National Federation of Independent Business, firms experiencing these problems are more likely to draw from personal resources than to borrow from a lending institution.

Mechanisms like micro-finance are required to assist high technology-based SMEs to reach their markets for two reasons. First, they have limited resources and secondly, new and emerging SMEs play a critical role of developing new industries for small national economies like Australia through to the international economy. The size of micro-finance loans varies in the SME literature. In Hong Kong micro-loans are made available up to US\$128,000 (Cattani 2002)

while those in the United States of America vary from US\$5,000-US\$25,000 (Bhatt & Tang 2001). Access to micro-finance is particularly important as it allows high technology-based SMEs to make sales for rapid growth and to reach into new markets (Bank of England Quarterly Bulletin 1999).

The focus on research of micro-finance is often on financial management and credit analysis. In addition, research is emerging on the interdependence of aspirations between micro-finance agencies and technology-based SMEs (Lapie 2001). Understanding the interaction in the nature of the relationship between demand (technology-based SMEs) and supply side (micro-finance agencies) of micro-credit (Deakins & Hussain 1994; Gibb 2000) provides insight in how micro-finance can be more effectively managed. In this paper, management of investment risk by the lender and ROI for the successful growing technology-based SMEs (Westhall, Ramsden & Foley 2000) is explored through the interdependence and shared vision of these stakeholders. The nature of micro-finance as an interdependent system and how to operate effectively within it is not well understood. The question is not whether stakeholders can cooperate. The question is "How well can they cooperate?" The focus of this paper is to explain how, when the relationship between lenders and borrowers is close, useful tacit knowledge about investment is exchanged and can result in better investment decisions.

This study conceptualises a theoretical model that clarifies the variations in processes for sharing vision (Leonard & Sensiper 1998), cognitive trust (Sako 1998) and variations in interdependence (Pfeffer & Salancik 1978), that are predictors of the effective tacit and explicit knowledge of a micro-finance agency lending officer and the SME owner or his/ her agent (for example the finance director) (Nonaka & Takeuchi 1995). Being able to assess the type of business relationship (MacMillan, Money & Downing 2000) will assist both the micro-finance lender and the technology-based SME owner to develop and grow these two sectors. Knowledge can be both "explicit" and "tacit". Explicit knowledge is formal and systematic. It is objective and rational. It can take the form of financial data, contracts, business plans and ratio analysis. That is, it is expressed in words and numbers. On the other hand, tacit knowledge is something not easily visible and expressible. It is subjective and intuitive. Examples of tacit knowledge include insights, intuitions and hunches. Tacit knowledge is deeply rooted in an individual's actions and experience as well as in the ideals, values or emotions he or she embraces (Nonaka & Takeuchi 1995). However, there is an inextricable link between the two.

## **THE GENERAL FINANCE GAP FOR SMES**

Micro-finance involves lending small amounts of funds for very specific initiatives. It is distinct from angel investors and venture capital. New technology-based SMEs can experience difficulties in gaining access to traditional sources of finance. Thus in the early growth cycle on technology-based SMEs in Australia there exists a gap in easily accessible funds. For instance an historical source of micro-finance for SMEs that is no longer available due to changes in the banking regulation was solicitors' funds that were offered at competitive interest rates. Most banks in Australia now direct SMEs towards credit cards as their solution to micro-finance for SMEs. In this way banks have no or little working knowledge of the SME in its early stages of development. In the United States, banks remain the primary source of external financing for working capital and capital expenditures, but are declining in relative importance to credit cards and trade credit (Scott, Dunkelberg & Dennis 2003).

Thus there is a call for improving the supply side of this sector. An exploration of cognitive trust, interdependence and buy-in to shared vision of the micro-finance lender and the SME owner (or delegate) can provide a possible explanation of how explicit and tacit knowledge is developed for assessing the SME's level of risk. For instance, the relationship with the traditional bank branch assumed established relationships between the bank branch manager and the SME owner (or delegate). This traditional relationship was based on trust and the paper-based transaction. A good number of banks have now moved away from the traditional model of bank branch manager to a regional structure at the same time the relationship of the bank manager has come under scrutiny as being limited (Gibb 2000; Mole 2002). Thus the banking sector seems to have moved away from developing and maintaining relationships with SME owners in Australia and other countries. In the United States, the federal government's efforts to overcome such behavior by banks has occurred primarily through incentives and encouragement from the Small Business Administration (SBA), such as guaranteed loan programs.

Another controversy is whether the bank manager is meant to provide industry specific business advice along with assessing SMEs risk (Gibb 2000). To address industry specific issues banks are increasingly assuming those SME owners (or their delegates) will partner with their accountants during the loan application process. This has been a means that has allowed banks to overcome the limitations of paper-based transactions and assuming the accountant will provide the necessary advice and base their reputation on the credit worthiness of the loan applicant. It has meant an increased burden for accountants for which micro-loans may not justify the transaction. This banking strategy also assumes all SMEs have an accountant who in turn has a relationship with a bank.

### **ROLE OF THE MICRO-FINANCE AGENCY**

A call for more research on the role of the micro-finance agency has been made for investigating greater efficiencies in the delivery of loans between the micro-finance agency and the client (Bhatt & Tang 2001; Gibb 2000). A number of studies have been carried out that examine agencies that are active in providing risk finance for new and emerging technology-based SMEs (Harris & Bovaird 1996; Westhall, Ramsden & Foley 2000). Why some agencies are successful and others are not is a matter of providing research on the interdependence of relationships that are based on individual stakeholder interests being mutually beneficial (Woolcock 1999).

There are a multitude of micro-finance agencies in the United States. Some are government-sponsored and may be based at any of the three levels of government in the American system: federal, state or local. One example is the SBA Micro Loan Program. Through this program, the SBA provides very small loans to start-up, newly established, or growing small business concerns. The SBA makes funds available to non-profit community based lenders (intermediaries) which, in turn, make loans to eligible borrowers in amounts up to a maximum of \$US35,000. The average loan size is about \$US10,500. A non-governmental agency example is the U.S.-affiliate of ACCIÓN International. The mission of this organization "is to make access to credit a permanent resource to low- and moderate-income small businesses owners in the United States. By providing small or "micro" loans to men and women who have been shut out of the traditional banking sector, ACCION helps build their businesses and increase their incomes" (ACCION USA, 2003).

It is difficult to separate the formal risk assessment from the nature of the relationship of the micro-finance agency and the technology-based SME (Deakins & Hussain 1994). Relying only on ratio analysis in risk assessment does not take account of the broader information sources concerning technology-based SMEs. These broader information sources are often based on interpersonal relationships that provide tacit knowledge of a technology-based SME's operations and the firm's potential. Explaining relationships in the financial transaction of micro-finance (Gibb 2000) is the focus of this paper. Understanding the management preferences, beliefs and expectations of the micro-finance agencies and technology-based SMEs (Hamilton & Fox 1998) will assist in understanding interdependence and shared vision of these stakeholders in the lending transaction.

Micro-finance has traditionally been perceived as in the domain of reducing poverty and unemployment and has been for firms that are marginal rather than those that are high growth or have high growth potential (Devereux & Fische 1993). Micro-finance agencies operate through community banks that include the Bendigo Bank or the South Side Bank of Chicago, along with credit unions in developed and developing countries and as agencies specifically for micro-finance such as the E.C.L.F. micro-finance agency of South Africa. Other examples are found in New Zealand—the Prometheus Foundation and the Prometheus Credit Union; in Canada—Assiniboine Credit Union, Credit Union Central of Ontario, Metro Credit Union and the VanCity Savings Credit Union; and in the United States of America—the Capital District Community Loan Fund.

Micro-finance agencies are closer to SME owners and provide more flexible services and loans than trans-national banks. Micro-finance agencies are usually incorporated independently of any government initiative, though they may receive government sponsorship in the funding of micro-loans (Westhall, Ramsden, & Foley 2000). How they manage assistance to finance SMEs is not well understood. There is little research about the micro-finance agency's internal operations of managing tacit knowledge in their assistance to new and emerging entrepreneurial SMEs.

### **INTERDEPENDENCE**

The overall interdependence between the lender and the technology-based SME owner is fundamentally underpinned by a power imbalance skewed towards the micro-financer. The reason for this is the coercive power of the lender to disapprove or call in loans (Mole 2002). However, it is in the best commercial interests of both the lender and the technology-based SME owner to develop a partnership in analyzing and interpreting risk from the internal and external environment of the technology-based SME.

Resource-dependence explores the exercise of power-dependence (interdependence) of individual organizations in an environment (Pfeffer & Salancik 1978; Pfeffer 1981; Thompson 1967). Resource-dependence for entrepreneurial development programs explores the degree of power-dependence (interdependence) micro-finance agencies can experience. It also infers a range of strategic initiatives that micro-finance agencies can implement to affect their degree of independence. Not much is known about why micro-finance agencies, with low power-dependence (interdependence) and with high cooperation, enable faster speed to market, sophisticated business practices and ROI/profit for their clients. What is known is that both social environment and organizational context have an impact on the frequency of learning (Amabile, Conti, Coon, Lazenby & Herron 1996; Martin, Rowe, & Christie 2001; Moorman & Miner 1998).

Power-dependence encompasses the power in the relationship(s) between the micro-finance agency and the SME client. The focus is on the power-dependence (interdependence) that these relationships create within the delivery of an entrepreneurial development program. For instance, a micro-finance agency that is highly centrally planned and controlled would have a high level of power-dependence with technology-based SMEs compared to an organization with a greater emphasis on partnership. Under conditions of partnership, power-dependence is far more dispersed. This view is consistent with the innovation literature. In one study, managerial influence on variations in ideas creation is characterized by the level of power in operational decisions and activities (McGrath 2001). Under conditions of dispersed dependence, micro-finance agencies seek resources through a number of differing institutions rather than a single sponsor.

Drawing on the resource-dependence literature provides an explanation of the influence that interdependence has on a micro-finance - micro-firm relationship. Interdependence characterizes the relationship between the agents creating an outcome, not the outcome itself (Pfeffer & Salancik 1978: 40). Within this resource dependence perspective, in the micro-finance relationship, interdependence exists whenever one actor does not entirely control all of the conditions necessary for the achievement of an action or for obtaining the outcome desired from the action. The theory offers a definition of interdependence that, like Axelrod (1984), identifies the notion of shadow of the future when it refers to the structure of resource dependence relations shadowing how micro-finance partners conform to each other's demands or how they extract profits from one another (Salancik, Krackhardt, Andrews & Tolbert 1995: 343).

Interdependence characterized by cooperation establishes a high-trust environment in which a micro-finance agency can undertake episodic interactions with a technology-based SME to build a shared understanding and mutually agreed upon decisions. The emergence of inter-organizational trust in the micro-finance relationship can reduce transaction costs (Sako 1998). Building trust in the micro-finance relationship is also an investment to increase future returns and a relation-specific skill (Asanuma 1989). Further, it gives rise not only to lower transaction costs or to higher net benefits from investment, but also to more rapid innovation and learning (Sabel 1994). In these situations, governance by trust can evolve as an informal control mechanism that enhances the effectiveness of transactions (Sako 1998; Smitka 1992). The higher the level of mutual trust, the better the micro-finance relationship innovation and learning performance is likely to be (Sako 1998). Strong trust emerges in response to a set of internalized norms and principles that guide the behavior of exchange partners and is independent of whether or not specific formal governance mechanisms exist (Barney & Hansen 1994).

### **PROCESSES FOR SHARING VISION**

It is important to recognize that processes for sharing vision between the micro-finance agency representative and the technology-based SME owner (or delegate) are a means for directing the talents and energies of each stakeholder towards valued ROI goals. Though ROI is not the only goal of SME owners, it is a means to measure the owners' success and a means to measure the return on the effort to grow the business. The "process" perspective explored in this paper is unlike the "content" perspective that focuses on strategic objectives such as the sharing of vision about the mission of a business. Processes for sharing vision occur at the operational level between a micro-finance agency representative and a technology-based SME owner (or delegate). The paradox is that a knowledge utilization capability is more likely when simultaneously, both openness in a transaction but also closure are managed well to converge on specific solutions

(McGrath 2001). Processes for sharing vision are dual mechanisms that enable this duality to operate in a relationship. This duality relates to divergence and convergence of thinking around a common aim (Leonard & Sensiper 1998). That is, the processes for sharing vision provide mechanisms to shift from generating maximum variation in ideas creation (McGrath 2001) and maximum contradiction in viewpoints to decisively limiting micro-finance outcomes to a minimum number of courses of action (Lazega 2000; McGrath 2001).

The buy-in to strategic vision by lender and borrower is characterized by a duality in its processes. First, differing viewpoints about risk emerge during discussions that occur in the micro-finance relationship as a result of non-routine activity (Fiol & Lyles 1985; Marks, Mathieu & Zaccaro 2001). Individuals' explicit statements or suggestions carry with them the weight of unspoken knowledge. That is, mental models, life examples, perhaps physical skills, even unrecognized patterns of experience which people draw upon to increase the wealth of possible solutions to the risk problem. This experience, stored as tacit knowledge, often reaches consciousness and made explicit in the form of insights, intuitions, and flashes of inspiration (Leonard & Sensiper 1998). When micro-financing addresses an unexpected, non-routine challenge, each skilled participant frames both the problem and its solution by applying mental schemata and patterns he or she understands best. The result can be a cacophony of perspectives. In a well-managed process in the micro-finance partnership, these varying perspectives can foster creative abrasion, intellectual conflict between diverse viewpoints producing energy that is then channeled into new ideas and products (Leonard-Barton 1995: 63).

On the other hand, knowledge utilization requires convergence upon acceptable action to clarify the way forward. Both tacit and explicit knowledge play an important role. Confining the discussion here to managing the tacit dimensions of knowledge, we suggest that three different types of tacit knowledge need to be managed in the micro-finance partnership. That is, tacit knowledge consists of the overlapping dimensions namely: specific, collective, and guiding. These three types of tacit knowledge combine to form a rough hierarchy from low to high tacit knowledge in terms of abstraction. A micro-finance partnership can have processes for sharing vision that consensus involves acknowledgement and acceptance that it is time to end the voicing of differing viewpoints for the purpose of decisively getting on with the task (McGrath 2001). This systemic view reflects the assumption that processes for sharing vision in the micro-finance partnership provide mechanisms to shift from generating maximum variation in ideas to limiting a partnership to a particular course of action.

Processes for sharing vision are an important antecedent to knowledge generation/ utilization because their absence undermines key partners' ability to develop a focused response to SME challenges and opportunities (Dougherty 1989). To date, however, they have not been the focal point of empirical studies. Thus, this study is an early contribution to our conceptualization of processes for sharing vision.

Based on this review, we find a gap in the literature pertaining to the relationship between interdependence, processes for sharing vision and knowledge generation/ utilization. A proposed relationship between types of micro-finance agency processes of sharing vision and interdependence is summarized in figure 1.

---

## **DISCUSSION**

The theoretical proposition of this paper is: the greater the degree of both micro-finance agency/ technology-based SME owner interdependence and the development of processes for sharing vision, the more likely effective knowledge generation/ utilization can occur.

Cell 1 relates to two factors of interdependence and processes for sharing vision that correspond to a situation that is characterized by “knowledge utilization capability” because of effective buy-in to strategic vision and high cooperation that is observable through well conceived assessment of the business plan/ concept. First, it relates to interdependence and processes for sharing vision that facilitate knowledge generation/ utilization practices for firms and micro-finance agencies to interpret and evaluate the risk of investment from both the internal and external environment to get products and services to market (faster speed to market). Better interpretation and evaluation of risk allows for issues and problems to be identified early and for appropriate action to be taken. Secondly, it relates to interdependence and processes for sharing vision that proactively encourage cognitive trust.

Cell 2 relates to two factors of interdependence and processes for sharing vision that correspond to a situation that is characterized by “knowledge utilization ad hoc” because of ineffective buy-in to strategic vision and poor cooperation that is observable through individually conceived assessment of the business plan/ concept. First, it relates to interdependence and processes for sharing vision that only sometimes facilitates knowledge generation/ utilization practices for firms and micro-finance agencies to interpret and evaluate the risk of investment from both the internal and external environment to get products and services to market (faster speed to market). Secondly, it relates to interdependence and processes for sharing vision that proactively discourages cognitive trust. For instance a lender may promote risk-averse advice that will protect the bank’s exposure and be only concerned with financial and collateral details (Gibb 2000; Mole 2002).

Cell 3 relates to two factors of interdependence and processes for sharing vision that correspond to a situation that is characterized by “knowledge utilization frustration” because of poor cooperation that is observable through poorly conceived assessment of the business plan/ concept. First, it relates to interdependence and buy-in to strategic vision that do not facilitate knowledge generation/ utilization practices for firms and micro-finance agencies to interpret and evaluate the risk of investment from both the internal and external environment to get products and services to market (faster speed to market). Secondly, it relates to interdependence and processes for sharing vision that proactively encourages cognitive trust.

Cell 4 relates to three factors of interdependence and processes for sharing vision that correspond to a situation that is “knowledge generation/ utilization failure” because of high ineffective buy-in to strategic vision and low cooperation that is observable through poorly conceived assessment of the business plan/ concept. First, it relates to structures and processes that constrain knowledge generation/ utilization practices for micro-finance agencies and SMEs to interpret and evaluate the risk of investment from both the internal and external environment to get products and

services to market (faster speed to market). Secondly, it relates to interdependence and processes for sharing vision that proactively discourages cognitive trust.

This model attempts to capture the type of micro-interactions that occur between the lending officer and a technology-based SME owner (or delegate). However, there are factors beyond the control of the micro-finance agencies and SMEs like market forces and economic trends.

A micro-finance agency provides a means to deal with the complexity of economic development and to coordinate knowledge utilization activities across program management. Internal management expertise within a micro-finance agency is of particular importance in this post-Fordist period (Amin & Thrift 1994; Freeman & Perez 1988; Freeman & Soete 1997) that can be characterized as a period of economic history in which firms are trading in highly complex environments. A micro-finance agency that can mobilize support for trading in complex environments requires having a high range of management expertise, though not all achieve this.

### **RESEARCH QUESTIONS**

From this model four questions are generated to examine the interdependence and shared vision of micro-finance agencies and technology-based SMEs. These are:

Q1: What are the factors that contribute to the interdependence between a micro-finance agency lending officer and a technology-based SME owner or his/ her delegate?

Q2: What are the processes for sharing vision between a micro-finance agency lending officer and technology-based SME owner?

Q3: Does interdependence have an impact on risk assessment?

Q4: Do processes for sharing vision have an impact on risk assessment?

Going beyond the model, there are other related questions that warrant investigation: Does the longevity of the relationship between the lender and borrower matter? Would the shared-vision be achieved through cross-training of the lender about the technology-based business and the borrower about the process of financing? What outcomes should be expected and measured from a shared vision? Does the model have applications to relationships in addition to borrower and lender, such as entrepreneur and equity investor?

Interdependence and processes for sharing vision provide a means to understand how inter-relationships are developed and maintained or not within the environment of a micro-loan for a growing technology-based SME. This understanding of micro-management processes is particularly important in the management of economic development programs. Successful development programs like micro-finance are dependent on how well we understand what processes are occurring at the micro-level of management.

### **CONCLUSION**

Within the above model, interdependencies include dual dimensions between the micro-finance lending officer and the technology-based SME owner (or delegate), namely the psychological and financial transactions dimensions. Further empirical research can examine the nature of these dimensions. This future research is relevant to theory as it contributes to our understanding of the nature of tacit knowledge and decision making. Future entrepreneurs experience the sharing of their vision and interdependence in many business situations. Future research opportunities can focus on the relationships they have with professions like accountants and solicitors, with

investors, with their supply chain, joint ventures and with key customers. The conceptualization outlined in this paper contributes to practice because it informs policy makers and practitioners about the process of interpreting and assessing financial risk in the micro-finance – technology-based SME relationship.

## **ABSTRACT**

Given that various types of entrepreneurial network/ cluster relationships are being promoted and researched, this paper fills a void in the literature in that it introduces an entrepreneurship system model for theory building. This entrepreneurship system framework provides a means for the design, implementation and evaluation of entrepreneurial networks.

The model explores a range of different strategic network issues in economic development within an entrepreneurship system. These issues include the network types, participant goal, participant conduct, network type, network system management, learning and culture. The goal of the framework is to explain how businesses organize networks in different commercial contexts. It clarifies issues to explain strategic differences in the networks and clusters that can operate in an entrepreneurship system.

Investigating the strategic differences in the network clusters that can operate in an entrepreneurship system, we develop a set of propositions regarding relationships among strategic issues leading to a viable network. Our model contends the following:

- There are identifiable factors contributing to the quality of network relationships in clusters.
- There are identifiable factors contributing to the structuring of partnerships in clusters.
- Network relationships have an impact on how business organizes in a business context.
- Structuring of partnerships has an impact on how business organizes in a business context.

The framework developed facilitates the analysis and evaluation of an entrepreneurship system. The paper concludes with a typology of the ways in which business organizes in commercial contexts based on network relationships and structuring of partnerships.

**Key words:** Networks, clusters, entrepreneurship system, interdependence, structuring of partnerships

## INTRODUCTION

There has been an increasing focus on entrepreneurial firms networked together in various ways (Florida 1996; Neck, Meyer, Cohen & Corbett 2004). Examples of these are Silicon Valley, Boston's Route 128, North Carolina's Research Triangle, Boulder County and the Italian Emilia-Romania. Network arrangements in an economy are now often seen on a broader scale as a foundation for economic growth. This can be seen specifically at the level of the regional economy (see Brusco 1982; Brusco & Righi 1989) where promotion of entrepreneurial networks and clusters can occur (Kinsella 1989).

Analysis of entrepreneurship has tended to examine informal social arrangements in promoting the creation and growth of new companies, interactivity, knowledge management and knowledge sharing. The literature on entrepreneurship and networks has identified a need for theory building (Hoang & Antoncic 2003; Neck, Meyer, Cohen & Corbett 2004). This paper fills a void in the literature in that it introduces a framework for theory building that can provide clarification that helps explain how well a cluster operates, within networks in an entrepreneurship system.

Network initiatives establish advantages and disadvantages where under certain conditions network links cannot be established, or where certain types of network may be unsuitable. Thus, the importance of creating, maintaining, and developing appropriate networks has increased, making it ever more important to understand the processes involved. The framework in this paper may be useful in the evaluation of network arrangements. The proposed framework may also assist in the design, implementation and evaluation of network arrangements for entrepreneurs within an entrepreneurship system. An entrepreneurship system operates in a region of high entrepreneurial activity (see Neck, Meyer, Cohen & Corbett 2004 for an elaboration of entrepreneurship system).

Networks mean different things to different groups. A rich cross-disciplinary literature accompanies the topic. Through a review of the literature, we attempt a synthesis of issues that may be useful to analyze and evaluate networks in the execution of economic development. There are five sets of theories that can be used in the analysis of networks, ranging from theories of transactions costs, resource dependency, strategic management, social network theory, and the Uppsala school of networks (Varamaki & Vesalainen 2003). These can be reduced to three sets of concepts, based on strategy, network management, and social dimensions. The strategic issues identified and developed from the literature in the proposed framework focus on collective transaction costs, collective action, trust, management of the network, the type of learning and culture. These issues provide a means to explain the forces underlying different types of network clusters in economic development for entrepreneurs.

The cross-disciplinary literature review of this paper builds theory about the nature of variations in networks. Specifically, Porter's cluster theory and modern innovation theory are applied to categorize networks within the two dimensions—"structuring of participants" and

“network relationships”. This review also draws on organizational theory, learning regions literature, knowledge management literature, and innovation literature, to explain variations in network arrangements. The analysis of the nature of networks using this two-dimensional typology may be of use in clarifying networks. The two dimensional framework developed herein purports that, whilst successful entrepreneurial network classifications are likely to be characterized by systemic cooperation, other network types are characterized by formal and linear network relationships—namely hub, satellite networks, state networks, anchored industrial or district networks and virtual networks. On the other hand, Varamaki & Vesalainen (2003) emphasize the fluid nature of network development, in their classification of network, from development circle, through loose co-operative circle, project group, joint venture and finally joint unit. Again, however, their approach is by necessity incomplete, given the acknowledged absence of the social-psychological dimension of cooperation.

Another relevant idea to such networks is that of clusters. Clusters within networks can be seen as a nested relationship. Within this perspective, businesses organize in different commercial contexts in clusters within broader networks. The ways in which clusters can be defined is not clear. What exists in the literature is a set of overlapping ideas. DTI (2001) identifies *six main* types of clusters, from vertical production chains, aggregations of connected sectors, regional clusters, industrial districts, networks, and innovative milieu. In terms of the formal academic literature, Markusen (1996) follows a structures based approach to classification of types of industrial district (from the traditional Marshallian New Industrial District, and its Italianate sub-category, hub and spoke districts, satellite industrial platforms, and the state centered district).

In contrast, Gordon and McCann (2000) concentrate on processes rather than structures, seeing the three basic types of clusters as deriving from agglomeration (from external economies of scale, scope, and complexity), industrial complex advantages (reducing transactions costs through location), and social networks. Indeed, this social networking element has a rich and diverse literature that accompanies it, generating a number of important overlaps with the (generally) more economics-focused cluster literature. This point is expanded upon later in this paper.

Types of advantages of clusters can be seen as basically twofold—that is, cost and knowledge based advantages, with industrial complex advantages existing as a hybrid of the two. These basic advantages (advantages which can also be applied to networks) focus on (i) economies of scale and scope of various types; (ii) industrial complex advantages from close proximity of expertise, finance and innovation; and (iii) information interchange from network paradigms.

The next section of the paper draws on a cross-disciplinary literature review to build theory about the nature of variations in networks. Transaction cost analysis provides a framework to clarify whether a firm internalizes within the individual organization, internalizes within an existing network or externalizes. In situations where the decision is to internalize within an existing network, distinct network types emerge based on the relationship between structuring of participants and network relationships.

For example, transactions costs economics and supply chain strategists would recognize networks as the way in which vertical linkages are established between firms at different stages of the production process, involving issues such as trust, sunk costs, etc. As previously identified analysis of entrepreneurship has tended to look at more informal social networking arrangements in promoting the creation and growth of new companies, interactivity, knowledge management and knowledge sharing, whilst Harrison et. al (1996) have seen technological learning as one of the dynamic agglomeration outcomes to be derived from combining geographical closeness and formal (transactions based) or informal relationships. Van Dijk and Sverrisson (2003), Lechner, and Dowling (2003), Varamaki and Vesalainen (2003), have also illustrated, the interest in the various types of network arrangements that are possible for entrepreneurial firms.

From this examination of the literature, it can be seen that the three basic advantages of networks/ clusters derive from transactions, agglomeration effects and network relationships. Another basic differential that can be observed, however, is between vertical/ horizontal, and formal/ informal clusters and networks.

The vertical and formal networks structures revolve around transactions costs, first expounded by Coase (1937) in his explanation of the firm, built upon by Williamson (1979), and outlined by Jarillo (1988). Firms exist because using the market for activities imposes costs (transactions costs such as opportunism, power, etc.). If these are high enough, then it is cheaper to internalize that activity within the firm itself. Cook and Emerson (1984) also highlight the issues of power and dependence within such market-mediated exchange network activities, issues that often moderate against such networks developing. However, where such transactions costs can be minimized, outsourcing and subcontracting of activities becomes more feasible and desirable, particularly if it allows companies to concentrate on the activity where they have expertise and comparative advantage. Examples in entrepreneurship of this are in high technology where new products are being developed.

From this the importance of vertical strategic networks become apparent, as does the link to the management of such arrangements (see Boyle 1994). In this regard the car industry and Japanese carmakers in particular are instructive, where long-term close relationships with first tier suppliers (of major sub-systems) are the norm, such that they are seen as an organizational network. These vertical networks of small with large firms are clearly therefore of importance to the competitiveness of the firms in the supply chain (Smith, Dickson & Smith 1991; Young, Francis & Young 1994). Larsen (1991) emphasizes such vertical collaborative relationships to SMEs, whilst Borch and Arthur (1995) argue for more analysis of strategically important networks of small firms.

In contrast to the formalized networking arrangements already described, a much larger, informal, often social, vertical and horizontal network phenomenon promotes and enhances entrepreneurial activity and growth generally (Birley 1985; Donckels & Lambrecht 1997; Neck, Meyer, Cohen, and Corbett 2004; Johannisson 1986). Attention has been drawn to the value that social networks and networking add to the creation, sustainability and growth of small firms (Birley & Westhead 1990). In particular, research has shown the importance that different, single elements of an entrepreneurial system may have on the overall macroeconomic development of a region (Kenny & Florida 1988; Stough, Haynes & Campbell 1998). There is however, a failure in research to explain the impact or importance of networks for entrepreneurs (Gibb & Davies

1990). The exception to this is a recent study by Neck, Meyer, Cohen and Corbett (2004) that took a systems perspective in their analysis of a region of high entrepreneurial activity rather than exploring individual issues in isolation. Their investigation of the interaction of many different issues of an entrepreneurial system, including SMEs, while also examining what impact this interaction had on the macroeconomic development of a region, is a useful, early study in the under researched area of entrepreneurial networks. In particular, the study provides insights into the nature of formal and informal network relationships within an entrepreneurial system. Like Neck, Meyer, Cohen and Corbett (2004), the framework presented herein perceives an entrepreneurship system as consisting of formal and informal network relationships.

The literature provides several other examples that support the argument that informal social network relationships are a characteristic of some clusters. What is significant in these examples is how entrepreneurs perceive the importance of relationships whilst conducting business transactions (Johannisson et al 1994; Shaw & Conway 2000). To illustrate this point, Borch & Huse (1993) describe how the networking of entrepreneurial firms' boards can assist such firms in Sweden and Norway (as well as the need for incentives). Indeed, Nijkamp (2003) indicates that modern entrepreneurs, particularly urban and ethnic entrepreneurs, need to be increasingly creative network operators and managers.

Gulati (1998) describes that the most important facet of any organization's market environment is its "social network of external contacts". The argument is that economic transactions take place within an embedded network of social relationships. Social networks normally link people or organizations to a set of relationships such as friendship or business interdependency. Network perspective builds upon the notion that economic actions are influenced by the social context in which they are embedded, which affects the quality of exchange in the relationship and thus whether it generates more or less favorable outcomes (Donckels & Lambrecht 1997).

It is also argued that the actions of those implicated can be influenced by the position of others involved (Gulati 1998). Those involved do not always make decisions based upon individual interest but based upon the strength of a relationship. This can produce mutual gain to continue the social network. The underlying mechanism of social networks is the quest for information and assistance that will reduce uncertainty (Alchian 1950). It has been acknowledged that social networks can assist in promoting behavioral conformity, which can influence the extent to which firms adopt new processes and innovations (Gulati 1998). Organizations or people that are tied are likely to share an understanding of behavior through discussion (Nohria & Eccles 1992). That is, they engage in informal network relationships.

Networks can, therefore, have horizontal/ vertical and formal/ informal aspects, depending on the network in question, as well as the transactions costs, agglomeration and relational advantages from their existence.

Next, network issues are explained. These are the strategic issues that are constant in all cluster types. Following an explanation of a specific cluster element, the second part of the analysis focuses on network categorization. This categorization explains variations in a specific network issues, based on variations in network relationship and structuring of participants. A review of the disparate literature on networks produced the following elements in the network

classification scheme which together provide a framework for analysis — namely, cluster type, participant goal, participant conduct, network type, network system management learning and culture. These are the key strategic issues faced by all clusters within networks in an entrepreneurship system.

The framework for analysis begins firstly with cluster type as a field for analysis. This section fundamentally establishes the rationale for selection of cluster types—that is, whether the relationship will be in the horizontal or vertical: formal or informal. The rationale for choosing cluster type is based largely on cluster theory and Lechner and Dowling's (2003) ideas of the advantages to be derived from the network. Further, it draws on Coase's (1937) transactions costs theory and Cook, and Emerson's (1984) review of management strategies.

Decisions about categorizing the cluster type are based on three factors—return sought, resources and relationships. Returns sought can focus on any one of the following objectives—cost reduction based objectives, knowledge based objectives, or a combination of the two. Decisions around resources focus on whether the resources/ capacity exist within the organization/ network to achieve the returns sought. Finally, decisions around relationship focus on whether a cluster wants to develop these resources internally (organization/ network) or go outside existing structures into new relationships. This decision depends on organizational/ network strategy, as well as transactions costs and related issues. The type of relationship necessary to achieve a cluster's objectives depends on capacity, strategy, transactions costs, and whether there is a perceived (as opposed to actual in some cases) match between the goals of the parties—that is, what they want from the relationship in terms of the type of performance outcome.

The second network issue in the framework for analysis is participant goals as a field for analysis. These can be seen to fall into the following categories, derived from strategy theories (such as Eisenhardt & Schoenhaven 1996; Mowery, Oxley & Silverman 1998). In brief, based on structuring of partnerships and network relationships, participant goals can be categorized as (a) good for me (G1). In this situation, the key goal is individual survival; (b) good for us (G2). In this situation, the key goal is collective survival of the network/ relationship; and (c) good for them (G3). In this situation, the wider survival of the entrepreneurship system is the key participant goal.

Once these cluster types and goals have been established, the third network issue that is of strategic interest in an entrepreneurship system is participant conduct. This issue is derived Ahuja (2000). It falls under three broad headings (with some degree of overlap creating a continuum). In short, participant conduct can be categorized as (a) control. In this situation, the cluster is characterized by transactions based approaches, which succeed if the transaction itself is the only issue (measured in terms of its output); (b) collective action. In this situation, the cluster participant conduct is characterized by an embedded, closed network based approach, which succeeds if the mutual goal is short term and internal capacity to meet this exists in the long term; and (c) co-operative learning. In this situation, an open network approach is adopted. This succeeds if there is a wide mutual goal in the long term, with internal capacity and seeking external capacity to fill gaps in the long term.

The next network issue is network type. Based on decisions about cluster type, participant goal and participant conduct the precise structure of the network type then needs to be established. Categorization of network type is derived from Ireland (1990). It falls into the following categories: (a) Transactions Based. In this situation, the network type is characterized by a formal mode of business. Output occurs via the transaction—for example, old style buyer-supplier relations, research and development; (b) trust based. In this situation, the network type is characterized by social, informal networks where the transaction occurs via the building of trust over time—for example, entrepreneurs; and (c) teamwork based. In this situation, trust is built via the teamwork of the entrepreneurship system participants. Please note that as you move towards a more systematic approach to how businesses organize in different commercial contexts, the categorizations within network type move further away from output as the key goal.

To these network issues and categories, we can then add network management as an issue. Categorization of network management draws on Snow, Miles and Coleman (1992). Their paper categorized the types of people needed to manage the network through different time frames. In brief, network management can be categorized as follows: (a) start. Network management focuses on creating the network in the immediate/ short term; (b) survive. The focus here is on connecting the network over the short/ medium term; and (c) sustain. The focus here is on developing the network over the long term.

The next issue in our framework is learning. In addition to Snow, Miles, and Coleman's (1992) categories, the social-psychological framework developed in this paper assumes that localized learning in clusters represents the best framework for an innovative, learning economy (Lundvall & Johnson 1994; Storper & Walker 1989). In a learning economy technical and organizational change has become increasingly endogenous. Learning processes have been institutionalized and feedback loops for knowledge accumulation have been built in so that the economy as a whole ... is "learning by doing" and "learning by using" (Lundvall & Johnson 1994). Localized learning processes are important in securing innovativeness and competitive advantage. This assumption is consistent with modern innovation theory that implies a sociological view of the process of innovation in which interactive learning is looked upon as a socially embedded process that is fundamental to the process of innovation (Lundvall 1992). The quality of interactive learning in clusters influences their capability to break path dependency and change technological trajectory through radical innovations, so as to avoid falling into "lock-in situations" as a result of weak competition from low cost producers (Asheim & Isaksen 1997). Thus, interactive learning is consistent with the organizational learning literature's concept of double-loop learning in which collective learning is characterized by "doing things differently" or "doing different things" (Argyris & Schon 1978).

The final issue in our framework relates to culture. According to Hofstede's (1980, 1984) research, power distance among workers in the US, Spain and Mexico are in monotonic order, with the US being the lowest, Spain being middling and Mexico being the highest. In particular, it is argued that power distance between cluster members is an indicator of cross-country cultural differences. In high power distance cultures, lower status cluster members are more respectful and obedient to higher status cluster members and visa versa in low power distance cultures.

Based on this literature review, clusters can be categorized within networks in an entrepreneurship system, by applying the issues and categories summarized in figure 1.

## **DISCUSSION**

The model in figure 1 is now explained. Cell 1 is indicative of the processes required for a successful traditional formal and vertical cluster and network. The strategic focus is narrowly cost and individual firm based, and is thus built on tight transactions based relationships within a hierarchical structure. The network management is thus likely to be focused on short to immediate term network creation. These networks are characterised by single-loop learning to increase efficiency and high power distance between cluster members of differing status. These processes can also be seen as indicative of clusters based around vertical supply chains, such as hub, satellite, R&D and state anchored industrial districts.

Cell 2 is indicative of the processes required for newer more informal vertical cluster and network types, such as Japanese style lean production supply chains, but also entrepreneurial cluster associations where there is a high power dependency. The strategic focus is more widely based around disseminating knowledge and by so doing reducing mutual cost bases. The goals are thus more collective, and are thus built on wider trust based collective action relationships, though still within a hierarchical structure. The network management is thus likely to be focused on medium term network building (though of course initial network creation skills are also important). These processes can also be seen as indicative of clusters based around vertical supply chains, such as some types of Marshallian clusters, but also some types of cluster associations. These networks are characterized by an emphasis on single-loop learning with ad hoc double-loop learning to both increase efficiency and to enable knowledge interchange. Whilst this can be seen in some ways as an improvement of the more rigid networks in cell 1 (for example supply chains), it may not be the most suitable arrangement for cluster associations where innovation outcomes are sought (in which case cell 4 may be more suitable). Like cell 1 these clusters are characterized by high power distance between cluster members of differing status.

Cell 3 is indicative of the processes required for informal horizontal cluster and network types, such as social networks of entrepreneurs with low power dependence, as exist in some cluster associations. The strategic focus is based around knowledge sharing and dissemination, as would be expected where small firms collaborate to generate scale effects. The goals are again collective, but can be wider, allowing for the growth of the network itself, and thus built on wider team based open network action relationships, without hierarchical structures. The network management is thus likely to be focused on long term network growth. These networks are characterised by a combination of single-loop learning and double-loop learning to facilitate the wider survival of the network through knowledge based exchanges. Clearly in this cluster type, network creating, sustaining and building skills are important, highlighting this as an area of particular importance, requiring a capacity-building focus. These processes can also be seen as indicative of clusters based around horizontal relationships, such as some types of Marshallian clusters and urban hierarchies. These clusters are characterised by low power distance between cluster members of differing status.

Finally, Cell 4 is indicative of the processes required for more formal horizontal cluster and network types, such as virtual organizations. The strategic focus is based around specific cost-reducing knowledge, as would be expected where small firms collaborate to generate scale effects. The goals are again collective, and thus built on wider trust based collective action relationships, though still within a hierarchical structure. The network management is thus likely to be focused on medium term network building. These networks are characterised by single-loop learning to facilitate a cost focused knowledge interchange network. These processes can also be seen as indicative of clusters based around vertical supply chains, such as some types of Marshallian clusters. This can be seen in some ways as an outcome of processes from cell 4; it may not be the most suitable arrangement for cluster associations where innovation outcomes are sought. These clusters are also characterised by low power distance between cluster members of differing status.

Clearly, however, this is not a necessarily static outcome. The literature suggests that there is the potential for networks to develop within an entrepreneurship system, moving from one cell to another, as strategic requirements change. The most obvious movements are from cell 1 to cell 2 for networks wishing to develop mutual knowledge bases that ultimately reduce cost, as exemplified by changes in the UK automotive industry as Japanese car makers set up production and supply chains in the UK during the 1990s (see Pickernell 1997). In addition, the loose processes described in cell 3 could develop into more formal structures (to cell 4) if the network participants determine that a virtual organization would best suit their strategic objectives, this formalisation also closing the network in terms of participants to create a much more formalised arrangement. However, movement from cell 2 to cell 3 is also possible, as for example, if the focus of a cluster association requires a greater degree of knowledge sharing and innovation, as opposed to knowledge dissemination through the network. Indeed, cell 1 arrangements may themselves generate creation of cell 2 arrangements, through the creation of supplier clubs of proximate firms at the same stage in the supply chain, often facilitated by larger companies up the production chain, or development agencies for example Source Wales.

Robust strategic decisions that addresses design, implementation and evaluation of economic development initiatives needs to take account of the type of resources required for different types of clusters. By developing an analytical framework that focuses on the design, implementation and evaluation of networks this paper addresses criticisms of the management of networks. The analytical framework provides a means for networks to be designed, monitored and evaluated to ensure resources are appropriately allocated to the different variables of the network. For instance if an economic development initiative for a region is a State Anchored Industrial District (due to declining significance) then the implementation of collective action is required. Appropriate allocation for a complete renegotiation of participation goals and learning could be required.

### **RESEARCH QUESTIONS**

From this model four questions are generated to examine the interdependence and shared vision of micro-finance agencies and technology-based SMEs. These are:

- Q1: What are the identifiable factors contributing to the quality of network relationships in clusters?
- Q2: What are the identifiable factors contributing to the structuring of partnerships in clusters?

Q3: Do network relationships have an impact on how business organizes in a business context?

Q4: Does structuring of partnerships have an impact on how business organizes in a business context?

Going beyond the model, there are other related questions that warrant investigation: How well do network clusters transform themselves to shift the focus of their organisation to fit changing commercial contexts? Are there examples of these arrangements that go beyond the classification system presented here?

Network relationships and structuring of partnerships provide a means to understand how business organizes in different commercial contexts. This understanding of clusters within networks in an entrepreneurship system is particularly important in the management of economic development programs. Successful development programs are dependent on how well we understand what strategic issues drive decisions about how clusters organize.

## CONCLUSION

Within the above model, cluster type includes the dual dimensions between network relationships—formal linear relationships and informal systemic relationships—and structuring of partnerships—vertical linkages or horizontal linkages. Further empirical research can examine the nature of these dimensions. This future research is relevant to theory as it contributes to our understanding of the nature of networks and clusters. The framework developed facilitates such an analysis. It obviously enables initial classification of the network/ cluster type within an entrepreneurship system, and the benefits to be derived from them. However, it also allows the definition of the likely processes to be at work within that type of cluster if the network is to be successful. This is important because if there is a mismatch at the cluster level, then this is likely to signal the potential failure of the network/ cluster to maximize the benefits to be derived from the relationship (or may signal the collapse of the network itself). In addition, however, comparison of the network participants in terms of their own viewpoints with regard to these processes can also provide an early warning to interested parties, of potential mismatches between participants, which could also, if unresolved lead to the failure of part or all of the network. Finally, it allows evaluation of the likely/ required development of the cluster/ network if it is to fulfill the entrepreneurship system's potential from an economic development point of view. In order to verify this, however, additional research is required in the several areas. First, research at the level of the cluster is needed to determine the efficacy of the four-cell model. Case studies of clusters that fall into the various categories are envisaged, with analysis to examine the various factors of importance (participant goal, participant type, network type, network management, and learning). Secondly, research is required at the level of the industry association, to examine processes of learning and innovation.

The purpose of this research could be to undertake a pilot study to examine variation in the innovation climate in which high growth SME general managers and their executive teams operate. The study could involve firms from biotech industry associations and could focus on the hypothesis that there is a relationship between the quality of learning and SME growth, building around a multi-level, multi-variant model of innovation climate to SME growth criteria variables. Examination of the senior executive team could provide insights into how and why firms develop or not develop beyond the start-up stage and why firms grow. Thirdly, research is required at the level of the economy. If the model is found to be robust, analysis of current government policy as

it affects networks within entrepreneurship systems could be carried out, to determine examples of good practice, areas where the model could suggest improvements and changes in policy to increase the effectiveness of government resources.

## **ABSTRACT**

The study analyses the cultural factors affecting entrepreneurship in the Philippines. Based on an examination of existing ethnographic studies that look into Philippine culture, a list of values, traits, and beliefs that could affect the conduciveness of the environment to entrepreneurship was drawn. Twenty-five statements are then formulated to associate the list of values, traits and beliefs to Philippine culture. Entrepreneurs are then asked to indicate their level of agreement with the statements using a 5-point Likert scale. A factor analysis was performed on the 25 items to determine if they can be reduced to lesser number but more meaningful set of factors. Lastly, a regression was then executed to determine whether there are significant relationships between these cultural variables and the conduciveness of the Philippine environment towards entrepreneurship. This study indicates that both positive and negative cultural characteristics impact on perceptions of conduciveness. Policymakers need to find ways to adjust policy and programmes to cope with these cultural characteristics. In instances where negative cultural characteristics severely affect the perceptions of conduciveness of the environment, policy makers need to think about long-term ways to change people's values and beliefs.

## **INTRODUCTION**

There is a shortage of research on institutional conditions of SMEs in Asia. Most of what has been done is limited only to formal institutional aspects such as: support services (Sarder, Ghosh and Rosa, 1997; Abdullah, 1999) and SME policy (Moha-Ashri, 1995; Meier and Pilgrim, 1994; Mohd-Yusuf, 1991). Philippine studies have also been limited to formal aspects, mostly on investigations of government macroeconomic policies on SMEs (Theocharides and Tolentino, 1991; Llanto, 1991; Lamberte, 1991; Guevarra, 1991; Koppel, 1990; Gatchalian, 1990, Jose-Nario, 1990; Tecson, et. al., 1989), and credit/financial intermediation (Saldana, et. al., 1993, Quesada, 1996).

It is important to view entrepreneurship from a broader perspective, and not just limit it to the formal institutional framework. Cultural attitudes affect the way individuals perceive and act on opportunities that are created by the institutional environment. Firm creation is a response of the individual to certain institutional conditions that provide incentives to become entrepreneurs. According to Lee and Peterson (2000:403), "There is a need for an entrepreneurship model that acknowledges the individual person without discounting the external environment that is beyond the individual or the firm's control." This study will, hopefully, address the gap in this research area.

## **LITERATURE REVIEW**

Several authors have stressed the potential importance of culture for explaining variations in entrepreneurship and economic development. According to Carsrud and Johnson (1989:26),

the study of social norms, mores and values is an effective avenue of research investigation with respect to the initiation and growth of new ventures. The social and cultural factors that enter into the formation of entrepreneurial events are most felt through the formation of individual value systems. In social systems that place high value on the formation of new ventures, more individuals will choose that path in times of transition (Shapiro and Sokol, 1982:83). Etzioni (1987:175, 183), stated that legitimation is a major factor in determining the level of entrepreneurship that is found in a society. The extent to which entrepreneurship is legitimate, the higher the demand for it; the higher the supply of entrepreneurship, the more resources are allocated to the entrepreneurial function. The immediate sources of legitimation are the values of the society and the relevant sub-societies.

Gnyawali and Fogel (1994:53) believe that socioeconomic conditions and governmental policies play an important role in the "propensity to enterprise". They suggest that factors such as public acceptance and support from family, community, and governmental agencies "create an 'enterprise culture' that enables firms to take reasonable risks and seek profits".

Min (1987) also incorporated culture as an explanatory variable for entrepreneurship. According to Min, some minority groups have cultural characteristics that are conducive to small business development. In a study conducted on Filipino entrepreneurs, Chu et. al. (2002) explored the issue of how Filipino culture affected the manner by which several primary strategic entrepreneurial decisions are made. The study generated several interesting findings. Filipino entrepreneurs enter into self-employment because of the potential to earn money. This is attributed to the poor economic conditions existing in the country and the limited job opportunities for the poor, unskilled, and uneducated population. A large portion of the sample also said they became entrepreneurs because of the need for independence. A second finding was that Filipino entrepreneurs adopt a "friendly attitude" as the primary approach to attract and retain customers while the secondary approach focuses on offering excellent service. The results support the researchers' argument that the relationship between the entrepreneur and his customer is an integral factor in the success of the business. The respondents also identified family as their major source of advice. The opinions of friends and fellow business owners were more valued than those of legal and financial advisors. These results indicate that the Filipino entrepreneur appears to rely on more informal social networks for advice rather than traditional or institutional sources of information. The results prove that the Filipino kinship system causes Filipino entrepreneurs to look towards their family and friends for all types of support including venture financing. Lastly, the study found that many entrepreneurs have parents who were business owners. These parents served as role models for their children to emulate.

Noting the success of Chinese entrepreneurs, Wu (1983: 112) identified some of their cultural values: a high propensity to save and reinvest business earnings; a universally strong desire to secure a better education for their children, who would then be expected to carry on the business and often did (a high N-achievement); and a strong sense of loyalty and mutual obligation within the Chinese extended family.

Min and Jaret (1985) linked cultural characteristics to entrepreneurial success among Koreans in Atlanta. They found a strong correlation between success and adherence to the cultural values of frugality and the work ethic.

Dana (1997) conducted an ethnographic study of entrepreneurs from Lesotho. He found that the culture in Lesotho encourages entrepreneurship inasmuch as it values the accumulation of

wealth; however, the same culture hinders some aspects of entrepreneurial activity through value-laden perceptions of property.

Entrepreneurship prospers if society views it with a favourable attitude. Societies and cultures that value entrepreneurship tend to develop societal systems to encourage it (Vesper, 1983). It has been noted that, among the Chinese, entrepreneurial role models encourage people to go into business, and entrepreneurs are often supported by close networks of family members and relatives (Kao, 1993; Siu and Martin, 1992). Programmes that develop societal awareness of entrepreneurship have a positive effect on small business development and growth.

Much previous entrepreneurial research has focused upon how others perceive entrepreneurs, or on comparisons between entrepreneurs and others in their society who are not entrepreneurs (Sexton and Bowman, 1985; Schere, 1982). These studies demonstrate that there are higher rates of firm formation in countries that have positive perceptions of entrepreneurship and that perceive entrepreneurship as a desirable occupation.

## **RESEARCH METHODOLOGY**

### **Selection of Respondents**

The probability method of stratified random sampling was used. The sampling of the entrepreneurs used the list of establishments from the National Statistics Office (NSO). The researcher requested the NSO to randomly generate a sample of 400 SMEs using employment size as criteria. Only the following four industry sectors were included in the survey of entrepreneurs—manufacturing, wholesale and retail, finance, real estate, insurance and business services, and community, social and personal services. These industries were selected as almost 90% of all SMEs in Metro Manila belonged to these industry sectors. The samples for each industry sector were then proportionately stratified according to the distribution of all firms per industry sector and size of the firm.

Table 1 presents the distribution of establishments based on employment size and industry sector. The total figure of 23046 firms was used to compute for the sample size, which were 376. Hence, 400 names were requested from NSO. Of the 400 only 350 responded (response rate 87,5%). However, only 290 of the 300 responses were usable.

-----  
Table 1 Here!  
-----

The survey is cross-sectional (ie. the survey information was collected at one point in time). Research assistants were instructed for two (2) two-hour sessions on how to distribute and collect the questionnaire. The assistants were assigned to distribute the questionnaires to SME owners all over Metro Manila. All questionnaires had a cover letter introducing the researcher, explaining the objectives of the study, and contact information about the researcher.

## **DATA ANALYSIS**

All questionnaires returned to the researcher were checked. In cases where at least half of the questions were not answered, the researcher discarded the questionnaire. After all unacceptable questionnaires were discarded, the questionnaires were edited. Answers to questions that are related were checked in case there were errors (i.e. if answer to a question is no, then the related question should be disregarded/not applicable).

- Factor analysis was performed on variables indicating cultural values as well as problematic policy areas to identify underlying factors that explain the pattern of correlations within a set of observed variables. The objective of the principal components analysis was to generate a first factor that would have the maximum explained variance. Then with the first factor and its associated loadings fixed, principal components located a second factor maximising the variance explained in the second factor. The procedure was then repeated until there were as many factors generated as variables. Varimax rotation was the rotation scheme used.
- Regression analysis was conducted to determine the relationships between conduciveness of the environment and cultural variables. A model was generated in this analysis. The variables in the regression were not dichotomous. The variables were ordinal in nature (i.e. strongly agree, agree, neutral, disagree, strongly disagree).
- Reliability was tested using Cronbach's coefficient alphas. This statistic determined the internal consistency of the items on the scale.

## RESULTS

### **Factor Analysis of Cultural Factors**

A factor analysis was performed on the questions related to culture. Findings from the factor analysis illustrated in Table 2 show the emergence of a nine-factor solution that accounts for 65,571 percent of the variance.

-----  
 Table 2 Here!  
 -----

The nine factors identified in the factor analysis are - Filipino values, child rearing practices, attitude towards work, attitude towards entrepreneurship, Filipino traits and culture, attitude towards responsibility and failure, entrepreneurial environment, social status, and values from childhood.

#### **Factor 1. Filipino values**

This factor had four item loadings and included the following items: compassion, loss of face, debt of gratitude, and friends and family expect different treatment. This factor deals with the entrepreneurs' perception of how the entrepreneurs' dealings and decisions can be affected by the above-mentioned values. The component loadings ranged from 0,564 to 0,817. In Philippine culture, family and friends expect to be treated differently in terms of transactions in the business. This could entail special discounts, extended credit or utilising the organisation's resources for personal use.

#### **Factor 2. Child-rearing practices**

This factor had four item loadings ranging from 0,511 to 0,868, and included items such as discourage exploration, questioning, taking initiative, and blind acceptance of authority. This factor related to the entrepreneurs' perception that Filipinos still use traditional authoritarian parenting methods that do not encourage independence in children.

#### **Factor 3. Attitude towards work**

This factor had two item loadings ranging from 0,877 and 0,882 and included the following items: entrepreneurship is morally and ethically acceptable, and honest and productive work is valued. This factor deals with the entrepreneurs' attitudes towards work. The work ethic is

valued highly in Philippine society. People who are industrious and honest are admired and idealised.

**Factor 4. Attitude towards entrepreneurship**

This factor had three item loadings ranging from 0,382 to 0,946 and included items such as entrepreneurship is legally acceptable and trading is acceptable in Filipino culture as well as positive environment for starting a firm. This factor emphasizes that entrepreneurs in the Philippines perceive that being an entrepreneur and a trader is acceptable.

**Factor 5. Filipino traits and culture**

This factor had four item loadings and included items such as: risk-taking, strong-hearted, God for compassion and man for action, and family support. This factor deals with the respondents' perceptions of what traits are needed by entrepreneurs. Family support is also very important in Filipino culture as they are the main source of moral and financial support. The component loadings range from 0,482 to 0,729.

**Factor 6. Attitude towards responsibility and failure**

This factor had three item loadings ranging from 0,587 and 0,686, and included the following items: existence of all-powerful forces, love for self, and fatalistic. Filipinos do not take failure and responsibility well. They tend to blame other forces such as God, the fates, and other people. This stems from their love for self and not being able to accept that they can make mistakes.

**Factor 7. Entrepreneurial environment**

This factor had three item loadings ranging from 0,413 and 0,820, and included the following items: upholding the ideals of competition, long range planning and the anticipation of future trends are practiced, and the conferment of social ranks is based on achievement. For an environment to be conducive for entrepreneurship, it must possess the above three attributes. It must have a competitive atmosphere that continuously challenges its participants. The entrepreneur should also plan for the future and anticipate future trends to ensure that s/he will always be at the forefront of the competition. Lastly, social ranks must be conferred based on achievement to encourage people to constantly improve on themselves.

**Factor 8. Social status**

This factor had two item loadings. It included the following items: lack of ease of movement between social classes, and colonial mentality. This factor deals with social issues affecting entrepreneurs. Another hindrance to entrepreneurs is the idea that anything foreign is always better than domestically made products. This hinders the development of local innovations. Lastly, the ease in moving across social classes also fosters entrepreneurship. Individuals can aspire to climb up the social ladder even though they are in a lower class at present. The component loadings ranged from 0,384 to 0,614.

**Factor 9. Values from childhood**

This factor had two item loadings ranging from 0,511 and 0,772 and included the following items: can aspire to be rich and famous, and traditional authoritarian child rearing practices. This factor deals with the entrepreneurs' perceptions of how the different values from childhood affect his or her decision to become an entrepreneur. Having the freedom to aspire to be rich and famous can be a stepping stone to becoming an entrepreneur. Traditional child rearing practices tend to stifle creativity, innovation and initiative, and can be a deterrent to entrepreneurship.

The four factors and their relative contribution to variance are presented in Table 2. It can be seen that all the nine factors have an eigenvalue of above 1, ranging from 1,068 to 4,640. Factor 1, Filipino values, contributes a variance of 16,571 percent, followed by factor 2, child rearing practices, which contributes 13,044 percent. Attitude towards work, factor 3, contributes 7,397 percent of the variance, while factor 4, attitude towards entrepreneurship, explains 6,393 percent of the variance. Factor 5, Filipino traits and culture, contributes 5,071 percent in explaining the variance while factor 6, attitude towards responsibility and failure, contributes 4,818 percent. Entrepreneurial environment, factor 7, contributes 4,462 percent, social status, factor 8, contributes 3,999 percent and factor 9, values from childhood, contributes 3,816 to explaining the variance. The total cumulative variance explained by the nine factors is 65,571 percent (refer to Table 2).

The data collected were also subjected to item analysis. The Cronbach's alpha coefficient ( $\alpha$ ) was calculated to determine the internal consistency of the items on the scale. The alpha value for the entire cultural factors scale was found to be 0,7649, which indicated that the internal consistency was quite high. Cronbach's alpha coefficient for each factor of the scale were as follows: factor 1 = 0,7943; factor 2 = 0,7822; factor 3 = 0,9629; factor 4 = 0,6476; factor 5 = 0,6452; factor 6 = 0,5184; factor 7 = 0,5231; factor 8 = 0,2549; and factor 9 = 0,3281.

### **Regression Analysis of Cultural Factors**

Table 3 presents the results of the multiple regression analysis on the perceived conduciveness of the environment against cultural factors. The results indicate that only six of the 26 variables entered in the analysis were significant predictors of perceived conduciveness. These six variables are: strong-heartedness (positive relationship), God for compassion and man for action (negative relationship), elders know what is best (positive relationship), acceptance of trading (positive relationship), can aspire to be rich and famous (positive relationship) and risk-taking (positive relationship).

The regression model is presented below:

$$Y_i = 1,164 + 0,394X_1 - 0,340X_2 + 0,114X_3 + 0,143X_4 + 0,096X_5 + 0,103X_6$$

-----  
 Table 3 Here!  
 -----

The results of the multiple regression analysis indicate that perceived conduciveness is positively affected by strong-heartedness, elders know what is best, acceptance of trading, can aspire to be rich and famous, and risk-taking. Clearly, emphasis on cultural traits such as strong-heartedness and risk taking encourage entrepreneurship by taking advantage of opportunities but being mindful of the corresponding risks at the same time. Attitudes towards trading also encourage individuals to become entrepreneurs by respecting and admiring people who start small (i.e. through trading). Being able to aspire to be rich and famous also generates a more positive view of conduciveness. If people are allowed to aspire for richness, they will try to become rich (through entrepreneurship). Being able to accept that elders know what's best also fosters a positive entrepreneurial environment. Elders can be used as role models and can provide advice as to the desirability of entrepreneurship as a career. Only one variable had a negative effect on conduciveness - God for compassion and man for action. In instances where individuals rely too much on God to work things out for them (rather than working them out on their own), this discourages the individual from becoming more entrepreneurial and takes away the initiative in making decisions and choices.

## DISCUSSION

The results indicate that cultural traits such as courage and risk taking encourage entrepreneurship. Positive attitudes of respect and admiration towards trading also encourage individuals to become entrepreneurs. Being encouraged to aspire to be rich and famous also generates a more positive view of entrepreneurial propensities. If people are encouraged to aspire to be rich, some will try to become rich by starting their own businesses. Being socialised to respect elders' wisdom also tends to generate a positive entrepreneurial environment. Elders can be used in specific instances as entrepreneurial role models, and can also provide advice as to the feasibility of entrepreneurship as a career.

Only one variable was found to have a negative effect on perceptions of conduciveness viz: "God for compassion and man for action". In instances where individuals were found to rely on God to work things out for them (rather than working them out on their own), this was found to discourage the individual from becoming more entrepreneurial and tended to take away their initiative in making decisions.

## RECOMMENDATIONS

It is very difficult to change institutional factors such as culture, norms, traits and values. A slow but realistic way to do this is to **expose children to independence, free-thinking and exploration at an early age**. Schooling can be used as a conduit to do this.

Various activities can be used to foster entrepreneurial thinking. Universities can also start **offering courses in entrepreneurship**. These courses can help students gain the skills they need to start their own businesses. They can also clarify and allay students' fears about entrepreneurship. Career counsellors can also **discuss the merits of entrepreneurship as a career option** to graduating students.

**Successful entrepreneurs can also be identified and promoted as role models for budding entrepreneurs to emulate.** This initiative has been started by a few Philippine television stations with their programmes featuring successful small business owners being interviewed. Articles in newspapers featuring these entrepreneurs can also encourage others to become more entrepreneurial and perceive entrepreneurship as a viable career option.

**Table 2. Rotated Factor Matrix for Cultural Factors**

| Item   | Filipino values | Child rearing practices | Attitude towards work | Attitude towards entrepreneurship | Filipino traits and culture | Attitude towards responsibility & failure | Entrepreneurial environment | Social status | Values from childhood |
|--|-----------------|-------------------------|-----------------------|-----------------------------------|-----------------------------|---|-----------------------------|---------------|-----------------------|
| Loss of face (Hiya)  | 0,817           |                         |                       |                                   |                             |   |                             |               |                       |
| Compassion (Awa)   | 0,815           |                         |                       |                                   |                             |   |                             |               |                       |
| Debt of gratitude (Utang na loob)  | 0,813           |                         |                       |                                   |                             |   |                             |               |                       |
| Friends and family expect different treatment                              | 0,564           |                         |                       |                                   |                             |   |                             | 0,434         |                       |
| Discourage exploration   |                 | 0,868                   |                       |                                   |                             |   |                             |               |                       |
| Discourage taking initiative   |                 | 0,828                   |                       |                                   |                             |   |                             |               |                       |
| Discourage questioning   |                 | 0,733                   |                       |                                   |                             |   |                             |               | 0,335                 |
| Blind acceptance of authority  |                 | 0,511                   |                       |                                   |                             | 0,382                                     |                             |               |                       |
| Entrepreneurship is morally and ethically acceptable                       |                 |                         | 0,882                 |                                   |                             |   |                             |               |                       |
| Trading is accepted  |                 |                         | 0,877                 |                                   |                             |   |                             |               |                       |

## ABSTRACT

This paper presents the results of a survey of businesses established between 2001 and 2005 in Rutherford County, Tennessee. Business owners or partners were asked about their sources of start-up capital, including personal and business credit cards, personal savings, home equity loans, bank financing (with or without collateral), venture capital, and funds from angel investors, friends, relatives, or other sources. In instances where credit cards were used as a source of start-up capital or to meet ongoing capital needs, additional questions were asked to explore the motives, attitudes, and other behaviors associated with entrepreneurs' use of credit cards. Findings portrayed a compelling picture of the use of credit cards by entrepreneurs. Credit cards are being used relatively frequently for starting businesses as well as managing ongoing operations in actual practice, and they should therefore be formally acknowledged as a mainstream business practice among entrepreneurs. Although members of the business press have already acknowledged the phenomenon, except to an extremely limited degree, scholars have not as yet demonstrated a reciprocal level of interest.

## Introduction

Traditional sources of new venture financing tend to be emphasized in text books and constitute mainstream thought; however, bootstrapping (Roberts, 2003) and other non-traditional methods are commonly used by start-up entrepreneurs. Many start-ups report a lack of access to venture capital and bank financing, especially when that latter form of financing is labeled a business loan (line of credit, et al), as compared to a personal loan. Given the typical criteria of many banks for granting a business line of credit, which may include an already established positive cash flow, three or more years in business, and good business as well as personal credit (Parchois, 2000), the reasoning behind the adage "banks only lend money to those who don't

need it,” is easy to understand. It is also apparent that the terms “bank funding” and “start-up” go together about as well as oil and water: they simply do not mix.

*U.S. Banker* cited industry sponsored research commissioned by MasterCard, which reported that 57% of small business owners use personal credit cards for their business (de Paula, 2003), and added “credit cards of all kinds are quickly gaining in popularity as a method for small business owners.”

Further readings in the business press highlight numerous instances where business founders have used multiple cards for start-up funding. Indeed articles appear frequently in *Inc.*, *The Wall Street Journal*, and other non-academic journals, magazines, and newspapers. Hise (1998) in *Inc.* magazine concluded that despite the horror stories that result from the use of credit cards to finance new businesses, personal credit cards remain a fast, cheap, and easy way to obtain much needed start-up capital. In a *Wall Street Journal* article, author T. J. McCue (1999) reported that it was not unusual for people seeking money for new businesses to accumulate a “myriad of credit cards for this purpose—possibly 14 or 15!” (p. 6). In another *Wall Street Journal* article by Selz (1994), entrepreneurs were reported to use their credit cards for start-up capital and continue to use their cards to pay operating expenses.

Meanwhile, scholarly research into the use of credit cards as an initial source of capitalization by entrepreneurs has been too infrequent and insufficient to provide an understanding of this phenomenon. A search of databases used by *ProQuest* resulted in only three articles, which examined the behavior of credit card users published in scholarly peer-reviewed journals during the past four years. Research by Swift-King (2004) examined the use of credit cards to pay cash all at once and use the float, or to simply use credit cards as an easy form of borrowing. Yarett (2004) examined a new variant of structured financing called “whole-business” or “operating-asset” securitization. Credit cards were considered by Yarett to be passive assets like mortgages. The third article by Zopounidis and Doumpos (2002) used credit cards as a means to study multi-group discrimination using multi-criteria analysis.

Beyond the topic of usage itself, limited scholarly research has been conducted as it pertains to the motives of entrepreneurs and other factors that may drive their behaviors when opting in favor of personal credit cards for business financing. Hence, the purpose of this present research study was to identify and analyze the use of credit cards (both business and personal) as a source of business capital as well as owner motives and rationales. Given the aforementioned paucity of existing scholarly attention to the topic, despite the widespread use of credit cards for funding business start-ups and ongoing operations (as well as the apparent importance of the strategy from the point-of-view of actual practice), we anticipated that our study might serve as a pilot for additional research, and we began in the Rutherford County, Tennessee market area as a matter of convenience. This paper will present our review of the existing literature, research methods, findings, implications, and recommendations for further research.

## **Review of Literature**

As noted in our introductory remarks, academic research on the use of credit cards by entrepreneurs and small business owners is scarce. A search of several internet databases

indicates that the issue of credit card use by small business owners is a research stream that has not been tapped by academics.

Although commercial loans may enjoy a “hallowed reputation for respectability” (Rosenfeld, 1999, p. 1), “more and more small business owners are turning to credit cards for funding...because they are easy to come by and the credit limits are high” (Scully, 2002, p.1). In its *2002 Report to the Congress on the Availability of Credit to Small Businesses*, the Federal Reserve Board indicated that overall 46% of small businesses utilized personal credit cards in connection with their start-up or ongoing operational costs (Report to the Congress, 2002). Categories were reported under the headings of organizational form, years under current ownership, sic code, and number of employees. The most frequent users of personal credit cards among small businesses were: proprietorships; 0-4 years of age under current ownership; professional services firms; or those with 10-19 employees.

The aforementioned report further posited that personal credit cards may be used as a substitute for business credit cards. Publications in the popular business press such as *Entrepreneur* magazine seem to concur, suggesting that “good, old-fashioned plastic” is a source of capital that remains “plentiful even in tough times” (Prince, 2003, p. 1).

Financial advisors, who write regular commentaries in newspapers and magazines, have on occasion recommended the use of credit cards as one of several sources of start-up cash. Williams (2005) goes so far as to say that credit cards provide small business owners with an easy source of cash and are an option that allows entrepreneurs to avoid the controls that can be placed on a small business owner by banks, angels, relatives or other investors.

However, a writer for *Credit Control* magazine (2002) reports that the federal government is worried about a trend toward replacing traditional bank loans (for less than \$100,000) with the use of credit cards by small-business owners in the US. Hence, the federal government feels that credit cards are a riskier vehicle for financing the activity of a business, according to reports issued by the US Small Business Administration (SBA).

Additional observers would agree that the practice is riskier than other ways to finance a business (Hise, 1998). Despite the risks involved, Hise reported that according to the *Survey of Small and Mid-Size Businesses* by Arthur Andersen’s Enterprise Group and National Small Business United, the top two methods for financing small companies were bank loans and credit-cards, which were used by 38% and 34% of the respondents respectively. What is even more interesting is that the same survey reported that 25% of the companies that used credit cards were using them “often or routinely.” Shermach (2004) reported that “holders of cards for small businesses use their cards more often than consumers do, and their average transaction is bigger than the average consumer’s” (p. 24).

What makes the use of credit cards so risky? Primarily, it is the large bill that arrives each month, which cannot be juggled as easily as if there were several small bills coming in. Another risk is the violation of most personal consumer-cardholder agreements, which state that personal credit cards cannot be used to fund businesses. Hise (1998) reported that it is standard practice for thousands of entrepreneurs to use their personal credit cards to provide initial capitalization.

Additional observers note that minority and women entrepreneurs are at an even greater disadvantage with regard to having the means to acquire capital through traditionally accepted sources (Brush, Carter, Gatewood, Greene, and Hart, 2004). An article by Thomas (2001) stated that, as compared to men, many women entrepreneurs avoid the sale of equity in their businesses and “are more likely to rely on credit cards and personal loans” (p. B.2) to finance a business.

## **Research Methods**

### Population

The population in this study consisted of 830 businesses in Rutherford County, Tennessee. These businesses were listed on *Reference USA* as having been started between 2001 and 2005. In addition, the primary contact person was listed as “owner” or “partner.”

### Instrument

A survey was developed that identified sources of start-up capital typically associated with the creation of new businesses. Respondents were asked to identify sources of start-up capital in relative percentages of total capital. The instrument also probed the manner in which credit cards were used in two separate sections, usage related to the start-up phase of respondents’ businesses, and usage related to the ongoing capital needs of businesses. Additional demographics were also identified.

### Data Collection

An invitation to participate in the study was sent to all members of the population by mail, utilizing a post card. Respondents were asked to go to an online survey, or to make other arrangements to participate by mail, fax, or telephone. Of the 830 cards that were mailed, 70 (11.86%) were returned as undeliverable. 32 completed instruments were collected, inclusive of both paper and online surveys. At the time of this writing, surveys are still being received.

## **Results**

Demographics for survey respondents showed that the breakdown in terms of legal entity of the responding businesses were 56.3% proprietorships, 15.6% S-corporations, 15.6% C-corporations, and 12.5% as limited liability corporations. Franchises made up 6.25% of the respondents with the remainder independently-owned businesses. Gender breakdown was 37.5% female and 59.4% male – the remaining 3.1% representing individuals who chose not to identify their gender. Of the businesses that did respond, 38.5% had been in business about four years, 15.4% for 3 years, 15.4% for 2 years, with 30.8% in business for one year or less. Approximately 87.1% of the businesses currently had one to four employees, 9.4% had five to nine employees, and 6.3% had ten to nineteen employees. No business had more than nineteen employees.

Responses from the survey portrayed a compelling picture of the use of credit cards by entrepreneurs. Entrepreneurs tend to use credit cards extensively in the funding of start-up capital, ranking second only to personal savings among the most commonly used forms (Table 1). Among respondents to the survey, 37.5% indicated that credit cards played a role in the collection of start-up capital, and provided 26.2% of the capital needed to those individuals.

---

Table 1 about here

---

Personal savings was mentioned less than twice as often (68.8%), but it provided more than twice the capital (56.0%). Overall, personal savings provided an average of 39.8% of the funding needed by entrepreneurs to start-up a business – the clear leading source based on average percentage of funding overall. Interestingly, although credit cards and personal savings were most commonly used, the funds provided were less as a percentage of total capital generated than would be expected based on the frequency of their usage. In fact, credit cards provided less funding (based on average percentage of funding if used) than any other source besides loans from friends. Based on this information, it may follow that credit cards are seen as a necessary source of funds in terms of access but not in terms of magnitude of funds. Another additional important finding from Table 1 is the lack of identification of venture capitalists and angel investors as sources for start-up capital – not a single respondent acknowledged either as a source for start-up capital.

External sources such as banks were relied upon heavily by those that tapped into those sources. Based on the survey, 46.9% of the respondents specifically identified a bank or some other formal arrangement such as a home equity loan as a source for start-up capital. A full two-thirds of the respondents indicated some sort of collateral usage when formal external sources were engaged. Moreover, banks (with and without collateral) provided some of the highest percentages of capital funding when those sources were utilized.

In analyzing our data, we also observed that start-up capital obtained from sources based on personal wherewithal was utilized by 84.4% of the respondents and accounted for 82.4% of total start-up funding on average. For purposes of our analysis we defined personal wherewithal as the aggregate total of credit cards, borrowing from relatives and friends, personal savings, and home equity loans. Our logic in doing so was to glean a view of the data in such a way that we might discern the value of social capital, personal assets, and borrowing power.

Of those that used credit cards for start-up capital, 25% of the respondents indicated that one or more business credit cards were utilized compared to 91% who identified personal credit cards as the source. Those using personal credit cards borrowed over a quarter of all startup capital from their personal credit cards on an average of 2.55 personal credit cards per person.

Table 2 shows the association between users of personal savings and credit cards for start-up capital. Based on those that identified either source as a basis for funding, the table indicates that it is relatively rare for someone to tap into credit cards when personal savings are not used (or non-existent as the case may be). The preference appears to be for the use of personal savings alone, with the secondary choice of credit cards to complete the funding, although the exact nature of this relationship could not be confirmed within the survey. Additionally, it appears that

those that use personal savings are more likely to utilize credit cards than those that do not use personal savings.

---

Table 2 about here

Fifty percent of respondents using credit cards indicated that the associated debt from start-up had yet to be paid off. This is not surprising in that 75% of those utilizing credit cards for startup capital named “Ease of acquiring un-secured capital” as their primary purpose for their use; another 17% indicated it was their only source of capital. Indeed, the results of the survey identified instances of entrepreneurs “floating” their borrowing using one credit card to pay off another. Table 3 shows the satisfaction and recommendations of that group concerning the use of credit cards for start-up capital. Clearly, those that had somewhat or more satisfaction with their use tended to recommend their use to emerging entrepreneurs as a source of start-up capital whereas individuals that were neutral or less satisfied tended to not recommend their use. Overall, 46.2% of individuals who used credit cards would recommend their use while 53.8% would not.

---

Table 3 about here

Table 4 shows the relative uses of credit cards in terms of purchases made during the start-up phase and on-going business. Not surprisingly, purchases during the start-up of the business tended to include more goods and equipment, whereas ongoing purchases tended to favor operational needs. Conferences/Seminars/Workshops/Training and Business Travel, Meals, and Entertainment became integral on-going credit card expenses, while small pieces of equipment and major equipment went to zero. An interesting yet clarifying view can be seen in the shift from “cash for survival” in start-up to “office rent” and “advertising” when the business is ongoing.

---

Table 4 about here

## **Discussion and Implications**

This study examined approaches to initial capitalization of start-up businesses as well as the use of personal and business credit cards to meet ongoing capital needs. We were interested in exploring the use of capital sources beyond those that are often emphasized in entrepreneurship text books, such as investment bankers, venture capitalists, and angel investors. Given the dearth of existing scholarly research related to the use of credit cards for the above purposes, our efforts were envisioned as a pilot study to guide future inquiry to be undertaken by both ourselves and other scholars.

Moreover, since credit cards are being used relatively frequently for starting businesses as well as managing ongoing operations in actual practice, they should be formally acknowledged as worthy of additional study. Although members of the business press have already acknowledged the phenomenon, except to an extremely limited degree, scholars have not as yet demonstrated a reciprocal level of interest.

Some of the more interesting implications of our study became visible after we began to combine sources under other logical typologies, such as “personal wherewithal,” discussed above. According to our findings, approximately eight out of ten start-ups, and eight out of ten start-up dollars, can be linked to personal wherewithal. This finding suggests important implications for the classroom, for scholars, for practitioners, including the lending community. In particular, additional emphasis should be placed upon educating would-be business founders on the role, risks, and rewards of using personal savings, credit cards, social capital, family and friends, home equity loans, and other personally leveraged strategies to capitalize business start-ups. We would also note some irony as it relates to bankers’ reputations for being reluctant to become involved with unsecured transactions for new businesses: in some cases, they are funding unsecured loans for start-ups through credit cards, anyway!

### **Limitations and Future Research**

The results of this study must be interpreted in light of several limitations. First, the response rate to the survey was low. The methodology used to collect the data directed participants to go to an online site to complete the survey, or to make other arrangements that would require additional efforts on the part of respondents to participate by mail, fax, or telephone. It could not be determined how many nonrespondents did not have online response capability (i.e., a computer, time, or both); respondents who lacked a fax capability would have faced analogous impediments. Second, because of the exploratory nature of this study, the survey instrument was the first to gather data used in this kind of research. Further refinements of the instrument will lead to improvements in the quality and clarity of responses. Third, this study was not designed to identify the reasons why entrepreneurs use credit cards for initial capitalization in place of other sources (e.g., personal savings, relatives, venture capitalists). Fourth, entrepreneurs and small business owners subject to the same set of circumstances may decide differently on the use of credit cards. This study was not designed to examine how individual entrepreneurs and small business owners would behave under similar (and dissimilar) circumstances. Fifth, the current study was primarily designed to examine the use of credit cards as a source for initial funds for start-up businesses; thus, the study did not attempt to examine the impact which personal savings, investment bankers, venture capitalists, angel investors, and other sources of capital have on the use of credit cards.

Despite the above limitations, the study provides some of the first evidence that connects entrepreneurial credit card usage with founders’ motives. The study’s measures included credit card usage in the context of competing choices (including “no other choice”). Further, the study probed entrepreneurs’ satisfaction, or lack thereof, with the use of credit cards for start-up purposes or ongoing capital needs.

Future research opportunities abound because of the scant amount of research in the area of credit card use for initial capitalization or ongoing capital needs. The impact that alternative sources of capital for start-up (e.g., personal savings, investment bankers, venture capitalists, and angel investors) have on each other is an interesting question that can be answered by future research. The study’s findings have provoked additional questions about entrepreneurs’ attitudes toward the use of credit cards, by suggesting other possible attitudinal variables to examine, such as: “sensible in moderation” or “never” a good idea. Another opportunity for further research

lies in examining the relationship between perceptions of credit card use and behavioral characteristics such as risk aversion, personality, performance, and gender. Thomas (2001) identified women entrepreneurs as showing a preference for credit cards and personal loans for financing purposes compared to the use of equity funding for the same purpose. Thomas' results suggest behavioral variables may exist which may explain why credit cards may be used before (or after) other alternative financing devices.

When Do Liabilities of Age and Size Dissipate? Searching for the Financial Legitimacy  
Threshold

## Abstract

This exploratory work adds to the literature by attempting to identify the point, as measured by age and size, at which investors bestow some level of legitimacy among small firms. To test these hypotheses, we draw from two large databases: the 1993 NSSBF and the 1998 SSBF. Each of these databases, collected by the Federal Reserve Board, contains over 4,000 SMEs with detailed information on their financing behavior. We employ a purely exploratory technique (cluster analysis) to determine, with no a priori assumptions, the relationship between size, age, growth, and attainment of the various types of financing. Our research shows that a threshold may indeed be identifiable—at least in general terms. However, the SMEs were much larger and older at the threshold than expected.

## INTRODUCTION

When do small firms achieve legitimacy in the eyes of investors? It is widely held that firms must reach certain size (termed liability of smallness) and age (termed liability of newness) thresholds before investors will consider them viable candidates. This exploratory work adds to the literature by attempting to identify the point, as measured by age, size, and growth at which investors bestow some level of legitimacy among small firms. While we recognize that it is unlikely that all firms will experience this threshold at the same time and place, there appear to be enough similarities surrounding the phenomenon that looking for generalities will provide value.

Numerous authors argue that small firms are not simply large firms scaled down (Scherr and Hulburt, 2001; Welsch and White, 1981; Pettit and Singer, 1985). It is likely that there are issues specific to smaller firms that make it necessary to consider them as a different class of firms replete with their own principles, especially when considering financing issues. For example, SMEs typically have greater growth options, shorter asset maturity, occupy different industry sectors, and have higher failure rates than larger firms (Scherr and Hulburt, 2001; Diamond, 1991; Pettit and Singer, 1985). In addition to assisting SME practitioners, policy makers, and lenders, the study of SME financing decisions may also provide interesting insights to existing financial principles and theories.

We draw from the rich literature on legitimacy, the developing literature on small firm legitimacy, and the SME finance literature. The intersection of these literatures allows us to make theoretically grounded propositions regarding the nature of a financial legitimacy threshold. We begin with an overview of legitimacy and the general notion of a threshold in the small and young firm. Next, we discuss the nature of legitimacy with regard to financing decisions. Finally, we submit and test propositions.

### The Legitimacy Threshold

The legitimacy threshold is defined as the point where the organization first moves from an untenable collection of resources to a sustainable enterprise as perceived by the entrepreneur. In life cycle parlance, it can be thought of as a firm moving from the birth stage to the growth stage. Scott and Bruce (1987) term this the “inception to survival crisis”. This, however, is only for descriptive purposes, as it is not the intent here to get involved in the debate surrounding the appropriateness of stage models. This work will focus only on transitions—specifically the legitimacy transition.

Although other researchers (Downs, 1967; Steinmetz, 1969; Scott and Bruce, 1987) have alluded to an LT, Zimmerman and Zeitz (2002) were the first to explicitly use and operationalize this term. They define the LT as: “[The point] below which the new venture struggles for existence and probably will perish and above which the new venture can achieve further gains in legitimacy and resources.” The authors do not venture a prediction as to when or where the event may happen, but they do state that: “An organization must achieve a base level of legitimacy that is dichotomous—it either does or does not meet the threshold” (Zimmerman and Zeitz, 2002).

It is worth mentioning an alternative here. Based on our research, all SGEs will not encounter a threshold. Just as some SGEs will be able to avoid (or not perceive) the early stage punctuation, it is also unlikely that all firms that do experience the LT will do it at the same time and place. That being stated, there appear to be enough similarities surrounding the LT that looking for generalities will provide value. There are two related theory bases that provide support for a universal LT. The first is, clearly, legitimacy. The second is the related concepts of liabilities of newness (LON) and liabilities of smallness (LOS).

The idea of early stage legitimacy essentially holds that external stakeholders accord the firm the clout to grow. Legitimacy cannot be taken, rather it must be granted by influential stakeholders (e.g. financiers, employees, suppliers, and/or consumers). These stakeholders, either analytically or tacitly, at some point decide that a given firm has the necessary influence to interest them, and most stakeholders want to have a feeling of relative permanence from an organization—a feeling that it is not teetering on the edge of extinction (Aldrich and Fiol, 1994). Regardless of the stakeholder under consideration, the key antecedents to achieve legitimacy are largely the same (e.g. historical financials, reliability, size, etc.) (Singh, Tucker, and House, 1986). So, even though SGEs are all very different, the environment (stakeholders) judges them on similar criteria. As a result, the idea of legitimization makes it unlikely that a given firm will be very small or very young when stakeholders confer their favor upon it.

This leads us to the LON and LOS literature. LON occurs because new firms do not yet have the systems established internally or externally that are required to compete effectively against larger firms (Carroll and Delacroix, 1982). LOS describes a condition in which small firms are more susceptible to environmental forces because of limited debt capacity, internal cash restrictions, and a limited product line (Morris, 2001).

To illustrate, in customer terms LON and LOS are accounted for in the concept of taken-for-grantedness (Hannan and Freeman, 1989). This describes a situation whereby the less a customer actually thinks about the source of legitimacy before legitimizing an organization, the better. This has also been termed cognitive legitimacy, and generally requires social actors to become so comfortable with an organization that they do not actively think about it (Shepherd and Zacharakis, 2003; Fiol and Aldrich, 1994). In a similar fashion, prospective employees will not choose a small firm without some level of employer legitimacy. This manifests itself as the problem of lack of familiarity and the problem of low levels of influence on population norms (Williamson, 2000). Lack of familiarity simply describes the fact that if a prospective employee is not sufficiently aware of a given organization, he or she is unlikely to legitimate that firm. In a similar manner, illegitimate firms cannot affect the current state of HR practices in a given population. In terms of financier stakeholders, these liabilities are manifested in adverse selection and moral hazard problems. Adverse selection describes a situation where a high quality firm may not be able to attain funding simply because the financier is unable to discern its quality (Akerlof, 1970). Moral hazard is an agency issue, which deals with the possibility that a SME owner/manager mismanages resources for personal gain and, because of opaqueness; investors may be unable to detect this behavior (Gerler, 1992). It is these financing stakeholders that this manuscript will address.

Just as a SME is unlikely to be very young or very small when legitimized, the fact that small firms are subject to liabilities of smallness and liabilities of newness makes it also unlikely that a given firm will be very large or very old when it is legitimized. Because of LOS and LON, small firms face much higher failure rates than their larger counterparts (Stinchcombe, 1965; Singh, et al., 1986), therefore if these firms are not legitimized relatively quickly after formation they will fail and will not have the opportunity to face the LT.

These conditions drive small firms (more than larger firms) to develop similarly and adopt similar configurations that Mintzberg (1979) and Miller (1984a) term: the entrepreneurial configuration. “In fact, most new organizations seem to adopt [the same] configuration, whatever their sector, because they generally have to rely on personalized leadership to get themselves going—to establish their basic direction, or *strategic vision*, to hire their first people and set up their initial procedures.” When organizations grow quickly they “make a relatively quick transition to another configuration” (Mintzberg, 1979). Mintzberg (1979) holds that factors surrounding the organization’s situation will influence the choice of structure. In particular he describes an entrepreneurial configuration, which fits most small organizations because situational factors (age, size, and environmental stability) drive them to the same general form. This leads us to believe that there is a relatively narrow “window” where a SME is likely to be initially legitimized.

It may add clarity here to provide some contrast—that is to discuss what the legitimacy threshold is not. The legitimacy threshold is not managerial capacity (MC). Introduced by Penrose (1959), managerial capacity essentially describes a situation where an organization reaches a limit on its ability to pursue additional entrepreneurial opportunities. This situation, or problem, is caused by a lack managerial acumen. There may, in fact, be a managerial capacity threshold, but this threshold would occur later in a firm’s development and has a different set of antecedents and characteristics. For example, managerial capacity issues are triggered internally, while legitimacy issues are triggered externally (Singh, Tucker, and House, 1986). The MC threshold occurs later in the life of a SGE and is generally a result of rapid growth. This is in contrast to the LT, which occurs earlier and is the predecessor of growth. We view the LT as a necessary, but not sufficient, condition for growth.

## THE LEGITIMACY THRESHOLD AND FINANCING

For this work we draw on Berger and Udell’s (1998) widely used financial growth cycle for small businesses which describes a situation where the financial needs and financing options change as the business grows, becomes more experienced and less informationally opaque (Figure 1). They further suggest that firms lie on a size/age/information continuum where the smaller/younger/more opaque firms “lie near the left end of the continuum indicating that they must rely on initial insider finance, trade credit, and/or angel finance” (Berger & Udell, 1998: 622). Their growth cycle predicts that as the firm grows it will gain access to venture capitalists as a source of intermediate equity and mid-term loans as a source of intermediate debt (Berger & Udell, 1998). In the final stage of the growth paradigm, as the firm becomes older, more experienced and more informationally transparent, it likely will gain access to public equity (PE) or long term debt financing (LTD).

---

Insert Figure 1 about here

---

General Proposition: SME's will organize into two distinct groups. One that is older and larger utilizes venture capital, trade credit, financial institution loans, and line of credit; another that is younger and smaller and utilizes insider finance, angel equity, and equity from owners.

## **METHOD**

### Sample

The sample in this study was taken from two different National Survey of Small Business Finances (NSSBF). The first NSSBF conducted the survey during 1994-95 for the Board of Governors of the Federal Reserve System and the U. S. Small Business Administration, and second was conducted during 1999-2000. The target population was all for-profit, non-financial, non-farm business enterprises that had fewer than 500 employees and were in operation as of the year-ended 1992 and 1998 respectively. The sample was drawn from firms listed on the Dun's Market Identifier file.

### Analysis

We employ an exploratory cluster analysis for the first portion of the analysis. The idea here is to use a methodology with little a priori bias to allow the data to organize into two groups based on our variable of interest. After deriving two groups from the cluster analysis, we subject the result to a multivariate analysis of variance to test for significance on the overall model and individual variables. Table \*\* shows the variable grouping for both 1993 data and the 1998 data.

---

Tables 1 and 2 about Here

---

### Measures

Per the Berger and Udell (1998) model we employ the following measures: age, size, growth, angel equity, family equity, owner equity, public equity, personal credit card, credit line, loan from owner, loan from institution, trade credit. We also include industry membership.

## **DISCUSSION**

The goal of this research was to provide some insight into the existence of a financial threshold for SMEs. While this is a broad, macro investigation we can provide some commentary and implications in our research and the nature of a threshold. The largest implication with regard to a threshold is that firms are surprisingly large and old before they begin using the more desirable forms of financing. However, in our opinion, the most interesting result is the membership in each of our clusters. Specifically the fact that there were a large number of SME's in the pre-threshold stage and small number in the post-threshold stage indicates that interesting things are occurring. Judging by the variability in this pre-stage this appears to be a very heterogenous group of SMEs, while the second group is relatively homogenous.

This is logical as firms at this stage have many different reasons for not pursuing the threshold. Some may wish to stay small or maintain control, while others simply cannot convince financiers to legitimize them. Romano, Tanewski, and Smyrniotis (2001) state that the only way to truly understand the SME capital structure process is to take the entrepreneur into account because, unlike larger firms, owner-managers control the majority stake in the firm and most would like to keep it that way (Scherr and Hulbert, 2001). Therefore many authors view the key characteristics of the entrepreneur as the desire to maintain control. While these individual characteristics are not yet well understood, it is important to understand that 'ulterior' motives do exist for SMEs owners making the financing decisions.

### **LIMITS**

The limits to this study are inherent to the broad exploratory nature of the topic. The identification of this threshold is preliminary since there are almost certainly a host of mediating factors that must be investigated. As mentioned above, intention is among the most important issues to be examined but experience, planning, and strategic posture are other internal issues to be examined.

We view the exploratory nature of this work as both a strength and a weakness. While many authors have stated that there exists a legitimacy threshold in SME development, these studies have been largely anecdotal. An equal number of researchers hold that the vast heterogeneity that exists among small, young firms precludes any identification of such a threshold. Instead of interpreting this as a final work on the threshold, it should be viewed as the first step in identifying this potentially exciting construct.

## **ABSTRACT**

Mega-retailers are widely criticized as causing devastation among smaller retailers, particularly in mid-sized markets in the United States. Others argue that small retailers can survive “in the shadow of the retail giants”, by offering levels of customer service that the mega-retailers can’t provide due to their very size. This paper reports the findings of an empirical study of the perceived impact of the recent opening of box-retailers, such as Costco and Home Depot on locally owned/operated small retailers in the North-Eastern Ontario city of Greater Sudbury, Canada from 1999 to 2003. The sample included 78 smaller store owners, on average in operation for the last 21 years.

Aggregate results confirmed the hypotheses that small retailers suffered lower sales and clientele since the arrival of mega-retailers, and could clearly identify their and mega-retailers' respective competitive advantages and disadvantages as compared to each other. Respondents had a significant perception of having an advantage over their mega-competitors in the areas of Store Cleanliness, Value for the Customer, Products' Quality, and Store Layout. While a number of respondents suffered lower sales, about one-third of them (the Resisting Retailers) had average sales growth of over 21%. Differentiation and Niche Marketing were the main aspects of a successful competing strategy adopted by resisting retailers against mega-retailers. Some of the strategic moves adopted by resisting retailers amounted to a “Vacuum Strategy”, which includes the refusal to carry brands available at mega-stores, and the refusal to service such brands or to have anything to do with mega-retailers, refusing any alliance with them and making it known to customers.

## **INTRODUCTION**

This paper reports the findings of an empirical study of the perceived impact of the opening of mega-, or box-, retailers on locally owned/operated small- to medium-sized retailers in North-Eastern Ontario, Canada. The study focused on the City of Greater Sudbury (CGS). A Census Metropolitan Area (CMA), the CGS is located in Northern Ontario, the region is known for its spectacular lakes, forests, and fauna as well as for its frigid winter weather, the region used by

most North American and Japanese motor vehicle manufacturers as a cold weather testing ground. The CGS has also been a Canadian market test city for several decades.

With a market of approximately 550,000 people, relatively isolated from large urban centers such as the Greater Toronto Area (GTA), Northern Ontario and the adjacent North Western Quebec area represent an ideal real-life size laboratory enabling the observation of the emerging battle between established local small retailers and the large mega-retailers such as Costco and Home Depot. The former opened in the CGS in 1999 and was quickly followed by Home Depot in an adjacent location. Subsequent openings of a number of similarly large stores continue in that location, resulting in the emergence of a significant North-Eastern Ontario power center involving around thirty stores. As the results below will show, some local smaller entrepreneurs have decided to fight, and a good number of them are resisting the giants with varying degrees of success.

The researchers also tried to identify what competitive advantages smaller retailers reported to be attempting to develop or maintain as they were confronted with the entry of mega-retailers into their immediate vicinity and within the regional market. The questions related to the impact of mega-retailers on specific categories of retailers and the issues related to the respective location of mega- and small retailers were also examined, as well as the positive, neutral, or negative financial impact of mega-retailers upon small retailers. The characteristics of those retailers who were successfully competing or resisting against mega-retailers as well as those of the unsuccessful ones so far were examined.

## **Definition**

A number of terms are attached to retail “super” store operations including "hypermarkets" in Europe (Gonzalez-Benito, 2001), and in North America “box retailers”, “discount retailers” and “mega-retailers”. These terms generally apply to stores which are 2,500 m<sup>2</sup> in surface and over (or 26,900 sq. ft.), but many new stores are 7,500 m<sup>2</sup> and more (80,700 sq. ft.). In this study the term “mega-retailer” is used since this appears to be the more common generic title and includes four types of large retail operations: discount stores such as Wal-Mart, category killers such as Home Depot, warehouse clubs such as Costco, and outlet stores such as The Shoe Company.

## **LITERATURE REVIEW**

Although there are numerous anecdotal press reports regarding the effects of mega-retailers, Wal-Mart in particular, empirical research reports are limited. Noteworthy U.S. and Canadian studies, including Beaumont (1994), Stone (1995 and 1997), Shils (1997), Jones & Doucet (1998), Doucet & Jones (1999), and Stone & Artz (1999) have concluded that the opening of mega-retailers in a community has the potential to impact on existing smaller merchants in two ways. Firstly, there will be an effect on the retail sector in terms of changes to sales levels; increasing in outlets in the immediate area carrying different product categories to the mega-retail outlets, a result of increased traffic. However, decline occurs in the overall market area in outlets carrying similar categories (Stone & Artz, 1995). Secondly, there will be changes in the way the merchants conduct their business in terms of competitive strategies: reduction in number of employees due either to lower sales levels or to increased efficiencies and changes in marketing practices in terms of pricing, product mix and store positioning, location of outlet and recognition of customer service as being central to survival. Others also point out that retail's

success is entirely dependent on a local economy's ability to generate purchasing power for the customers, while large retailers drain wealth away from an area (Fruth, 2000).

Shils's (1999) comprehensive study identifies both social and economic effects, the social effects being the physical and social decline of neighborhoods and town centers as pre-existing retailers fail to survive. The more serious economic effects include, firstly, retail closures as traditional retailers fail to compete, with the consequent loss of jobs including the employment of the owners themselves. Secondly, reduced numbers of employees was noted; a result of Shils's "drain away" effect caused by the presence of mega-retailers shifting activities from various geographic traditional retail centers or clusters.

In seeking community approval to locate stores, mega-retailers have promised increased job numbers. In several cases it is reported that the number of jobs have not materialized to the extent promised, a situation exacerbated by the fact that, according to the Shils study, each new part-time job in a mega-store eliminates about one and a half full time job in smaller stores. Further, most jobs in the mega-retail stores are "minimum wage" with little opportunity for improvement or promotion. Most are non-union with all the ramifications implicit in such situations (i.e. absence of provision of health and fringe benefits to large numbers of employees). In some situations, they report, the mega-retailers have closed down operations after several years. Having forced the closure of much of the local retail trade, the closures leave a retail vacuum and an increased unemployment problem (Dalal, Al-Khatib, DaCosta, and Decker, 1994).

Shils pointed to the erosion of “free retail market” choice for consumers both in terms of choice of retailer, shopping location and brand and other choice issues. Citing a 1996 statement of Wal-Mart’s CEO, David D. Glass, at their annual stockholders meeting of that year, “We are going to dominate North America!” Shils points to the “decimation of communities’ “main street” retailers, unable to compete (p.6).

Conversely, Archer & Taylor (1994) argue that small retailers can survive “in the shadow of the retail giants”, the key being levels of customer service that the mega-retailers can’t provide, their very size limiting their abilities in this area. More specifically, Berry (1999, 2001) contends that by using five well-documented retailing best practices, the “Five Pillars of Retailing”, survival and success can be achieved. Berry’s “Five Pillars” of retailing, components of his “retail model”, are:

1. Solve Customers' Problems
2. Treat Customers with Respect
3. Connect with Customers’ Emotions
4. Set the Fairest (not lowest) Price
5. Save Customers’ Time

Berry argues that all five of these practices must be implemented in order for the concept to be effective. For the purpose of this study, the authors have developed the five scales described below in the “Methodology” section.

Studying the impact of mega-retail mainly in the Toronto area in Canada, researchers at the Ryerson University Centre for the Study of Retail Activity (Doucet and Jones 1999) found that employment and sales had increased among mega-retailers, and decreased among their smaller

competitors located in storefront retail strips. They also found that stores located closer to mega-stores suffered the most.

## **SETTING OF THE STUDY AND MEGA-RETAIL BACKGROUND OF THE REGION**

### **Expansion of Mega-retailers into Ontario:**

While mega-retailing can be traced back to the creation of the first department store by Aristide Boucicaut in Paris in 1852 (Chirouze, 2003), and to the opening of a first Woolworth store in 1879 in Lancaster, Pennsylvania (Perry, 2001), the arrival of mega-retailing in Canada generally, and Ontario in particular, has been the result of the expansion of U.S. mega-retailers into the country since the late 1980's. Insofar as Ontario is concerned, until 1999 expansion was confined largely to the more populous southern part of the province. The greatest expansion of mega-retail outlets is occurring in the Greater Toronto Area (GTA). Jones and Doucet (1998) record 93 outlets of this form (a total of 418,000 m<sup>2</sup>, or 4.5 million square feet) in the GTA area by 1990 increasing to 268 stores (1 million m<sup>2</sup>, or 11.1 million sq. ft.) by 1998. Expansion has continued with 2002 data showing 614 outlets (2.7 million m<sup>2</sup>, or 29 million sq. ft.), (Hernandez, Biasotto, and Jones, 2003; Hernandez, Jones, and Maze, 2003; Simmons, 2003).

### **Setting:**

The setting of the study is the City of Greater Sudbury, occupying a key location on the Trans-Canada (East-West) main highway and a hub for access to much of North-Eastern and North-Western Ontario from either Toronto or Ottawa. Located 385 km (240 miles) north of the GTA, the city has a population of over 160,000 people.

### **Mega-retail background in the CGS:**

With the exception of Business Depot – Staples, who opened a modest-sized store in 1993, and Wal-Mart, who acquired a small Woolco store in 1994, mega-retailers' real expansion into northern retail market areas beyond Barrie, a sleeper town some 100 km (60 miles) north of the GTA, occurred in 1999 with the opening of the approximately 13,000 m<sup>2</sup> (140,000 sq. ft.) Price/Costco Warehouse Membership Club store in the City of Greater Sudbury (CGS) in Northern Ontario. This was quickly followed by the opening of the 14,000 m<sup>2</sup> (150,000 sq. ft.) Home Depot adjacent to the Costco location in Sudbury. With the subsequent opening of other mega-retailers, including Pier 1, Danier Leather, Homesense, ShoeSource, Mark's Work Warehouse, Chapters-Starbucks, and a large Sears Home furniture and appliance outlet in the same location, a significant "power center" was being created in the north-east of the city.

Winners and Wal-Mart have also opened stores in other locations, both in the north-end of Sudbury, in recent years. Wal-Mart are building a 10,000 m<sup>2</sup> (105,000 sq. ft.) plus second store in the south-end of the City with capacity expansion potential for a further 3,250 m<sup>2</sup> (35,000 sq.ft.) A further 14,000 m<sup>2</sup> (150,000 sq. ft.) of added retail space in the South End was occurring with the expansion of a mall anchored through an existing but much expanded Zellers discount department store (a Canadian-based chain, formerly a subsidiary of the U.S.-based chain, K-Mart, purchased by the Hudson's Bay Company retail chain in 1996) targeted against Wal-Mart. It is expected that Greater Sudbury would host about 50 mega-retail stores by the end of 2005.

### **Mega-retailers' Market Area:**

The designated market area (Malone, Given, Parsons, 1996) from which the mega-stores in the CGS attract customers comprises much of North-Eastern Ontario and parts of the Western Abitibi-Temiscamingue region located on the Western part of the Province of Quebec. Greater Sudbury forms the pivotal center of an area containing a total population of over half a million people all within 350 km (220 miles) of Sudbury. The market area embraces a number of small- to medium-sized rural communities and cities including Parry Sound to the south-east, French River to the south, Elliot Lake and Sault St. Marie to the west; Hearst, Kapuskasing, Rouyn-Noranda (Québec), Kirkland Lake and Timmins to the North and New Liskeard, Temagami, and North Bay to the East-North-East. More detailed discussions of the economic structure of the region have been published elsewhere (Cachon *et al.*, 2001; Mulholland, R. *et al.* 1998).

Two aspects of the issue of the impact of mega-retailers on the economy in the CGS and area are important to note. Firstly, the region is vast and is considered to be relatively remote from the major population centers of the GTA and Barrie, where the nearest mega-retail outlets are located. This aspect is discussed further in the “Methodology” section below. Secondly, in many cases, particularly in the United States where individual rural regions are in constant competition to save local jobs, mega-retailers, have been attracted into regions by low-cost land and promises of property tax exemptions offered by local authorities in the belief that permitting such developments would increase opportunities and improve general economic conditions. This did not occur in Sudbury where the local authorities have made the companies responsible not only for property taxes, but also for infrastructure modifications including roadways, drainage and other municipal or utility-provided services.

## **RESEARCH METHODOLOGY**

### **Hypotheses:**

Drawing on the results of the earlier research cited in the literature review, the following hypotheses were formulated:

1. Small retailers have seen a drop in gross sales since mega-retailers came to the city;
2. Small retailers have seen less out-of-city clientele since mega-retailers came to the city;
3. Small retailers can identify clearly their competitive advantages and disadvantages as compared to mega-retailers;
4. Small retailers can clearly identify the competitive advantages and disadvantages of the mega-retailers;
5. Small retailers are involved in planning innovative competitive strategies to enable them to better compete against mega-retailers;
6. Small retailers located within eight km (five miles) of the mega-retailers have seen a significantly stronger decrease in gross sales, as compared to retailers located further away;
7. Small retailers located within eight km (five miles) of the mega-retailers have seen a significantly stronger decrease in profits, as compared to retailers located further away;

### **Secondary Data Sources:**

In addition to the reports noted in the literature review, secondary data included municipal retailer and product/service category data on a local basis. Copies of market review and impact studies conducted on behalf of Costco and others were obtained; such studies are required by the local municipality's planning authority and provide a useful perspective.

**Primary Data Sources:**

Primary data were collected using a cluster sampling approach involving 180 retailers within a 30 km (20 miles) radius of the center of the CGS and in the primary retail clusters described above; 78, or 43.3% of the retailers contacted participated in the survey, a proportion similar to that obtained in earlier studies involving personal interviews with retail store owners (Cachon and Cotton, 1997). Retailers trading in product categories directly affected by the box stores were identified on the basis of the Statistics Canada 1980 Standard Industrial Classification system. They included food, liquor, and prescription drug stores, shoe, apparel and fabric stores, household furnishing, electronics, and appliance stores, automotive parts stores, general merchandise stores and other retail stores such as book and stationery stores, florist shops, lawn and garden centers, hardware, paint and wallpaper stores, sporting goods stores, musical instrument and record stores, jewelry stores, camera and photographic supply stores, toy, gift, hobby and novelty stores, opticians, art galleries, artists' supplies stores, luggage stores, pet shops, and discount retailers.

**Sample:**

Four geographic cluster samples were used and included the four primary retail activity areas in the CGS area: the City Center, the area in the south end of the CGS known as The Four Corners, the North-end of Sudbury (New Sudbury), and the suburban areas of Nickel Center, Rayside-Balfour and Valley East, all within a 30 km (20 miles) radius from the center of the city. The sample included 78 smaller store owners, on average in operation for the last 21 years, with an

average business surface of 300 m<sup>2</sup> (3,230 sq. ft.) - as compared to 4,650 to 14,000 m<sup>2</sup> - 50,000 to 140,000 sq. ft. - for mega-retailers.

**Instrument:**

A semi-structured, 22-question instrument was developed and pre-tested by the authors. It was reviewed and approved by Laurentian University's Ethics Review Board. The questionnaire included a scale comprising 18 items covering the 5 sets of retail practices proposed by Berry, based upon store image variables previously developed and used by the authors (Cachon, 1990; Marks, 1976). The questionnaire was administered during the summer and fall of 2003.

The scales used to measure the five components of Berry's model included the following variables:

1. Solve Customers Problems:
  - Competence of salespeople
  - Availability of salespeople
  - Service quality to clients
2. Treat Customers with Respect
  - Treating customers with respect
  - Courteous salespeople
3. Connect with Customers' Emotions through the retail experience
  - Cleanliness of the store
  - Choice/variety of products
  - Suppliers/supply chain
  - Value/value chain (any advantages given to clients as compared to competitors)
  - Quality of products
4. Set the Fairest (not lowest) Price
  - Fair pricing
  - Avoiding hidden charges for customers
5. Save Customers' Time

Store location  
Short cash waiting lines  
Convenient shopping hours  
Easy to figure, non-confusing store layout  
Easy access by road  
Easy parking

### **Data analysis:**

The data were analysed with versions 11.5 and 12 of SPSS for Windows. Descriptive as well as other statistical analyses were performed.

## **RESULTS**

### **Descriptive statistics:**

The GCS small retail shops are typically family-owned businesses often involving more than one generation of entrepreneurs. In terms of location, 17 small stores were located within three km (two miles) of the mega-retailers in New Sudbury, 18 were located in the City Center area, less than five km (three miles) from the mega-stores, 22 were located in the Four Corners, approximately eight km (five miles) from the mega-stores, and the remaining 21 respondents were located in suburban areas between 15 and 30 km (ten and twenty miles) away from the mega-stores.

On average, the 78 entrepreneurs surveyed employed 4.75 full-time employees in 2003, as compared to 4.92 in 1997, two years before the opening of the first mega-store. They also had 3.39 part-timers working with them in 2003, as compared to 3.27 in 1997. Between 1999, year of the opening of the first mega-store, and 2003, smaller store owners reported an average decline in sales of 7.51% for the period, an average decline in profits of 2.94%, and an average

decline of customer traffic of 7.51% from Greater Sudbury and of 0.71% from outside the Greater Sudbury area. These results confirm hypotheses 1 and 2.

In terms of competition, 53 respondents (67.9%) identified large discount retail chains as their competitors, and 25 of them named Home Depot and Costco as being these competitors. The remainder of the respondents saw themselves more in competition with other smaller retailers, or considered that a niche marketing strategy prevented them from having real competition to speak of within their perceived target market area.

#### **Unsuccessful Retailers:**

37 of the 78 respondents (47.4%) reported that their sales volume had decreased since the arrival of the mega-stores, in a range from 6% to 50%, with an average decrease of 21.3%. As a consequence, they had to reduce their average number of full time employees from 7 to 5.75, and their average number of part-time employees from 4.33 to 3.78, even if their stores were, on average, slightly larger than the overall average, 325 m<sup>2</sup> (3,477 sq. ft.) vs. 300 m<sup>2</sup> (3,230 sq. ft.). In terms of profitability, the average decline among this group was 12.35%, almost half the decline in sales, suggesting that adjustment measures had already been taken in order to stem the damage caused by the new competition. 36 of the 37 respondents identified discount retail chains as their competitors, with Costco and Home Depot cited by 20 of them; also cited as discount chain competitors were Wal-Mart, and the furniture, appliances and electronics chains Future Shop, The Brick, and Leon's.

The decline in clientele traffic was also more pronounced among unsuccessful retailers, as compared to the general respondent population: a decrease of 18.24% for clients from Greater Sudbury, and 9.2% for out-of-region customers. The categories of businesses who saw declining sales mostly include hardware, paint, and wallpaper stores, food stores, discount stores, stationery and book stores and general merchandise stores. These categories of stores were affected regardless of their location, as t-tests comparing means across locations showed no significant difference for the variables above. The average number of 23 years of existence of unsuccessful retailers was not significantly higher than that of resisting retailers.

### **Resisting Retailers:**

While 8 respondents declined to answer the question about their sales volumes, another 33 respondents, or 42.3% of the total, reported stable sales in 17 cases, and average increases of 21.6% in 16 cases, for an overall increase in sales average of 10.5% over the years following the arrival of the major box-retailers. These figures are consistent, even if substantially higher, with those reported by Stone (1995) for specialty stores' sales in cities with a Wal-Mart store in rural Iowa after five years, of +5.5%. The higher figure observed in Sudbury is likely related to the size and population of the market area described above, as compared to rural Iowa.

Profitability was reported as being up by 7.3% by these 33 retailers, and up by 20% on average by the 16 respondents who had net sales increases. In contrast with their unsuccessful counterparts, resisting retailers both increased their full and part-time personnel since the mega-stores arrival, respectively from 3.67 to 4.33 on average for full-time employees, and from 2.82 to 3.42 for part-time employees. The absolute numbers of full and part-time employees were not

significantly different between resisting retailers and the overall respondent population.

Similarly, store sizes were not significantly different from the overall average of 300 m<sup>2</sup> (3,230 sq. ft.). In the case of resisting retailers, customer traffic from outside Greater Sudbury had increased by 11% since the mega-retailers arrival, while local traffic had increased by 6.4%.

These retailers cited most often (60.6%) local stores as their competitors, and were of the opinion that mega-retailers offered “low-end, inexpensive products” they were not interested in competing against. Only 18% of them cited Home Depot, Wal-Mart, Leon’s, Rona Cashway, Sears, and Home Sense, as their primary competition. Meanwhile, Costco was only cited by five respondents, as a second main competitor (one case), or as a third main competitor (four cases).

The categories of businesses represented among the 33 resisting retailers include specialty shops such as opticians, prescription drug stores, shoe, apparel and fabric stores - including higher end men’s and women’s clothing stores and specialty shops -, household furnishing, electronics, and appliance stores, book and stationery stores - with an established institutional and corporate clientele -, florist shops, lawn and garden centers, sporting goods stores, musical instrument and record stores, jewelry stores, camera and photographic supply stores, toy, gift, hobby and novelty stores, artists’ supplies stores, luggage stores, and pet shops, and discount retailers. Only two hardware, paint and wallpaper stores appeared in the group of resisting retailers. Four small general merchandise retailers, or corner stores, appeared in this group, and one discount store. Again, location in one area of the city or another had no incidence on being part of this group, which invalidates hypotheses 6 and 7, and, with an average of 21.6 years in operation, these retailers were not significantly different in terms of business longevity from their unsuccessful peers.

### **Strategic Variables:**

The scale results comparing the smaller store owners' perceptions of their retail strategy as compared to the mega-box retailers' strategic variables are summarized in Table 1. T-tests comparing the perceptions of resisting entrepreneurs as compared to unsuccessful ones showed no significant differences between the two groups on mean strategic variables scores, except for Convenient Shopping Hours. There was a significant difference at  $p < 0.005$  level between unsuccessful and resisting retailers' mean scores (77.1 vs. 58.6) for this variable, perceived as less important by the resisting group. While the scores are self-reported by the respondents, they show a strong awareness from their part of their respective position of strength or weakness as compared to mega-retailers on the 18 variables, thus confirming Hypotheses 3 and 4.

---

Table 1 about here

---

In terms of the respondents' perceptions of using Berry's best retailing practices, the Solving Customers' Problems (P1), Respect for Customers (P2), and Fair Pricing (P4) subscales were the areas where they felt having a strategic marketing advantage against mega-store competitors. On the Connecting with Customer Emotions Through Retail Experience (P3), and Saving Customers' Time (P5) subscales, respondents had a significant perception of having an advantage over their mega-competitors in the areas of Store Cleanliness, smaller stores being cleaner than the larger ones, Value for the Customer, Products' Quality, and Store Layout, smaller stores being non confusing in their layout relatively to mega-stores.

On the latter two subscales, the respondents did not see themselves significantly different from the mega-retailers on the six following strategic variables:

1. Choice and Variety of Products
2. Suppliers/supply chain
3. Store location
4. Convenient shopping hours
5. Easy access by road
6. Easy parking

#### **Planning Innovative Competitive Strategies against Mega-retailers:**

The fifth hypothesis was more qualitative in proposing that smaller retailers were involved in planning marketing strategies that would allow them to compete effectively against the mega-retail competition. Three qualitative questions were used to verify this hypothesis: What strategies, if any, have you taken to compete against other retailers? How can you compete with the large discount retail chains? Have you considered: a) Associating with other retailers in your area in order to compete against box retailers? b) Starting a joint venture with other retailers in your area in order to compete against box retailers? c) Associating with a box retailer who is not in direct competition, but rather complementary to your business?

Most of the resisting retailers, as well as a few unsuccessful ones, did not respond directly to the questions above, but described specific strategies they were using to compete as successfully as

possible. Below are a number of them, but first, these two statements made by resisting respondents provide some background on their state of mind towards mega-retailers.

#### Statement #1

Many of the box retailers that have come to Sudbury have not affected our business in a typical sense. We are a small mid-to-high end furniture store and therefore the product in many box stores does not compete with our business. However, I do feel they have had a very negative effect on business because of the mentality of the consumer as a result of box stores. The small business has been forced to advertise on a constant basis with the word "Sale". It means we are forced to spend more money on advertising and in truth the product is probably on sale every day of the week. I have seen box and mattresses advertised at chain stores at \$ 2,200 for half price (\$ 1,100), when the exact same product is in our store every day at \$ 995. This is a result of the consumer just needing to see the word "Sale", what I refer to as the box store mentality. I only hope that the consumer becomes smarter when reading advertising of box stores.

#### Statement #2

Sudbury's non-growth and the loss of small competitors have helped the strong survive. Sudbury is the Toronto of the North, which brings in people for the weekend from out of town, for the theatre, hospitals, schools, Science North and box stores. In return, hopefully the money spent at restaurants, gas stations, accommodations will gradually sift through the system and get to the small retailer. The small retailer has to find their niche to survive. Toronto is our biggest competitor.

### **Brand and product/service strategies**

To improve their financial situation, resisting retailers had dropped lines of products and/or brands sold by big box stores to replace them with others, sometimes more exclusive and expensive, or likely to deliver higher margins and sell faster. Others reduced costs and increased

prices on more exclusive products or decided to stop discounting major products, limiting sales and quantity deals to accessories such as belts and jewelry, thus securing a more exclusive store image and a better emotional connection with high income customers' self-image.

Solving customers' problems meant emphasizing a specific service, important to one or more significant segments of clientele, such as enhanced delivery services. For example, a building supply store offers on-roof shingle delivery, a service not offered by the competing mega-retailer and worth more in time and wages to roofing contractors than the extra cost to them. It also meant offering better repair services, faster, done on a local basis and for longer periods. A local computer store offers three-year warranties on several products, thus securing a loyal clientele.

Other retailers reported giving customers more discretion in their choice of a specific product. Smaller lumber retailers allowed their customers (building contractors) to choose each individual plank, while mega-retail stores oblige their clients to take delivery of whatever planks handled by their sales personnel, regardless of knots or imperfections. Hardware store owners reported having a competent and better paid sales force to retain customers and secure repeat business as well as word-of-mouth publicity from loyal customers: competent and well-experienced personnel will provide clients with invaluable advice on how to replace obsolete plumbing with proper-fitting supplies, saving clients the frustration of having to submit to multiple visits to the store in order to find the proper replacement product.

In terms of products offered, some retailers increased their store size in order to expand product lines which are not fully available at mega-stores: in given product categories, mega-stores often

carry only one or two items: for example musical instruments, compressors, seasonal clothing, vacuum cleaners, ladders, office and home furniture. Other retailers said they advised customers they would refuse to service or repair brands sold exclusively by mega-retailers.

### **Promotional and communication strategies**

One store owner said it would be important to educate customers and make them realize what Big Box stores foster: a low wage, low cost economy with no job security, which is the opposite to what local consumers keep asking for from their large local employers: higher wages and job security. These employers are branches of large national banks, mining and paper companies, other local branches of large multinational and global corporations, governments, hospitals, schools and public sector institutions.

Some of the food stores, which are affiliated with larger national wholesale chains, had developed promotional material attacking Costco directly, with point-of-purchase slogans suggesting to customers they could pay similar prices and get a better deal: "No Membership Required"; "Buy Large Packs and SAVE"; "Count on us for More". At the same time, these same stores paid attention to limit waiting at cash outlets and to customer satisfaction by asking, for example, whether customers found all the products they were looking for that day and providing them with some form of meaningful answer in case they did not. Such practices are consistent with recent research findings on improving customers' retail experience (Berry, Carbone, and Haeckel, 2002; Walsh, 2003; Rosenblum, 2004), particularly with respect to the fact that many consumers are ready to sacrifice money for time saved up to a certain limit.

## **Supply chain strategies**

Regarding supply channels, some retailers developed or joined contractual channels such as purchasing retail groups, wholesale chains and national franchises. Others were seeking the engagement from as many manufacturers as possible to guarantee that products supplied to mega-retail stores would be different from those sold to smaller retailers in terms of quality and product attributes.

By their mere presence, mega-retailers significantly disrupted the supply chain of several categories of retailers. This appeared particularly important in the hardware and food products categories. Consider cordless power tools such as saws, routers, drills, and other small hand tools: in the pre-mega-retail era, hardware store owners would buy them from a contractual national supplier at a price of, let us assume, \$ 59.99, and sell them at retail for \$ 79.99. The same tools are available now at a local mega-store for \$ 39.99 each, thus undercutting both the retail and wholesale former prices. Smaller retailers were left with limited choices, including dropping the whole product line (not a viable choice for a hardware store on such a staple product line), dropping the brand in cause and seeking another competitive one, or convincing the national supplier to create a new product line under an existing national private brand or under a new brand name altogether, with all the development and promotion costs associated to such a move.

## **General strategies: the Vacuum Strategy**

In general, differentiation and niche marketing were the main aspects of a successful competing strategy adopted by smaller retailers against mega-retailers. Some of the strategic moves

adopted by resisting retailers amount to what can be called a “Vacuum Strategy”, the components of which include:

- 1) The refusal to carry as many brands as possible that are carried by mega-stores;
- 2) The refusal to service such brands, and
- 3) The refusal to have anything to do with mega-retailers, any kind of alliance or cooperation with them.

These moves were clearly not concerted from the part of the smaller retail entrepreneurs, but those who defended and advocated these moves made it clear that it was also important for them and part of their strategy to inform their customers of these actions. These retailers were deliberately turning their backs from mega-retailers in an attempt to isolate them from the local customer base on as many product lines as possible. Better sales and profits would be secured through appropriate branding, pricing, customer experience, and product/service differentiation among their specialty product categories.

While it is too early to say whether such strategies will keep a significant core of successful smaller retailers in the Greater Sudbury area, it is important to understand that retail wars do not occur in a vacuum, but within a larger economic and social-political context in constant evolution. That context is not only influenced by private industry competition, but also by decisions taken by the various levels of government. Meanwhile, the overall economy of the region has been affected by international demand, particularly for metals, which are the main exportable by-product of the local economy besides agricultural products such as beef, deer, buffalo, meat, and cereals. These issues are the subject of the following discussion on mediating factors.

## **MEDIATING FACTORS**

The economy of the CGS and Northern Ontario has been described as involving two groups of major employers, large corporations on one side, and local, provincial, and federal governments on the other (Cachon et al., 2001), both groups providing average incomes more than twice those obtained within firms of less than twenty employees (Mulholland et al., 1998, p. 26). The relative importance of small business and entrepreneurship in the economy of the region has yet to be determined, but it is almost certain that both large corporations and governments, who provide a strong employment base to the area, play a major role in sustaining local small businesses, particularly within the retail sector. Retail sales involve store sales to the general public as well as procurement contracts for institutions and corporations.

The local economy of the CGS suffered setbacks between 1996 and 2001: Statistics Canada data issued following the 2001 Census showed a decline in the population of the Greater Sudbury area of about 10,000 people over those five years. It is likely that a large proportion of the population decline resulted from the loss of employment in three key levels of government which all implemented personnel reduction programs during the period 1996-2001. Meanwhile, there are indications that, in the private sector, areas such as the mining services industry gained jobs and were still expanding through 2004 and 2005 due to the high level of metal prices. A total of twelve metals are mined in the Sudbury, which is still considered the largest nickel-cobalt ore basin in the world: nickel, cobalt, copper, gold, silver, the six platinum group metals, and iron.

It is certainly likely that these two phenomena had an impact on retail sales in the region, in addition to the arrival of mega-retailers. It is also possible that the long-term effects of the mega-retailers presence in the Greater Sudbury area will take more than a few years to show themselves clearly, at least on some sectors: Stone (1995) has shown that mega-retailers continued to have a negative impact on Iowa rural communities' restaurants after five years of presence.

### **CONCLUSION AND OTHER CONSIDERATIONS**

The overall results showing declining sales, particularly among general merchandise and hardware stores are consistent with findings from other empirical research in Canada (Doucet and Jones, 1999) and in the U.S. (Stone, 1995 and 1997). Secondary data showing an increase in sales per capita in Sudbury are also consistent with the literature.

Smaller retailers were well aware of their competitive position and, at least some of them, believed they were adopting adequate strategic marketing responses to their new competition. Two facts observed among resisting retailers might represent a risk for them: 1) Taking the attitude that convenient shopping hours may not be as important can have severe consequences on customer traffic in the long run and 2) Informing customers that brands sold by mega-retailers shall not be serviced could be interpreted as trying to force customers' hand, resulting in backlash behavior on their part, i.e. choosing the cheaper mega-retailed brand instead.

Many of the respondents were not properly informed of the role played by local and other levels of government in relation to the mega-retail entry into the CGS market. A number of them were

convinced that mega-retailers had been receiving tax incentives and various types of “tax breaks” for which local small owners were not being compensated; they were also questioning the local support provided by mega-retailers in terms of charities, sponsorships, giveaways and other demonstrations of good corporate citizenship. There seemed to be a deficit of information between some of the small retailers and the various levels of government about what is being done to sustain and promote local business while keeping a healthy level of competition within the retail sector in the region and the country. It can certainly be assumed that similar ignorance is present among a majority of customers and the general public.

Resisting, or successful retailers were concentrated mostly in the specialty shopping categories, including corner stores with vast assortments of products available at hours where the mega-stores are closed and located in residential neighborhoods. Unsuccessful retailers were more likely to be confronted by mega-retailers on identical product lines and brands, or on products perceived by customers as being homogeneous in nature rather than differentiated.

With regards to locating the retail business, the relatively small size of the city, coupled with the ease customers can drive from one shopping zone to another, rendered the fact of being located nearer or farther apart from the mega-retailers not significant in being successful as a Resisting retailer. It is more likely that successful advertising in the local media would ensure customer visits from both local and out-of-town people, as long as the proper market strategies are also put into practice.

It is likely that mega-retailers also affect the supply chain for many smaller retailers in the North-Eastern Ontario and North-Western Quebec areas, including those located in smaller towns and in rural areas. As in one of the aforementioned examples, some respondents indicated that some prices obtained at Costco and Home Depot were lower than their wholesaler's prices: this prompted some of them to switch from a former wholesaler to mega-retailers as their primary supplier. Shils (1997) reported similar moves in the U.S. However, these strategic moves are not necessarily available to all retailers, many of them being members of exclusive distribution channels such as franchises, which prevent them from seeking alternate supply sources.

### **Other issues**

There are other issues related to the development of mega-retail power centers which were not within the scope of this research but are nonetheless important. They are particularly revolving around community planning, social, and environmental issues. Studies and reports such as Beaumont (1994), Duerksen and Goebel (1999), and Perry (2001) provide examples and guidelines on how community leaders and planners should establish relevant legislation and control mechanisms in order to limit the potentially negative effects of mega-retail. Perry reports a series of regulatory strategies adopted across the United States, including Mequon (Wisconsin), St. Petersburg (Florida), Fort Collins (Colorado), and the states of Vermont and New Jersey; the report provides specific recommendations for public authorities at the local and regional (state) level: coordinate the planning of retail development and review its impacts at the aforementioned levels.

The mega-retail phenomenon has reached all continents, particularly as the result of expanding multinational retail firms such as Wal-Mart, Carrefour, Ahold, and Metro. The impact of mega-retailing on smaller independent retailers is likely to be similar across continents and cultures, unless governments develop mechanisms supporting smaller retailers in their resistance. Further research would be required to examine the international "battlefield" between mega- and smaller retailers.

The authors thank the Certified Management Accountants Association of Canada - CMA Canada for financially supporting this research, and the Certified General Accountants of Canada - CGA Canada for providing funding to attend the I.C.S.B. World Conference in Washington.

Table 1

## COMPETITIVENESS SCALES DATA:

Small retail store owners self ratings as compared to their ratings of mega-retailers

| Berry's Pillars | Variable                    | Mean small Retailers self ratings | Mean ratings of mega retailers | t-test significance |
|-----------------|-----------------------------|-----------------------------------|--------------------------------|---------------------|
| P1              | Competence of salespeople   | 81.47                             | 34.93                          | .000                |
| P1              | Availability of salespeople | 76.19                             | 36.59                          | .000                |
| P1              | Service quality             | 88.41                             | 34.64                          | .000                |
| P2              | Respect for customers       | 91.76                             | 41.32                          | .000                |
| P2              | Courteous salespeople       | 89.85                             | 40.75                          | .000                |
| P3              | Store cleanliness           | 80.90                             | 50.15                          | .000                |
| P3              | Choice/variety of products  | 73.38                             | 66.76                          | .257 n.s.           |
| P3              | Suppliers/supply chain      | 69.77                             | 59.22                          | .072 n.s.           |
| P3              | Value for customer          | 73.79                             | 53.1                           | .000                |
| P3              | Products' quality           | 82.00                             | 55.46                          | .000                |
| P4              | Fair prices                 | 78.28                             | 59.92                          | .000                |
| P4              | Avoidance of hidden charges | 79.84                             | 50.16                          | .000                |
| P5              | Store location              | 61.94                             | 67.42                          | .339 n.s.           |
| P5              | Easy access                 | 71.31                             | 69.67                          | .738 n.s.           |
| P5              | Easy parking                | 70.97                             | 67.74                          | .573 n.s.           |
| P5              | Shopping hours              | 70.00                             | 70.97                          | .823 n.s.           |
| P5              | Store layout                | 81.31                             | 62.46                          | .000                |

NOTE : Each scale was from 0 to 100. The t-tests were paired-samples tests.

“A *small business is not a small big business*” This is almost certainly the most commonly quoted sentence in introductory chapters to books and articles on the management of SMEs. Over time, the postulate of the SME as an entity governed by specific laws of management has established itself as a genuine paradigm structuring research in the field, giving legitimacy to the creation of scientific journals and research associations like the ICSB (*International Council for Small Business*) in the English-speaking world or the AIREPME (*Association Internationale de Recherche en Entrepreneuriat et PME*, International Association for Research in Entrepreneurship and SMEs) in French-speaking countries.

This theory of the specificity of SMEs has now been widely accepted. It nevertheless has one major drawback. It does not precisely define the specificity of SMEs. If SMEs are specific, it must also be admitted that large companies are, too. Using the same term, *specificity*, to define two such fundamentally different realities is clearly unsatisfactory. The two types of specificity thus need to be qualified and given a more precise term.

The theory that we put forward is that the specificity of the management of SMEs is proximity. We use the term *proximity* as an ambivalent concept that refers to both what unites us and brings us together (*closeness*), as well as what shuts us in and isolates us (*closure*). Proximity refers to the classic concepts of family<sup>1</sup>, friendship and neighbors, as well as to more modern concepts such as “link” and “social capital”. All these concepts have the particularity of revealing the same ambivalence between closeness and closure.

As regards *family proximity*, Bridge, O’Neill and Cromie (1998:129) note that a “family business can produce a permanent, solid family atmosphere and *esprit de corps*, which can often encourage both a closeness among staff and long-lasting relationships with customers, suppliers and other contacts”. The family can also, however, become a very closed circle and the source of clan-like management techniques, particularly in terms of human resource management (giving positions of responsibility exclusively to members of the

---

<sup>1</sup> It should be noted that originally the word proximity, from the Latin *proximitas* and *proximus*, was used in the 15<sup>th</sup> and 16<sup>th</sup> centuries in its legal meaning of family relations in deeds of inheritance (Le Boulch, 2001).

family) or of setting objectives (a refusal to accept growth as a means of maintaining family control of the business). Denieuil (1992) mentions this type of phenomenon several times. The family business is often seen as “the universe of continuity, certitude and trust, as opposed to the faceless company which is exposed to the dangers of chance and subjected to the unpredictable decisions made by associates”: “If he is not a member of your family, you can expect him to be capable of doing anything to you, good or bad. A member of your family will try to do his best and to develop, with all the benefits coming back to the family, through my sister’s children. The metaphor of the closed circuit (“will come back”) and autonomy sanctioned by being a member of the family structure should be noted”. Once again, this is the closeness/closure ambivalence.

The same can be said for friendship. Firstly, “sociologists have especially noted that the value of friendship increases as the closeness of the family declines” (Bell, 1981 *in* Yager, 1998). This means that friendship is a strong link for proximity that can sometimes replace family ties. But this friendship can also become a form of exclusion and closure. “The two-person nature of the Great Friend Approach is implicit. So all-encompassing and exclusive a relationship would be hard to sustain in a three-way (triad) or a group (network) setting. Such an idealized and intimate friendship thus cancels out other friends or friendships. The Great Friend relationship is hence as exclusive and as binding emotionally as marriage is legally” (Yager, 1998). Friendship is a type of proximity that can insidiously become a form of exclusivity.

As regards neighbors, a neighbor is someone who occupies the closest place, someone at a relatively short distance and someone we frequent. But in legal terms, a neighborhood is often understood to be a place of potential nuisance and disorder. A neighbor is thus also someone who can disrupt daily life, someone with whom we are in disagreement and someone separated from us by some kind of enclosure. The term neighborhood thus also refers to the ambiguity of proximity, between closeness and closure.

The concepts of links and social capital are more recent. They both have their foundations in sociology (Granovetter, 1973; Bourdieu, 1980). Regarding links, although many authors have highlighted their function as a means of making contact (*the link that links*), it is also important to note the negative dimension of the *link that binds*<sup>2</sup> (Laplantine, 2003). This ambivalence can also be seen in terms such as *bound*, giving “*bound up with*”, meaning *connected* or *linked to*, as well as *boundary*, meaning a limitation. Similarly, although *bond* is a synonym for *link*, it also suggests *bondage* (slavery and submission).

The same can be said for social capital, which Bourdieu (1980) defines as “the sum of the resources, actual or virtual, that accrue to an individual or a group by virtue of possessing a durable network of more or less institutionalized relationships of mutual acquaintance and recognition”. Although social capital is often seen to be a strength, it can also be a weakness, especially when it leads to phenomena of withdrawal and imprisonment. The title of the article by Grabher (1993), written to contrast that of Granovetter, “The weakness of strong ties: the lock-in of regional development in the Ruhr Area” is quite explicit on this subject. This article “describes the troublesome attempts to transform the close interfirm linkages into loosely coupled networks” (Grabher, 1993: 256). He identifies a threefold “lock-in” of regional development : functional lock-in, cognitive lock-in, and political lock-in. If the social capital is

---

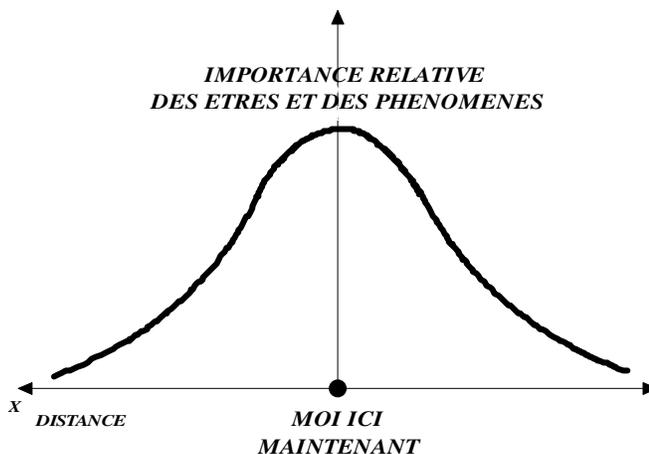

<sup>2</sup> According to Laplantine (2003: 186): “The French language of the 12<sup>th</sup> century used the word “lien” to designate a *lead* (for a dog) and, a little later, in the Gascon language, the term meant *chain*”. It is thus easy to understand a “link” is something that links, but also something that ties. Once again, this is the ambivalence of proximity.

too strong, it can even lead to *corporatiste*<sup>3</sup> phenomena as we have shown in the Californian Mondavi's failure to set up his business in the small village of Aniane in France (Torrès, 2004). "The relation between positive and "negative" social capital can be viewed in a similar light. Capital (except financial capital) is timebound. The social capital of groups and regions that is considered negative from society's standpoint came into being once upon a time as a rational solution intended to safeguard and strengthen the group's interests (...) By creating strong networks, actors/groups have shut others out from the resources and markets to which they have access" (Westlund and Bolton, 2003: 81).

All these concepts reveal the ambivalence of the concept of proximity.

Of all the works on proximity, the psychology of space described by Moles and Rohmer (1978) gives an ideal summary of this ambiguity by introducing two concepts, that of proxemics<sup>4</sup> and that of partition. They propose a subjective and "egocentered" conception of space which corresponds to the "Here and Now" point of view of the individual in a given situation (living space), perceived as being the center of the world: "Me, Here and Now, I am the center of the world and everything is organized in relation to me in a discovery that is a function of my audacity. A world that is focused on Me is only peopled with beings and events to the extent that I perceive them. This is what is known as proxemics, with the importance of beings, things and events necessarily diminishing with distance to the extent that their perception itself diminishes" (Moles and Rohmer, 1978).

This is how Abraham Moles and Elisabeth Rohmer define the notion of proxemics. According to them, "fundamentally and axiomatically, what is close is more important than what is far, all things being equal, be it an event, an object, a phenomenon or a being." (Fig. 1). The Law of proxemics appears as a principle of organization that creates a hierarchy in the degree of importance of the actions and reflections of the individual<sup>5</sup>.

**Figure 1. – Moles and Rohmer's Law of Proxemics (1978)**

<sup>3</sup> *Corporatisme* is both a preference granted to oneself and one's own (peers, relatives and friends), and a form of protection against others (those on the outside and strangers).

<sup>4</sup> Here, we do not use the term "proxemics" in the sense of E. Hall (1981), referring to the study of perception and the use of space by Man.

<sup>5</sup> This idea of growing function can be seen again in Campbell (1978): "feelings of inequity are a function of the perceived closeness".

For those interested in the management of small-sized companies (Small Entreprises and Very Small Entreprises), the value of this axiomatic is twofold: on the one hand, it is founded in psychology (Moles, 1976; Schwach, 1993), which is a particularly appropriate field for understanding the strategic and organizational behavior of small-sized companies<sup>6</sup> (Gervais, 1978; Parent, 1978). On the other hand, it is also based on the centrality of a single point of reference (the *Me, Here and Now*). This last aspect is perfectly suited to the situation of SMEs, as it is generally recognised that one of their specificities is the important role given to the director-owner, a central reference point *par excellence* (Marchesnay, 1991; D'Amboise, 1993; Julien, 1998). This is reminiscent of the famous expression from Gumpert and Boyd (1984), “*The business is the ‘ego’*”. Moles and Rohmer’s egocentered conception of space seems very apt for explaining the mechanisms that govern how a highly personalized management system functions.

The remainder of this article will aim to demonstrate to what extent the effects of proxemics and the effects of partition make it possible to explain in a unified and coherent manner a considerable number of existing results. The aim of this article is to propose a general theorization for the smallness of companies based on the concept of proximity.

#### 1.- The relevance of the proxemic model in understanding the specificity of SMEs

It is in this sense that proximity management, as we see it, is not confined to simple metric measurement. It is the choice-making principle for owner-managers. All other things being equal, the SME manager will opt for what is both geographically and temporally closer to him. This preference for proximity, and the management style that results from it, is a strategic and organizational construction enabling the SME manager to keep control of his firm and its development.

Several theoretical advances in the field of SME management reveal the existence of hierarchical mechanisms of this type, based on proximity:

- *In the choice of country for export*: attacking international markets seems to be governed by a proximity principle, as shown by the Swedish school in Uppsala in its concept of psychic distance (Johanson and Vahlne, 1977). Similarly, the 6-stage exportation model developed by Bilkey and Tesar is based on proximity: “firms at early export stages should focus on psychologically close countries and firms at later stages should focus on psychologically more distant countries” (Bilkey and Tesar, 1977: 95). As Joffre (1987) remarks, “we often insist on the geographical rigidity of small- and medium-sized companies. The presence of small-sized companies decreases as the commercial distance increases, with

---

<sup>6</sup> In terms of spatial decisions, Koenig and Joffre (1985: 194) note that “the satisfactions of a psychological nature in the choice of a particular site are more important in individual companies than in large companies, where power is more spread out and where there is greater rationalisation”. It is precisely this aspect that makes Deshaies (1998) say that in SMEs, it is preferable to talk of *reasons* for localization (in reference to the entrepreneur) than of *factors* of localization: “The entrepreneur becomes the obligatory source of information. You should start with him, rather than with a uniform space as in traditional localization theories. Instead of drawing up a list of theoretical postulates concerning space, you should replace them with a set of hypotheses on the representations, attitudes and behavior of entrepreneurs”. We believe that Moles and Rohmer’s Proxemics Law is the response to this desire.

exportation on a large scale remaining the specialty of large companies". Similarly, the concepts of "glocalization" (Johanisson, 1994) and "internationalizing milieus" (Torrès, 1999; Fourcade and Torrès, 2001) have made proximity an active principle in the export strategies adopted by SMEs.

- *In the choice of successor-buyer*: despite the fact that "in the minds of company directors, the alternatives are neither exclusive nor part of an unchanging order" (Haddadj and D'Andria, 2001), the director of an SE who wants to make over his company is often subjected to what we could refer to as an "*organization into a hierarchy of his choice of successor*": a preference for the family, then the employees, clients or suppliers and finally for a third party. In this way, "when choosing a buyer, company directors often adopt a system of concentric circles, starting with the closest contacts and relations and progressively widening their search" (Bah, 2002). This organization into a hierarchy can be broken down into three segments: the *internal segment* (the director's heirs and close family, the executives or all or part of the employees in the company), then the *immediate segment* (the clients, suppliers, colleagues, accountant and so on) and finally the *external segment*, which corresponds to a market open to unknown third parties. According to Bah (2002), the first two segments make up the "closed" market that operates essentially in a trust-based manner and by "word of mouth". Only the third segment is a truly "open" market, although it has a bad reputation as companies that are on the market are often seen as "lame ducks" by potential buyers. We thus find ourselves returning to the classic problem of asymmetry of information and the well-known article, "The Market for Lemons" by Akerlof (1970).

- *In strategic choices*: Ansoff's product/market model also provides an implicit organization into a hierarchy for the way in which companies develop. Development axes must first of all be established within a single sector, within a single activity in the company. Once this axis has become saturated, it then becomes possible to envisage diversification, either in terms of profession or in terms of mission. Total diversification is a last resort solution, as it is the most subject to risk. "Bearing in mind that synergy gives companies the advantage of a higher consolidated return on investment than any group can hope for, at first sight it could seem that diversification should be made according to the principle of maximum synergy. That is, preferring changes that are the least different from the normal experience and internal resources of the company" (Ansoff, 1989: 132). This model brings us back to an implicit order, which goes from horizontal growth ("the most normal, the most common and the most habitual type of growth for companies", [Parent, 1978]), to vertical and finally to conglomeral growth. The smaller the size, the more the company has a vested interest in remaining within its field, as Penrose developed quite clearly in his theory of interstices. Who cannot see, here too, that these strategic principles are further proof of a proximity rule that indicates that a company's growth must go from what is closest (its niche or its interstice) to what is most distant and most subject to risk (diversification). The stagist models of growth can be interpreted as being part of a proxemic design.

- *In recruitment choices*: generally speaking, the smaller a company, the more it tends to prefer proximity in its management of human resources. In a survey conducted recently in France on the management of human resources in small companies, Chassard (2003) demonstrates that acquaintances and word of mouth are the top responses, well ahead of temping agencies or recruitment agencies. Directors of small companies do not like

intermediaries and prefer to make use of their own lists of contacts when they must take on new staff. This type of behavior is perfectly rational, as a recommendation from someone you know is a vote of confidence. It is for this reason that when directors of SMEs hire someone new, they prefer to start with their spouse, then turn to their family in general or circle of friends. Looking on the job market, which is much more anonymous, is only a last resort. Family, friends and an immediate circle of acquaintances are thus a strategic resource when the director says that he uses them as his main source for recruitment purposes. It is the very importance of these proximity human resources that made Letowski (2003) say that the concept of Human Resources is meaningless in very small companies, unless “non staff” human resources are taken into account, such as spouse, children, associates, peers and so on.

- *In the choice of means of financing*: many empirical validations of Myers’ pecking order theory (1984) for financial choices as applied to the field of SMEs stipulate that the growth of SMEs is essentially financed by self-financing, then by bank loans, rather than by issuing share capital (opening the capital) (Norton, 1991; St-Pierre and Baudouin, 1995; Mahéroul, 1999). Similarly, Belletante’s concept of “*financial territory*” (1991) or Crevoisier’s concept of “*proximity capital*”<sup>7</sup> (1998) support our theory of a hierarchical principle of proximity in financing. This *financial proxemic* also makes it possible to explain why SMEs prefer short term financing to long term (temporal financial proximity), or why, according to Hirigoyen (1984), SMEs pay more attention to maintaining the profitability of a company in the short term than to future profitability<sup>8</sup>. This once again reminds us of the concept of proximity in the relations the director-owner has with his banking partners. Effectively, “the results of certain surveys show that directors tend to do business with only a few financial institutions (sometimes only one). It is more profitable to develop a good relationship with a banker, who ends up understanding the personality of the owner-director and accepts his own, personal way of making decisions” (St-Pierre and Baudouin, 1995). Binks and Ennew (1997) go even further, recommending *participative behavior* between SMEs and their bank: “Clearly, perfect information is an unobtainable goal, but a *close working relationship* between bank and business can significantly improve information availability”. Later, they add: “While collateral may be one mechanism for reducing the adverse effects of information asymmetries, the development of a *close working relationship* is an alternative. An effective banking relationship, by its nature, must involve two parties. For bank and businesses to invest time and effort in developing and maintaining such relationships requires that there are discernible benefits from so doing. (...) Further analysis suggests that more participative relationship types are associated with benefits to the firm in the form of better financing conditions and better quality of service and benefits to the bank in the form of more favorable customer assessments of bank service” (Binks and Ennew, 1997: 90).

- *In the choice of support networks and backing*: Gibb’s “layers” theory (Bridge, O’Neill, Cromie, 1998) once again bears witness to the hierarchical proxemic relationships

---

<sup>7</sup> As further proof of the link between proximity and financing in SMEs, Corpataux (2003) showed in his doctoral thesis to what extent the draining of the regional financing circuit in Switzerland mainly had an impact on SMEs. In his opinion, “the result is that from now on, SMEs can grow in two ways. Either they enter the stock market, with all the technical problems that that entails for small organisations, or they sell out to large, international groups. In the 1990s, for example, all the brand names from the clock-making sector were taken over by large groups” (Corpataux, 2003: 116).

<sup>8</sup> Hirigoyen (1984) wisely states that directors of SMEs turn their companies into *expense centers* rather than *profit centres*.

between the various spheres that make up the director of an SME's support network. According to Gibb, "a small business will be subject to many influences. It is not however always obvious what these influences will be or what will be the interplay between the different influences". "The relative strengths of the influences of different groups of people are indicated in a diagram produced by Gibb to indicate the layers of small business support networks. One implication of this is that the closer, and more personal, layers will always have a much stronger influence than the outer, and more official, layers" (Bridge, O'Neill, Cromie, 1998). Gibb considers that the influence of the support network is organized into a hierarchy in relation to proximity and thus draws the following conclusions: "If friends when consulted are negative in their advice then it will be far more influential than any positive input from government agencies". These opinions and influences are not all equal, but are organized into a hierarchy on the basis of weighting that increases in relation to the closeness of the link with the owner-director.

Figure 2. - The "layers" theory (source: A. Gibb, 1988 in Bridge et al., 1998).

These six examples show that the effects of proximity create a hierarchy of strategic decisions that privilege that which is close to the detriment of that which is distant<sup>9</sup>. The proximity principle is, in our opinion, a response that is adapted to the principles of limited rationality and the asymmetry of information. Proximity is a vote of confidence. This type of behavior, which privileges proximity, is perfectly rational because anything recommended by a close friend or family member, or business relationship with an acquaintance, is trustworthy. Here, proximity plays the role of guarantee as well as a reducer of uncertainty. It reduces the asymmetry of information and broadens the rationality. This recalls Akerlof (1970), who advises someone selling a car in good condition to sell it to someone who trusts him – in other words, someone he knows. Proximity is the most natural response, and the least costly, to the problem of the asymmetry of information.

The aim of the remainder of this paper is to demonstrate the role and importance of the effects of proximity in SME ethics.

<sup>9</sup> There are several counter-examples to this proxemic concept. Studies on INV (International New Ventures), companies that grow rapidly or start-ups, on capital-risk and so on show that certain small-sized companies diverge completely from this conception. It is these companies that we have qualified as managerial SMEs as they tend to be managed like miniature versions of large companies. This type of company is the opposite of the standard SME, and is the illustration of denaturation phenomena (dilution of specificities) (Torrès, 1998).

## 2. – Ethics as a field of application of the proxemic model for SMEs:

### 2.1. - Ethics as a relationship to others:

The search for a unifying definition of ethics, particularly in the field of management, finds itself confronted with the multiplicity of the rules of action adopted and the paths taken by moral conscience. It would seem difficult to try to make a synthesis of these standards as a means of extracting a common concept for acting well. The solution thus lies not in this diversity, but, on the contrary, in returning to the original question of moral sense. Analysis of the major philosophical texts devoted to ethics effectively makes it possible to recall the profoundly individual nature of moral sense on the one hand and, on the other, the role played by morals in the preservation of the social links to which Man aspires beyond (or within the very heart of) his egocentric desires. From this, it is interesting to retain a definition of ethics that comes from an individualistic approach to the relationship with others.

An individual's moral acts, which shape his relationships with others, are a translation of his concept of justice (distributive). "We can [thus] see in any moral act an *attribution* or allocation of something (rights, objects, feelings, intentions, etc.) to someone. Specifying this something comes down to *sharing* [...]" (Moessinger, 1996, 105).

The fundamental moral problem with which the actor is faced is thus focused on the way in which, by using these rules, he consciously tries to reconcile his search for personal interest with the respect of that of others. The quest for morality in action effectively comes up against the limited nature of the means at his disposal, which prevents him from dealing with all the parties concerned by his decision in the same manner, directly or indirectly.

He is thus obliged to choose the partner(s) that he must privilege, morally speaking.

This principle of distributive justice that underlies all moral acts thus leads to a distribution of wealth. In other words, within the company, it leads to a distribution of added value.

- *The intention and power of the actor in the face of others*: It is very widely accepted that morality (the object of which is to give human actions a framework liable to guarantee social cohesion, but which fights the centrifugal effect of each person's search for their own personal interests) tends to limit the ambitions of each individual, who must take his fellow man into account. Morality as we see it in an act is also a function of the consequences that are attributed to it in its satisfaction of the interests of others. It is in this sense that every moral act can be defined as an act of sharing.

The result of this sharing is nevertheless not always enough to make it possible to judge the morality of an act. There must be, in addition, the respect of the interests of others. The notion of respect, as explained by E. Kant (in *Practical Reason*), is the very "moral motive" behind the decision, which pushes the actor to treat others as an end in themselves, and not as simple means. In order to be moral, an act must be *deliberate* and *disinterested*. Deliberate, because the respect of others must be one of, if not *the*, real motive behind the decision. Disinterested, because it must not be a conscious means of pursuing one's personal interests. If this were the case, it would no longer be a question of moral motive but of pragmatic motive (in Kant's sense).

As the actor, by means of both his decisions and his choices, nevertheless irremediably pursues his interests (material interest or moral satisfaction at having acted well), it is thus only the intention or motivation regarding others that gives the act its moral nature, independently of the vagaries of its implementation. It would nevertheless be inaccurate to claim that an act is morally good *because* it satisfies the interests of others, just as it would be inexact to claim that an act is morally condemnable *because* it goes against the interests of others.

The moral qualification of acts thus appears to be very relative, as it is a function, when the actor has (or believes he has) interests opposed to those of others, of the recognized legitimacy of the satisfaction of his own desires. This relativity is double:

The judgement will vary with the identity of the moral judge, his personality, experience and position as regards the act (the judge can be the actor himself or an external observer who is more or less close to the actor).

Furthermore, the judgement, which is based on confrontation and the comparison of alternative interests, can only be expressed in terms of degree in most cases. It is thus generally an appreciation of the ordinal, rather than cardinal, type. Different scales for measuring ethics have thus been proposed (for example, Reidenbach & Robin, 1991; Skipper & Hyman, 1993) to understand the hierarchy established by the referee in terms of the morality of behavior. Certain authors esteem, for example, that it is more serious to deceive a child than an adult, the reason being that a child is, by nature, weaker. For others, on the contrary, as a deception necessarily creates a situation of superiority regardless of the usual nature of the power struggle that exists between the actor and his partner, it should be judged as it stands, independently of the context in which it is placed.

Finally, the question of morals is only raised for the actor who, free in his decision-making, has power over his partners, that is, those involved in his choices. It is a good thing, for example, if a company owner, who has power over his subordinates, can be led to envisage the use of fixed-term contracts and thus make a moral judgement on the precarious nature of the jobs he has thus created.

## 2. 2. – The weight of individual representations:

The recognized moral character of an act is thus based on the representation (which is built up in the course of the act, that is, the ‘enaction’ in the sense used by Varela) that is made of its consequences.

- *The four elements of ethical representation:* This representation concerns four elements.

- It is based on the intention of the actor: judgement is based on the idea one has of the goal being sought.

- It is based on the nature of others, that is, on both the identity (physical and moral) of the different people involved in the decision and on the choice of those in whose interest one esteems oneself obliged to act out of priority. Not only is the decision made in a situation of limited rationality, but also the inextensible nature of the means at one’s disposal force one to abandon the idea of simultaneously satisfying all the identified people involved, as they often have conflicting interests.

- It is thus also based on the idea that one has of the interests of others. What are the needs of others? How can one preserve another's interests in a satisfactory manner? What is the best way of satisfying these interests?

- Finally, it is based on the legitimacy of the actor's self-satisfaction in his own interests when, in the representation that he has of them, it is obtained to the detriment of others to a varying degree.

Morals, or the ideal that guides action, aims for the absolute satisfaction of the interests of others. But the action itself supposes a degree of arbitration.

Ethics are thus the representation that one has of a classification of interests, considered from the viewpoint of their legitimacy. The key question is thus knowing whether or not this legitimacy is sensitive to proximity. The partner can be more or less close, more or less distant. For example, can it be deemed more serious to steal from one's mother, brother or a friend than from a stranger? An affirmative answer would lead to acceptance of the hypothetical influence the proximity link has on ethical judgement. On the contrary, a negative answer would mean that theft should be judged as it stands, independently of the links of proximity binding the thief and victim.

As part of the teleological approach to ethics, where the morality of an act is measured by the yardstick of its consequences on others, it has been possible to demonstrate the influence on moral judgement of the proximity perceived with the partner involved in the decision (Misrahi, 1997; Dupuy, 1999): the closer the partner is considered to be, the greater the sensitivity to his perceived interests. Nevertheless, motivated by the same desire to act well, the actors obey the rules and/or patterns of logic of varied actions. For example, certain, using a Kantian form of logic, would systematically refuse to steal for the reason that, as theft cannot be built up into a universal law, it is intrinsically bad, whereas others would not hesitate, on occasion, to conceal a truth that could hurt someone. It is thus that those who respect the teleological concept of ethics favor the direct respect of the interests of others, whereas those who prefer a more deontological approach come out more in favour of indirect respect. For the latter, morality is born of the scrupulous respect of the rule that is the best guarantee of the respect of the interests of everyone, as it makes all decisions predictable and the standardization of behavior makes anticipation easier. Their approach is reason-based and is less sensitive to the affective dimension of interpersonal relationships than the teleological approach. There is little or no personalization of those involved. That said, the most fervent supporters of the deontological viewpoint are not strangers to cases of conscience caused by finding themselves incapable of respecting exactly these rules, which are necessarily too general to not, on occasion, be contradictory. Being obliged to come out in favor of one side or the other thus forces them to explicitly evaluate the consequences of their act on the interests of others.

As this approach is based on the idea of respecting the interests of others and thus of having a prior definition of the partner(s) to be privileged, it has three advantages:

- it comes within the framework of progress in the concept of company which has moved from the "stockholder model" (which traditionally places the shareholder as the only important partner for a company) to that of "stakeholder model", for which the company has become an "arena" for a much wider community of partners (shareholders, family, clients, suppliers, employees, local groups and so on).

- in methodological terms, it makes it possible to go beyond the questions inevitably raised by the observer as regards the real motivations of those involved by focusing essentially on concrete facts. Moreover, it protects the observer from the temptation to become the judge himself given that, in the end, everyone is simply trying to protect or develop his own needs.

- finally, it makes it possible to include the study of ethics in the framework of the proxemic approach to SME management. Effectively, by identifying the degree of proximity of each partner, it thus becomes possible to test the link between the classification of the interests of others and their degree of proximity. In other words, this ethical approach is the ideal framework for the general model based on the Law of Proxemics (Moles et Rohmer, 1978).

As the fundamental characteristics of ethical judgement thus waver between egocentricity (judgement is made using oneself as the starting point) and alterocentricity (it is made in relation to others), this leads us to wonder whether or not it is a relevant field of observation for the law of proxemics in SMEs. In other words, the question is whether or not the distance between the director-owner of a small company and the various stakeholders is the explanation for the classification of their interests drawn up through the ethical choices made.

Two proposals can thus be made:

P1: There is a distance between the director-owner of the SME and his partners (spatial representation of the partners)

P2: This distance explains the classification that he draws up between the interests present (effect of proxemics).

### 3. - Methodology:

As a means of validating these proposals, we have used the results of a survey conducted in the Languedoc-Roussillon region in France. The director-owners of 194 companies with less than 50 employees (69% of the companies were very small businesses with less than 10 employees) and from all sectors of activity were questioned. The questionnaire was given face-to-face, and its object was to describe the ethical attitudes of the director-owners in relation to organizational and personal contingency factors. For this communication, we will cover only the factors liable to describe the proxemic effect (Courrent, 1998). The operationalization of the concepts was as follows:

- *Proximity*: Identifying the proximity of the parties involved supposes prior classification of these partners, adapted in particular from the works of Trevino (1993), Longenecker (1995) and Goodpaster (1997). Six categories have been retained: clients, employees, State, municipality, administrative department or region, and suppliers (Courrent, 1998).

It can be tempting to want to identify the perceived relative proximity with each of these categories by means of a question of the “with which type of partner do you feel the closest?” type, classifying each category according to the relative degree of proximity. This apparent simplicity in fact comes up against the complexity of the concept of proximity and,

as a result, the difficulty for the questionees to have a very clear idea of this proximity. Does the question, for example, refer to geographical, affective or cognitive proximity?

A summary of these various dimensions can be attempted by identifying, for each category, a common-ground of interests (are the expectations of your suppliers / clients and so on similar to those of your company?)

- *Ethics*: The classification of the interests of the parties involved can be obtained by means of the following question: “given that it is difficult to satisfy the aspirations of all one’s partners, which are the aspirations that, in your opinion, a small company should privilege?” (classify the six categories of partners, starting with those toward whom the company should be the most attentive and ending with those toward whom it should be the least attentive).

#### 4. - Results

##### 4. 1. - Proposal P1:

The proximity identified by the convergence of interests produced the following classification:

Table n°1 : Classification of partners in relation to the convergence of interests

|                    |       |
|--------------------|-------|
| Partners           |       |
| Employees          | 67,9% |
| Clients            | 65,1% |
| Suppliers          | 59,0% |
| Municipality       | 48,2% |
| Other local groups | 36,3% |
| State              | 18,4% |

It should be noted that the differential between the proportion of questionees who feel close to their employees and those who feel close to their clients is low (2.8 points). This is clearly not very significant, and is doubtless the explanation, at least in part, for the results obtained for proposal 2.

##### 4. 2. - Proposal P2:

The hierarchy operated by the directors between their partners is clearly defined if we refer to the opinions given: 1- clients, 2- employees, 3- suppliers, 4- municipality, 5- department or region, 6- State.

Table 2: Distribution of director-owners in relation to the classification they make between their partners

| Proxemic rank | Partners  | Rank1        | Rank2        | Rank3        | Rank4 | Rank5 | Rank6 |
|---------------|-----------|--------------|--------------|--------------|-------|-------|-------|
| 1             | Employees | 41,8%        | <b>46,4%</b> | 8,2%         | 3,1%  | 0,5%  | 0,0%  |
| 2             | Clients   | <b>57,7%</b> | 36,6%        | 3,1%         | 1,0%  | 1,0%  | 0,5%  |
| 3             | Suppliers | 0,5%         | 10,3%        | <b>64,9%</b> | 12,4% | 5,7%  | 6,2%  |

|   |                     |      |      |       |              |              |              |
|---|---------------------|------|------|-------|--------------|--------------|--------------|
| 4 | Municipality        | 0,0% | 4,6% | 18,6% | <b>63,4%</b> | 12,9%        | 0,5%         |
| 5 | Department – Region | 0,0% | 0,0% | 3,6%  | 12,9%        | <b>71,1%</b> | 12,4%        |
| 6 | State               | 0,0% | 2,1% | 1,5%  | 7,2%         | 8,8%         | <b>80,4%</b> |

This classification is clearly defined, given the significant differential that there is between the highest score and the others for each of the five ranks in the hierarchy. The variation in the differential from one rank to another nevertheless corresponds to non negligible nuances.

The State, region and department, and municipality occupy respectively the last three places of the classification with the highest differentials in score. The State is thus classed in last place by 80.4% of those who answered, 71.1% put the region and department in 5<sup>th</sup> place and 63.4% put the municipality in 4<sup>th</sup> place.

On the other hand, although the clear majority of the director-owners questioned placed their attention primarily on their clients (57.7%), there were still 41.8% who “preferred” their employees, which reduces the differential for these two categories to 15.9 points for first place and 9.8 points (in favor of the employees this time) for second place.

Finally, suppliers occupy a median position in the classification for 64.9% of those questioned. This is a considerable majority, and is 46.3 points higher than the next score for this place.

In other words, directors of SMEs agree largely, not to say massively, in their lack of sensitivity to the interests of the State (and, to a lesser extent, those of local groups). They also agree in their affirmation that they are keen to satisfy the expectations of their clients and employees. On the other hand, they are more divided as to the place to be given to these two categories of partner, even though a non negligible majority came out in favor of the clients.

The classification in the satisfaction of the interests of those involved thus corresponds, more or less perfectly, to their classification in relation to proximity. Clients are favored over employees, even though employees are considered to be closer.

Proposal 2 thus seems to be validated.

The general classification of partners, including the apparent dissonance observed between ranks 1 and 2<sup>10</sup>, can no doubt be justified by the instrumental concept of ethics that directors seem to have: as they consider ethics more as a management tool (58.8%) than as a constraint to their actions (24.2%), the relative attention given to their partners is doubtless a means of developing the company’s performances.

Table 3: Distribution of the director-owners in relation to their concept of ethics as either a constraint to action or a management instrument:

| Constraint or means  | Number of answers | Frequency |
|----------------------|-------------------|-----------|
| Always a constraint  | 12                | 6.2%      |
| Often a constraint   | 35                | 18.0%     |
| Don’t know           | 33                | 17.0%     |
| Often an instrument  | 81                | 41.8%     |
| Always an instrument | 33                | 17.0%     |
| Total                | 194               | 100.0%    |

<sup>10</sup> Dissonance caused by the fact that the feeling of convergence of the company’s interests with those of the clients is close to that regarding the employees (see the results for proposal 1).

Preferring clients to employees, despite the fact that employees are considered to be closer, is symptomatic: a decrease in effectiveness no doubt seems less prejudicial for the efficacy and efficiency of the company than the dissatisfaction of the clients, especially as the differential in the proximity index is low (less than 3 points). As for the State and local groups, it is highly likely that within the French context, director-owners expect little in terms of positive feedback for their companies: the legal and regulatory side of their activity, which is considered above all to be a constraint, is generally felt to be more developed than actions judged positive (particularly public orders). It should be noted that the disinterest in, or hostility to, professional bodies is negatively associated with the degree of decentralization of power that it represents.

Another explanation can be found in the lack of formalization of ethics in SEs. As a result, although rather paradoxically, directors of SEs partially adopt a deontological stance by acting like colleagues (as regards the problems identified as universal and common to all) for whom the ethical stance is explicit, and they privilege the teleological approach as soon as the problems seem to them to be particular to their own company.

## 5. - Conclusion:

After presenting the general model that supports this theory, this article has demonstrated how the effects of proxemics are shown in the ethical judgement of the director-owners of SMEs. By fitting in with the stakeholder approach, which is central to current work on ethics and social responsibility in companies, the authors have highlighted the role and importance of proxemics in the classification of the interests accorded to others. They have shown in particular that the degree of proximity significantly affects ethical behavior, depending on the nature of the partner (family, employee, client, supplier, administration, State and so on). From these results, it can be deduced that the ethical judgement of director-owners of SMEs is profoundly *egocentric*.

## ***ABSTRACT***

Franchising is one of the most understudied areas of entrepreneurship despite its economic significance and international scale. This paper aims to redress this neglect by examining business format franchise systems in the UK. The paper focuses on two key questions, namely why firms franchise and how the network expands spatially. Forty in-depth interviews with franchisors across six different sectors of franchise activity have been conducted. The findings suggest that franchise firms undergo a four-stage spatial expansion life cycle: the initial (pilot), roll out, consolidation and maturity stages. Three strategies were used to achieve network growth: (i) a franchisor-led approach; (ii) a franchisee-led approach; and (iii) a hybrid approach (franchisor and franchisee-led). Methods of growth included utilising single, multi-unit and area operators. These expansion strategies illustrate the locational decision making processes of both the franchisor and the franchisee.

## ***INTRODUCTION***

*“Franchising has emerged in recent years as a highly significant strategy for business growth, job creation and economic development both in the US and in world markets” (Preble and Hoffman, 1995, p80).*

Since the 1970s, most developed countries have experienced a significant increase in franchise activity. North America, Europe, Australia and Japan all have extensive franchise markets (Price, 1997). It is estimated that there are 320,000 franchise outlets in the US (one in every 12 retail outlets) which account for 40% of all US retail sales (International Franchise Association, 2002). Franchise activity has also extended into some developing markets such as South America (e.g. Mexico, Brazil), South East Asia (e.g. Indonesia, Malaysia and Singapore), South Africa and Central

and Eastern European countries (e.g. Czech Republic, Hungary and Slovenia; McCosker, 1998; Pavlin, 1996; Scholtz, 1997; Swartz, 1995). In the UK, there are approximately 700 franchisors, employing 330,000 people and turning over £9.65 billion (British Franchise Association, 2004).

Business format franchising consists of a contractual relationship between a franchisor and a franchisee. The franchisor is the owner of a name, idea, product, service, confidential process or specialised piece of equipment while the franchisee is allowed to use, produce or market the name, idea, product, service etc. through a franchised outlet or outlets (which are legally separate entities). A franchisee must operate the outlet in accordance with the franchisor's 'blueprint' or 'format' (i.e. the procedures and regulations relating to the daily operation of the business) devised by the franchisor and set out in the franchise contract (Price, 1997; Stanworth and Curran, 1998; Stanworth et al., 2004). Franchise activity can be found therefore in most sectors of the economy: in both 'blue' and 'white collar' sectors, such as, retailing, hospitality (i.e. fast food and hotels), health and beauty, home maintenance, construction, domestic cleaning, distribution and delivery, professional and business services (e.g. consultancy, recruitment, accountancy), reprographics, printing and photo processing. As Curran and Stanworth, (1983, p9) observe: "*franchising is a widespread business form encompassing a wide and diffuse range of economic activities.*"

The growth of the franchise business form and increasing economic significance and international scale of franchise activity has led to a burgeoning academic literature on the topic with "*this organisational form assuming an increasing importance in a*

*number of academic debates*” (Price, 1997, p90). However, the franchise literature is fragmented and limited in an academic sense and with a narrow disciplinary and topic focus (Elango and Fried, 1997; Hoy *et al.*, 2000; Price, 1997). The majority of the academic franchise literature originates from the business, management and economic disciplines (Stanworth, 1994; Price, 1997). Moreover, there has been a tendency to concentrate on a narrow range of themes within the literature. Many researchers argue, therefore, that the franchise business form is an understudied area of activity given its economic significance and international prevalence (Bates, 1995; Fenwick and Strombom, 1998; Knight, 1984; Withane, 1991).

Indeed, it is argued here that franchising is inherently geographical and that a geographical perspective of franchise activity is a valuable line of academic inquiry: issues of expansion, location, territory and local market environment are central to franchise activity. This article focuses on the first of these which is spatial expansion. As franchising is used as a strategy for firms to achieve expansion, it is something of a paradox that *how* expansion is achieved has not been rigorously examined in the academic literature. In other areas of economic activity – manufacturing and other service based sectors – the expansion process has been well-documented (Chapman and Walker, 1991; Hamilton, 1979; Hayter, 1997; Jones, 1981; 1982; 1988; Jones and Simmons, 1990; Keeble, 1976; Laulajainen, 1987; Mercurio, 1984; Sparks, 1986; Taylor, 1975; Watts, 1980). Spatial expansion of franchise systems has been examined at the international level within the franchise context (e.g. Aydin and Kacker, 1989; Fladmoe-Linquist, 1996; Hackett, 1976; Hopkins, 1996; Hoy and Hoy Echegaray, 1994; Hoy *et al.*, 1998; Kedia *et al.*, 1994; McCosker and Walker, 1992; Preble and Hoffman, 1995; Shane, 1996b; Walker and Etzel, 1973; Walker, 1989).

However, very few studies have examined the expansion process of franchise firms at the *national* and *sub-national* level. This neglect is surprising, particularly as most franchise systems are *not* international operations Price (1997). Therefore, little is understood about how franchise systems expand within *national* boundaries.

This is as a result of the limited research, in both the geographical and franchise literatures, which has examined franchise system expansion at the national level. There have been only two explicitly geographical studies that have examined the spatial expansion of franchise systems - KFC in the UK (Newby and Hardwick, 1979) and McDonalds in the US (Aspbury, 1985). Both studies employed spatial diffusion and central place theories as frameworks of analysis in which to understand the expansion process. Similar to the expansion patterns outlined by research which has examined other service-based activity, these studies also suggest that the two fast food systems expanded in a hierarchical manner, opening franchise units in cities and large towns, thereby colonising the main population centres first. Over time, franchise units were also opened and operated in smaller settlements. However, expansion did not occur in only a hierarchical manner and furthermore, expansion and the pattern of expansion was not determined solely by franchisors. Once established in a location, the local expansion of a franchise system was facilitated by a 'contagious' or 'neighbourhood effect' whereby interpersonal contact and communication spread the franchise concept to the market and to potential franchisees within an area, via existing franchisees. Existing franchisees were also responsible for determining the pattern of expansion in localised areas: Aspbury (1985) found that some of the more successful McDonald's franchisees became multi-unit franchisees and located additional outlets within their localised area.

Attempting to understand the spatial expansion of the KFC and McDonalds franchise systems through the framework of spatial diffusion and central place theories is a useful starting point for offering insights into the franchise expansion process.

However, a major limitation of this approach, as Aspbury (1985) concedes, is that spatial diffusion does not adequately address the question *why* the firms expanded in the way they did. The main weakness of both studies is that neither attempts to fully understand or explain the spatial patterns evident in both networks in terms of underlying *firm decision making processes* and *firm expansion strategies*. For example, Aspbury (1985) contends that the hierarchical expansion evident in the McDonald's network is related to market potential and demand, where the firm may have entered largest markets first because such markets would have proportionally more potential entrepreneurs than smaller markets. This availability of potential franchisees would have facilitated early growth of the system. However, it is difficult to know if a hierarchical strategy was what the firm originally intended, as the firm's underlying reasons and motivations were not addressed by the study.

A further limitation of the Newby and Hardwick (1979) and Aspbury (1985) studies is that both systems used in the research are in the fast food sector. As business format franchising is a heterogeneous activity, the findings from these studies may not be applicable to other sectors. Knowledge and understanding of how franchise systems achieve expansion is therefore limited, in terms of its sector focus.

However, more recent research has attempted to examine the expansion strategies of franchisors in the UK (Forward and Fulop, 1995). Although the franchise expansion process was not the main focus of the research, the findings from this study suggest that firms had either site-led or franchisee-led strategies for achieving spatial

expansion. With a franchisee driven strategy, franchisees were recruited to a network first and then suitable sites were found. With a site driven strategy, sites in which to locate were found first and then suitable franchisees were recruited to a network. Although these findings are insightful and Forward and Fulop (1995) attempt to explain the decision making processes underlying franchise expansion the research was only conducted with a small number of franchise systems (n=9). Thus, such strategies may not be in use in other UK based franchise operations, and generalisations become difficult.

Therefore, in light of the weaknesses of extant literature, there is a need to clearly understand how franchise systems achieve spatial expansion by examining the growth strategies that are used by firms. Undertaking an in-depth examination of this issue, will enable observations of empirical regularities in franchise spatial expansion and from a practical perspective, this could help new firms embarking upon franchising assess and face the challenges and issues associated with the expansion process.

### ***AIMS AND METHODOLOGY***

Two main questions for investigation arise. In order to understand *how* firms expand, it is first necessary to examine *why* firms use franchising to achieve expansion, as this is the first decision making process undertaken by a potential franchisor. One of the dominant themes examined in the academic franchise literature is the question of why firms franchise. One of the main explanations - the resource constraints perspective - is implicitly geographical, as the theory explains the use of franchising as a way to achieve *rapid* spatial growth by accessing vital expansion resources of the franchisee. Therefore, the first question will assess whether firms in the current study use

franchising to achieve rapid spatial growth or use franchising for other potential benefits by asking:

***1.) Why do firms expand by using the franchise method?***

The second question will address how firms achieve growth by examining the strategies which are used to achieve spatial expansion. In so doing, the study offers the first in-depth analysis of the spatial decision making processes of franchisors from across different sectors of franchise activity and from within the UK:

***2.) How do franchisors achieve spatial expansion – what strategies are used to achieve growth within the UK?***

In addressing these questions by means of a survey of a broad range of firms from across the different sectors of franchise activity, this paper aims to understand the underlying firm decision making processes and expansion approaches that are used to embark on and achieve franchise network growth within the UK. It does this by adopting an exploratory qualitative approach - using in-depth interviews with a small sample of firms - which enabled access to underlying reasons, motivations and decision-making processes of key agents (directors/managers/owners) in franchise operations and facilitated an understanding of a firm's behaviour and activities. Forty interviews were conducted with UK-based franchisors (which includes the UK master franchisee for some international franchise systems). The selection of firms was dictated by the issue under consideration: with the focus of inquiry on spatial expansion and rationalisation of franchise systems (part of a wider study, see Cox, 2002) selection of the sample was deliberately restricted to established franchisors who would, by definition, have had some experience of expanding, operating and restructuring franchise systems. Therefore, firms had to have at least ten franchise

units in order to be considered for inclusion. In addition, in order to reflect the diversity of franchise activity, the sample comprised approximately equal numbers of firms across six sectors: retail; fast food; personal services; distribution; business-to-business; and industrial and commercial. In most cases firms were identified from the *UK Franchise Directory*. A small number (n=5) were approached on the basis of recommendation or pre-existing contacts. A total of 80 franchisors were approached: non-responses were related to difficulties in making contact with the Managing Director or Franchise Director and the general 'interview fatigue' amongst the bigger franchisors in particular. Most of the questions were open-ended, and interviews were recorded and transcribed.

#### TABLE 1 ABOUT HERE

The characteristics of the sample are shown in Table 1 (see Cox, 2002, appendix 3, for further details). The absence of franchisors less than five years old reflects the requirement that firms should have at least 10 franchised units. The majority of respondents had between 10 and 49 franchised outlets (37.5%) or 50-99 franchised outlets (35%). However, the size of some of the respondents is understated because these figures do not take into account master franchises which have their own franchisees. For example, one of the retail franchises had 36 area franchises which together operated approximately 1,500 units. The majority of the respondents had their head office in London or the rest of the South East of England.

## ***REASONS WHY FIRMS FRANCHISE***

The majority of firms in the sample franchised operations because the method enabled access to vital resources (the financial and human capital of the franchisee), which facilitated rapid organisational and spatial growth; a finding which supports the resource constraints theory of franchising. The resource constraints perspective contends that franchising is used as a method to gain access to franchisee resources (financial capital, human capital and local market knowledge) which enable a firm to realise growth (Hoy *et al.*, 2000). The firms in the present sample identified financial capital as the most important resource to access. Franchisee funds are an effective source of expansion capital as a franchisee provides capital not only through an initial fee for the franchise format, but also through ongoing royalty fees which can facilitate further expansion of the franchise network (Curran and Stanworth 1983; Dant, 1995). Rapid expansion is therefore possible because a firm is not reliant on financial resources of retained profits or debt-secured finance, as company-owned chains can be, for example (Kaufmann and Dant, 1996).

The alternative theoretical perspective to the resource-base explanation of franchising - agency theory - attempts to explain franchising as an effective way of addressing the classic problem between a principal (an owner of an outlet) and an agent (a manager of an outlet). Principals may not know if an agent is 'shirking' and insufficiently promoting an owner's interest without the aid of costly monitoring mechanisms. Agency theory argues that franchising effectively addresses the shirking problem as it aligns the interests of the agent (the franchisee) with those of the principal (the franchisor) by forging links between franchisee compensation and performance. As a franchisee has a financial interest in the business as an owner-operator of a unit, it is

assumed that they will be more motivated to make the business succeed. This will also lower the propensity to shirk, as any shirking will reduce profit and compensation for the franchisee. Subsequently, the need for supervision and monitoring are greatly reduced, although not eliminated (Kirby and Watson, 1999; Shane, 1995).

Only a minority of firms (7) cited reasons associated with agency as the motivation for adopting a franchising strategy. According to these firms, franchisees were more highly motivated than managers/employees and offered higher levels of commitment and standard of service which, franchisors maintained would have been less evident in manager-run company-owned units. Such benefits arose because a franchisee had invested his/her own capital in the business and was therefore more motivated to make it succeed. Indeed, six of the seven firms had tried company-based expansion before embarking on the franchise route. These firms decided to use the franchise method as a means of overcoming the problem of agency in poor performing company-owned/manager-run outlets.

The remaining 15 firms in the sample stated that their motivations for franchising were *both resource and agency related*. Combining access to financial capital with highly motivated unit owner-operators were key benefits of the franchising method for these firms. Therefore, it is argued here that both theoretical explanations *in combination* can provide greater insights into the reasons why franchising is used as a strategy to achieve growth.

Firms also identified some of the problems, which can occur with franchising. The main disadvantages were lower profit margins and the difficulties of maintaining control over franchisees. For firms in this sample, the disadvantages were a trade-off franchisors were willing to make, as these firms believed the advantages of the franchise method outweighed the disadvantages. In summary, this section has sought to examine why firms franchise. However, the decision to franchise is only the first part of the organisational and spatial expansion process. Therefore, the following section addresses the second research question of the paper, namely how firms expand and the strategies that are used to achieve growth.

### ***THE LIFE CYCLE MODEL OF FRANCHISE SPATIAL EXPANSION***

Current understanding of the spatial expansion issue is limited. Examining spatial expansion strategies has the potential to assist new firms about to embark on franchising with the expansion process and help them anticipate some of the problems and challenges of expansion. However, whilst the original research question proposed to examine expansion strategies, it is evident from the findings that spatial expansion needs to be considered in a 'life cycle' context. In other words, spatial expansion - and the strategies that are used for this - is not a static process (Forward and Fulop, 1995), but rather the expansion process is a dynamic one, occurring over several identifiable stages with strategies altering over time.

Applying life cycles models to business organisations first emerged in the 1960s and early 1970s (McGuire, 1963; Christensen and Scott, 1964; Steinmetz, 1969; Greiner, 1972). According to Bouchikhi and Tornikoski (2001, p382) life cycle theory is where *“each stage of an organisation’s life is characterised by a particular*

*managerial style and a set of management problems. As the key problems change, so should the firm's organisational design configuration.*” Although there have been many different life cycle models proposed in the literature, the models all share some common assumptions. First, different stages in life cycles are sequential in nature; second, stages occur as a hierarchical progression that is not easily reversed; and third, each stage involves a broad range of life stage specific organisational activities and structures (Quinn and Cameron, 1983). For this reason life-cycle models have been criticised as being too deterministic (Kirby, 2003; Miller, 1987). However, others have argued that it is possible to identify common patterns of organisational transition that occur in firms (Kazanjian, 1988), and life cycle models add to our understanding of the complex phenomenon of growth, describing how it happens and the effects that it can have on organisations.

Indeed, life cycle or ‘stage’ models have been one of the most dominant frameworks describing the process of small business growth (Churchill and Lewis, 1983; O’Farrell and Hitchens, 1988; Stanworth and Curran, 1976). However, as Floyd and Fenwick (1999, p33) observe:

*“there has been no attempt to apply such models to franchise system growth and development, nor has any model been developed specifically for franchising. Given the strong interest in franchising at academic and professional levels, a growth and development framework for franchises is urgently needed.”*

Applying a stages model to franchising reveals that similar to small business growth, (and regardless of variation in firm sizes, sectors and capacities for growth), there is a sequence of identifiable stages common to the organisational development of most

franchise systems (Floyd and Fenwick, 1999). The five stages identified by Floyd and Fenwick (1999) for franchise system development were hatchling, nestling, fledging, adulthood and beyond adulthood. The evidence from the present study also suggests that firms undergo different stages in the process of achieving *spatial expansion* (see Exhibit 1). Like other life cycle models, the four stages of spatial expansion were generally characterised by key expansion processes.

#### EXHIBIT 1 ABOUT HERE

The first stage is the initial phase, where firms pilot the franchise concept and establish the first franchises (time phase 1). The second stage is the main 'roll out' phase, where firms embark upon nation-wide expansion and determine the strategies and methods used to achieve growth (time phase 2). The third stage is a period of consolidation where firms strengthen and reinforce their networks (time phase 3). The fourth stage for firms is maturity, a process of managing and maintaining established franchise networks (time phase 4). Some firms also seek non-domestic expansion through internationalisation activities in the consolidation and maturity stages.

The spatial expansion life cycle, like other life cycle models, is sequential and linear in nature. Once the key process of each stage has been achieved (e.g. completion of the roll out process) movement into the next stage occurs (e.g. a period of consolidation). However, the length of time spent in each stage varies from firm to firm with, for example, some firms achieving roll out comparatively rapidly (e.g. 18 months) whilst for other firms roll out was a lengthy process (12 years in one case).

The length of time firms spend in a stage is dependent upon a number of internal and external factors.

First, it is dependent upon a franchisor's strategy and ambition. The reason some firms had slow growth rates (and therefore a lengthy period in one stage) was because franchisors had decided that growth should be achieved at a manageable rate.<sup>1</sup>

Second, this decision was often related to the size of the franchisor's head office operation. If management resources and infrastructure were limited this had implications for the number of franchisees that could be recruited each year as the amount of time and support new franchisees could be given by head office personnel would be limited. Head office support can therefore play a crucial role in the early development stages of franchise networks (Mendelsohn, personal correspondence, 1999). Third, time spent in a stage was also dependent upon a firm's market positioning and level of competition. For example, the four greetings card distribution franchisors in the sample all developed around the same period (1992-1994). However, two of the firms grew rapidly within two-three years in an attempt to establish their systems as market leaders. When these firms entered the consolidation stage, the other two greetings card franchisors were still rolling out their networks.

## ***STRATEGIES AND METHODS USED TO ACHIEVE SPATIAL EXPANSION***

### ***Stage 1 – Initial Stage of Expansion***

---

<sup>1</sup> Franchising is often perceived to be a strategy used by firms to obtain *rapid* organisational growth. However, some firms in the present survey found franchising attractive for reasons other than gaining access to franchisee capital to finance rapid growth: it was for agency related reasons also.

The first stage in the spatial expansion life cycle is the initial stage of expansion, where firms set up a pilot operation for the franchise system and embark on a process of establishing the first franchises within networks. Previous industrial location literature (including both the manufacturing and service sectors) has shown that the initial stage of spatial expansion is characterised by growth occurring either in, or locationally near to, the home base or home territory of a firm (Chapman and Walker, 1991; Jones, 1988; Jones and Simmons, 1990; Watts, 1975). Therefore, the question arises whether similar geographical clustering in the early stages of expansion is replicated in franchise operations. Locating a pilot operation and the first few franchises near to a firm's home base may enable a franchisor to monitor progress closely in the early test phase as well as minimise travel costs. Indeed, Newby and Hardwick (1979) found that in the case of KFC, the early test stage and the location of the first four to five units in the mid-late 1960s did occur near to the home base of the franchisor. However, initial locational clustering of an operation may negate one of the key benefits of franchising which is the ability to achieve rapid growth and brand dissemination on a national scale. Therefore, the following section will examine whether locational clustering in the initial stages of expansion is something that occurred in the current sample of franchise firms. The discussion first outlines whether the firms established pilot operations, the reasons for this and where pilot operations were located. The section then moves on to discuss the establishment and location of the initial franchises.

### ***Pilot Operation***

It has been argued that one of the most vital components in the organisational development stage of a franchise network is the operation of one or more pilot units

as this will determine whether the franchise format has the potential for success (Falbe and Dandridge, 1992; Felstead, 1993; Forward and Fulop, 1997; Mendelsohn, 1990; Price, 1997; Stanworth, Purdy and Price, 1997).

Pilot operations were established by two-thirds of the sample, indicating that the majority of firms considered it important to test the franchise concept before embarking upon roll out. In the sample, pilot unit locations were determined by whether the pilot was company-run or franchise-run. The pilot operations that were company-run (20) were all located in the same city/town as the franchisors' head office locations. The remaining seven franchise-run pilots were operated by franchisees who determined where the pilot operation would be located. Thus, in these cases, the pilots were not related to the location of the home base of the franchisor. In half the sample, therefore, an initial geographical clustering occurred with the location of pilot units. However, as Floyd and Fenwick (1999) observe:

*“prospective franchisors should test the concept in another location before embarking on franchising because some concepts are difficult to replicate, and outlet specific factors, such as location or great staff may be responsible for the original business's success” (Floyd and Fenwick, 1999, p36).*

Half the firms in the present sample (20/40) had not tested the franchise concept in another geographical market as only one unit had been operated as the pilot, which was also corporate-run and not *franchise-run*. Additionally, a number of other firms (13) had not piloted the *franchise* operation but instead relied upon previous operating experience of running corporate units. For those firms that did run pilot operations, establishing test units in the same location as the head offices enabled them to be easily monitored and supported. However, whilst these firms had 'tested' the

franchise concept, it is debatable whether they had truly 'tested' aspects of running a *franchise* operation. Firms that established pilots as franchises were the ones to comment that they had mostly learned about operational aspects of franchising, such as managing the franchise relationship. For firms with company-run pilots, learning about running a franchise operation developed at a later stage when the first franchisees were recruited to networks. Whilst this did cause some initial 'teething' problems, it did not affect the long term viability of the firms.

### ***Location of First Franchises***

For the majority of firms in the sample, the first franchises established in networks did not occur in clusters around the home base of the franchisor. Instead, initial expansion occurred on a wider geographical scale. This finding does not, therefore, support the existing literature, which has examined the expansion process in the manufacturing sector and other types of service activity (Chapman and Walker, 1991; Jones, 1988; Jones and Simmonds, 1990; Watts, 1975). However, the lack of initial growth clusters in franchise operations can be explained by two possible factors. First, as the section on why firms franchise confirmed, franchising is often used by firms as a strategy to achieve rapid growth. If expansion is constrained to one area, this is perhaps counter-active to achieving growth *rapidly*. Expanding and operating a more dispersed network can achieve greater and more rapid brand dissemination in the early stages of growth and allow a franchise to become established and known on a broader geographical scale and 'seed' localised markets. Second, in the manufacturing sector or other service activity the expansion process will not necessarily be determined by a second party (the franchisee) and this factor can also explain why expansion did not occur in an initial cluster for the majority of firms. However, the franchisors did admit that an initial expansion strategy which occurred

on a wider geographical basis sometimes caused operational difficulties with, for example, managing and supporting franchisees if they were located across the country.

However, there were a number of firms in the sample (16) in which initial expansion did occur in a cluster around the home base of the franchisor. Although these firms identified a number of operational advantages to locational clustering or controlling growth within an area, there were also trade-offs to this initial expansion approach. Restricting expansion to a specific geographic area could potentially discourage potential franchisees attracted to the system, and franchisors sometimes lost opportunities to develop a territory or a location because of this.

### ***Stage 2 – The Roll-Out Stage of Expansion***

After establishing the pilot operation and the first franchises, the sample firms entered the roll out stage – the main period of expansion. Only ten firms were currently in the main roll out stage; all the remaining firms in the sample (30) had passed through this stage. Roll out is the stage where firms determined the strategies and methods that were used to achieve expansion. Three types of strategies could be identified: proactive, franchisor-led strategies, where firms pre-determined territories or expanded through both the corporate and franchise route (Strategy 1); reactive, franchisee-led strategies where firms waited for franchisees to determine franchise development (Strategy 2); or a mixture of both (Strategy 3). Single unit operators was the main *method* facilitating expansion in this stage. However, a small minority of firms used the area, or master, franchise method.

*Strategy 1 – Franchisor-Led:* Strategy 1 was a franchisor-led approach to growth with franchisors determining the roll out process and deciding where the franchise will develop. Under this approach, franchisors either expanded through both the corporate and franchise route (Strategy 1a) or predetermined the territorial basis of a network (Strategy 1b). Whilst Strategy 1a is self-explanatory, Strategy 1b warrants further explanation. Seventeen of the sample firms predetermined the territorial allocation of their networks before recruiting franchisees in the main roll out phase of expansion. These firms divided the UK into a master distribution plan of territories, with franchisors determining locations/areas where they wished to establish units. Small-scale territories were then allocated around locations/areas where units would be established and based on operational requirements. The majority of this group of firms (13/17) were mobile operations. Therefore, it was a necessary operational requirement for franchisors to allocate franchisees with clearly defined areas in which to work. The remaining four firms (4/17) that used strategy 1b were locationally based firms and not mobile operations. These firms pre-determined the territorial allocation of their networks because of the *method used to franchise*. The method used to franchise was an integral part of the expansion approach used in the roll out phase of growth, as all four firms used area franchising. Therefore, pre-determining the territorial basis of a network was necessary for the establishment of area/regional master licences, which were granted to franchisees. Territories were also large-scale geographical areas compared to the other firms that pre-determined territories. Franchisees would be given the development rights to a territory and have an agreement to open ‘X’ number of units over a specified period of time.

*Strategy 2 – Franchisee-Led:* Strategy 2 was determined by the franchisee. The franchisee determined the ‘roll out’ process of franchise units, deciding when and where the franchise developed. There were two types of franchisee-led strategies. The first strategy was locationally/territorially dependent (Strategy 2a) whereas, the less common, second type, of approach did not entail the franchisee being locationally/territorially dependent (Strategy 2b).

*Strategy 2a - Franchisee-Led: ‘Bespoke’ Approach:* The majority of firms in the sample (20/40) had a ‘bespoke’ approach to growth in the roll out expansion stage. This confirms Forward and Fulop’s (1995) finding that most of the franchisors in their sample had franchisee-driven procedures for achieving expansion. The bespoke approach is a somewhat ‘unplanned’ way of achieving expansion, as franchisors rely on franchisees to determine when and where the franchise develops. The bespoke approach illustrates the differences between corporate expansion and franchise expansion. With corporate expansion, a firm determines when and where the firm will open units. Zellar et al., (1980) have questioned whether franchisees play any role in the locational decision making process of franchise expansion. Clearly for firms adopting this approach the franchisee initially determines where the franchise will develop.

However, whilst the approach is initially determined by the franchisee, franchisors have the ultimate decision determining whether the sites/locations where potential franchisees propose to open franchise units are viable. If locations are not viable (for reasons such as insufficient population, lack of customers, too much competition) the franchisor does not allow the franchise to develop in such locations/areas. However,

suitable alternative locations were sought with potential franchisees. In those cases where franchisors allocated territories, these were then allocated around the location of the unit. In many cases, franchisors had informal plans of locations or areas where they thought there was potential for the franchise to develop. Thus, the dual decision making process of both franchisor and franchisee determines spatial expansion. The types of firms that adopted this approach were not limited to any particular sector or type of operation (i.e. mobile or location based). In fact, the approach was used by firms across the six different sectors of activity and by both types of operation.

*Strategy 2b – Franchisee-led: Locationally Unconstrained Operations:* Two business-to-business franchisors had a locationally unconstrained approach to growth. Both firms did not allocate defined territories for franchisees to operate in and nor were franchisees tied to specific locations. The franchisors did not allocate territories or sites as it was considered an unnecessary operational requirement which would have restricted business. As both franchises operated with franchisees being specialist experts in one area (e.g. energy-cost management or pharmaceutical recruitment) a franchisee's 'market' was not constrained to clients in one geographical area, but was instead spread throughout the country. Franchisees could decide therefore where they 'located' their businesses (i.e. geographically as well as home-based/office-based), which meant that franchisees could be located in the same city or town but working in different specialist fields. However, market overlapping or 'poaching' of customers did not occur within the networks because the franchise operations were structured so that this did not occur.

*Strategy3 – Hybrid: Franchisor and Franchisee-Led:* As Forward and Fulop (1995) observe empirical matters are rarely clear-cut. As with their sample, where franchisors had both franchisee and site driven strategies for achieving growth, so a small number of firms in the sample (4) had a dual approach to achieving growth in roll out, which was determined by *both the franchisor and the franchisee*. The firms in this category first had a bespoke approach for achieving expansion, with franchisees determining the roll out process of franchise units. However, these firms also had a more proactive approach to achieving growth than simply waiting for franchisees to be recruited to the network. Thus, the franchisors also determined growth by expanding through company owned and operated units. For these firms company expansion and a site driven policy for achieving growth was a solution to the difficulty of attracting and recruiting suitable potential franchisees, a strategy firms also used in the Forward and Fulop (1995) sample. Firms used corporate units in two different ways. First, site-led corporate infill was transitory (Strategy 3a). The franchisor identified and bought company-owned shops with the intention of franchising these units when suitable franchisees were found in such locations. Second, corporate ownership in conjunction with a franchise strategy was an intentional part of achieving expansion (Strategy 3b). Company-owned stores were used firstly as a response to the difficulty of recruiting potential franchisees for locations identified as suitable sites for development, and secondly, so that franchisors could access two profit streams.

In sum, roll out is the main stage in the expansion life cycle for achieving growth. The firms in this sample had similar strategies to those identified by Forward and Fulop (1995), where firms had either franchisor or franchisee-led approaches for the

expansion process, or a combination of both franchisor and franchisee-led approaches (hybrid). Single unit operators was the main method facilitating expansion, although a minority of firms used area franchises to expand.

### ***Stage 3 – Consolidation Stage***

Subsequent to the main roll out phase of expansion, firms entered a stage of consolidation. Thirty of the sample firms were currently in, or had undergone this expansion stage (21 firms were currently in consolidation, the remaining nine were in maturity). After the sample firms achieved a certain amount of geographic coverage, networks were strengthened and reinforced. Regardless of the expansion strategies and approaches used in the main roll out stage of development, strengthening and reinforcing networks involved the same issue for firms: filling network gaps that were planned at roll out where franchisors wished to locate and have unit representation. In addition to infilling networks gaps, a second process also occurred for some firms in the consolidation stage. This process helped firms achieve consolidated networks but arose because new market opportunities, which were not planned or predicted by firms at roll out, arose over time. Shifting demographics, competitive pressures and factors internal and external to the system make it difficult for a franchisor to predict the saturation point of a franchise system. Therefore, the second process, which occurred in the consolidation stage, was to fill new market opportunities that arose in networks over time. For some firms, changing levels of market potential and opportunities to develop new units meant that networks had to be restructured and territories altered to accommodate new and existing franchisees/units.<sup>2</sup>

---

<sup>2</sup> This issue is discussed in a forthcoming paper, Cox and Mason, 2005.

There was also one further expansion process that occurred with some firms in this stage. Whilst the majority of franchisors, in the consolidation stage attempted to achieve consolidated networks on a UK scale, a number of firms (9) additionally took the opportunity to develop and expand internationally and establish master licences in European countries. For some of these firms this was a reactive strategy to potential master franchisee enquiries, but for others internationalisation was an intentional franchisor-led strategy, where new international expansion opportunities were sought. However, as the aim of this study was to examine expansion on a *national* scale this issue is not discussed further.

As in the roll out phase, the strategies and approaches used to consolidate networks differed. As with the previous phase of spatial development, expansion was determined by the franchisor, the franchisee or a combination of both. The majority of firms continued to be reactive and wait for franchisees to approach the system (a franchisee-led approach). However, marketing, promotion and advertising became more specific and proactive in response to greater locational constraints. Locationally mobile franchisees were also seen as a solution to overcoming the difficulty of infilling, although only in a minority of cases were franchisees willing to relocate. For a minority of firms, more proactive expansion strategies were used in the consolidation phase than were used in the roll out phase of development (a franchisor-led strategy) as they opened and established corporate units to overcome the infilling problem. Altering the method of franchising used in the roll out phase of expansion (i.e. developing existing single unit franchisees into multi-unit franchisees) was a way for firms to fill gaps in their networks (a franchisor and franchisee-led strategy).

#### ***Stage 4 – Maturity Stage***

For the nine firms in maturity, this stage was characterised by managing and maintaining franchise networks. This involved three activities. First, the majority of firms maintained networks by managing the renewal and resale of franchise units, with some firms additionally embarking upon new expansion phases within the UK. Thus, expansion was not restricted to only the initial stages of growth. Second, a minority of firms sold their networks to larger corporations and thirdly, some firms sought new expansion opportunities external to existing networks by developing new franchise concepts and systems or internationalising operations.

### ***CONCLUSIONS***

Franchising is a strategy that enables a firm to achieve rapid spatial and organisational growth. Paradoxically, *how* expansion is achieved has not been examined rigorously or extensively by extant research. Therefore, this paper has sought to understand the spatial expansion process of franchise systems in the UK in order to redress this neglect. Two key questions were addressed: why firms franchise and how franchise firms achieve spatial growth.

The first process of expansion is for a firm to decide to use franchising as a means to achieve growth. In examining this issue, the first part of this paper has contributed to existing theoretical debates, which have sought to understand why firms franchise.

Although agency theory has assumed predominance in extant literature, the evidence from the current study highlights the importance of the resource-constraints theory as an explanation for why firms franchise. A key advantage of franchising identified by this theory, and confirmed by the majority of firms in the present sample, is the ability

to utilise the financial and human capital of the franchisee to realise rapid spatial expansion. However, a number of firms in the present sample also cited that it is because of *both* resource and agency related advantages that the decision to franchise was taken. Therefore, the first conclusion is that whilst, separately, both the resource and agency perspectives can aid explanation of why firms franchise, it is a more balanced view - incorporating both perspectives – which can provide more detailed insights for understanding the reasons franchising is used as a strategy to achieve expansion.

The life cycle model is the conceptual framework – utilised in other areas of organisational literature – which has been developed in this paper to understand the spatial expansion process of franchise systems. Through use of this model, the article has provided new exploratory insights into how franchise operations achieve expansion with the strategies and methods that are used to grow and develop over time.

Four key stages have been identified in the life cycle. The first stage of the spatial expansion life cycle is the initial stage, characterised by the piloting of the franchise operation and the establishment of the first few franchises. The second stage is roll out, the main period of expansion, characterised by firms determining (or continuing from the initial stage) the strategies and methods used to achieve nation-wide expansion. The third stage is consolidation, characterised by the strengthening and reinforcing of networks by filling locational gaps. While the last stage, which only a few firms in the sample appear to have reached, is maturity.

The second conclusion is that the four stages of the life cycle model demonstrate and enable insights into the generalisability and empirical regularities of the spatial expansion process. The firms in the current sample progressed through different stages of growth, characterised by key spatial developments. However, the strategies and methods used to achieve expansion varied inter- and intra-sectorally and few clear trends were evident within the sample. Whether a firm used a franchisor-led strategy, a franchisee-led strategy or a combination of both for achieving expansion was not sector specific nor determined by the type of operation (i.e. mobile/location-based).

The third conclusion is that the lack of clear trends regarding expansion strategies, whilst reflective of the broad sectoral range included in the current sample, demonstrates more significantly that franchising – despite often being treated as a homogenous economic activity (by the academic and practical literatures) – is heterogeneous in nature. The methodological approach used in this study has therefore enabled greater insights to be gained and given a more accurate representation of the nature of franchise activity.

The lack of distinction in understanding which strategy is used by a specific type of firm from a particular sector of activity demonstrates that other factors are responsible for determining the expansion process. Therefore, the fourth conclusion is that it is the *key actors* in a franchise system – both the franchisor and the franchisee – and their underlying decision-making processes that determine the strategies and methods used to achieve expansion. The franchisor may predetermine territories, open corporate units, or simply wait for a franchisee to determine when and where the franchise system will develop locationally. Indeed, it is this factor, that a second

party (i.e. the franchisee) plays a key role in determining the expansion process, which distinguishes franchise expansion from manufacturing and other types of service based expansion.

Therefore, this paper has argued that previous academic literature, which has examined the spatial expansion issue (Newby and Hardwick, 1979 and Aspbury, 1985) is limited, as its emphasis has been to describe patterns of franchise system expansion rather than the *processes* causing these patterns. It is evident from the findings that it is the combined decision making processes of both the franchisor and the franchisee that determine spatial outcomes. More recent academic literature (Forward and Fulop, 1995), which has examined the strategies franchise firms use for achieving growth, is also limited. This research focuses on only one stage (roll out) in franchise system development and does not take account of the dynamic nature of network development. However, the spatial expansion life cycle developed in this paper captures the dynamic element of the expansion process, illustrating that strategies and methods alter over time according to the stage of development.

### ***Practical Implications, Limitations and Future Research Avenues***

The findings from this study highlight a number of management challenges inherent in unit and network growth. There is potential for new or established franchise systems to benefit from these findings. Such advantages have also been highlighted by other types of organisational life cycles (e.g. Churchill and Lewis, 1983). In a practical context, the expansion life cycle model can provide an informative framework to guide firms intending to franchise. Knowledge of each of the expansion stages can enable an existing franchisor, or a potential franchisor, to better understand

the processes and possible problems associated with each stage, as well as anticipate any challenges of future stages. For instance, in the early stages of growth, establishing a pilot can substantially add to the time and financial costs of developing a franchise operation. The advantages and disadvantages of allocating territories and exclusivity will also need careful consideration by new franchisors. In latter stages of network development, franchisors may have to consider more locationally targeted marketing and advertising campaigns, or alter methods used to franchise (e.g. from single-unit franchisees to multi-unit operators) to fill gaps in networks. Network restructuring may also be necessary in latter stages of development but the legal and practical implications of territories and exclusivity - allocated in earlier stages - may have an effect on a franchisor's ability to restructure.

The life cycle model captures the dynamic nature of franchise system expansion over time and space. However, the study has been conducted in only one spatial context - the UK. There is potential, therefore, for the expansion life cycle model to be transposed to other contexts and the model's applicability to different countries and economies could be tested to assess comparability in type and sequencing of expansion stages. As this paper has examined only *national* expansion, the life cycle model could also be tested on a larger geographical scale (i.e. internationally) to explore whether similar or different expansion processes and stages occur in the international expansion process. Such future research would generate further insights and observations of the empirical regularities and irregularities of franchise system expansion.

## ABSTRACT

The paper discusses the future of small enterprise development as a viable tool for economic development and it makes two arguments. First is that small enterprise development as a tool for providing greater economic security for the poor needs to be integrated into the larger economy. Consistent with the theory of property rights we argue that small enterprises stand a better chance of both integration in a value chain and benefiting from such integration when there are opportunities for producer participation in ownership as a product moves up the value chain. Second is that entrepreneurial ventures in developing countries need sources of financing beyond microcredit. There is no doubt that microcredit has an important role to play in improving the lives of the poor. However, as a source of finance for small enterprises, microcredit has at best a tangential role.

We present cases of enterprise development in India and Nepal to illustrate the arguments in the paper. Specifically, we include the experiences of Chamoli Tasar Pvt. Ltd. (value adding activities in the tasar silk subsector), Dev Bhoomi Madhu Pvt. Ltd. (bee keeping and honey processing), Humla Oil Pvt. Ltd. (distills essential oils and markets them), Mallika Handmade Paper (handmade paper and paper products from lokta) which are all producer owned companies, as well as the experiences of Dolaka Cooperative Society (a cooperative involved in the cultivation, harvesting and distillation of wintergreen oil).

## INTRODUCTION

Facing a business environment of increasing globalization micro and small enterprise development models must come to grips with new economic realities if they are to gain relevance as tools for economic development. This means shedding outmoded ideas and strategies, some of which are dearly held, and adopting more progressive ones that can help to level the playing field somewhat, giving small enterprises a stronger opportunity to develop and compete.

If enterprise development is to play a significant role in economic development – making a meaningful contribution to alleviating the problems of pervasive global poverty then it is clear that a new strategy is needed. In his path breaking work The Fortune at the Bottom of the Pyramid, C.K. Prahalad (2005, p. ix) sums up this point concisely. “It was also clear that we have to start with a new approach, a ‘clean sheet of paper’. We have to learn from the successes and failures of the past – development aid, subsidies, governmental support, localized nongovernmental organization (NGO)-based solutions, exclusive reliance on deregulation and privatization of public assets ... has not redressed the problems of poverty”. More and more, economically insecure households and communities are demanding income generating opportunities that go beyond what traditional agricultural and rural development has to offer. Micro and small enterprise development will have to provide many of these opportunities if it is to play a significant role in economic development and poverty alleviation.

This paper looks at two aspects of enterprise development, the need to integrate micro and small enterprise development into the larger economy and the role of financing in this process. There are some major implications here. One is that the promotion of local solutions and local entrepreneurship without linkages to the wider economy has not made much of an impact in reducing poverty. The other, that microfinance (the latest “silver bullet” of the development community) is fine up to a point but does not adequately address the substantial credit needs of small enterprises if they are to graduate from the informal to the formal sector economy in order to make a more sustainable contribution toward the alleviation of poverty and to economic growth.

## **THE ECONOMIC ROLE OF SMALL ENTERPRISE DEVELOPMENT**

Small enterprises have long been recognized as an important component of poverty alleviation and economic development, but attempts to promote them in a systematic and effective manner have not met with great achievement. Successful enterprise promotion programs remain more the exception than the rule. The traditional “livelihoods” model of enterprise development most often viewed enterprises in a vacuum, as entities unto themselves. There was little or no attempt to place the livelihood within the context of the larger economy and no attention was paid to identifying backward and forward linkages that could strengthen the enterprise’s viability and chances of succeeding. In the worst of such cases, livelihoods were developed without even a thought being given to markets. The wisdom prevailing in such cases was that if one could grow or make a product, one could certainly sell it. Far more attention was paid to identifying and transferring technologies and techniques and markets were assumed to be readily available.

The new theories of industry evolution argue that entrepreneurship and small enterprise development<sup>1</sup> contribute significantly to the growth of national economies (Jovanovic, 1982; Klepper, 1996) and that this impact is even more pronounced in globalized knowledge-based economies (Audretsch, 2004). A number of studies in OECD countries examined a link between entrepreneurship and macroeconomic performance showing that in recent decades the entrepreneurial activity had a positive effect on the output growth (Carree and Thurik, 1998; Reynolds et al., 2000). The evidence is less compelling for developing countries. Studies in several African countries point to the reverse and negative relationship: periods of rapid economic growth are characterized by the negative contribution to overall employment from net

firm creation (Liedholm, 2002). Microenterprises in developing countries are often involved in marginal activities that get replaced by higher yield activities in larger enterprises during prosperous times. However, there are high-growth-potential enterprises in both developed and developing countries that should be given special attention in public policy initiatives.

Various national and international approaches attempted to enhance capabilities and performance of SMEs in developing countries. One such example is CEFE (Competence based Economies through the Formation of Entrepreneurs), which is an entrepreneurship development program for developing countries managed by the German organization GTZ (Gesellschaft für Technische Zusammenarbeit). A relatively new approach to enterprise development has been taking shape over the past few years and is known as the Subsector/Business Development Services (SBDS) strategy (Lusby, 2002). The subsector/business service (SBDS) approach is an attempt to combine the strengths of subsector analysis and business service market development. Subsector analysis can help identify constraints to enterprise growth and competitiveness in a given subsector. Business service market development, on the other hand, provides a framework on how to promote and support commercial services that address those constraints for a large number of subsector companies. When pursued jointly, they can result in programs that have significant impact on livelihood income and stability.

The subsector approach gives more focus to the BDS strategy, ensuring that services for enterprises will continue once the program is over and that their impact will be sustained. It also shows how clear links can be established between program interventions and livelihood impact. The SBDS approach is conducive to reaching smaller enterprises, especially in rural areas due to its focus on forward and backward linkages between enterprises at all levels of the supply chain and the commercial relationships between them. It helps to bridge the process through which informal microenterprises enter the more formal economic sector (Liedholm, 2002). The SBDS approach is also instrumental in the identification and promotion of embedded services, often found in the relationships between actors in specific supply chains, which is particularly important for sustainability and efficiency of the achieved sectorial structures.

## **THE NEED FOR FINANCING IN SMALL ENTERPRISE DEVELOPMENT**

The second main area of concern in small enterprise development involves a realistic understanding of what is needed to finance small enterprises. This is the age of microcredit as the silver bullet for financing small-scale endeavors. There is no doubt that microcredit has an important role to play in improving the lives of the poor and disenfranchised and has many substantial accomplishments to its credit. However, as a source of finance for small enterprises, microcredit has at best a tangential role. Loan amounts are too small for enterprise requirements and their interest rates are too high. There needs to be more progressive thinking on how to provide finance to small enterprises with terms and conditions that are affordable.

Microfinance is the range of financial services including savings accounts, loans, and insurance schemes that are available to poor households and microenterprises and are usually managed by NGOs, cooperatives, and specially established microfinance institutions. The microfinance movement came about due to the unresponsiveness of mainstream financial institutions to credit needs of the poor. Microcredit is fine for lending at the household level or microenterprise level

where finance requirements are small and repayment can be made in a relatively short period. But credit requirements for an enterprise that needs working capital or wants to expand its physical plant cannot be met by microcredit. First of all the interest rates on microcredit loans are high, often around 18-24% and sometimes much higher and secondly, given such high rates, payback periods are short. Several recent studies argue that microfinance is more of a band aid solution rather than a policy of macroeconomic importance (Hogue, 2004; Daley and Sautet, 2005).

Furthermore there is the question of fairness. Why should a small enterprise be expected to pay such high interest rates when others are able to access credit at much lower rates? The stock answer of course is the high risk involved in loaning to this sector. But is this based on factual evidence or is it motivated by class bias? One would assume that the notion of risk of small enterprises is supported by statistics, but then if they have never had access to such credit where do these statistics come from? On the other hand the payback rates characteristic of the microcredit industry are so high – anything less than 90-95% is considered a failure – that there seems to be some justification for assuming that these sectors might well be excellent credit risks. What needs to be done is a serious analysis of risk of different economic classes and sectors that looks at hard facts and tries to chip away at class biases. One study in India on why debts go sour found that banks are often as much at fault as their debtors (Desai, 2005).

On a more positive note, the microfinance movement has created one of the most important innovations in the field of economic development in recent times – the Self Help Group (SHGs). These are self-selected associations almost exclusively women with a membership of 5-20 that form the core of the microfinance movement and are the main reason for its success. More to the point here, these SHGs are now becoming a platform demanding attention to the needs of their members for developing more income generating opportunities.

Although microfinance has proven its ability to combat poverty in the short-term, we still need to address a number of fundamental institutional concerns such as (Daley and Sautet, 2005):

- Discriminatory laws, such as those that allow only males to legally own property;
- Excessive regulation, that makes mainstream credit applications a virtually impossible process for the poor;
- Endemic corruption, particularly in the disbursement of loan funds by mainstream financial institutions that significantly increase the cost of borrowing; and,
- The lack of formalized property rights.

The agendas of development programs have to include the goal of improving availability of external financing in the developing countries. In general, start-up companies have restricted access to established funding channels (debt financing from commercial banks or leasing companies), while start-up companies from developing countries face additional challenges due to the nonexistence of equity funding sources (venture capitalists, private investors). Lack of such sources largely reflects the overall level of development in these countries, but their introduction is also hindered by the inadequate systems of property rights.

The theory of property rights focuses on how ownership of assets affects the efficiency of trading relations (Barzel, 1994; Hart, 1995) and how the state protects the benefit streams of the asset

ownership (Prasad, 2003). Systems of property rights are sanctioned behavioral norms upon which “value-creating activities are implemented so that resources can be channeled to higher yield uses” (Kim and Mahoney, 2002, p. 234). Four necessary characteristics of property rights were identified (Tietenberg, 1992, pp. 45-6): (1) universality – all resources are privately owned; (2) exclusivity – all benefits and costs accrued as a result of owning and using the resources should accrue to the owner; (3) transferability – all property rights should be transferable from one owner to another on a voluntary basis; (4) enforceability – property rights should be secure from involuntary seizure by others. All of the above conditions are rarely in place and the analysis of the property rights structure can identify problems in each of these conditions that lead to inefficient allocation of resources. Well-defined property rights are particularly important for developing countries (Prasad, 2003); however, there is often a lack of political will to institute appropriate systems of property rights.

## **RESEARCH PROCEDURE AND METHODOLOGY**

The paper draws from the experiences of a number of successful enterprises in the Indian and Nepal Himalayas taking lessons from four such cases in particular. These are: Chamoli Tasar Pvt.Ltd., Dev Bhumi Madhu Pvt. Ltd., located in Uttaranchal State of India and Mallika Handmade Paper Pvt. Ltd. and Deudhunga Cooperative in a remote western region of Nepal. One important lesson here is that if such undertakings can be successfully launched in such remote rural areas, then there is good reason to believe that these successes can be replicated elsewhere in the developing world.

We used descriptive, case study methodology to examine the two main themes in our paper: integration of small enterprise development (SED) into broader economic development and the role of financing in SED. The first author was involved in the enterprises practically from their inception and continues to be involved until the present. His involvement in these cases varies from a participant observer in the Nepal cases to a project designer, fund raiser and business development services facilitator in the two India cases.

Chamoli Tasar and Dev Bhumi Madhu have been operating for the past ten years and Mallika and Deudhunga for the past five years. 2188 men and women participate in all four enterprises. In all cases the producers/collectors participate in value addition activities beyond supply raw materials. The most pronounced example is Chamoli Tasar in which the producing community is involved at every stage of the value chain from rearing of the silkworms, to reeling and spinning of yarns, to weaving of fabric and finished products. In Dev Bhumi Madhu the producing community has an ownership position in the honey processing plant and will benefit from value addition through the revenues generated by processing, packaging, labeling and also organic certification. In Mallika Handmade Paper the community makes paper from the lokta shrub and efforts are now on to add further value to this paper by transforming it into various consumer items such as notebooks, lampshades, and screens. Finally, in the Deudhunga Cooperative the community owns and operates the distillation plant that transforms the wintergreen leaves into essential oil.

Characteristics common to all four cases<sup>ii</sup>:

- All are community owned but engage trained management for daily operations;

- All are involved in the value chain beyond the supply of raw material and employ the subsector/business development services approach to enterprise development and facilitation; and are organized as formal sector institutions;
- All are hampered by lack of access to affordable credit for both working and fixed capital, which inhibits their growth and potential;
- Women are involved throughout the enterprise and as shareholders and board members of governing bodies;
- All have a clear commitment to sustainable harvesting and use of resources and have detailed systems to assure this is achieved.

## **SMALL ENTERPRISE DESIGN IN DEVELOPING COUNTRIES: FINDINGS AND RECOMMENDATIONS**

The objective of our work is to come a step closer to a realistic and cost effective framework for designing enterprises that have clearly defined goals and activities that complement the dual objectives of conservation and economic security. Based on a systematic examination of field based enterprise activities we abstracted characteristics that are responsible for the successes of these activities and we identified and analyzed those components that did not work or required reworking to try to understand where the failure occurred.

While there are many reasons for their individual success, including highly motivated promoters, selection of subsectors with good growth potential, and adequate funding to cover their development costs, the one important feature common to all is their use of the subsector/business development services (SBDS) strategy which requires looking at enterprises as part of the larger economic landscape and linking them both vertically and horizontally within the subsector. This in turn opens up the potential for increasing the participation of the producers/harvesters/collectors at higher levels up the value chain. While both of these seem to be common sense, they are rarely practiced in enterprise development. Rather the usual practice is to look at an enterprise in isolation of the larger economy and to assume that if something can be grown or made, then it can be sold.

The most comprehensive example of facilitation of a subsector up the value chain is Chamoli Tasar Pvt. Ltd. The value chain starts with the production of eggs in an operation called a grainage (49 people). The eggs are reared (440 rearers) into silk worms which in turn become cocoons. The best quality cocoons are preserved (8 people) as seed cocoons for the next crop, while the rest are spun (179 spinners) or reeled (23) into yarns. The yarn is woven into fabric by 9 weavers, which then is sold on the market. All 708 workers are from 35 villages scattered throughout the region and all are shareholders in the business. Rearers earn on average the equivalent of \$93 for three to four months work; a single spinner can earn \$12 per month for very part time effort and up to \$51 per month for concerted effort, or with more than one spinner in the household. Reelers earn on average \$17 per month again depending on level of expertise and output. An experienced weaver can earn up to \$30 per month. In most cases several members from the same family participate in different functions with the accrued incomes resulting. All functions are decentralized and act as individual enterprises. For example the rearers are divided into 70 groups. They purchase their eggs from the company which also sells other needed supplies such as rearing tents, racks, etc. Each group of rearers is responsible for

selling its cocoons either back to the company as seed cocoon or to a spinning/reeling center. Price is based on quality of product. While reeling is undertaken jointly in centers, spinning has been completely decentralized to the household level. Again, the product is sold to the weavers who set the price based on quality. In order to generate greater economies the company also purchases some cocoons and outsources some of the weaving. The company is responsible for securing information on design and color and garment types required and passing this information on to the weavers. It is also responsible for marketing and distribution of the final product. To date the company is yet to break even so there is no issue of distribution of profits yet.

This pattern is followed though less extensively in all the other cases. In the Deudhunga Cooperative 897 families are involved in collecting wintergreen which is sold to the distillation unit for about \$0.01 per kg and transformed into an essential oil which sells for \$9.00 a liter (300 kilos of raw material worth \$3 = 1 liter of oil). Fuel and other processing costs come out to about \$2 per liter leaving a net revenue of \$4 some of which is returned to the collectors and some is spent on village improvements as decided by the shareholders.

Promoting the participation of the producers/collectors at different levels of the value chain adds to the difficulty of the task and some might argue that it is burdened with potential failures that could pull the whole effort down. However, limiting the role of producers to collecting, harvesting, or producing raw materials or minimally processed materials for sale to others is often not economically attractive for poor households. Certainly in the case of natural resource based enterprises, success depends on the participation of the collectors/harvesters/ producers as far up the value chain as possible, which has to be facilitated by appropriate ownership arrangements. Systems of property rights have to be developed as a matter of developmental public policy, participants have to be educated about various ownership options, and property rights have to be enforced and secured within the system. While this increases the complexity of the strategy, it is by no means an impossible task as is shown in the cases of Chamoli Tasar, Dev Bhumi Madhu, Mallika Handmade Paper, and Deudhunga Cooperative.

The major constraint facing these enterprises is lack of access to capital. Many people assume that microcredit is the answer to micro and small enterprise financial needs. But this is not the case. The experience of these four companies has shown that it is virtually impossible for them and thousands like them to access credit on reasonable terms. Chamoli Tasar needs \$2000 for a product finishing unit. It cannot access mainstream capital so it once again has to turn to an NGO which can find grant money to cover the purchase. The problem is that the NGO does not want to own a fabric finishing unit but it cannot in turn sell it or give it to Chamoli Tasar, a private company. This situation is repeated in many of these enterprises. For example the honey processing plant used by DevBhumi Madhu is owned by an NGO which leases it to the company. In that case when a loan application was made to a development bank, the bank would not lend to the company, but would lend to the NGO. This leads to a 'catch-twenty two' situation for such enterprises. On the one hand the mainstream financial institutions claim the enterprises have no assets for use as collateral, yet, on the other hand, they refuse to assist them in creating such assets. Mallika Handmade Paper needs funds for product development and market intelligence, but again although the company has a solid record of profitability, finance is not forthcoming. In all case these companies must rely on NGOs to find grants. A system that is

clearly not sustainable nor is it advisable for good business practices. All four companies are in need of additional financing that goes beyond the capacity of microfinance.

A comprehensive framework for small enterprise design needs to address concerns of various stakeholders at micro and macro levels: existing and nascent entrepreneurs, local governments and various societal organizations, and international community and aid organizations. These stakeholders pursue a plethora of interdependent goals: business survival and profitability, economic development, social transformation, conservation, the best practices in enterprise development and poverty alleviation.

Through the cases we examined one of the approaches to enterprise development (SBDS strategy) and identified its advantages and analyzed sources of deficiencies in enterprise development process. The majority of problems in the observed companies arise from the fact that their needs have outgrown the capacity of microfinancing and that there are no good alternatives in existence for financing high-growth-potential entrepreneurial ventures in developing countries. In developed countries, these types of companies are largely financed through private investments and venture capital; however, such sources of funds are rarely available in developing countries. Facing the increasing gap between the rich and the poor of the world, a number of current developmental initiatives are calling for 100% debt write-offs for the poorest nations in the world. The problem with this solution is that debt relief by itself is not going to induce the business start-up activities in these nations. Instead, we argue for partial write-offs, along with moratoriums on repayment of the remainder of the debts, where the balance of the available funds is used to build infrastructure for entrepreneurial activity.

## CONCLUSIONS

The paper makes two arguments. First is that small enterprise development as a tool for providing greater economic security for the poor and disenfranchised needs to be integrated into the larger economy with due attention given to backward and forward linkages and particularly to markets. Consistent with the theory of property rights (Hart, 1995) we argue that small enterprises stand a better chance of both integration in a value chain and benefiting from such integration when there are opportunities for producer participation in ownership as a product moves up the value chain. As such, the clustering that goes on to generate economies of scale among individual producers at the production level (clustering often facilitates training, technology transfer, marketing, product development, perhaps financing) needs to be replicated as far up the value chain as possible (federation of smaller clusters into value adding processing, transport, packaging enterprises). One effective way of accomplishing this is the Subsector/Business Development Services model that is concerned with the development of business service markets to support enterprise development within the context of the subsector. Companies in each specific subsector need individually tailored combinations of assistance through a variety of business development instruments (assistance in marketing, new technologies, hiring labor, product development, business advice, access to resources etc.).

The second argument is that entrepreneurial ventures in developing countries need sources of financing beyond microcredit. It is clear that the poor are doing their part in proving their credit worthiness. The development community is doing its part in designing effective business

development strategies. The ball is now in the court of the mainstream financial institutions to devise policies and operational systems that can effectively meet the needs of growing and dynamic enterprises. A parallel system such as the one that came about with the microfinance movement will not come to the rescue of the banks in this case. They themselves must step up to challenge and meet it head on.

### Endnotes

---

<sup>i</sup> Audretsch (2004) argues that there are important distinctions between entrepreneurship and SME policies in terms of the policy orientation breadth, instruments, as well as in the formalization of governmental support.

Entrepreneurship policy has broader focus as it aims to stimulate creation of new enterprises beyond the existing stock of SMEs.

<sup>ii</sup> Due to the limited space in this publication, we are presenting a summary of common characteristics in the section Research Procedure and Methodology, and the most relevant findings in the section Small Enterprise Design in Developing Countries: Findings and Recommendations. Cases will be presented in their entirety in separate publications.

# **FINANCIAL MANAGEMENT AND ANALYSIS PRACTICES IN SMALL BUSINESS : AN EXPLORATORY STUDY IN INDIA.**

**Ashim Kumar Das**

National Institute of Technology, Silchar, India.

**Nikhil Bhusan Dey**

Assam University, Silchar, India.

## **ABSTRACT**

“Small is beautiful” which is more relevant in India as small business units contribute nearly 40 p.c. of gross industrial value and 7 p.c. of her GDP. Small business are the only ray to hope for large number of people for survival as because most of the states are industrially backward, having poor infrastructure facilities and subsistence nature of agriculture.

Growing literature on financial management supports the argument that in small business, financial management is one of the key issues. It not only increases the success rate but also affects the level of performance of a business. This research paper reports an exploratory study by raising some queries on the financial management practices of small businesses in India and attempts to find empirical justification on the usual practices by the small business.

The research does prove that there is a wide gap between theory of financial management and in actual practices by the small business in India and show that firms not doing well are less likely to have knowledge on financial management and proper business records. While the exploratory nature of the study does not allow its results to be generalised, but suggest the need for further theory development in the field of financial management for small business and formulation of hypotheses for wider empirical analysis in future.

## **INTRODUCTION**

Small Business development has become increasingly important in recent years in both developed and developing countries (Roy and Hutchinson, 1983). In India, SSI sector contribute nearly Rs. 6.5 lakh crores (40 p.c. of gross industrial value and 7 p.c. of GDP), on the other hand small trading units contribute nearly Rs. 44,200 crores worth of value added in the country's economy (NSSO Report, 1997). Different studies have also shown that most of the new jobs created in this country come from small business. According to the survey of the World Bank in March, 1988, giving encouragement to the growth of small enterprises was the best way to benefit the masses or non-agricultural job seekers in the developing countries.

Establishment of small business units would provide the youth, their fruitful opportunities for self-expression and for increasing their natural well being. Country's younger generation feel frustrated because they do not have assurance that their education and scientific talents would be fully utilised. Therefore, increasing the small and medium sectors of our economy would strength the back-bone of society and also curb, social unrest in the economy (Barpujari, 2002). It is more so in the North-Eastern Region (NER) of India, because the states in this region are industrially backward, having poor infrastructure facilities and subsistence nature of agriculture – where small business is the only ray of hope for large number of people for survival.

Recognising the importance of small business units in the socio-economic development in India, a study was undertaken in NER of India to explore and highlight the status of financial management practices of small business. The existing literature strongly supports the argument that in small business, financial management is one of the key issue. It not only increases the success rate but also affects the level of performance. The major objectives of the study was to assess the level of perceived awareness of the owner-manager of small businesses about the tools and techniques of financial management and to examine the actual uses of financial management tools/techniques and their impact on the survival and growth/well being of the small units. The result of this study is expected to highlight the areas of accounting and financial management that require attention from the private and public organisations interested in development and growth of small business in India. In a nutshell, the study is to enquire, whether small business units which do not have to collect financial information for dissemination to others, have enough information to pursue the goal.

## **REVIEW OF EXISTING LITERATURE**

A substantial body of perspective literature has evolved dealing in whole or part with use of financial tools and techniques by the small business units. In recent times, the books written on financial management for small business emphasise the importance of developing skills in reading and interpreting historical financial statements to monitor financial health and progress (Black, 1950; Barrow, 1988; Harman, 1979; Tungale, 1952; Rauseh, 1982; McMahan, 1986; Meredith, 1986; Walker and Petty, 1986; Scarborough and Zimmerer, 1993; Kuchl and Lambing, 1994). In journals of small business, many articles strongly advocated the use of financial analysis skills for small business units (Mayo and Rosenbloom, 1975; Konstans and Martin, 1982; McMahan and Davies, 1994).

Studies have been undertaken to determine the uses of financial ratios by the small business owner managers to monitor their business performances (Lewis and Toon, 1986; Holmes and Nicholls, 1989; McMahan and Davies, 1991). Attempts have been made in these studies to measure business success as function of knowledge and use of financial information.

Research work on small business at West Midland, U.K. (Nayak and Greenfield, 1994) shows that firms which do not do well, is not because of lack of business records and lack of awareness of key business factors, but due to the lack of adequate accounting knowledge and proper financial records. Comprehensive financial reporting and analysis should generally lead to improved financial control and that this in itself could significantly increase the chances of a small enterprise (business) prospering through growth (McMahan and Davies, 1994).

There is wide gap between theory and practice of management accounting in case of small business. On the other hand financial accounting system is based on the traditional "Mahajani" system and is incomplete in nature (Soral and Jain, 1994). Past experience and intuition plays important role in financial decision making. Among the other factors, the non-use of financial tools and techniques for economic decision-making has resulted in a variety of financial problems, which the small units face (Vinayak, 1987).

Growth can result in financial stresses such as cash-flow difficulties and excessive use of debt. These financial problems create a critical need for improved financial control which can come about through an upgrading of financial reporting and analysis system (Hutchinson and Ray, 1986).

A study by Holmes and Nicholls (1998) concluded that the amount and nature of accounting information prepared or acquired is dependent on number of operating and environmental variables like, business size, age, industrial grouping, owner-managers education etc. Study also shows that there is a big gap between the owner-managers, awareness and the uses of financial management techniques (Siop and Ahmed, 2000). They (owner-managers of small business units) are venturing into business without proper accounting and financial (control) 'know-how'.

Rice and Hamilton (1979) in their study found that small businessman employed a multidimensional, stochastic, non-quantitative decision process, which are primarily informal in nature. The finding was that for a majority of small businessman decision were the result of 'experience', 'intuition', or 'guesswork'. This implies that in small business units scientific decision making process does not take place.

Another study (LeCornu, et.al. 1996) has thrown light on the financial objective of small business units. They found that financial management of small enterprise is or should be qualitatively as well as quantitatively different from that of large enterprises. It also appears that behaviour and decision making in small enterprises are unequivocally attached to the personal motivations of the owner managers.

Efficient and scientific management of finance in an enterprise is of prime importance for achieving the ultimate goal i.e. profit maximisation. In practice, the matter of production or materials quality or marketing, in the ultimate analysis, relates to financial issues (Sen, et. al., 2001).

Therefore, all out efforts are needed for applying the tools of financial management to the enterprises in a scientific manner in the interest of injection of fresh confidence and restoring the financial health of the organisation.

### **OBJECTIVES OF THE STUDY**

- (i) To assess the level of perceived awareness of the owner-manager of small business units about tools and techniques of financial management.
- (ii) To examine the pattern of managerial use of the financial management tools and techniques by the small businesses.
- (iii) To evaluate the impact of financial management practices on the survival and growth of the small business units.

### **RESEARCH METHODOLOGY**

***Tools of data collection*** : The present research work being exploratory in nature called for field data from the natural setting. The data were collected with the help of a structured questionnaire along with a loosely structured personal interview schedule (guide) for the entrepreneurs. A pilot

survey was conducted by the Researcher within small group of small business units in Silchar town of Assam state of India to know the tendency of the entrepreneurs (owner-managers) in answering the questions and the type of data which were made available by them. Consequently, the questionnaire was modified suitably and a set pattern of question was emphasised through the questionnaire as well as in the in-depth interviews.

**Population / Universe of study :** For the present research the working definition of “Small Business units/firms”, which fulfilled the following quantitative characteristics were considered :

- (I) All Small Scale Industries (SSI) registered and unregistered (as defined under SSI Policy, 1991 as amended in 1998)
  - Manufacturing unit – investment limit in plant and machinery upto Rs. 10 million.
  - Ancillary unit – investment limit in plant and machinery upto Rs. 10 million.
  - Tiny sector including service sector – investment limit upto Rs. 5 lakhs.
- (II) Small Trading units (Whole seller/retailer) who run firms with under fifty (50) employees (with full time/part time; skilled/unskilled labourers).

**Selection of Sample :** Non-random judgement sampling was used so that data are representative and purposive in nature. Due care has been taken to include in the sample different segments of the small business population. The segments are (a) Manufacturing units, (b) Service units (c) Trading units.

**Size of Sample :** As the gamut of small business is very large, it was decided to take a sample size of around 220 from the entire region keeping in mind the different business segment and different states involved. However, finally 208 duly filled in questionnaire were collected and out of which 191 duly filled in correct questionnaires were processed for the purpose of analysis. The researcher collected field data through interviewer assisted questionnaire from seven states of NER of India viz., Assam, Meghalaya, Tripura, Mizoram, Arunachal Pradesh, Manipur and Nagaland. Small business units were selected from seventeen (17) major commercially important places of the region.

**Statistical tools for analysis of data :** Since it was not possible to meet the assumptions underlying parametric statistical testing, the study used appropriate non-parametric tests of association. Chi-square is an important non-parametric test. We require only the degree of freedom for using this test. Chi-square ( $\chi^2$ ) can be used (i) as a test of goodness of fit, (ii) as a test of independence.

## **LIMITATION OF THE STUDY**

The study is likely to have following limitations inspite of our best efforts :

- (i) As the widely-acknowledged authority on exploratory research Tukey, pointed out, it is still true that exploratory methodology can only be a beginning, a base from which subsequent confirmatory research can begin. With this in mind, the present research might be judged on the basis of the questions it raises regarding potential significance for further investigation, rather than upon answers it may provide.
- (ii) A further limitation of the present research work is that the methodology used could not gauge all the factors influencing the responses, such as the moral standing and social

- beliefs of owner-manager. These considerations on financial management and reporting practices, limits the internal and external validity of the study.
- (iii) The present study was conducted in a relatively economically backward region of India, (i.e. North-Eastern Region of India) hence due care should be exercised in generalising the result in terms of the entire country.
  - (iv) The dynamics of small business enterprise growth are inevitably complex and affected by many factors other than financial management. It was not possible to control for these other influences in the exploratory study with a limited sample size.
  - (v) Given small sample size and the lack of homogeneity among small business population and the selection bias, there is a need for caution in making generalisation based on its findings.
  - (vi) As no official definition was there for small businesses in India, a working definition for the study was framed taken into consideration – qualitative and quantitative parameters/characteristics.
  - (vii) The sampling and data collection methodologies employed inevitably impose limitations on interpretation of the results of this study. The accuracy and completeness of the data collected relied heavily on the ability and skills of interviewers and also the co-operation of owner-managers interviewed.

## **STUDY FINDINGS**

### **(I) Profile of owner-managers and their business :**

Demographically, 97 p.c. of the owner-managers of small business under study were male and only 3 p.c. were female. More than half of the businesses (65 p.c.) were over 5 years of age. Majority (92 p.c.) of the businesses were one man business i.e. sole proprietorship business; only 8 p.c. of the units were found partnership firms (more than one owner); and no company form of business were there in the study. Majority (57.6 p.c.) of the respondents were employing more than one employee. Nearly 60.7 p.c. of the respondents had a family background other than business, while 32.5 p.c. operated family-oriented enterprises. The majority of the owner managers had educational credentials not relevant to their enterprises' activity, as all of the owner-managers under study had general educational qualification, like graduation (36.6 p.c.), Inter/HS (36.6 p.c.) and upto HSLC (27.7 p.c.); no technically qualified professionals were found in the survey.

The small business units of North-Eastern Region of India mostly (92 p.c.) operate in the local market i.e. to meet the local market demand. Nearly 88 p.c. of the respondents were registered units (Registered under local authority i.e. Municipal Corporation, Municipal Board, Sales Tax etc.). It was observed from the study, that principal activity of the small businesses were trading (70.2 p.c.) in North-Eastern region of India. In relation to size, more than half (52 p.c.) of the business enterprises reported monthly sales revenue of upto Rs. 10,000/-; only 4 (2 p.c.) enterprises where monthly revenue earning was more than Rs. 5 lakhs.

### **Analysis according to the features of the business :**

To see the relationship between different features of the small business under study, chi-square test was employed. (i) The result of test revealed that the age of the business and their (perceived) level of performance/achievement were independent. (ii) On the other hand, when

we test the relationship between different business sector and the performance level, it was observed that there has some relationship with business sector and their performance. (iii) The test also revealed that there has some relationship between size (in terms of monthly sales turnover) of the business units and their respective age. We can conclude that, the size of the business increases with relation to their ages. (iv) Chi-square test also observed that business experience (in terms of years) of the owner-manager of small business has no relation with their business performance/achievement. This two attributes are independent.

## II. Level of awareness :

The present study has identified 28 (twenty eight) most commonly used financial management tools and techniques and tried to judge the level of awareness of the owner-manager of small businesses (Table – I) .

**Table – I**  
**Awareness level of owner-manager of small business of North-Eastern region of India**

| Financial management tools in practice   | Awareness level<br>(N=191) |
|--|----------------------------|
| Purchase Ledger  | 20%                        |
| Sales Ledger   | 11%                        |
| Cash Book  | 100%                       |
| Debtors Book   | 100%                       |
| Creditors Book   | 100%                       |
| Depreciation   | 15.7%                      |
| Trial Balance  | -                          |
| Bank Reconciliation Statement  | 5.2%                       |
| Profit and Loss Statement  | 34%                        |
| Balance sheet  | 34%                        |
| Sales / Purchase Budget  | -                          |
| Capital Budgeting  | -                          |
| Cost-volume-profit (CVP) Analysis  | -                          |
| Job Costing System   | -                          |
| Process Costing system   | -                          |
| Beak-even analysis/point   | -                          |
| Inventory Control Method (EOQ, ABC analysis, FIFO, LIFO etc.)  | -                          |
| Stores Ledger  | 11.5%                      |
| Liquidity measures through Ratio analysis (Financial Ratios), Liquidity Ratios, Quick Ratio, Capital gearing ratio, debt-equity-ratio etc. | -                          |
| Fund flow analysis   | -                          |
| Comparative financial statement analysis   | -                          |
| Working capital management   | -                          |
| Calculation of cost of capital   | -                          |
| Pay back method of analysis (NPV) and Internal rate of return (IRR)  | -                          |
| Auditing   | 5.7%                       |
| Tax matters  | 77%                        |
| Investment management  | -                          |

The result of the study observed that only 12 (twelve) financial management tools/techniques were known to owner-manager and out of these 12 known instruments barring cash book, creditors book and debtors book (100 p.c. aware), the awareness level on other techniques were very low. This result was consistent with Mirze's (1979) findings that the degree of awareness and uses of budgeting was low ..... and the firms size affected its use. This finding of the present study on the level of awareness of owner-managers of small business units in North-Eastern region of India, tends to confirm the findings of Grablowsky and William (1980) that small business owner-managers, do not use these business financial appraisal techniques because they find these highly quantitative. According to Holmes (1986), the responsibility for using financial management tools, generally rests upon owner-manager of a small business. But as the owner-managers level of awareness was very low on financial management, therefore, proper and judged use of those instruments for analysis did not apply to small business of North-Eastern region of India.

### III. Financial Reporting and analysis practice :

Running a business effectively require an awareness and good/proper knowledge of how the business is doing by the owner-manager of a small business on a day to day basis. Apart from legal requirement there is a practical necessity to keep sufficient records to ensure that business activities can continue without problem and in proper direction. However, the fields of accounting and finance have yet to provide an accepted normative theory indicating which financial reports are most valuable in financial management and how often they should be used (McMahon and Davies, 1994).

The question in the survey which related to Basic Record keeping were :

How do you measure Financial Performance of your business ?

The study observed that 51.3 p.c. (p.c.) of the small business units under study, measure their performances on the basis of 'Sales' i.e. total amount of sales during a particular period of time. Only 43 p.c. of the respondent use profit and sales (both) to evaluate their business performances.

What is the frequency of preparing financial Accounting records ?

The survey result revealed that, only 15 p.c. of the small business units of North-Eastern region of India kept their Accounting information upto date on a daily basis; 36 p.c. on a monthly basis and 49 p.c. i.e. majority of them upto date their accounting records on yearly basis.

**Table - II**

#### **Perceived level of performance and frequency of record keeping by the Small Business**

| Frequency of preparing /<br>Financial Records | Level of Achievement |                        |
|---|----------------------|------------------------|
|   | Doing well (N – 109) | No doing well (N – 82) |
| Daily   | 17%                  | 12%                    |
| Weekly  | NIL                  | NIL                    |
| Monthly                                       | 29%                  | 44%                    |
| Yearly  | 53%                  | 43%                    |

N.B. : One unit of above 8 years of age did not prepare accounts.

The result of chi-square test revealed that, the perceived level of achievement and frequency of record keeping has no relationship, i.e. these two attributes were independent. But the study observed that small business firms doing well were more likely to be comfortable with

accounting to maintain financial records and were much more likely to keep their books upto date at least on a yearly basis (53 p.c.).

**Table – III**  
**Age of the Small Business and frequency of record keeping**

| Frequency | Age of the Business                   |                                       |
|-----------|---------------------------------------|---------------------------------------|
|           | Less than 5 (five) years old (N – 67) | More than 5(five) years old (N – 124) |
| Daily     | 4.5%                                  | 21%                                   |
| Weekly    | NIL                                   | NIL                                   |
| Monthly   | 28%                                   | 36%                                   |
| Yearly    | 67%                                   | 42%                                   |

Chi-square test were employed to study the relationship between age of the business and frequency of record keeping. The result indicated that these two attributes has some relationship. As the data (Table – III) revealed that nearly 21 p.c. of more than 5 years old small business units wrote up their books of account daily compared to younger (less than 5 years old) business (4.5 p.c.). Similarly, nearly 35 p.c. of older business (more than 5 years of age) maintain their books monthly compared to younger business (28 p.c.). To see what are the different books of account are maintained by the small business units. Question was asked and the survey result is as follows :

**Table – IV**  
**Common accounting tools used by small business**

| Name of the accounting tools | Used in percentage (N=191) |
|------------------------------|----------------------------|
| Sales Book                   | 9.4%                       |
| Purchases Book               | 12.5%                      |
| Cash Book                    | 100%                       |
| Debtors Book                 | 100%                       |
| Creditors Book               | 100%                       |
| Ledger                       | NIL                        |
| Profit and Loss A/c          | 24.6%                      |
| Balance sheet                | 10.5%                      |

The financial data of small business under study were mostly (90.5 p.c.) kept in single entry system or indigeneous (Mahajani) system, and conversion into double entry is very difficult as records are kept haphazardly. In most of the cases, accounting records were written in one general ledger or register, incorporating various kinds of business accounting information in one common place. The survey result observed that, small business record keeping system is tailor made i.e. based on the requirement and the nature of the business. These accounting statements are generally easy to prepare and understand by the owner-manager themself.

The chi-square test revealed that educational qualification of owner-manager of small business and the uses of financial management and accounting tools were independent. There is no significant difference between educated and less educated owner-manager with regard to use of financial management tools.

### Analysis by features of the business :

There was significant difference with regard to basic record keeping techniques between firms which were less than 5 years old (younger) and those more than 5 years old (older). The study also indicates that older business units were more knowledgeable and diligent enough in record keeping about their business than younger business.

The analysis shows interesting features about the different types of business sector. The retailer, who have the least complex decision process, were the most diligent record keepers – compared to other sector.

There was no major difference between firms doing well and not doing well in keeping the books of account for financial management by the small business owner-managers. The most revealing insight from the analysis is that those not doing well were not diligent enough in preparing financial statements like profit and loss account and balance sheet which are most important accounting tools for business appraisal and financial management and future planning.

**Table - V**  
**Basic Record keeping : Analysis by the features of the businesses**

| Basic Accounting Records for proper financial management | Age of the business            |                                   | Business Sector        |                      |                 | Achievement        |                         |
|--|--------------------------------|-----------------------------------|------------------------|----------------------|-----------------|--------------------|-------------------------|
|  | Less than 5(five) years (N-67) | More than 5(five) years (N – 124) | Manuf acturing (N- 22) | Retail Trade (N-134) | Service (N- 35) | Doing well (N-109) | Not doing well (N – 82) |
| Self kept  | 90%                            | 49%                               | 45.5%                  | 68%                  | 57%             | 60.5%              | 67%                     |
| Computer used  | 3%                             | 14.5%                             | 4.5%                   | 11.9%                | 8.5%            | 15.6%              | 3.7%                    |
| Profit and loss a/c                                      | 6%                             | 35%                               | 45%                    | 24%                  | 14%             | 28%                | 19.5%                   |
| Balance sheet  | 3%                             | 14.5%                             | 13.6%                  | 11%                  | 5.7%            | 15.6%              | 3.6%                    |

**Table - VI**  
**Size of the business and financial management practices (according to monthly sale turnover)**

| Financial Management Tools/Techniques | Upto Rs. 10,000/- (N – 99) | Rs. 10,000/- to Rs. 20,000/- (N – 55) | Rs. 20,000/- to Rs. 50,000/- (N – 20) | Rs. 50,000/- to Rs. 1 lakh (N – 3) | Rs. 1 lakh and above (N – 14) |
|---------------------------------------|----------------------------|---------------------------------------|---------------------------------------|------------------------------------|-------------------------------|
| Sales Book                            | -                          | 1.8%                                  | 20%                                   | 100%                               | 71%                           |
| Purchase Book                         | -                          | 5.4%                                  | 35%                                   | 100%                               | 79%                           |
| Profit and loss a/c                   | 5%                         | 27%                                   | 50%                                   | 100%                               | 100%                          |
| Balance Sheet                         | 1%                         | 9%                                    | 20%                                   | 67%                                | 64%                           |
| Accounts audited yearly               | -                          | -                                     | 10%                                   | 33%                                | 57%                           |

N.B. : Cash Book, Debtor Book and Creditors Book were kept by all (100%) of the small business units of North-East Region of India.

The study revealed that, as the sales turn over increases the use of more financial tools were observed. Those small businesses which has monthly sales turnover of more than Rs. 50,000/- were more diligent in maintaining details financial records.

As the awareness level of owner-managers was very poor, therefore, very few financial management and accounting tools and techniques were practiced by the respondent to assess the level of performance of the business unit. The present study observed a different pattern of behaviour in financial record keeping in the field of cost accounting, pricing decision, credit management, inventory management and capital investment decision, which are at total variance with the prescribed standard rules of financial management and accounting. In most of the cases, small business decision process is the result of 'experience', 'intuition', or 'guess work'. All the respondents of the present study said that even if they did not have firm figures or formal accounting records, but they knew (according to their own perception) how their business is doing. They generally follow a multidimensional and non-quantitative decision process which were primarily informal in nature. This was corroborated by Rice and Hamiltan (1979) study.

The findings of the present study and earlier studies could not able to establish a direct link with improved financial management practices and their (small business) level of achievement/performance. Thomas and Evanson (1987) were similarly unable to establish such relationship.

## **SUMMARY AND CONCLUSION**

The changing economic circumstances have pushed our economy from "infant protection strategy" to the stage of economic liberalisation and to meet the challenges of globalisation. Under these circumstances, it is but natural that the government is shifting its focus from small scale industry by curtailing the fiscal concessions and other benefits doled out to this sector in 70's and 80's. This new but non-protective culture for small businesses, a different outlook with a competitive attitude to mobilising and utilising the resources, is needed by the small entrepreneurs in their struggle for existence in the age of 'survival of the fittest'.

Review of the effectiveness and uses of the financial management tools and techniques, in most of the previous analyses is recorded in the context of large corporate sectors. But if we want to unearth the correct perspective, it is observed that only 500, out of 5,00,000 active business enterprises in India, are recognised corporate setups. Ironically, more than 90 per cent of our industrial units, with turnover in the range of a few thousand, continue to function in an apparently, unprofessional way. So any isolated attempt to improve the efficiency of these few giants may be futile, without improving the rest of the business sector. Following the examples of ASEAN tigers, we must concentrate on the medium and small scale business enterprises, for all round development.

The result of the study highlight the wide gap between theory and practice of financial management. Small Business owner-managers may hardly find the existing financial management techniques of use. At the same time, little effort has been made in the field of research on developing tools and techniques for small business (Soral and Jain, 1994). With their peculiar problems and limited resources, this small business sector generally "relies more on

traditional accounting namely financial and taxation matters, rather than financial management.” The theories of financial management as so far developed, has little relevance in catering to the specific needs of the small business. Thus, the theory and the practice of financial management being interdependent may form a vicious circle hindering the growth of this vital sector. In this age of cut-throat competition more sophisticated financial management tools cannot be a luxury for small business units to flourish. However the onus of designing suitable kit for financial management for small business lies on the academics, which in turn calls for the need of a “real life research” (Chowdhury, 1995).

An accounting system which is the basic of financial management as all the financial data is first of all recorded according to the rules of accounting in the business books of accounts. The accounting system is only useful for financial management as it is upto date and accurate. To prevent errors and to provide correct information of the business, the business accounting system must provide for certain internal checks. A standard method for protecting against errors or employee fraud is to have two or more individuals involved in the recording function. An alternative approach for ensuring accuracy is to employ the services of a public accountant or a book-keeper. Assistance will also be provided by a book-keeping service agency in filling out tax returns and in making periodic audits. Still another approach to handling the accounting function is to purchase a simplified book-keeping systems (software) which is available in the market for small business. Such systems are ideal for the business owner who knows little about accounting and has some workable knowledge on computer.

But there is no denying the fact that small business units in India are facing some problems, which makes the application of these tools difficult due to lack of knowledge, and awareness of the tools of financial management as most of the firm are marginal units. Difficulties are there, but they are not insurmountable, given the determination and concerted efforts – problems of implementation can be overcome. There is no alternative to the observance of proper discipline and financial ethics for ensuring the optimal and efficient use of financial resources. Therefore, measures should be taken to familiarise the owner-managers with modern tools, and their benefits to be derived from their use etc., through the provision of training, short term courses, conferences, seminars/workshops etc. by the development agencies.

At the present stage, it is sad to observe that young technical manpower is shifting to white collar and office jobs, instead of being groomed in factory shop floors. As a result, the think tank of our industries are starved of essential tech-force nourishment and the outcome is self restraining. On the other hand, our management curriculum has not really looked into the requirements of these medium and small scale sector of businesses. Trained managers are rarely interested in working for this sector and generally do not understand or contribute, even if capacitated. Largely, the scope of professionalism does not get an entry in the small business sector in India.

As we understand, the present small business definition in India was framed to withstand the competition from the large scale industries within the country, in a protective environment of 60's and 70's. But at present Indian economy has underwent a 'U' turn from protection to a market economy where we need a broad based small business definition to withstand the competition. In the proposed new definition, where limits on investment have to be removed and include all the constituent of small business i.e. Trade, Industry and Commerce to meet the

present challenges. Therefore, government policies have to shift its direction from investment criteria to employment in defining small business. The proposed shift in the policy shall act as a facilitator of economic activities – as small business may be promoted in the light of employment generation and to cultivate the spirit of entrepreneurship in the country's economy. The Government of India is enacting a legislation soon on Small and Medium Enterprises (SME) Development for the first time in 2005.

In conclusion, this study's major findings will hopefully help focus the attention of researchers, business practitioners and policy makers on the needs and challenges facing small businesses in the field of financial management. These small business units/firms can be formidable competitive forces both domestically and internationally, as they often are the sources of technological innovation and employment generation for developing country like India. Such findings should accelerate the search for ways to improve the efficiency of small business units to match their high growth rates in sales with higher achievement level.

**ABSTRACT**

A major component of the first semester entrepreneurship course is the development of a situation analysis for one of Inc. magazine's 500 fastest growing companies. Each student researches the industry, company, brand, competitors, consumers, marketing mix, and international ramifications for a specific company.

An Entrepreneur Program faculty member and a Business Communication faculty member jointly handle the situation analysis assignment. By having two faculty members involved in this integrated project, students realize that both aspects of the assignment, research and writing, are very important. Furthermore, each carries an equal amount of weight with respect to grading. The assignment, itself, represents about one-sixth of the total course grade for a *twelve-credit*, semester-long course.

In course evaluations, students continually say the assignment should remain an integral part of the program and that it provides the background needed to write their business plans.

## INTRODUCTION

A situation analysis is a major step in the strategic planning activity of any firm, regardless of its size. While much is written about preparing business plans, and many examples may be found in textbooks and on the Internet, little time is devoted to the situation analysis itself.

### THE SITUATION ANALYSIS ASSIGNMENT

A major component of the first semester entrepreneurship course is the development of a situation analysis for one of Inc. magazine's 500 fastest growing companies. Because the Inc. list is composed of entrepreneurial ventures, the list is a perfect fit for the assignment.

Students are given the complete Inc. list of companies and are told to choose a company from the list that they will analyze. The analysis is very detailed and covers all facets of the business except financial. Privately-held companies rarely are willing to provide the necessary financial data that would make analysis worthwhile.

Each student writes a situation analysis in which he or she researches the industry, company, brand, competitors, consumers, marketing mix, and international ramifications for a specific company. In the final section of the report, the student synthesizes the material and develops recommendations for changes in the marketing mix, target market, and international marketing of the company.

The final report is enhanced with prefatory parts (cover, title page, letter of transmittal, table of contents, list of illustrations, and executive summary) and supplementary parts (works cited and appendices). The assignment represents about one-sixth of the total course grade for a *twelve-credit*, semester-long course. Thus, the situation analysis assignment is a major component of the course with respect to time, effort, and grade impact.

### AN INTEGRATED PROJECT

The integrated communication approach to this project is unique and provides multiple benefits for students and faculty. An Entrepreneur Program faculty member and a Business Communication faculty member jointly handle the situation analysis assignment. The Entrepreneur Program faculty member is responsible for the content of the analysis while the Business Communication faculty member is responsible for the writing and related communications portions. By having two faculty members involved, students realize that both aspects of the assignment--research and writing--are very important. Furthermore, each carries an equal amount of weight with respect to grading.

Students' poor writing skill is a common topic of discussion among faculty members, who generally agree that additional writing assignments are critical in developing students' written communication abilities. However, faculty members rarely have enough time to grade multiple written assignments, so they give fewer overall assignments and more team-based assignments. Another factor that leads to fewer writing assignments is the difficulty in simultaneously grading content and writing skill. Good writing encompasses three major areas: content and

organization; style issues such as paragraph development, transitions, and sentence structure; and correctness such as grammar, punctuation, mechanics, and word usage. When students have multiple errors in style and correctness, it is difficult to focus on the content of the written analysis. The integrated approach to this project allows the Business Communication faculty member to help students with style and correctness issues. The Entrepreneur Program faculty member is then free to focus on content alone.

One exceptional aspect of the project is that students are forced to revise. In most written assignments, students receive the graded copy, quickly scan the faculty comments, and throw the assignment into their backpack, never to be seen again. In this project, the student writes Part 1 of the situation analysis, receives the graded copy, and must revise Part 1 to be included in the final report. When students write Part 2, they incorporate the suggestions and corrections from Part 1. The improvement from Part 1 to Part 2 is often dramatic. After students revise Part 2, they write the third part of the analysis and combine all three sections with the prefatory and supplementary parts. The three separate submittals help students' revision skills; time management is also improved due to the intermediate deadlines. As an added incentive for students to improve their writing, each part is worth more points than the previous part.

The assignment includes several handouts that provide a very specific, required format. Students are informed that many formats are possible for a situation analysis, but they must use a particular outline, develop standardized headings, and follow specific guidelines for visuals; instructors find that the standardization is a significant benefit when grading multiple reports.

## **LEARNING OBJECTIVES**

The situation analysis assignment has several learning objectives:

1. To give students first-hand experience doing research on businesses that are not household names without much information readily available on the Internet and other popular sources. Students find they must contact the companies personally, most effectively by telephone first and by email later. They often contact competitors, local newspaper reporters, and other local sources as well. In effect, the students must practice some of the actions of investigative media reporters, a learning experience to which few business majors are ever exposed. The assignment develops students' oral and interpersonal communication skills in addition to their writing skills.
2. To expose students to the type of information they will need when they prepare their own business plans later in the Entrepreneur Program. A significant component of a comprehensive business plan is an analysis of the industry, competition, market, et cetera. In effect, the situation analysis assignment allows students a practice run before the real thing.
3. To give students experience in preparing a well-written report—not just another research paper. Writing style, correct usage, graphics, and professional presentation are all important considerations in instruction and grading. In today's educational

environment, students too rarely are required to practice writing that combines primary and secondary research sources into a comprehensive report.

## **EVALUATION**

Students complete Part 1 of the report that covers history of the industry, history of the company, introduction to the product, five-year market share, sales history, and competitive analysis. The Business Communication instructor evaluates, edits, and makes suggestions for revision based on organization, style, tone, grammar, punctuation, mechanics, visuals, formatting, and documentation of sources. The Business Communication instructor does not evaluate the content of the report.

The Entrepreneur Program instructor grades the content of Part 1. Students then revise Part 1 for inclusion in the final report. The process is repeated for the evaluation of Part 2 (analysis of environmental variables and consumers' demographic, psychographic, and behavioristic profiles). The final report includes prefatory parts, revised Parts 1 and 2, Part 3 (marketing mix, international ramifications, conclusions, and recommendations), and supplementary parts.

The final report is evaluated by the Entrepreneur Program faculty for content and analysis and by the Business Communication faculty for written communication skills. Each student submits two copies of his/her report, one to the Business Communication faculty member and the other to the Entrepreneur Program faculty member.

In course evaluations, students continually say the assignment should remain an integral part of the program, even though it is not a popular assignment with either students or faculty. Students must work individually—without a group to share the effort—and each assignment requires an exceptional amount of time and effort on the part of faculty. However, students report that the assignment gives them the background needed to write their business plans the following semester.

## **THE SITUATION ANALYSIS ASSIGNMENT**

Shown below is the assignment the students receive. As noted above, the assignment is divided into three parts with Part 1 due about one month into the course, Part 2 one month later, and the complete analysis due about one week before the end of the semester. The completed project must be submitted in time for both the Entrepreneur Program faculty and the Business Communication faculty to have time to complete their grading.

### **Situation Analysis for Management 401**

#### **I. Overview of the Situation Analysis**

The first step in business planning is to conduct a situation analysis that provides the background for analyzing a company's competitive position. A situation analysis is an evaluation of the organization's environment and of the organization itself. After the situation analysis is complete,

the planner specifies goals, strategies, action plans, and budgets to be accomplished over a specific time period.

Place yourself in the role of a consultant for a business research firm. You are to conduct some portions of a traditional situation analysis. What follows below is a general outline of what you are asked to do.

In keeping with the objectives of the Entrepreneur Program, you are asked to analyze an entrepreneurial venture. Each year Inc. magazine compiles a list of the 500 fastest-growing private companies in the U.S. You are to analyze one of this year's 500. Finding information about your company will be a very difficult task: these are private companies; they are not established firms with long track records.

## **II. Writing the Sections in the Situation Analysis**

- A. Brief history of your industry (2 pages maximum).
- B. Brief history of your company (2 pages maximum).
- C. Brief introductory description of the primary product category and specific brand (if there is a brand).
  1. Past five-year sales history of your company.
  2. Past five-year market share history of your company.
- D. Competitive analysis.
  1. Identification of all significant competitor companies.
  2. Brief description of the closest competitor, its product mix, and the competitor's brand (2 pages maximum).
  3. Strengths and weaknesses of the closest competitor compared to your company.
  4. Other environmental variables affecting your industry and your product.
- E. Evaluation of existing customers of your company.
  1. Existing customer demographic profile.
    - a) Factors such as typical occupations, marital status, sex, household head, race, education, age, household income, stage in family life cycle, and social class. (If yours is a business-to-business firm, consider customers in terms of other businesses buying from your firm. Thus, you will need to describe their size, location, products, etc.)
    - b) Graphs to visually reinforce your written description.
  2. Heavy user psychographic profile including user personality, values, and lifestyles.
  3. Buying behavior profile.
    - a) Purchase occasion.
    - b) Benefits sought.
    - c) Usage pattern including when used, where used, how used, frequency of use, average amount used, urban density of consumers (rural, urban, suburban), geographic regions of heaviest usage, etc.
- F. Marketing mix for your company.
  1. Product analysis.

- a) Primary product—Its development; branding strategy used (if any); features and benefits; and strengths and weaknesses.
  - b) Competitive advantage based on unique product features, ingredients, etc. not offered by the competition.
  - c) Seasonal sales fluctuations including factors that boost or restrict the market for your product, such as customs and unfavorable climatic conditions.
  - d) Product quality.
  - e) Life cycle analysis—Stage of your product and how your company is managing this stage.
  - f) Package (if any) analysis—Sizes, assortments, and any special features that are used to more effectively market your company's product.
  - g) Services provided with product (if any).
  - h) Warranty/guarantee (if any).
2. Price analysis.
- a) Actual price charged for product using a table to compare product prices with nearest competitor (on a price per unit basis for various sizes). The relative impact of demand, costs, and competition in the setting of your product's base prices.
  - b) Pricing policies employed by company (e.g. any discount, promotional allowances, flexible pricing, geographic pricing, price lining, skimming, and penetration).
3. Distribution analysis.
- a) Channels of distribution for your company from the manufacturer to the customer/consumer; diagram of channels of distribution; types of intermediaries (wholesalers, retailers) and their functions in each channel; whether distribution is international, national, regional, or local; and whether distribution is intensive, selective, or exclusive.
  - b) Logistical problems with distribution (e.g. lack of acceptance by middlemen, stock shortages, and unreliable deliveries).
  - c) Strengths and weaknesses of the present distribution.
4. Promotional analysis.
- a) Overview of past and current promotions for your company.
  - b) Apparent objectives of current promotions.
  - c) Relative emphasis devoted to the various promotional mix elements.
  - d) Advertising—creative strategy and media selection.
  - e) Direct marketing and how it used for your company.
  - f) Sales promotion—how it is used and its objectives.
  - g) Public relations.
  - h) Personal selling—location in the distribution channel and types/roles of salespersons.
  - i) Integration of promotional mix elements.
  - j) Promotional examples (in appendix).
- G. Summary, Conclusions, and Recommendations.
- 1. Brief summarization and conclusions about the competitiveness of your company.
  - 2. Recommendations that could enhance the competitiveness of your company.

# **PROFILE OF MICRO BUSINESSES IN A RESIDENTIAL AREA IN SOUTH AFRICA**

De Klerk, S., Kroon, J., Lesomo, T. and van der Walt, JL.

## **ABSTRACT**

Micro businesses play an important role in the distribution of goods and services, especially in low income areas that are further away from the Central Business District (CBD). Micro businesses or Spaza shops, as they are also called, provide a way of living to their owners, family members and sometimes employees.

For local government, financial institutions and other development agencies to be able to assist in the development of micro businesses it is important to determine the nature and problems these businesses experience.

This study determined the profile of the owners and their businesses in Tlhabane, a residential area in Rustenburg in the North-West Province of South Africa. A convenience sample was used that included all the micro businesses in the area. By means of a questionnaire the owners of all 61 micro businesses were interviewed personally.

Conclusions include that many of these micro businesses struggle in terms of expansion because their low turnover, and consequently profit, is lower than they expected. One of the most important problems is the training and support to enable survival in the long run. The majority of the owners of these micro businesses have little or no education and limited background about business.

## **INTRODUCTION**

Micro businesses play an important role in many communities, especially in residential areas that are further away from the Central Business District (CBD) or shopping malls, where they fulfill in the most basic needs of the community and provide a livelihood to their owners and some family members. As these micro businesses grow they often employ someone outside the family, sometimes only on a temporary basis, to assist, especially when the owner or family members are not available.

Micro businesses are growing in numbers on a daily basis all over the world and many of them operate as home-based businesses (Longenecker, Moore & Petty, 2003:275). The owners of these micro businesses have competencies and skills that enable them to create and/or sell products and services that provide in an urgent need in the areas where they are located. The result of the operation of these businesses stimulates initiative and in some cases basic innovation. They promote healthy competition and fulfill a much needed socio-economic role in these communities.

It is estimated that there are more than 2 million people engaged in some form of self-employment in micro businesses in South Africa (GEM, 2002:28). These businesses play a significant role in the distribution of goods and services, especially in the under-developed and rural communities of South Africa with a high unemployment rate. However, most of these micro businesses have problems, in terms of support either in the form of financing or training, to survive in the long run.

The importance of encouraging the establishment of small and medium-sized businesses, which could contribute to economic development and job creation, cannot be emphasized enough. To enable the creation of an environment conducive to the development of micro businesses it is important to determine the nature of as well as the problems experienced by these micro businesses. With these results of this study available, recommendations regarding aspects that hamper business development can be made to local government, financial institutions and developmental organizations. If these problems can be alleviated an environment conducive to micro business development can be created.

### **AIM AND METHODOLOGY**

The aim of this paper was to research the profile of the owner and his micro business, the support they receive as well as the problems they experience.

A literature study was done concerning entrepreneurship and micro businesses to link the theory with the characteristics of the entrepreneurs as well as concerns regarding their businesses.

A residential area, Tlhabane, just 3 kilometers from Rustenburg in the North West Province, was chosen as convenience sample. Tlhabane is in the centre of very large mining activities in the Rustenburg region. Most of its residents are workers in the neighboring mines. The population of the residential area is estimated at about 34 000 people and 61 informal micro businesses exist in this residential area.

The purpose of this study was to determine the profile of the owners and their businesses in Tlhabane. The study was conducted by using a convenience sample that included all the businesses in the specific residential area. A questionnaire was developed and tested in another area with the owners of five micro businesses. The final questionnaire was administered by one of the researchers by conducting personal interviews with each respondent. This was done to ensure reliability of data due to fact that Tswana is the native language of most micro business owners and a few of them were unable to read or complete a questionnaire in English. Conducting interviews made it possible to include all 61 micro business owners in this study.

A business is regarded as a micro business if the business employs less than 5 people. It would normally consist of the owner and one or two family members, and/or one or two other persons employed. These businesses are usually informal since they do not pay taxes, keep records or do business on formal premises. They have a limited capital base and their owners have little or no business skills. Some micro businesses do grow to small businesses and their level of income varies considerably (Moolman, 1998:29).

## LITERATURE REVIEW

Entrepreneurial people are defined by Kuratko and Welsch (2001:12) as people who seek and take advantage of opportunities and through doing so they add value. A definite element in this specific area is the value that is added to the community and livelihood of the individuals engaged in entrepreneurship. Some of the most important factors concerning the entrepreneur's background and influencing the business are explored and include the age, level of education, assets and training, as well as support to the entrepreneur.

### Age

The relationship between age and the entrepreneurial career process indicates that in terms of chronological age, the highest percentage of start-ups seems to be in the 25 to 35 year age group and although each situation is unique, there are some concerns that influence the entrepreneur's decision at certain ages (Longenecker *et al.*, 2003:20). Obviously there are exceptions to this generalization, as factors like experience, financial support, energy level and ability to manage a business also play an important role in starting a business (Hisrich & Peters, 1998:72).

As an example, in the age group of approximately between 20 and 25 the main concerns of the potential entrepreneur will include to be educated, gain work experience, as well as acquire financial resources. Later on, at the age of between 35 and 45, the potential entrepreneur might have different concerns, such as the fulfillment of family responsibilities, the attainment of seniority in their current workplace and the risk of losing an investment in a retirement program (Longenecker *et al.*, 2003:20).

### Education

Education is important in the upbringing of entrepreneurs, because it plays a major role in helping them to cope with problems by which they are confronted and correct deficiencies in business training. The ability to deal with people and communicate clearly in written and spoken word is important in any entrepreneurial activity (Hisrich & Peters, 1998:71). Potential entrepreneurs need to be exposed to creative business education in the classroom to make them aware of situations in the creative workplace (Driver, 2001:28). Although education of entrepreneurs is frequently addressed by higher learning institutions there is a greater need to make it more specific so as to apply it to specific situations and to the individual's needs (Maxwell, 2001).

In conclusion it can be said that South Africa's education system, cultural and social norms do not promote an entrepreneurial mindset and it will take some time to change this pattern (Naude, 2001:15).

### Assets

Assets is an important prerequisite for a successful business. Assets can refer to items which have monetary value and which are owned by a business (Dempsey & Pieters, 1996:1). These assets can consist of both fixed and current assets.

To high-growth orientated entrepreneurs the business is perceived as tool to achieve wealth. The growth of assets implies accumulated wealth when the individual is used as the main unit of analysis. In other instances sales growth and growth in employment are also used as measurement facilitating instruments (Sexton & Landström, 2000:38).

An entrepreneur is motivated from an intrinsic perspective and therefore elements such as status, self-achievement, living one's passion and other personal achievements are often viewed as more important factors in the calculation of assets in the business (Van Tonder, 2003:6).

### **Training and support**

Training is one of the most important parts in running a business (Parker, 2004:279). Training begins with young people when they are in primary school. Schools have cross-curricular themes to pursue economic awareness and empowerment, which creates an opportunity to develop a positive culture, attitude and motivation towards business. It is well known that the correct mix of management skills is important for any business, and it is critical if a business is to grow successfully (Bridge & O'Neill, 1998:250).

Business training and support include newly developed, as well as enhanced industry training. Staff and human resources need to be educated and developed on a continuous basis in terms of their specific occupation through effective training and education (Maxwell, 2001). In South Africa it was found that the percentage of entrepreneurs that feel that they are equipped with appropriate skills was not even half the percentage in other countries. The training and skills development of especially underdeveloped entrepreneurs in South Africa is important in the management of existing small and medium-sized businesses (Uekermann, 2004:12).

### **Capital**

Business can barely run without sources of funding. In order to access funding, financing has to be provided either through loan or own capital from the owner. When stepping out on their own, entrepreneurs realize that the personal and financial contributions they must make will come primarily from their own pockets (Timmons & Spinelli, 2004:88). Entrepreneurs must take a careful look at what financial resources they have and how much of those resources they can contribute to the business opportunity.

## **RESULTS**

The responses of all 61 micro business owners in Tlhabane were included in the results. The biographical information provides an overview of the gender, marital status, age, and level of education.

**Table 1: Gender**

| <b>Gender</b> | <b>Frequency</b> | <b>Percentage</b> |
|---------------|------------------|-------------------|
| Male          | 34               | 55,7              |
| Female        | 27               | 44,3              |
| Total         | 61               | 100,0             |

More male micro business owners are operating in the residential area than women.

**Table 2: Marital status**

| <b>Marital Status</b> | <b>Frequency</b> | <b>Percentage</b> |
|-----------------------|------------------|-------------------|
| Married               | 38               | 62,3              |
| Unmarried             | 13               | 21,3              |
| Divorced              | 1                | 1,6               |
| Never Married         | 9                | 14,8              |
| Live together         | 0                | 0                 |
| Total                 | 61               | 100,0             |

The highest percentage of people, 62,3%, while 21,3% of the respondents were unmarried and 14,8% of the respondents indicated that they were never married.

**Table 3: Age**

| <b>Age category</b> | <b>Frequency</b> | <b>Percentage</b> |
|---------------------|------------------|-------------------|
| 18-25               | 3                | 4,9               |
| 26-35               | 23               | 37,7              |
| 36-45               | 15               | 24,6              |
| 46-55               | 13               | 21,3              |
| 55+                 | 7                | 11,5              |
| Total               | 61               | 100,0             |

From Table 3 it is clear that the biggest group of respondents (37,7%) is between 26 and 35 years, followed by 24,6% between 36 and 45 years.

**Table 4: Level of education**

| <b>Level of education</b> | <b>Frequency</b> | <b>Percentage</b> |
|---------------------------|------------------|-------------------|
| Up to Grade 6             | 7                | 11,5              |
| Grade 7-9                 | 12               | 19,7              |
| Grade 10-12               | 42               | 68,8              |
| Total                     | 61               | 100,00            |

The majority of the respondents, 68,8%, have a level of education between Grade 10 and 12, followed by 19,7% with an educational level of between Grade 7 and 9. The educational level of these entrepreneurs is comparable with that of the rest of the population in the area.

**Table 5: Duration of stay in area**

| <b>Duration</b>    | <b>Frequency</b> | <b>Percentage</b> |
|--------------------|------------------|-------------------|
| Less than 1 year   | 1                | 1,6               |
| 2-5 years          | 4                | 6,6               |
| 6-10 years         | 5                | 8,2               |
| More than 10 years | 51               | 83,6              |
| Total              | 61               | 100,0             |

More than 83% of the respondents had lived in the area for more than 10 years.

**Table 6: Nature of business activity**

| <b>Business Activity</b> | <b>Frequency</b> | <b>Percentage</b> |
|--------------------------|------------------|-------------------|
| Retail                   | 53               | 86,9              |
| Services                 | 8                | 13,1              |
| Manufacturing            | 0                | 0                 |
| Total                    | 61               | 100,0             |

It is clear that 86,9% of the micro businesses are retailers, also called Spaza shops, whilst only 13,1% of the respondent's businesses are into rendering services.

**Table 7: Duration of operation**

| <b>Duration</b>    | <b>Frequency</b> | <b>Percentage</b> |
|--------------------|------------------|-------------------|
| Less than 1 year   | 5                | 8,2               |
| 2-5 years          | 29               | 47,6              |
| 6-10 years         | 16               | 26,2              |
| More than 10 years | 11               | 18,0              |
| Total              | 61               | 100,0             |

Most of the respondents' micro businesses (47,6%) have been in operation for between 2 and 5 years whilst 26,2% have been operating for between 6 and 10 years.

**Table 8: Form of business**

| <b>Form of business</b> | <b>Frequency</b> | <b>Percentage</b> |
|-------------------------|------------------|-------------------|
| Sole proprietor         | 59               | 96,7              |
| Partnership             | 2                | 3,3               |
| Close corporation       | 0                | 0                 |
| Cooperative             | 0                | 0                 |
| Company                 | 0                | 0                 |
| Total                   | 61               | 100,0             |

The fact that 96,7% of the respondents were operating their businesses as sole proprietors correspond with their size as micro businesses. Only 3,3% of the respondents were operating in partnerships.

**Table 9: Place of Business**

| <b>Place of business</b>        | <b>Frequency</b> | <b>Percentage</b> |
|---------------------------------|------------------|-------------------|
| Family home                     | 48               | 78,7              |
| Adjacent to family home         | 4                | 6,6               |
| In location outside family home | 9                | 14,7              |
| Total                           | 61               | 100,0             |

Most of the respondents (78,7%) are operating from a family home with only 6,6% operating adjacent to the family home and 14,7% are operating in the location outside of the family home.

**Table 10: Access to services**

| Services    | Frequency | Percentage |
|-------------|-----------|------------|
| Water       | 1         | 1,6        |
| Electricity | 60        | 98,4       |
| Percentage  | 61        | 100,0      |

It is clear that 98,4% of the businesses have access to electricity and only 1,6% use water for their business services.

**Table 11: Capital employed**

| Capital           | Frequency | Percentage |
|-------------------|-----------|------------|
| Up to R1 000      | 20        | 32,8       |
| R1 001- R5 000    | 25        | 41,0       |
| R5 001- R10 000   | 7         | 11,5       |
| More than R10 000 | 9         | 14,7       |
| Total             | 61        | 100,0      |

Most of the businesses (73,8%) started with an amount of less than R5000 and only 26,2% needed more than R5 000 as initial capital.

**Table 12: Source of funds for the business**

| Source of funds              | Frequency | Percentage |
|------------------------------|-----------|------------|
| Own funds/Savings            | 38        | 62,3       |
| Retrenchment package         | 13        | 21,3       |
| Pension                      | 0         | 0          |
| Local money lender           | 1         | 1,6        |
| Loan from family or friends  | 6         | 9,8        |
| Saving Club or Stokvel       | 3         | 5,0        |
| Loan from commercial bank    | 0         | 0          |
| Income from another business | 0         | 0          |
| Total                        | 61        | 100,0      |

The majority (62,3%) of the respondents had their own funds/savings to start the business and 21,3% of the respondents used their retrenchments package while 9,8% were being helped by their family or friends. Five percent used an informal saving club or stokvel as source of funds. Although the stokvels blossomed in black residential areas, they are generally not oriented towards helping micro businesses with start-up capital (Iheduru, 1998:73). Stokvels as a seed capital source for companies in Asia and Indonesia have proved to be the starting point for later larger conglomerates (Parker, 2004:76).

**Table 13: Tried to get a loan**

| Tried to get a loan | Frequency | Percentage |
|---------------------|-----------|------------|
| Yes                 | 11        | 18,0       |
| No                  | 50        | 82,0       |
| Total               | 61        | 100,0      |

Only 9,8% of the respondents tried to get a loan, whilst 82,0% of the respondents never tried because of the belief that they would not be successful.

**Table 14: Were you successful in getting a loan?**

| Successful in getting a loan | Frequency | Percentage |
|------------------------------|-----------|------------|
| Yes                          | 1         | 9,1        |
| No                           | 10        | 90,9       |
| Total                        | 11        | 100,0      |

Only one of the respondents was successful in getting finance. Reasons given for being unsuccessful were the following:

- “Lack of own property.”
- “No property to use for collateral purposes.”
- “The bank wanted some kind of security.”
- “Lack of enough collateral.”
- “No records were kept.”
- “The business not profitable enough to pay back the loan.”

**Table 15: People working in the business (including the owner)**

| Owner and employees | Frequency | Percentage |
|---------------------|-----------|------------|
| 1                   | 31        | 50,8       |
| 2-4                 | 30        | 49,2       |
| 5+                  | 0         | 0          |
| Total               | 61        | 100,0      |

More than fifty percent (50,8%) of the respondents work alone in their businesses. None of the respondents have five or more employees and the businesses can therefore all be regarded as micro businesses.

**Table 16: How many are family members**

| Family members | Frequency | Percentage |
|----------------|-----------|------------|
| 0              | 3         | 5,0        |
| 1              | 43        | 70,5       |
| 2              | 8         | 13,1       |
| 3              | 6         | 9,8        |
| 4              | 1         | 1,6        |
| Total          | 61        | 100,0      |

A total of 70,5% employed only one family member, while 24,5% of the respondents employed between two and four family members. Respondents prefer to employ their family members (95,0%). A primary benefit from working in a family business comes from the strength of family relationships (Longenecker *et al.*, 2000:30). Only 5,0% of the respondents have non-family members working for them.

**Table 17: Assets of the business**

| Assets            | Frequency | Percentage |
|-------------------|-----------|------------|
| R100-R2 000       | 22        | 36,0       |
| R2 001-R5 000     | 18        | 29,5       |
| R5 001-R10 000    | 15        | 24,6       |
| R10 001-R20 000   | 4         | 6,6        |
| More than R20 000 | 2         | 3,3        |
| Total             | 61        | 100,0      |

The highest percentage of businesses (36,0%) have assets of between R100 and R2 000, followed by 29,5% having assets of between R2 001 and R5 000. Only 2 businesses have assets of more than R20 000.

**Table 18: Profitability of business**

| Profitable | Frequency | Percentage |
|------------|-----------|------------|
| Yes        | 35        | 57,4       |
| No         | 26        | 42,6       |
| Total      | 61        | 100,0      |

Only 57,4% of the respondents view their businesses as being profitable. It implies that they think that they are making a reasonable living, while the rest said they are not making any profit because they perceive it as being too little money for a living.

**Table 19: Monthly turnover**

| Turnover (per month) | Frequency | Percentage |
|----------------------|-----------|------------|
| Up to R1 000         | 11        | 18,0       |
| R1 001-R2 000        | 15        | 24,6       |
| R2 001-R3 000        | 20        | 32,8       |
| R3 001-R4 000        | 8         | 13,1       |
| More than R5 000     | 7         | 11,5       |
| Total                | 61        | 100,0      |

Only 32,8% of the respondents' sale figures were between R2 001 and R3 000, followed by 24,6% with between R1 001 and R2 000. It is clear that most of the respondents' turnover is very low. If an average markup of 33,3% is used, a turnover of R2 500 will generate a gross profit of only R625 per month. That is less than the minimum wage.

**Table 20: Income earned from business**

| Income per month | Frequency | Percentage |
|------------------|-----------|------------|
| Up to R1000      | 25        | 41,0       |
| R1001-R2000      | 21        | 34,4       |
| R2001-R3000      | 10        | 16,4       |
| More than R3000  | 5         | 8,2        |
| Total            | 61        | 100,0      |

Most of the respondents (41%) had an income of up to R1 000 whilst 34,4% of the respondents earned between R1 001 and R2 000 a month.

**Table 21: Are business records kept**

| <b>Business records kept</b> | <b>Frequency</b> | <b>Percentage</b> |
|------------------------------|------------------|-------------------|
| Yes                          | 16               | 26,2              |
| No                           | 45               | 73,8              |
| Total                        | 61               | 100,0             |

Table 21 above clearly shows that the majority of the respondents (73,8%) did not keep business records while 26,2% of the respondents did keep business records.

**Table 22: Characteristics of customer base**

| <b>Customers</b> | <b>Frequency</b> | <b>Percentage</b> |
|------------------|------------------|-------------------|
| Males            | 0                | 0                 |
| Females          | 0                | 0                 |
| Young            | 0                | 0                 |
| Middle aged      | 0                | 0                 |
| Older            | 0                | 0                 |
| All              | 61               | 100               |
| Total            | 61               | 100               |

None of the businesses concentrated on a specific market.

**Table 23: Products advertised**

| <b>Products advertised</b> | <b>Frequency</b> | <b>Percentage</b> |
|----------------------------|------------------|-------------------|
| Yes                        | 1                | 1,6               |
| No                         | 60               | 98,4              |
| Total                      | 61               | 100,0             |

In the area where the businesses are located it is not common to advertise, as confirmed by 98,4% of the respondents.

**Table 24: Supplier**

| <b>Suppliers</b> | <b>Frequency</b> | <b>Percentage</b> |
|------------------|------------------|-------------------|
| Wholesalers      | 53               | 86,9              |
| Retailers        | 8                | 13,1              |
| Total            | 61               | 100,0             |

Most businesses (86,9%) are supplied by wholesalers, while only 13,1% of the businesses got their products from retailers.

**Table 25: Credit granted**

| <b>Credit granted</b> | <b>Frequency</b> | <b>Percentage</b> |
|-----------------------|------------------|-------------------|
| Yes                   | 23               | 37,7              |
| No                    | 38               | 62,3              |
| Total                 | 61               | 100,0             |

Only 37,7% of the businesses sell on credit compared to 62,3% that do not sell on credit.

**Table 26: Percentage credit sales**

| <b>Percentage credit sales</b> | <b>Frequency</b> | <b>Percentage</b> |
|--------------------------------|------------------|-------------------|
| 1-25                           | 12               | 52,2              |
| 26-50                          | 11               | 47,8              |
| 51-75                          | 0                | 0                 |
| 76-100                         | 0                | 0                 |
| Total                          | 23               | 100,0             |

Only 12 of the businesses that sell on credit sell between 1 and 25% on credit and 11 of the businesses sell between 26 and 50% on credit.

**Table 27: Misfortune suffered by the business**

| <b>Misfortune</b>         | <b>Frequency</b> | <b>Percentage</b> |
|---------------------------|------------------|-------------------|
| Stolen equipment or goods | 6                | 50,0              |
| Loss due to bad debt      | 4                | 33,4              |
| Violence in the area      | 1                | 8,3               |
| Natural disaster          | 1                | 8,3               |
| Total                     | 12               | 100,0             |

It is evident that 49 of the businesses did not have any misfortunes, with only 6 businesses having encountered stolen equipment or goods, and 4 businesses had misfortune due to bad debt. Only 1 business had misfortune due to violence in the area and 1 had misfortune due to a natural disaster.

In an open-ended question, the respondents were asked in which way they had dealt with misfortunes. Various responses were received, of which the most salient were the following:

- “I had to price some of other goods to recover amount of stolen goods”.
- “I had to operate without using the fridge, but using a freezer until I had enough money for it”.
- “I used my pension funds to restart it again after repairing disaster due to fire”.
- “Although some were recovered, then again I bought some containers to store some other goods to protect form theft i.e. more security was provided”.
- “The saved money was used to replace the equipment sold”.

**Table 28: Use of a bank account**

| <b>Bank account</b> | <b>Frequency</b> | <b>Percentage</b> |
|---------------------|------------------|-------------------|
| Yes                 | 55               | 90,2              |
| No                  | 6                | 9,8               |
| Total               | 61               | 100,0             |

More than 90% of the respondents had a bank account, compared to 9,8% of the respondents who had no bank account.

**Table 29: Type of bank account**

| <b>Type of account</b> | <b>Frequency</b> | <b>Percentage</b> |
|------------------------|------------------|-------------------|
| Personal account       | 51               | 92,7              |
| Business account       | 4                | 7,3               |
| Total                  | 55               | 100,0             |

The majority of the respondents (92,7%) had personal accounts, compared to 7,3% of the respondents who had business accounts.

**Table 30: Support from any organization in various activities**

| <b>Support</b>                | <b>Frequency</b> | <b>Percentage</b> |
|-------------------------------|------------------|-------------------|
| Training                      | 4                | 6,6               |
| Advice                        | 0                | 0                 |
| Mentoring                     | 1                | 1,6               |
| Assistance with business plan | 0                | 0                 |
| No assistance                 | 56               | 91,8              |
| Total                         | 61               | 100,0             |

More than 90% of the respondents had no assistance or training from any organization whilst only 1,6% of the respondents has encountered mentoring and 6,6% of the respondents had training before starting the business.

Open-ended questions were asked in order to determine the usefulness of support and ways in which support could be applied. The most important comments on the usefulness of support were the following:

- “I had worked at OK before, so it was easy starting the business and running it”.
- “Yes, it helped me start the business. Revlon gave me the training”.
- “A three-day business training helped me deal with customers especially pricing of goods and satisfying my customers”.
- “Our service is good now and customer’s numbers are increasing”.

The respondents’ opinion on what organizations should do to support small business, embraced the following:

- “They should help us with a training course”.
- “Financing and location are most, I would ask for”.
- “Assisting in loaning and give some advice and helping with the business plan”.
- “Location site is often a problem”.

- “Give more training to existing businesses”.
- “Financing and assisting with business plan”.
- “Financing of small business”.
- “Advice on how to run the business”.
- “Support financially and help with information and advertising”.

In the last open-ended question respondents were asked to provide the difficulties businesses persons faced. The most important comments were the following:

- “Loaning money”.
- “Customers not paying in time”.
- “Taking responsibility i.e. control which led either to a success or failure”.
- “Managing the business”.
- “Not having a place of my own to operate”.
- “Commitment and dedication to the business”.
- “Long operating hours stress me a lot”.

### **CONCLUSIONS AND RECOMMENDATIONS**

It can be concluded that the businesses in this residential area face a number of problems. Most of these businesses struggle in terms of their financial situation, monthly turnover and thus profit. These businesses are not registered and as such most of them do not keep business records. Only one of the 11 respondents that attempted to get a loan was successful in obtaining it, mainly due to not having collateral, not keeping records or the business not being profitable enough to repay the loan.

The majority of the owners of these businesses had school education of between grade 7 and 12, but only a few had a background about business. Previous experience and training was mentioned by the respondents to be useful in starting and running a business. Training (4 respondents) and mentoring (one respondent) was the only support these respondents had received. Training and support to survive in the long run is thus lacking according to respondents in this residential area.

Nearly none of the businesses advertise their products. Some of these businesses do suffer misfortunes in terms of theft or loss due to bad debt that makes it difficult to cope. Most of the respondents use their personal accounts as personal and business account.

To conclude, it can be said that good management practices and business related aspects are a prerequisite for running a successful business. However, the owners of these micro businesses need to be assisted in several ways.

From the data gathered, the following recommendations can be made:

- Training of the owners and their assistants should be a high priority. The content of training programs should include basic general management (Planning, organizing, leading and controlling, decision-making, coordination, delegation, communication, leadership and motivation), marketing, credit management, customer relations and record keeping.

- Training should be done and afforded in the following ways. Basic training could be done by letting students practice their skills to do basic training of the respondents. A business person from a large business could act as temporary mentor to assist in facilitating meetings of business owners and in improving their awareness and basic knowledge of management. Training institutions and government agencies could also assist in organizing, funding and formally offer training workshops.
- Support, mentoring or advice should be available to the owners of the micro businesses to increase turnover and profitability of their businesses. One way of assistance could be the formation of a type of chamber of business or support committee that could meet monthly and discuss mutual challenges, provide basic management knowledge and suggest action steps.
- Access to financial services should be enhanced. These services could include assistance by banks with managing their accounts, personal and business budgeting and improvement of the chances of funding and the effective and productive use of potential funding. Having a link between small businesses and big businesses could also enhance assistance in terms of financing or loan applications.
- Suppliers to micro businesses should also provide some assistance. Suppliers could also be involved in training the owners of these micro businesses in good credit management, pricing and ways to promote their merchandise. In this way the trust in micro businesses can be built to improve relationships between new and existing small businesses and suppliers.

# **CHALLENGES FOR SMALL BUSINESS ENTREPRENEURS: A STUDY IN THE WAIKATO REGION OF NEW ZEALAND**

**Sukh Deo**  
**Senior Lecturer**  
**Faculty of Business & Technology**  
**Waikato Institute of Technology (Wintec)**  
**Hamilton, New Zealand**

## **Abstract**

Small Business Entrepreneurs (SBEs) today face many new challenges in their entrepreneurial efforts with in New Zealand as well as internationally. They often possess the experience of some form of craft or trade training. But generally they are very poorly trained to manage a business. SBEs rarely undergo any formal management training and/or business education. It is also true that today they face an increasing number of challenges in their entrepreneurial efforts than their counterparts two decades ago. In the new economic climate in New Zealand and globally, particular attention needs to be focused on SBEs to ensure that they acquire and use appropriate managerial skills that are needed for small business practice. This attention is needed to minimise the risks of failure in their entrepreneurial ventures. This will prevent SBE's from the unwanted traumatic impacts of business failures on their families and the communities in which they exist. This study is an attempt to identify and examine some of the key challenges faced by the entrepreneurs involved in small businesses in the Waikato region of New Zealand. The findings from this study are expected to be used for a further research that will advise policy decisions, assist in the review of innovation and entrepreneurship management training programmes, and assist in the quality of SME advisory and mentoring services provided in the Waikato region and elsewhere in New Zealand.

## **Introduction**

The major economic reforms initiated by the Labour government during the mid 1980's have seen a major liberalisation and transformation of the New Zealand economy during the last two decades. In order to enhance the utilisation of available economic resources, minimise costs and wastage, manage the economy more efficiently and generate a new level of prosperity , besides other initiatives, state owned departments and organisations were restructured, split up and corporatised or privatised , the NZ dollar was allowed to float in the foreign exchange market and tariffs were eliminated or reduced . There is little doubt that New Zealand is currently one of the most open and deregulated economies in the world. It is also true that many of the larger corporations operating in New Zealand are owned and controlled from overseas. Change and transformation has remained as a key feature of the NZ economy ever since the reforms started. In more recent years there has been a growing realisation to transform away from relying a lot on agricultural outputs toward more dependence on new and knowledge-based businesses. The processes involved in bringing about such a large scale transformation of the economy over the last two decades have changed the game significantly for the small firms and the SBEs. Starting

up and conducting business today is a much more complex and competitive undertaking than it was two decades ago. On the other hand, the present policies for the management and development of the economy and transforming it into a knowledge-based economy require a major contribution from the country's small businesses and, in particular, the innovative and entrepreneurial abilities of the SBEs. The present government realises the important role the SBEs have in the economic development process and it is taking new policy initiatives with more resources to encourage innovation and entrepreneurship. In this context a study to identify some of the key challenges for the SBEs is timely and meaningful.

### **Defining an entrepreneur**

There is no globally recognised, single definition of an entrepreneur. Also any attempt to define it is not a clear-cut task. This single definition problem is also true for a small business entrepreneur (SBE). One key reason for this definition problem is the fact that no two entrepreneurs, big or small, are the same. Some are new and some have been in business for quite some time- in this study one SBE has been in business for only six months in contrast to another one who has been an owner manager for last thirty years. Some started from next to nothing while some had sufficient wealth for a start-up. Some entrepreneurs are old and some are young. Some males and some females. Also entrepreneurs belong to a minority group in the general population of any nation.

The word *entrepreneur* is derived from the French word *entreprendre*, meaning "to undertake." French word 'entre' means *between* and 'prendre' is a verb that means *to take*. This suggests that the word *entrepreneur* was just another term used for a merchant who acted as a go-between or a middleman between different agents or groups involved in trade. French economist Richard Cantillon (1680-1734) is known to be one of the first to have used the term *entrepreneur* and related it to those who carried the risk in the economy (Bill Bolton and John Thompson (2004; 14)). It is highly possible that Cantillon used the term to refer to someone who took the risk between the buyer and the supplier. The French verb 'entreprendre' is used in relation to undertaking a venture or even in relation to a new business start up. Thus the word *entreprendre* in French is very closely related to the word *entrepreneur* in English. Today the word *entrepreneur* is commonly used in French, as well as in English in a very wide context to refer to people doing different things in different markets.

A literature search for a suitable definition of *an entrepreneur* indicates that it is somewhat easier to explain the *what* of an entrepreneur. But it is difficult to accurately pinpoint *who* is an entrepreneur. A number of definitions are indicated in the literature. According to Robert Hisrich and Michael Peters (2002; 10) -, "To an economist, an entrepreneur is one who brings resources, labour, materials and other assets into combinations that makes their value greater than before, and also one who introduces changes, innovations, and a new order. To a psychologist, such a person is typically driven by certain forces-the need to obtain or attain something, to experiment, to accomplish, or perhaps to escape the authority of others. To one businessman, an entrepreneur appears as a threat, an aggressive competitor, whereas to another businessman the same entrepreneur may be an ally, a source of supply, a customer, or someone who creates wealth for others, as well as finds better ways to utilise resources, reduce waste, and produce jobs others are glad to get"(Hisrich & Peters, 2002).

Each profession views an entrepreneur from its own perspective. However they do have some common themes such as risk taking, organising, creating or doing something new or a little different and wealth. Also a single definition will be restrictive because entrepreneurs are found in all professions and each profession has its own perception of this human individual who seems to be quite different from most in the society.

The definition of an entrepreneur as - “*A person who habitually creates and innovates to build something of recognised value around perceived opportunities*” – as drawn up by Bill Bolton and John Thompson (2004; 16) is considered useful for the purposes of this study. It is considered appropriate because this definition captures the orientation, motivation and personality of an entrepreneur and provides useful guidance in this study in problem definition, sample selection and interpretation of results. Hence for the purpose of this research, an entrepreneur is a person who recognises a gap or an opportunity in the market in his/her own area of interest and passion; seizes and converts the opportunity into a workable and marketable idea; uses effort, time, money and skills to add value to the idea; takes risks to implement the idea generally in a competitive marketplace; and endeavours to obtain the rewards for taking risk and use of resources.

### **Why Small Business Entrepreneurs (SBEs)?**

Firstly, for the last eighteen years the author’s passion, professional experience and research interest have continually been in the area of small to medium size firms operating in New Zealand and overseas. During this period the author has provided mentoring and advisory services to more than eighty SBEs in New Zealand and overseas. Over the last five years interest has increased substantially in the area of innovation and entrepreneurship management especially in relation to the SBEs.

Anecdotal evidence suggests that many in the society have quite contrasting perceptions of managers in a large public sector organisations and corporation when compared with the perceptions held for the SBEs. The former are generally perceived to be tertiary qualified professionals who spend a significant proportion of their work time in attending meetings, develop and maintain bureaucratic systems and processes, network, promote the organisations image and public relations, delegate most of their work to others, generally remain far removed from the actual customers and are generally concerned with their own areas of work.

In contrast, the small firm owner/managers are generally perceived to be poorly qualified and trained in business management, spend very little or no time in formal boardroom meetings, use minimal bureaucratic structures and processes in their ventures, spend little time in PR and networking, work with their employees as a member of a team to complete clearly specified jobs and orders, and keep close to the customers. Most of the SBEs carry the burden of the business in their heads all the time instead of just a little chunk of it.

There is no doubt that large corporations and organisations will continue to survive and grow in the market as they continue to obtain and use resources to : achieve economies of scale in production, purchasing, distribution and R&D; conduct business internationally ; recruit , train and develop skilled labour force; offer attractive pay packs to their professionally trained

managers ; do long term planning; diversify and minimise risks of failure from economic downturn or other uncontrollable variables such as war, terrorism, tsunami or the spread of a disease such as Sars . However, the business realities of the SBEs are characterised by being - non-bureaucratic, flexible, and dynamic ; sensitive to changes in the demand for their products in the market; close to the customers; highly motivated as owner/managers due to their cash flow, financing and equity positions; more direct and effective in communicating with their staff , customers and other stake holders ; focussed on a single or a related line of products; mindful of the quality of the products and are able to customise products and services with little fuss to suit customer needs . One example of this last feature of a SBE is, in the sample interviewed, a small car dealer who invites customers to choose from the Internet a car to suit ones tastes and budget from a selected car yard in Japan. From the Net he pulls down all crucial details for a range of cars to choose from. After negotiating an acceptable bid price with the customer he places his bid online at the auction yard in Japan. Once a bid is successful he arranges for the shipment of the car from Japan, completes all importing and registration requirements and delivers the vehicle to the customer in less than twenty days. This SBE explained this sales technique as an innovative way of maximising- his revenues and profits, customer satisfaction and cash flows while at the same time minimising- his risks, costs on inventory, advertising, space rentals and the daily cost of keeping vehicles in a presentable form in his open air car yard.

Other motivations for this study come from a consideration of the following:

- (i) The large scale and rapid economic reforms in New Zealand since mid 1980's has created a very competitive and challenging environment for most businesses, and in particular, the SBEs. One characteristic of New Zealand businesses is that about 95 percent of those registered for tax employ less than five people and therefore, by definition, are small. One may argue that during the last two decades the economic initiatives of the successive governments have been to clear the way for the economy to become more open, with the market for goods and services operating more freely. But as far as the small firms are concerned conducting business today is a more complex undertaking than it was a decade ago.
- (ii) Currently, there is an increasing emphasis on globalisation and internationalisation in business regardless of size and type. Therefore this regional study provides a preliminary understanding of some of the impacts of globalisation on SBEs. Some 'new factors' such as -spread of Aids, wars, diseases, terrorism and the occurrence of natural disasters e.g. the recent tsunami, need to be factored into business planning, practices , decisions and training programmes to minimise the risks of failure.
- (iii) The researcher possesses several years of experience working as a small business mentor/advisor and running courses to train SBEs in the management of innovation and entrepreneurship.

Hence any research involving the SBEs falls within the author's area of passion and provides some challenge and excitement .

### **Research purpose and questions**

The main purpose of this research was to identify some of the key challenges and difficulties that small business entrepreneurs face in the Waikato region of New Zealand. A carefully designed and pilot tested questionnaire, used as an instrument , included questions that required SBEs to provide information on - their overall business situation ; cash flow and finances ; marketing and

sales; profits ; staffing and employment ; legislation and compliance ; vision and passion ; doing trade internationally ; and the key challenges and difficulties they faced today .

## **Methodology**

For the purpose of this initial study a four-page written questionnaire was administered electronically to an independently selected sample of SBEs operating in the wider Hamilton city area of the Waikato region. The sample was selected from the small businesses data base developed and managed by the Business Development Centre (BDC) located in Hamilton, the main city for the Waikato region. Data from thirty six fully completed questionnaire responses obtained from the SBEs engaged in a wide range of enterprises and industries in the region were analysed to write this report. A convenient sample of fourteen SBEs from the above sample were further interviewed at their own business locations to get a more clear understanding of the survey responses received . These on-the site interviews with the SBEs were aimed at obtaining a more in-depth understanding of the challenges they faced and to establish what could be done to improve training in innovation and entrepreneurship management.

## **Findings**

This exploratory research was completed by the middle of March 2005. The findings are based on the data collected from a sample of thirty six SBEs most of which come from the wider Hamilton city area. The findings from this study indicate some common themes and concerns- suggesting that whatever the type of business, the strategic and operational challenges faced by the SBEs are often quite similar across various industries. A summarised version of some of the findings is presented below:

- (i) With regard to the size of the business in terms of the number of staff the average number employed was 5.03. One SBE had 40 staff and when he was as excluded from the sample the average number employed dropped to 4.04. Fourteen percent of the SBEs were operating all by themselves. 44 percent of the SBEs operated with only two or fewer staff whereas 75 percent of them had five or fewer staff. This data on employment compares well with the national employment statistics for the SMEs that make up about 97 percent of all the businesses in New Zealand and employ 19 or fewer FTEs and 86 percent employ five or fewer FTEs i.e. full-time equivalent of the total number of employees and proprietors working full-time and part time in a business.<sup>1</sup>
- (ii) Each SBE was asked to give the key reasons why he/she was in that particular business. About 50 percent indicated that they expected to earn good financial returns and have an improved life style. They were in the business to - be own boss, have basic freedom, make as much money as possible, and have an enjoyable life style. Interestingly enough 70 percent of them said that they were in that particular business because they had the expertise and experience in that industry and were quite passionate about what they were doing. Nineteen percent saw a gap in a growing market and figured out that the market was underserved and /or there wasn't much competition in the market for what they

---

<sup>1</sup> (*Small Business Advisory Group's Annual Report, August 2004, p8*)

wanted to do. They also show the potential to grow reasonably quickly and trade internationally.

- (iii) SBEs were asked to list the key challenges they faced when trading internationally or in their plans to trade overseas. Although only 33 percent of the SBEs surveyed were involved in trading internationally and operating on an average about 29 percent of the business in foreign markets, majority, in fact, 86 percent indicated that trading internationally posed challenges and difficulties. They listed the key challenges they faced when trading internationally. An analysis of their responses shows that the main challenges come from the following key areas:
- (a) Finding a reliable business partner or a distributor in the country of interest. Some indicated that they could not afford the time and money to be away from their businesses to meet face to face with an overseas distributor or partner to make all business arrangements.
  - (b) Marketing and selling a product in another country is costly, difficult and with more uncertainties than selling locally. Most felt that they had to depend on an overseas agent or partner to promote and sell their products. They perceived difficulty in establishing trust and confidence in their products amongst the customers overseas. Some expressed concern at “getting ripped off” by agents involved in the international trade. Also meeting the demands of overseas customers involved plenty more resources and efforts e.g. “setting up mid-night shift work to support US customers who require response within a few hours” as one SBE pointed out.
  - (c) Risks involved in trading overseas. Some SBEs were concerned that occasionally they get an overseas customer who would place orders but fail to follow it through. Also when overseas customers do not pay the bills promptly they faced cash flow problems that itself created further problems in the daily business.
  - (d) Fluctuating exchange rates make international trading difficult for the SBEs, particularly when revenues and costs involve different currencies. The survey indicated that a very strong NZ dollar is having an adverse effect on the export incomes of the SBEs. In October 2000 the NZ Dollar was trading for around US 39 cents. On 10<sup>th</sup> March 2005 the dollar was exchanging for US 74 cents (The New Zealand Herald, 2005). This represents a 90 percent appreciation of the NZ dollar against the US dollar in the foreign exchange market. The rapidly appreciating NZ dollar is fast eroding the incomes of the SBEs who are exporting.
  - (e) Meeting shipping and customs requirements. Some had difficulties in obtaining customs/MAF clearances and suffered from a shortage of shipping availability. During an interview one SBE responded that in the foreign country “bureaucracy placed impediments and wharf companies showed scant regard and care for property and there were unnecessary delays due to lack of staff”. Hence it is

possible that trading internationally may cause quite a bit of frustration too sometimes.

- (f) Many SBEs were not familiar with the culture, ethics and business practices in a foreign country and this was another source of challenge for them
- (iv) When asked if they were comfortable with their cash flow to meet all the liabilities as they fell due, 47 percent indicated that they were very uncomfortable with their cash-flow situations to meet their liabilities. A common concern for most was that the cash flow was irregular and fluctuated a lot in the amount received or to be paid out. Those in seasonal markets had huge fluctuations in their cash flows. A general lack of working capital, not being able to pay all the bills on time, using up most of the profit to update plant and technology to keep up to speed in the market, clients not paying on time, the ongoing compliance costs and high fees for professionals were given as the key reasons for the challenge in managing the cash flows.
- (v) Sixty four percent of the SBEs were quite unhappy with all the pieces of legislation they had to follow in order to operate their business ventures. About 20% said they were very unhappy with all the rules and regulations they had to abide by in order to operate their businesses. The pieces of legislation with which most SBEs had a varying degree of familiarity were those relating to ACC, Inland Revenue Department, Winz and OSH. It became evident from the interviews that there were just too many pieces of legislation the SBEs needed to follow in the start-up process and in the daily operation and management of their businesses. Some SBEs indicated that the legislation minefield was getting bigger each year and “changing and updating is too regular and unnecessary” and “is accompanied by increased costs”. Consequently for many, the statement “wouldn’t know all the legislation we’re supposed to follow, except it’s a lot...” would hold true.
- (vi) Fifty three percent of the respondents indicated that meeting all the compliance costs was really an issue for them. Twenty eight percent felt very strongly about the compliance costs they had to meet in order to operate their ventures. A common issue for many SBEs was the fact that “it cost them a great deal of money to comply with “- OSH regulations, ACC levies, accreditation and liability insurance, health and safety requirements, and GST and taxes to remain compliant with various rules and regulations.

## **Conclusions**

Within the small business category as given for New Zealand, 75 percent in the sample employed fewer than 5 people and within this category 44 percent of the SBEs operated alone or with only one staff. This indicates that at least 50 percent of the SBEs are, in fact, operating as micro businesses and are faced with challenges from being too small in the market. Most SBEs face challenges and some of which are quite unanticipated. The areas in which they need solutions and support include – financing and management of cash flows, marketing and sales management, legislation and compliance ; maintaining a clear vision for the business; managing the adverse impacts of unexpected events happening locally and else where in the world , coping

with technological changes , especially IT ; the impact of globalisation and the need for a better management of business internationally.

### **Where to?**

The findings from this study are expected to be used for a further research that will advise policy decisions, assist in the review of innovation and entrepreneurship management training programmes, and assist in the quality of SME advisory and mentoring services provided in the Waikato region and elsewhere in New Zealand.

E-mail: S.Dhaliwal@surrey.ac.uk

### **Abstract**

Female Entrepreneurs are responsible for one third of all start-up businesses in the UK. They are vital to the economy and the future growth of the SME sector. Their dynamism and enterprise enriches the sector. Despite the positive contribution and untapped potential of women in business, the UK government has failed to support an increase in women owned businesses.

This paper is based on a project of the same name currently in progress at the University of Surrey. Training Women to Win supports initiatives relating to gender discrimination in employment. The project also fits with, and has been informed by, the DTI/Small Business Service's Strategic Framework for Women's Enterprise.

The aims of the project are to investigate whether past and current interventions available to female entrepreneurs have been effective and to ascertain whether female entrepreneurs are satisfied with the initiatives. It will further examine whether female entrepreneurs believe that these initiatives have contributed to the financial success of their businesses and assess the impact of targeted women's enterprise support programmes. It will also attempt to assess the reasons for longer start-up periods for female-owned businesses and the role of supply and demand factors as constraints in start-up finance. Finally, it aims to identify any existing discrimination and actions to combat the discrimination female entrepreneurs face when accessing enterprise support.

A postal survey will be conducted on one thousand women selected from a target audience. There will be several focus groups as well as face-to-face interviews on a limited number of the women.

The project will provide an audit of existing training and business support provision as well as detailing the impact of past and current initiatives designed to assist female entrepreneurs. It will produce key recommendations for use when supporting future initiatives and produce recommendations highlighting the possible direction of future provision.

## **1.0 Introduction**

The Training Women to Win project has received European Social Fund (ESF) funding for a period of two and a half years from 1 January 2004. Its aim is to assess the impact of targeted women's enterprise support programmes - to examine whether female entrepreneurs are satisfied with these initiatives and to test whether or not they consider that they have contributed to the financial success of their business. The project fits with the DTI/Small Business Service's Strategic Framework for Women's Enterprise (Sharing the vision: a collaborative approach to increasing female entrepreneurship, 2003) and bridges a number of gaps in current research. For example, the reasons for longer start-up periods for female owned businesses and the role of supply and demand factors as constraints in start-up finance. This will help to identify any existing discrimination female entrepreneurs face when accessing enterprise support.

The objective of the project is to identify good practice and to produce and pilot recommendations that will improve current business support and training provision for women.

The project is effectively split into three stages. The first stage used desktop research to look at enterprise initiatives currently in place. 128 UK initiatives have been identified, offering a mix of business support, incubators, mentoring and business tools. The second stage was to send a questionnaire to targeted women. The final stage was to conduct a series of interviews and focus groups in order to elicit more detailed answers and to follow up certain areas of the questionnaire.

106 questionnaires were completed (a 10% response rate) and the main findings were:

- Women tend to start and run businesses mainly in their late 20s and to mid 40s.
- The main challenges faced by the women were a lack of confidence and financial pressures.
- Reasons for starting a business ranged from finance, independence, flexibility, childcare friendly and lifestyle choice. Others started up following redundancy. A

significant number of women were eager to develop an idea they firmly believed in.

- The most important source of start up capital was personal savings, followed by family and then banks and/or financial institutions.
- The most popular sectors women started businesses in were coaching/mentoring, business services, sales/marketing/PR, media & publishing and education/training. A significant number were in IT/computing.
- A significant number of respondents hold a degree or postgraduate qualification.
- A significant proportion of respondents have children of an age where childcare is an important issue.
- The majority of respondents identified themselves as white British, with only 13 from ethnic minorities.

## **2.0 Female Entrepreneurship**

Early studies on female entrepreneurs concentrated on descriptive accounts of the characteristics and motivations of women in business and their experiences of business ownership, particularly at start up. More sophisticated studies include themes on gender differences regarding management of the business, particularly with regard to finance, business networks and performance (Carter et al 2001).

Female Entrepreneurs are responsible for one third of all start-up businesses in the UK. An estimated 130 000 out of 380 919 start-ups were run by women in 2001. Around 26% of women are self employed in the UK (Carter and Anderson 2001).

The study of female entrepreneurship is gaining momentum globally and many reasons are posed as barriers to it such as in the EU, Stephenson (2002) identified several barriers including a lack of sufficient day care places, societal norms which relegate the primary responsibility for child and domestic care to women. Other barriers identified were access to capital, networks, social support. There was also a lack of sex desegregated data (Stephenson 2002) which hindered analysis. However, consistently across countries evidence suggests that amongst other differences women are less likely to be self employed than men, more likely to start smaller businesses, less likely to have growth firms, less likely to have employees, start their businesses with lower capitalization, finance their firms differently and make greater use of personal rather than professional or business networks.

Women are becoming increasingly involved in entrepreneurship across Europe but face specific problems in setting up and running businesses which are different from those faced by male business owners that are either directly or indirectly related to gender (CEEDR 2000). Women are half of the population of Europe, but make up less than one quarter of the businesses assisted by general business support organisations. Only a minority of general business support organisations have some form of special services or policies aimed at women entrepreneurs.

The economic importance of women's business ownership is now internationally recognised and the numbers of women starting businesses in the UK are increasing

relative to their male counterparts. This is undermined by indications that while access to finance continues to be a major problem, of new concern is that women's business development is being hindered by poor engagement with new technology (Carter *et al* 2002). There is further evidence to support this regarding the Irish economy (Henry and Kennedy 2003), where setting up new economy companies in high technology, professional services and construction is virtually untapped. Marlow (1997; 2002) has also noted the challenges facing female entrepreneurs.

## **2.1 Unequal entrepreneurs?**

It appears that, in general, the UK government has failed to support an increase in women owned businesses.

In general studies have shown that women have less access to start up capital; less management experience; are less welcome in the informal business networks that often provide vital support for small firms. (The Industrial Society 2001).

They have difficulties accessing finance because, for example, guarantees required for external financing are often beyond the scope of personal assets and credit track records. In addition, women face sexual stereotyping from banks. There are informal financial networks, which they find difficult to penetrate. Women rely heavily on personal savings, an estimated 80-99% of initial capitalisation compared to that of 30-59% for men (The Industrial Society 2001).

Ethnic Minority Entrepreneurs face the double discrimination of both race and gender. They face cultural and business barriers as well as issues around social marginalisation. Asian women are a growing group within the SME community and yet there is a paucity of qualitative knowledge regarding this heterogeneous group where education, caste, religion, status of husband and so on are important factors. Asian men tended to benefit from exclusiveness where ethnic solidarity created accessible capital, labour and markets and exclusion forced them to seek economic alternatives. This is not so for the women. Mirchandani (1999) demands the integration of issues of race and ethnicity into studies of self-employment by women

### **3.0 Methodology**

#### **First Stage:**

To conduct desktop research looking at all the initiatives in place currently. Desktop investigation identified 128 UK based initiatives offering business support, incubators, mentoring and business tools.

#### **Second Stage:**

To send a questionnaire to targeted women. Questions revolved around personal data in order to build a profile of the women, the nature of the business in terms of sector, location, number of employees and length of business. The other main areas were the business entry decision and whether there was any awareness or support from agencies. The women were also asked to rate their satisfaction if these organisations had been used.

Finance was another important area. It was important to ask the women how they financed the start-up of their businesses, the amounts required and any advice or training received in this area. They were asked if they submitted a business plan and if they received any help with the writing of this document.

The questionnaire was posted on-line, in collaboration with *Everywoman* Ltd., on the project website. Links were established from other sites such as Everywoman, Business Link Surrey and brought to the attention of women on the University's own database. In total about 1000 women were targeted.

#### **Final Stage:**

To conduct interviews and focus groups. A series of interviews and focus groups were conducted with women in business, in order to elicit more detailed answers and to follow up some of the questions presented in the questionnaire.

#### **4.0 Analysis**

The detail of our findings is presented in Section 4 of this report and in the appendices. This section (Section 3) highlights the major points that have come out of the research undertaken and summarises the conclusions we have drawn.

Our research shows that most women tend to start a business between their late twenties and mid forties, with a significant number either starting or continuing their business after the age of 46. Most of these cited independence, flexibility and/or lifestyle as being the main motivators for their career decision. Childcare was less of an issue, although still a factor. Significant also, was the fact that 66% of this group hold a degree, or some kind of postgraduate qualification. A number of conclusions could be drawn from this. The stereotypical assumption is that women pursue self-employment to obviate the need for childcare. In fact, in many ways the opposite can be true. To devote the time necessary for starting and building a new business, childcare provision continues to be a necessity and, indeed, may need to be extended in many instances. This was borne out by the number of respondents who found the number of hours they had to spend on their business activities to be problematic (although, obviously, this may not be solely a childcare issue). In any case, one of the conclusions to be drawn is that childcare is an important issue (59% of respondents have children of dependant age) and one that must be taken into consideration when designing the mode, timing, and organisation of training.

Another obvious conclusion is that women delay starting a business until they have gained higher educational qualifications (or, in some instances, this acts as a trigger for their decision). Women in this position have already demonstrated a willingness to study beyond the statutory level and an acceptance and commitment to the value of education and training. From this point of view, they are more open to the idea of continuing professional development and thus more accessible to training providers.

Starting a business at a later stage of life can also be shown to impact on the way in which the business is established in terms of finance. Our research shows that personal savings account for the vast majority of start-up capital – this has been true for 86% of respondents. Family help is a factor too, but to a far lesser degree. At the other end of the scale, only 4% of respondents opted for government loans. There are

important lessons here for the government agencies. Responses indicated that women were not reluctant to ask for government assistance, but rather that they found the myriad of agencies and apparent support to be confusing, and systems to be bureaucratic. Not all experiences were negative, but many women find that government information presents as an impenetrable mass and agencies are too focused on meeting their own targets to provide appropriate help. Having said that, there were a number of advocates for the basic levels of support provided by agencies. There does, however, seem to be a lack of support for taking businesses forward into the growth and maintenance phases of the business cycle. In other words, although sometimes confusing, start-up support does seem to be available for most women if they have the tenacity to seek it out. However, guidance and support for the next level of development is not apparent.

The top six challenges faced by our respondents were:

- Lack of confidence
- Financial issues
- Hours worked
- Resource availability
- Lack of support
- Bureaucracy and legislation

More stereotypical issues like childcare and discrimination, although cited as issues, were low down on the list. As indicated elsewhere in specific responses, the care of dependants is a significant consideration. Our interpretation of the apparent inconsistency here is that respondents were considering specific challenges in relation to starting and owning a business. Childcare is a generic problem – a factor whether a woman is employed or self-employed and therefore not specific to the issue of self-employment. It is, however, a vital consideration when designing training and support for female entrepreneurs and must inform both the content and the delivery mode of any pilot training programme arising from this research.

It is perhaps surprising that discrimination didn't figure higher in the list. This could be taken as a positive sign and, in some ways, is indeed encouraging. However, there

are two issues here. Firstly, the vast majority of our respondents run businesses in the following sectors:

- Coaching/mentoring
- Business services
- Sales/marketing/PR
- Media & publishing
- Education/training

Far fewer come from "high-tech" and other traditionally "male sectors." It may be expected then that less discrimination would be encountered in these "allowable" female pursuits.

The second issue returns to the question of the generic responses given by respondents. They tended to define challenges that they encountered, on an ongoing basis as a result of being female. This can actually mask some of the specifics. This research and other studies that have been carried out, reveal that women face problems in accessing some of the more traditional forms of support. In particular, women can face a lack of credibility with mainstream lending institutions and can suffer from a lack of access to traditionally male business networks.

Of the top six challenges, there are two – lack of confidence and hours worked – that can perhaps be regarded as symptomatic of the problems faced by female entrepreneurs. Financial issues and lack of support can also be a gender specific to a degree, but are more likely to be faced by male counterparts (albeit, perhaps, for different reasons). Most of these issues were highlighted in some way by our respondents when we asked them what type of training they thought would benefit them on an individual level and that would take their business forward. The training highlighted was:

- Boosting confidence
- Communication & public speaking
- Motivation
- Networking
- Marketing

- Leadership skills
- Financial advice

The pilot training programme arising from this research will cover all of the above areas and will be delivered in a way that is sympathetic to the needs of our target group in terms of mode, timing and organisation.

#### **4.1 Main Emerging Themes.**

##### **Value of Business Support Provision**

On the whole the women felt they had,

*Made useful contacts at network events.*

The services offered proved to be a good source of information and a sensible starting point,

*They helped us to focus on what needed to be done to get started and to make a logical plan.*

*I'd never run a business before and wanted to find out about regulation, make sure that I'm marketing my work properly and benchmarking my business against others.*

Specific training and courses were also praised,

*Training provided by Business Link is very informative.*

*The one to one meetings with Business Link professionals were extremely useful in having an independent third person look at your business.*

*The training has been essential to start networking and find opportunities in the market. The support has been motivating in terms of finding objectives, strategies and action points.*

However, there was some dissatisfaction with the provision. Many of the women felt that their requirements were not met,

*Business link did not meet my requirements and more importantly were bad in following up communications.*

Many were not aware that these services existed,

*I did not know they were available.*

Many women found that these organisations were a good starting point to open up networks and to give advice and support but were not as useful after this stage,

*Support was great at the initial stage, when I was going to set up a business and had very little idea how to do it. Now that the business is mature and successful I can't find much help from the above agencies in developing it further.*

The main criticisms were that the help offered was theoretical rather than practical, information was given, but in many cases these facts were already known to the women so there was no added value.

*Business Link was theoretical not practical.*

*Business Link free workshops were very good giving lots of information, but the networking element never seems to work at all.*

*Business Link only told me in a report what I already knew.*

Some cited specific cases when they were disappointed,

*I joined a Business Mentoring course which was dreadful - not pitched properly and did not provide any information I didn't know myself as it was focused on marketing/sales, which is my business sector anyway.*

*Lack of on going interest or support in my venture.*

*Lack of understanding of my type of business on their part.*

*Not enough networking time, a long presentation not relevant to the size of my company*

#### **4.2 Gender Specific Issues**

Many did not find gender an issue,

*No - I don't particularly see myself as different just because I'm female, and I haven't experienced any gender-related issues in growing my business.*

Some felt it was an advantage,

*Age and sex can have a bearing, but often they are advantages!  
Mine is a woman-orientated business - they are my customers!*

A lack of confidence was mentioned,

*If everyone worked on building their confidence and knowledge about what they want to do - most obstacles simply disappear.*

Women find difficulty in juggling their personal and professional lives and generally feel that they lack support. They also have a harder time convincing others of their ability and have to break down this prejudice.

Many of the women felt,

*There needs to be more women mentors. Most of the Business Link mentors are men who have held senior positions in large companies and can't appreciate that running a small business from home can be equally as rewarding as being employed in a senior position within a blue chip company.*

Others felt it was a two way problem,

*I believe there are issues concerning the perception of businesswomen e.g. feeling out of place in the business world, lack of confidence, feeling intimidated, not wanting to appear aggressive or pushy.*

One of the main concerns was juggling their various roles,

*Sometimes the hint that I cannot really be a good wife or mother spending so much time running the business, meeting clients.*

*Trying to juggle childcare, work & home life.*

*Childcare childcare childcare (it costs too much and there aren't enough places). For self-employed people who don't have a regular income, we still have to commit to costly childcare or lose a place.*

*The males network on the golf course, I hate golf! Having to run my business and my household - all the house issues fall to me, including management of childcare. But apart from that men and women face the same problems I believe. Many perceived 'female problems' are more likely to be confidence related in my opinion.*

*I find the support of other women invaluable. Business link seemed to be primarily men, would like to see more women available to support women in business.*

#### **4.3 Business Support - Helpful?**

*They do not offer expertise in all areas and are normally run by people who have never been self-employed.*

*I don't seem to fit into their criteria.*

*Not easy to find out about.*

*I received comprehensive help (grants, training, business advice, networking opportunities, references) with starting up my business from Business Link and Enterprise Agency without even knowing what help was available. Very important for new businesses.*

*The information provided is useful and sound, but a more interactive learning environment would be more helpful and more practical.*

*Too much red tape as to how and where they are able to help me.*

*Either not targeted at my needs, not communicated to me or inaccessible.*

*Contacted business link and felt that they were not clear about what they could/could not offer.*

*Not easy to see how support agencies can help - lack of trained staff, too focused on meeting own targets rather than supporting those outside the agency.*

*Sometimes too woolly and non-specific to be of real practical benefit.*

*What most people don't realise is the amount of support that is there if people are prepared to find out about it.*

*They are very helpful in giving grants and helps to start your business. But there's a jump between starting and maintaining in the market and that's when continuity and stability of the business is a problem.*

*There is a lot out there but it is all very confusing/bewildering and feels as if it will take too much time to access.*

*I would like to feel there was ongoing support - one off meetings or training's are fine, but lack continuity.*

*Information available is often in long-winded brochures and sometimes confusing. Often get passed around organisations trying to find the right individual to speak to.*

*Give basic assistance. The best support I've had is from people doing it successfully.*

*It's a question of narrowing down what is helpful for your own situation.*

*They are too prescriptive and too short... business advice and support is a long term process*

*Don't offer much help to anyone who isn't 'disadvantaged'.*

*Lots of advice from all difference sources - but each business is individual and encounters different problems/issues. Forming a relationship with the advice source is hard as you are just another number walking through their door.*

There were many comments about the “one size fits all” aspect of business support provision, in particular with regard to the Government agencies.

*Often a one size fits all. Does not recognise individuality of needs/ability/motivation/knowledge and experience. Often advisors not qualified or capable. They do not inspire confidence and offer very limited ideas. Often very risk averse and discouraging.*

*Most of the advice is generic - overall good but not necessarily when you actually need it!*

Through both our research and the questionnaire, it was found that training offered by these organisations tends to be at times that are not convenient for our respondents, especially for those women with dependents.

*I would prefer to see more daytime events. It's near impossible to attend breakfast and evening events.*

## **5.0 Recommendations**

Childcare and flexible working arrangements are significant issues when planning training. Training providers should, therefore, consider mode, delivery and training when designing a training programme. Our research indicates that relatively short (circa 2 hours) and informative sessions in the middle of the day are the most suitable for this target audience.

Much of the business support currently available is not as effective as it could be. Our research shows that many respondents, although largely aware that agencies exist, are often unaware of the services that they provide and/or how to access appropriate support. It seems that the profile of agencies needs to be raised, there needs to be better signposting or available services and better accessibility for those services offered.

Business support is acknowledged by some to be very good at the initial stages. However, further into the business cycle, this support seems to tail off or, if it does not, then there is less awareness of the help available. The specific recommendation here is that agencies should consider second and subsequent stage provision and ensure awareness and accessibility for this target market.

A major criticism of the government agencies is that the help offered is theoretical rather than practical and that it simply reiterates what was already known. There is a perception, therefore, of very little added value. The recommendation here is that there should be more female entrepreneurial representation amongst business mentors and advisors, as well as more practical examples of female experiences in starting and running a business.

Leading on from this, there is a view that current advice reflected mainstream values and appears conservative and risk adverse. Having more representation from female entrepreneurs would also address this issue.

### **ABSTRACT**

The resource based view of the firm would seem to suggest that for SMEs the greater their internal resource capacity and the greater the level of external resources available in the environment the less likely the SME will be to form strategic alliances. In this research we explore these relationships and suggest that it is a complex interaction between SME resources, resource needs and environmental munificence that determines the likelihood that an SME will form an alliance. In specific we view the interaction between firm size and the level of national R&D intensity in determining the likelihood that an SME will form an R&D alliance. The study hypotheses are tested utilizing over 2000 completed surveys from SMEs in eight countries.

### **INTRODUCTION**

Resource Based Theory (RBT) and Transaction Cost Theory (TCE) both specify that firms with resource deficits reach into the external environment to obtain needed resources (Barringer and Harrison, 2000). The tenets of both theories suggest that firms will only seek to obtain needed resources through alliances with other firms when the resources are not available in the markets. The underlying assumption is that the more

munificent the environment the less need there is for alliance relationships that carry an inherent potential for opportunistic behavior. Unfortunately, despite the intuitive appeal of this assumption regarding the motivation for alliance formation, there is a great deal of inconsistency in the empirical results of studies seeking to confirm the relationship between environmental munificence and the rate of alliance formation (Park, Mezas, and Song, 2004).

In this research, utilizing a survey of 2,054 SMEs from eight countries, we explore the relationship between national R&D intensity and R&D alliance formation by SMEs. We hypothesize, consistent with RBT and TCE assumptions, that in general the greater the level of R&D intensity, considered as a form of environmental munificence, in a given market the less likely firms will be to form R&D alliances. We suggest that this relationship does not hold true for all SMEs. We hypothesize that SME size moderates the relationship between environmental munificence and R&D alliance formation such that larger SMEs are more likely to form R&D alliances the greater the level of R&D intensity. In exploring these results we suggest that a careful consideration of the types of resources needed by SMEs based on their size as well as the level of resources held by an SME explain the seeming contradictions in RBT prescriptions regarding alliance formation.

To the best of our knowledge no one has previously tested the interaction between SME size, as reflective of resource types and levels, and R&D intensity, reflective of environmental munificence. Park, Chen and Gallagher (2002) suggest that there is in fact a surprising lack of research on how firm resources interact with environmental conditions to determine strategic choices. The findings of the present research have implications for both theory and practice. The findings strongly support the tenets of RBT and suggest possible explanations for the inconsistency in the findings of past empirical research. Specifically, the results indicate that researchers, seeking to understand why SMEs form alliances, should go beyond considering firm and environmental resources separately to consider the complex interaction between both the levels and types of resources needed by SMEs and those available in the environment. Study findings also have implications for managers and policy makers. Given the existing structure of national R&D investments it is important for policy makers to understand the interaction between SME resource needs and those that are available in the environment and the implications that this has for when, where and how to support the formation of collaborative relationships between firms.

## THEORETICAL FOUNDATIONS

Although past research has suggested strong links between firm size and organizational behavior, studies into the relationship between firm size and the rate of R&D alliance formation has produced mixed results (Pisano, 1990; Sakakibara, 2002). The RBT view of the firm suggests two reasons that the rate of R&D alliance formation may be greater for larger SMEs than for smaller SMEs. First, larger SMEs are assumed to in general have greater levels of internal resources making them more attractive as potential alliance partners than smaller SMEs (Park, Mezas and Song, 2004). Smaller

SMEs are typically younger in age with less to offer potential partners (Stuart, 2000). Second, larger firms while typically having greater capacities and relationships that need exploitation also need to focus on developing and discovering new products and markets (Park, Mezas and Song, 2004; Singh, 1995). This dual need results in a greater rate of alliance formation by larger SMEs. RBT rational as well as past research findings suggest the following hypothesis:

H1: The likelihood of R&D alliance formation will be higher for larger SMEs than for smaller SMEs.

Research into the role of the institutional environment in organizational behavior indicates that institutional factors have an important role in determining the strategies that firms pursue (Barney, Wright and Ketchen, 2001). Park, Chen and Gallagher (2002) argue that the more benevolent a market is, in terms of key resources, the less likely it will be that firms will seek to form alliances. RBT reasoning suggests that in general if resources are available in the markets firms will not seek out resources through alliances due to the inherent risk of opportunism in such relationships. Although this reasoning makes intuitive sense research findings suggest that the relationship between environmental munificence and alliance formation may in fact be the reverse when technology-intensive environments are considered. In technologically munificent environments, while there may be greater resources available to the SME, there are also greater demands on continued innovation (Harrison, Hitt, Hoskisson and Ireland, 2001). Kelly and Rice (2002) argue that rapid technological obsolescence and the need for greater breadth of technologies make it difficult for a single firm to stay competitive. These findings suggest two opposing hypotheses regarding R&D alliance formation and environmental resource munificence—in specific the level of R&D intensity in the institutional environment of the SME.

H2a: The likelihood of R&D alliance formation will be higher the higher the level of national R&D intensity.

H2b: The likelihood of R&D alliance formation will be lower the higher the level of national R&D intensity.

Taken collectively the two resource-based views of alliance formation presented in support of the first two hypotheses would seem to indicate a possible moderating effect between SME size and environmental munificence—and specifically in this research R&D intensity. As previously noted RBT reasoning and past research suggest competing hypothesis regarding the relationship between alliance formation and environmental munificence. Taking into consideration the role of SME size, as reflective of resource capabilities and needs, would seem to provide a solution to these contradictory assumptions. The likelihood of R&D alliance formation by larger SMEs, typically with a greater need for involvement in both exploratory and exploitative alliances (Park, Chen and Gallagher, 2002), would tend to be greater the higher the level of R&D intensity (as reflective of more technologically-intensive environments). The likelihood of R&D alliance formation by smaller SMEs who are typically focused primarily on exploitative alliances rather than exploratory alliances (Park, Chen and Gallagher, 2002) would tend

not to be impacted by the level of R&D intensity. This reasoning leads to the following hypothesis:

H3: SME size will moderate the relationship between the level of national R&D intensity and R&D alliance formation. The rate of R&D alliance formation will be higher for larger SMEs the higher the level of national R&D intensity. The rate of R&D alliance formation for smaller SMEs will not be impacted by the level of national R&D intensity.

## METHODOLOGY

The study hypotheses were tested utilizing a survey of 2,054 SMEs, both those with R&D alliances and those that have never formed R&D alliances, in Australia, Sweden, Mexico, Norway, Finland, Indonesia, Greece and the Netherlands. Additionally, a wide range of macro economic data was collected in order to test our assumptions and to control for a wide range of factors that might potentially impact R&D alliance formation. The survey process was rigorously designed and the resulting data unique in both breadth and depth. Hierarchical logistic regression analysis was utilized.

We defined an SME based on size with firms selected at random for the survey ranging in size from 6 to 500 employees. Only independently owned SMEs manufacturing firms that were managed by either the original founder or a general manager with an equity position in the company were included in the final analysis. A key informant designed was used and while every attempt was made to make the survey process equivalent in each country, the methodologies did vary somewhat based on differing constraints. Survey items that were originally developed in English were back translated with care and the surveys either delivered to the randomly selected firms by mail or hand delivery. Both empirical tests and random surveys of non respondents suggested no significant differences between the responding and non-responding SMEs.

### Study Measures

All of the measures utilized, both objective and perceptual, were drawn from existing research. Firm size was assessed based on the total number of employees as reported by the respondent with the natural log of size utilized in the analysis. National R&D intensity was measured by the ratio of R&D expenditures to the real GDP of the country (in 1990 U.S. dollars) and based on a five-year average ending with the year of data collection in each specific country in the study. Data for this measure was drawn from the United Nations Department of Economic and Social Affairs (UNESCO) Statistical Yearbook (2002). The dependent measure for the study, R&D alliance formation, was based on a direct response by the SME as to whether or not the SME currently held or previously held an R&D alliance (either process or product based).

In order to as best possible isolate the impact of SME size and R&D intensity on the likelihood of R&D alliance formation a wide range of control variables was included in the study. These control variables included the age and gender of the respondent, perceptions regarding the attractiveness and uncertainty of the SMEs market, beliefs in

the necessity for alliances, the financial strength and risk propensity of the SME, the industry—characterized by the level of technology—of the SME and the legal system of the SMEs home country. Each of these variables has been either shown or hypothesized in prior research to have a potential impact on strategic choice to form alliances.

The statistical model was tested using hierarchical logistic regression. In the base model all control variables were entered. The contrast group for the industry group was “low technology” and the contrast group for the legal system was “French Civil Law” countries.

## RESULTS

Table 1 provides the study demographics. A total of 2,054 SMEs were utilized in the study out of 7,078 SMEs surveyed (29% overall response rate). Of the SMEs responding 583 held an R&D alliance.

---

Place Table 1 about Here

---

The results of the logistic regression analysis are provided in Table 2. Hypothesis H1 predicted, supported by RBT reasoning, that the likelihood of R&D alliance formation would be greater for larger SMEs than for smaller SMEs. The results of the analysis support this assumption with firm size positively related to the likelihood of R&D alliance formation. Hypotheses H2a and H2b provided competing predictions regarding the relationship between R&D intensity and alliance formation. The results tend to support H2a suggesting that the greater R&D intensity the greater the likelihood of R&D alliance formation, but consistent with the predictions of H3 this does not hold true across all SMEs. There is a significant interaction between SME size and R&D intensity in determining the strategic choice to form R&D alliances.

---

Place Table 2 about Here

---

In order to understand the moderating role of firm size on the relationship between R&D intensity and R&D alliance formation a graph of the relationship was prepared and is presented in Figure 1. The graphic analysis suggests, consisted with the predictions of H3 that the likelihood of alliance formation would increase for larger SMEs as the level of R&D intensity increases. Also as predicted it can be seen that increases in R&D intensity of little impact on alliance formation for smaller SMEs.

---

Place Figure 1 about Here

---

The control variables provide some interesting results as well. The findings suggest that the greater the perceived growth in the market the lower the likelihood of alliance formation while perceived uncertainty is associated with a greater likelihood of alliance formation. Both a belief in the necessity for alliances as well as higher levels of exporting provides a greater likelihood of alliance formation. There are also differences seen across both industries, as categorized by the level of technological development, and legal systems in the likelihood of R&D alliance formation.

## DISCUSSION AND CONCLUSIONS

RBT reasoning seems to suggest that in general the greater the level of resources available to an SME internally the less likely the firm is to seek to form alliances but that this tendency is often offset by the attractiveness of larger SMEs as alliance partners due to their greater resource capacity. The fact that larger SMEs often seek out alliance relationships is also in part explained by the need of larger SMEs both to exploit existing resources and to focus on discovering and developing new products and markets (Park, Chen and Gallagher, 2002). In a similar fashion RBT reasoning suggests that the greater the level of resources available in the SME's environment (environmental munificence) the less likely the SME will be to form alliances. It is suggested in this research that this may not be the case across all sizes of SMEs. In specific, one type of environmental munificence, R&D intensity, is suggested as being reflective of an environment in which technological innovation and the need for technological breadth is essential. In this type of environment, even though technological resources are in greater supply, larger SMEs will be more likely to form R&D alliances in order to acquire increased innovation capabilities. Smaller SMEs, due to their lower resource capacities, are typically more focused on exploiting existing capabilities and in this research are found not to be more likely to form alliances when R&D intensity is high.

The results of this analysis extend our understandings of the resource based view of the firm by suggesting that it may not be either the internal capacity of the SME or the environmental resource base that determines the likelihood for R&D alliance formation but rather an interaction of the two. The results of this study have important implications for policy makers as well. It would appear that the need to form R&D alliances by SMEs is dictated not only by the availability or lack of availability of technological resources in the environment but also the by the resource capacity of the SME and types of resources needed by the SME. Given the existing structure of national R&D investments it is important for policy makers to understand the interaction between SME resource needs and those that are available in the environment and the implications that this has for when, where and how to support the formation of collaborative relationships between firms.

# Teaching Scientists Entrepreneurship: A Dialectical Approach

Hung-bin Ding<sup>1</sup>

Harsha Desai

Donald O. Fedder

## ABSTRACT

Today, we know relatively well about what should be taught in the entrepreneurship program for non-business majors. However, our understanding of *how* should the non-business students be taught is still limited. To address this issue, we study the entrepreneurship curriculum developed for the Nontraditional Doctor of Pharmacy (NTPD) students in the University of Maryland Baltimore. In principle, the core of this entrepreneurship curriculum resembles a typical business school entrepreneurship course with an emphasis on developing a business or a project plan at the end of a two-semester long, six-credit course sequence. This entrepreneurship curriculum for PharmD has a successful track record. From 1995 to 2003; 35% to 40 % of the business plans developed by the NTPD students have been successfully funded. Although the program is structured in a similar manner as many other short-term entrepreneurship curriculum in non-business programs, its implementation and dialectic approach create a dynamic learning environment that has effectively assisted non-business major graduate students to engage in business venturing activities. The infusion of dialectical inquiry at the NTPD program enables students of pharmaceutical science to exploit their professional expertise while developing competence in business planning. In this research, we reported the design of NTPD entrepreneurship curriculum and the training of business planning. Given the lack of foundation business knowledge and course time limitation in NTPD (and other hybrid programs), we posit that the effective implementation of dialectical inquiry will help students improve the quality of new venture planning.

## INTRODUCTION

The growing interest and media attention on private enterprise and the ownership society have created a new demand for entrepreneurship training for non-business majors. Since 1990s, many American universities have developed entrepreneurship curriculums for students and researchers from non-business disciplinary backgrounds (Katz, 2003).

The increasing demand for such curriculums from the broader university community often shows up in the form of short courses or modules (Gartner and Vesper, 1994). The hybrid programs developed for scientists and engineers present a new challenge because of the embedded differences between academic science and entrepreneurship education. The academic training of scientists and engineers emphasizes the importance of identifying and explaining the “variances” of nature (Mohr, 1982). Although variance-theorizing play an important role in the theory development of management and entrepreneurship research (Chiles, 2003), the training of entrepreneurial management focuses on the process of new organization creation, which requires understanding of potential customer groups and skills to manage a business start-up. In addition, the non-business major students lack the fundamental knowledge of business management. While this gap of knowledge needs to be addressed within a reasonably short period, sufficient time needs to be allowed for students to apply the knowledge gained to carry out business planning. Although there is general consensus of what should be taught in the non-business majors, there is limited understanding of *how* these student should be taught.

To address this issue, we study a successful entrepreneurship curriculum developed for the Non-Traditional Doctor of Pharmacy (NTPD) Program at the University of Maryland School of Pharmacy in Baltimore. NTPD students acquire the fundamental knowledge of the four key functional areas in running a business, marketing, operations, finance, and organizational behavior in the first half of the two-semester sequence. Building upon the functional knowledge, students are required to write a plan to develop a pharmaceutical care service program in the second half of the two-semester sequence. The functional courses were taught by business faculty while the business planning courses were co-taught by a business professor and a pharmacy professor.

In conclusion, this study identified two implications for administrators and educators of entrepreneurship curriculums for non-business majors. First, dialectical inquiry challenges students to validate the underlining assumptions of their business plans and improve the quality of business planning. Second, the NTPD students are mostly interested in creating businesses in the pharmaceutical care industry. The highly homogeneous professional background and a well-defined market segment may have allowed the students to thoroughly understand the dynamics of market.

## TEACHING ENTREPRENEURSHIP

The focus of entrepreneurship education is to help students recognize business opportunities and act on these opportunities (Jones and English, 2004). Although small

business management or self-employment management have long been important research subjects in the social science research (Davis, 1968), entrepreneurship as an academic area of training was not widely adopted by American business schools until late 1980s. As successful new ventures are effective integration of an entrepreneur's internal environment (e.g. knowledge or psychological traits) and external environment (e.g. life-cycle of industry, technological trajectory) (Sarasvathy, 2004), it is not surprising that many academic instructors design entrepreneurship courses or curriculums to facilitate the effectiveness of internal-external environment integration. A survey by Hills (1988) reports four objectives of these entrepreneurship curriculums in U.S. business schools:

1. increase awareness and understanding of new venture process,
2. introduce entrepreneurship as an option of career,
3. understand functional business relationships, and
4. recognize or understand traits and characteristics of entrepreneurs.

To accomplish these objectives, a prevailing practice is to design the entrepreneurship course as a discovery process in which students are encouraged to identify a viable business opportunity and to pursue this opportunity through coached business plan writing (Fiet, 2001).

As entrepreneurship becomes a mature discipline in the business schools (Katz, 2003), the rest of the academes start to systematically explore the potential impacts of entrepreneurship on non-business areas. Many entrepreneurship programs were established in the 1980s to encourage scientists and engineers to exploit laboratory discoveries for business potential or to create new platforms of research. However, university scientists and engineers do not see commercialization of business opportunities as the only reason to engage in entrepreneurship. For example, a survey of academic life scientists shows five types of entrepreneurial activities in universities: 1. creating large scale scientific projects, 2. earning supplementary income, 3. gaining industry support for university research, 4. obtaining patents, 5. commercialization of new discoveries (Louis, Blumenthal, Gluck, and Stoto, 1989). The differences of interests between business and non-business academics illustrate the inter-disciplinary distinctions embedded in the social institutional environments. While business school academics and students have interested primarily in exploring entrepreneurial opportunities in the market place, academic scientists and engineers pursue entrepreneurship in both market and institutional settings.

Academic entrepreneurship traditions based in science and engineering, create obstacles for commercialization of its technology. First, university-based scientists and engineers appear to be more comfortable exchanging ideas and concepts with colleagues rather than venturing forth into the private sector. Although there have been administrative measures to encourage university-industry technology transfer in the last decade, the results have been disappointing (Markman, Gianiodis, Phan, and Balkin, 2004). Second, even for those interested in pursuing commercialization, their lack of knowledge in business operations and interaction between market and for-profit organizations has proved to be a behemoth challenge (Markman, Phan, Balkin, and Gianiodis, 2005).

As the number of universities interested in commercialization of research grows, hybrid entrepreneurship programs are created and housed in school of engineering or school of science. Such organizational arrangement aims to mitigate students' uncertainty about new venture initiation in the market place. These programs also bring entrepreneurship skills and knowledge to academic scientists and engineers who are inspired to pursue opportunities in the market place.

### **ENTREPRENEURSHIP TRAINING IN NTPD**

The objective of the Non-Traditional PharmD program is to provide licensed pharmacists, who have a Bachelor of Science in Pharmacy degree, the opportunity to earn the Doctor of Pharmacy degree. The objective of the entrepreneurship module in the doctoral program is to give knowledge and appropriate skills to the students that are both useful and "actionable" (Argyris, 1993). In principle, the core of this entrepreneurship curriculum resembles a typical business school entrepreneurship course with an emphasis on developing a business or a project plan at the end of a two-semester long, six-credit course sequence. This entrepreneurship curriculum for PharmD has a successful track record. From 1995 to 2003; 30% to 40 % of the business plans developed by the NTPD students have been successfully funded.

#### **The structure of the curriculum**

Although the program is structured in a similar manner as many other short-term entrepreneurship curriculum in business and non-business programs (See Meyer, 2001 for a brief review of current state of entrepreneurship education), its implementation and dialectic approach create a dynamic learning environment that has effectively assisted non-business major graduate students to engage in business venturing activities.

The dialectic approach, or dialectical inquiry, has long been an important element in strategic planning (Mason, 1969). In the early stage of strategic planning, managers exchange opinions and raise constructive challenging perspectives to reach consensus.

The Non-Traditional Pharm.D. program recognized early the need and importance of a management track in an otherwise technical doctorate. Argyris (1993) promotes actionable knowledge; knowledge that individuals can use in which a commitment to personal responsibility and a dedication to effective action and learning are paramount. The intent in the program was to give knowledge to the students that were both useful and "actionable". The management pathway included four key functional areas of business: marketing, operations, finance, and organizational behavior.

#### *The Two Course Sequence*

The management pathway was designed as a two-course sequence with an objective of providing students with the business language and tools. Both courses were 16 weeks in duration.

### First Course

This course, labeled PHNT 511, provided a business foundation which includes marketing, finance, operations, and organizational behavior with each of the four subject areas lasting for a total of 12 hours taught over a three-hour session over 4 weeks.

The teaching challenge was obvious - in a typical business school, undergraduate students spend up to four years learning about each of these subjects; we were providing the basics in 12 hours, systematically examining key issues in the four functional management areas.

Each module was taught by an instructor who was usually not a pharmacist but had a health care background – consulting service, professional service provider, operations professor in a business school. One of the key qualifications for the instructor was their considerable experience in business or academia. The second qualification, perhaps even more important than the experience, was instructors' ability to convey concisely and succinctly the most important ideas and concepts in each functional area; precision and brevity were critical.

In each of the four modules, students had opportunities to test ideas about a pharmaceutical care project such as: health care service feasibility, new service / product development and implementation related business plan, chronic disease education service, and medications compounding service for children and elderly.

For example, in the marketing module the students could create a brief marketing plan and get feedback from the instructor; in the operations module, many students designed a "business-process" related to their pharmacy practice site suggesting ideas for improvement.

The module grades ranged from "A" to "C". The required written work was typically submitted by the students at the end of each module; and instructor's comments along with an appropriate grade were returned to the students within a week. Feedback was exhaustive, rapid and frequent. Students were also asked to report on an occasional Fast Feedback in the middle of the modules; this feedback was used by instructors to make mid-module corrections. At the end of each module students were also asked for their "lessons learned."

### Second Course

The second course was designed to give the Non-Traditional Pharm.D. students a hands-on experience in the development of a business plan with an eye toward its implementation possibilities. These submissions were comprehensive and included all relevant sections of a typical business plan. In contrast, submissions in the First Course were focused primarily on each functional area.

The students were required to develop business plans that were "practical" with lots of real data and hard evidence supporting their plans – we continually asked, "how do you

know' question that had to be satisfied with both primary and secondary data and literature search.

Thus the planning process afforded students opportunity to develop a well documented paper mimicking a business plan or a feasibility study that explored relationships between the business aspects of the plan and the pharmaceutical care outcomes for the target patients.

### **Dialectical inquiry**

In NTPD, the dialectic approach is used to assist students in their Second Course that helps the students develop new ventures. The dialectical inquiries help students apply the functional business knowledge to the pharmaceutical care context; well implemented dialectical interactions help students see the potential results of each event and each intended action.

This second 16-week long course created a forum for "structured debate" in which students are forced to consider alternative interpretation of their assumptions. The course meets five times during the semester. The course meets weekly during the first two weeks. The third session of the course takes place four to five weeks after the second session and six to seven weeks into the semester. The fourth session is generally scheduled for the 10th or the 11th week. The final session takes place during the 16th week when students submit their final plans. The spacing of the meeting classes is intended to allow students prepare and submit work-in-progress to the instructors.

The students are required to submit completed sections of their plans as the semester progresses. Each submission is returned promptly to the students with extensive comments for rewriting and regrouping the information submitted in the reports. Most of the exchanges take place face-to-face during the five scheduled sessions or via fax or e-mail.

In this milieu, these not-so-frequent sessions serve two purposes: first, the ample time between sessions allows students to gather material, rewrite sections and allow time to revise and resubmit sections. And second, the face-to-face sessions allow the students to discuss challenges facing them – the questions comprise a simple “how do I prepare a budget” to a much more nuanced question about identifying a subtle opportunity targeted toward a particular ethnic segment of the population.

Students were repeatedly asked to revise and resubmit their draft plans. The most important question that drove the discussion was: How do you know?

For example, in developing a marketing module we asked the students how did they know there was a ‘market’! The question got to the heart of two critical data: first it forced the students to remove all unnecessary clutter surrounding their research (they had to focus on the task at hand); and two, it forced them to link business assumptions (how do you know you have a market? How do you know somebody will pay for the service? How do you know how much demand there is?). Furthermore, in marketing sections, the

students, first, had to demonstrate, using appropriate published literature, that there was a need. Having established the need they had to collect data – either directly via meetings and surveys in the target community with their target market segments or from precisely collected secondary data published in public records and private papers.

This relentless questioning comprises the principal activity during face-to-face and email communications. The business school professor provided the framework that included questions about projects' business models as well as necessary detail establishing a market, development and writing of management experience to carry-out the project, details including site selection and business processes governing the operations of the plan and needed financial analysis and pro forma statements. The pharmacy school professor provided the necessary pharmaceutical care knowledge - it didn't hurt at all that the pharmacy school professor had operated a pharmacy himself when young and continues to run, as the founder-executive director a very successful service organization providing direct pharmaceutical care.

Often there are students who have already passed this 'stage' of their research and writing and quite willing to help their peers - the class as a whole acts as a large "consulting" practice; the conversations are quite animated, providing tidbits of advice and suggestions for improving each other's paper. It's a delight to see 'ahas' emerging from these conversations as the give-and-take during the class builds confidence in those students who may be having a problem getting started with their plans or those who may be encountering writer's block.

This practice of continual sharing of experiences and question-driven participation produces uniformly superior written reports. They are well written and reality-based having ample justification for the markets being pursued along with appropriate financial and managerial information. Since the reports are developed by practicing pharmacists there is a lot of realism and plain language that avoids jargon. These reports invariably show that they have the necessary management experience and the expertise to carry out the proposed project. Finally, these reports are written with a passion suggesting superb confidence in one's expected results if the plans were to be implemented. Time and again we hear that these plans have been accepted by their "superiors" or that the request for money has been granted by the funding agencies.

## **DISCUSSION**

The recent boom of hybrid entrepreneurship programs in American universities reflects a strong drive to encourage scientists and engineers to take an active role in identifying and pursuing potential business opportunities. While the functional knowledge such as accounting, marketing, and operations management remains an essential foundation of knowledge for future entrepreneurs, our observation finds that training of business planning may play a significant role in improving the quality of opportunity identification and resource mobilization.

Dialectical inquiry planning approach improves the quality of business planning (Mason, 1969) and increase the satisfaction of planning process (Schweiger, Sandberg, and Ragan, 1986). The dialectical inquiry process provides a forum of structured debates (Mason, 1969). The implementation of dialectical inquiry in NTPD indicates that such structured debate facilitate the students' understanding and appreciation of new venture planning through three mechanisms.

First, the dialogue between the instructor and the students enables students to validate the assumptions. The instructors of the entrepreneurship course may not be the experts of the specific venturing contexts proposed by the students. However, as non-experts in pharmaceutical science, the business instructors are able to provide alternative interpretation of any assumptions adopted in the business plan. To address these questions, students may have to either validate the existing interpretation of assumptions or to re-evaluate the validity of the alternative perspectives. Although not all business plans demonstrate apparent improvement of quality, students reported to have gained better understanding of assumption validation and new venture planning.

Second, entrepreneurship courses only accounts for a small percentage of overall curriculum requirement in non-business programs. For example, the NTPD entrepreneurship curriculum consists of two courses in a 16 course degree program. Although it is feasible to cram functional knowledge and the training of planning in one semester or shorter, such course design does not allow students sufficient time to reflect to engage in productive debate with the instructors. We found that the one year course sequence seems to be sufficient to NTPD students. However, more analyses will be necessary to determine the impact of lag time and the learning effectiveness.

Finally, hybrid entrepreneurship programs tend to be restricted to specific contexts (Katz, 2003). The narrowly defined context of business venturing is designed to fit the professional specialty of students. In addition to the NTPD program, notable examples include the Entrepreneurship for Artists in Maryland Institute College of Arts; Entrepreneurship for Physicists at Case Western Reserve University. We found such curriculum design effectively engages students to the dialectical debates. Since the students have expert knowledge in the technology and delivery of products/services, the debates tend to be more focused on the creation of business organization and the validity of underlying assumptions.

## **CONCLUSION**

As public interests in entrepreneurship increases, the number of hybrid entrepreneurship program in American universities has been on the rise. The spill-over of entrepreneurship education from business schools to other academic disciplines presents a new challenge to educators. The infusion of dialectical inquiry at the NTPD program enables students of pharmaceutical science to exploit their professional expertise while developing competence in business planning. In this research, we reported the design of NTPD entrepreneurship curriculum and the training of business planning. Given the lack of foundation business knowledge and course time limitation in NTPD (and other hybrid

programs), we posit that the effective implementation of dialectical inquiry will help students improve the quality of new venture planning.

## ABSTRACT

Women entrepreneurship in economic development of any nation has been documented for its significant contribution. This means that the neglect of women in the development process constitutes a human waste. The increased role of women in economic development had spurred the government in developing policies on women development. However, several studies have discovered that women performance was still low specifically in the small and micro scale industries. Problems like low productivity, high rates of business failures, and no access to credit among others had hindered their growth. In light of this, the study examined the policy implementation of the two programs created to mobilize women on entrepreneurship development. It attempted to determine if the programs have succeeded in empowering women economically and socially. It also aimed to uncover the possible implementation gap problems and determine the extent of which these gaps have affected the effectiveness of the policy implementation.

The study was carried out in Osun State, Nigeria. The subjects of the study who were members of the programs were selected by random sampling method. A total of one hundred fifty respondents were interviewed with the aid of predetermined question. The questionnaire was designed to ferret information using the Women Equality Empowerment Framework. This was to determine the level of development impacted by the programs. Statements were developed to operationalize development into welfare, access, conscientization, participation, and control. These were measured by a 5-point scale method. The variables were described and highlighted using descriptive analysis.

The results showed that despite some constraints in the implementation due to implementation gap, there was an average impact of the programs on women development. Welfare like housing, clothing and food were average. Access to land was also average, but access to credit, services were low. However, the respondents had high access to their own labor. It was further revealed that the programs had impacted highly on the ability of the respondents to relate themselves with the society and that their participations to group activities had increased. Although a high result was revealed in conscientization level, their low level of control over the resources might affect their involvement because of a gap that exists between efforts and rewards. It is therefore imperative that overcoming gender inequality must be a high priority in policy development concerning women.

## INTRODUCTION

One of the key factors in determining the success of development is the status and position of women in the society. This means that the neglect of women in the development process of any country constitutes a human resource waste. In this premise, it will be a disservice for any country to ignore its women population in its development efforts. The task before any government, therefore, should be that of moving steadily and firmly in the direction of economic development by involving women. Faleye (1999) stressed that women's development is not nearly about reducing poverty by increasing productivity, but also about women's liberation and empowerment.

True development means the development in the three categories of a woman. These are individual, social, and economic development (Rodney, 1972). Individual development means increased skills and capability, greater freedom, creativity, self-discipline, responsibility and material well being. Increasing capacity connotes social development, while economic development is determined by the increased capacity of the members of a society in dealing with their environment. This emphasis means that development at the individual stage subsumes both the social and economic categories of development. Development is dynamic and therefore assumes a continuous transformation process and a movement towards better and improved conditions, locally and internationally.

In Africa, women constitute about 50 percent of the population and account for about 60 to 80 percent of the agricultural production. Therefore, for a meaningful development to take place, women development must not be overlooked. In Nigeria, women actively played a meaningful role in the industrialization process of the country. The role of women in social and economic development specifically in the small and micro enterprises was found to be primal in

the economic development of their communities. Their potentials have spurred the government in devising policies to stimulate the industrial sector specifically in the development of indigenous technology. Accordingly, the government has developed trade and industrial policies that will foster industrial development and increase production of manufactured goods in the country. Majority of these policies were created for the informal sector. For instance, the government has formulated policies introducing the Better Life Program (BLP) to improve the conditions of the rural women and the Family Support Program (FSP) to improve the fortune of the family and the condition of women in general.

### **PROBLEM STATEMENT**

The Better Life Program came into existence in 1987 and later launched in all states and local areas of the nation aimed at mobilizing women for resource productivity. The primal objective of this program was to sensitize the government and indeed private organizations to the useful role that women could play in national development. The declaration of International Year of the Family by the United Nation in 1994, as a result of global economic and social upheaval, gave insight into the conception of the Family Support Program, which was predominantly in favor of women whether they are in the rural or in the urban area. This program aimed to improve and sustain family cohesion through promotion of social and economic well being of the Nigerian family. These programs were introduced with the purpose of stimulating and motivating women towards achieving a better life and higher standard of life and good family life of women specifically the entrepreneurs in the small and micro scale industries. In line with these programs, the policy is supported with other fiscal and monetary policies geared to making efficient use of resources, mobilizing domestic savings for investment, and utilization of raw materials among others.

However, observation showed that the fortune of women in Nigeria has not been considerably improved in spite of these programs. According to Aina (1993), there have been complaints about the implementation of the two projects. Ogolo (1997) in her study concluded that the BLP and FSP programs had not really accomplished much. She referred to the program as merely publicity –grabbing gimmick, which is better known for its manner than for its matter. Faleye (1999) predicated that the implementation of these programs was found to have not accomplished much in his study. Faleye pointed out the weaknesses in the programs. He revealed that the rural women and the family unit did not feel the impact of the programs despite the propaganda through mass media. This is not to say that nothing positive came out of the program. Aina (1993) reported an increase in the number of women cooperatives from 413 at the inception of BLP to 9, 422 by 1991. Ogolo (1997) also highlighted the social awareness among rural women through intensive public enlightenment campaigns organized by the programs.

Several studies discovered further that women engaged in the small and micro scale of the industrial sector were still striving to grow and were still bombarded with problems. These problems include high rates of business failures, low productivity; and no access to capital, credit, and labor among others. It was also noted that the policies introducing economic enhancement programs were gender-blind. It was also observed that women were not explicitly included in the programs. Although it was evident that women were found to have been engaged in small scale business, a lot of constraints have hindered their economic participation. In light of this, the study investigated and evaluated the implementation of the programs to determine their impact on women entrepreneurship development, that is, how far the programs have succeeded in achieving their primal objectives of empowering the women involved in the programs, both economically and socially. It attempted to uncover the possible implementation gap problems

and determine the extent of which these gaps have affected the effectiveness of the policy implementation.

### **FRAMEWORK FOR ANALYSIS**

Policy implementation is mainly the activities that are carried out in the light of established policies. Egonmwan (1991) was of the view that implementation refers to the process of converting inputs such as financial, material, technical, human into outputs – goods and services. He further described it as the stage where the earlier preparation and designs, plans and analyses are tested in the harsh light of reality. Policy implementation has been described as one major problem confronting developing countries such as Nigeria. The implementation problem in developing countries is the problem of a widening gap between intentions and results. A manifestation of implementation gap is the phenomenon of the rich getting richer while the poor are getting poorer in spite of avowed stated policy goal of elimination of poverty and equality of access to the basic needs of life. Implementation gap also manifests in the widening of the distance between stated policy goal and the realization of such planned goals. (Egonmwan 1991).

Boserup (1970) opined that development programs in developing countries tended not to be effectual or productive because planners had failed to understand gender inequalities. Development can be viewed as empowerment, the liberation of women. Development is not complete without the reduction of poverty through increasing productivity. However, to achieve a high level of empowerment, structural inequality in the society should be addressed. Therefore, for the empowerment of women, there must be women's collective mobilization to overcome particular instances of institutionalized gender discrimination.

Empowerment is a process aimed at consolidating, maintaining or changing the nature and distribution of power in a particular cultural context. The process is rarely linear because it

takes twists and turns. It includes both resistance and consent, and ebbs and flows as groups with different relations to the structures and sources of power come into conflict (Morgen and Bookman, 1988). Smith (1996) considers empowerment to be a process that can only begin in a climate in which there are high expectations and where everyone feels respected and valued and where people will offer their best at all times. The concept of empowerment ranges from encouraging people to play a more active role in their work through involving them in taking responsibility to enabling them to make more and bigger decisions without having to refer to someone higher in position. Similarly, empowerment is seen as an expansion of freedom of choice and actions which means an increase in one's authority and control over the resources and decisions that affect one's life (World Bank, 2003). In other words, focusing on how women have to be empowered economically and socially, policy implementation must stem from the framework on the Women's Equality and Empowerment Framework (WEEF), which looks at all levels of equality from the perspectives of welfare, access, conscientization, participation, and control (Ostrom, 1974).

Women's Equality and Empowerment are ladders of equality identifying the five levels of empowerment for women to advance towards equal status with men. The higher the levels of equality automatically mean high levels of development and empowerment. The lowest level is the welfare level, while the highest is the control level. Welfare is the level of material resources that females have relative to males in such areas like nutritional status, food supply, and income. Women are seen here more as passive recipients of welfare benefits. The gender gap can be identified through the disparity between males and females on indicators of nutritional status, mortality rates among others. Women's empowerment cannot highly take place at this level because an attempt to improve welfare level will entail access to resources. Access is the

restricted access to the resources of production available in the society results in women's lower level of productivity. These include land, credit, labor, and services. Empowerment means that women are made aware of the differential situation and encouraged to take actions for gaining access to their fair and equal share of the various resources made available within the household and within the wider system of state provision. When there is an attempt by women to overcome the obstacles to access, it means that they have confronted the systematic discrimination, which can be addressed only through the empowerment process to conscientization.

Conscientization refers to the gender gap as a belief gap. The belief that women's lower socio-economic position, and the traditional gender division of labor is a part of natural order. So empowering women, therefore, implies the sensitization to such beliefs and practices and their rejection. It also means that women's subordination is not part of the natural order of things but is imposed by a system of discrimination, which is socially constructed and which can be altered. The realization by women that their problems do not derive so much from their own personal inadequacies, but rather by institutionalized discrimination against women and girls helps to bridge the gender gap caused by inequality.

Participation refers to the participation of women in various positions. However, women participation in the developing countries is very marginal. In terms of gender gap, women's participation is the visible and obvious phenomenon. Participation means that women equally with men, are actively involved in the development process. This includes equal participation in the decision making process as well as in development projects; particularly the projects that affected their direct community. This could mean that women would be adequately represented in a development project in the area of needs assessment, project planning, management, implementation, and evaluation. Equality of participation means involving women from the

community affected by the project and involving them in the same proportion in decision making as their proportion in the community at large. the need to effectively involve the target beneficiaries in the direct projects can be likened to the belief of the public choice theorists which give room for polycentric structure of administration by which people will be able to contribute to decisions that affect their lives.

Control means a balance of power between men and women, so that neither is in a position to dominate. It means that women have power alongside man to influence their destiny and that of the society. Women's increased participation at the decision making level can only be said to lead to their increased development and empowerment if such participation enables them to achieve increased control over factors of production, access to resources and the distribution of benefits. In a situation where the wife makes the effort but the husband collects the benefits, there is a serious gender gap between effort and reward.

Following the above premise, at what level can one say then that a woman is empowered. Using the analytic framework for evaluation, the issue of women empowerment from the perspective of the process overcoming gender inequality through the 5 levels (ladders) of equality would show that the lowest level of women empowerment is attained when equality gap between man and woman is bridged at the level of welfare. Access, which is the next level, implies access to land, loan facilities, labor services, opportunities, and to use own labor. In this case, there is no doubt that empowerment will improve or better still, guarantee better and steady income. In conscientization, the woman is being conscious of her environment, which cannot be done without the individual socializing with the people in the environment. In the participation level, women equally with men, are actively involved in the development process and when there is increased control over the factors of production and when there is a balance of power between

women and men, so that neither a position of dominance. This level of empowerment enables women to actualize themselves. Self-actualization produces such satisfaction as power, prestige, status, and self-confidence. It is at this level at which women feel fulfilled.

## **METHODOLOGY**

The study was carried out in Osun-State, Nigeria. The state comprised three Senatorial Districts, namely Osum East, Osun West, and Osun Central. The subjects of the study were selected from each of the senatorial districts using the random sampling technique. The selected communities were Ile-Ogbo Iperindo, and Ilobu. One hundred and fifty women respondents that participated in the programs were identified in the three communities with the assistance of officials from the Ministry of Information and Women Affairs in the state that were stationed in the various local government as project officers.

The study used both primary and secondary sources of data. Structured interview with the aid of predetermined set of questions (questionnaires) were used to collect the pertinent primary information. The interview schedule was supported by focus group discussion among the selected fifty women groups that participated in the two programs using the double sampling technique. There were three focus group discussions held in each of the three communities. Selection of groups was based on age and education level. The focus group discussion was carried out before the interview schedule as an interactive measure apart from eliciting deeper issues relevant to the variables of the study.

The dependent variable development of women entrepreneurs was operationalized using women's equality and empowerment framework from the perspectives of welfare, access, conscientization, participation and control. Statements were developed in each category addressing the objectives of the programs to measure success of implementation employing the

5-point scaling method. The independent variables, which were the two programs were measured using the objectives set for the policies by Liker scale method. Data collected were analyzed using descriptive statistics to describe and highlight the variables of the study.

## **RESULTS AND DISCUSSION**

### **Demographic Characteristics of the Respondents**

The results in Table 1 show that majority (42%) of the respondents were between 30 and 39 years of age. About 23 percent were above 50 years of age and about 17 percent were between 40 and 49 years. The results also show that majority (89%) of the respondents were married and about 51 percent of them had more than four children, while 26 percent had 3 children. The data can be inferred that the respondents are still at the working age and the married status of the respondents connotes high level of responsibility. Having more than 4 children indicates the necessity of having additional income. This explains the need in participating in the program. The data also revealed that 37 percent had attained higher than secondary level of education, while primary was the lowest level attained by the respondents, which shows that the programs were not left to the illiterates along, neither left in the hands of those with only certificates.

### **Assessment of Programs on Welfare**

The programs aim was to enhance the economic standards of women entrepreneurs in the small and micro scale industries and empower them economically. The results in Table 2 revealed that the programs had averagely impacted their welfare with a grand mean score of 3.329. Furthermore, the programs had made positive impact on the women health care with an average mean score of 3.840. The data also showed that nutritional status, clothing, and housing were affected averagely with mean scores of 3.380, 3.480, and 3.013 respectively. It was further

revealed that income had low mean score (2.933). In fact, it was revealed that 19 percent of the respondents indicated that they did not feel the impact of the programs on their income at all. Also, about 13 percent indicated the same in housing that the programs did not have impact at all.

### **Assessment of Programs on Access**

Facilities refer to land, credit, labor, services and utilization of own labor. The results in Table 3 showed that the respondents had an average access to facilities with a grand mean score of 3.136. The results further showed that the respondents had high access to own labor (4.020), and average access on service (3.140). The access to land (2.78), credit (2.860), and labor (2.880) were revealed to have quite a bit impacted by the programs. These are important resources in the process of production and the absence of these resources has a significant effect on the capacity of the women to contribute economically. It was revealed that 19 percent of the respondents had the opinion that credit facility did not affect their capacity to contribute economically. The results can also be inferred that if these facilities are available to them, they could positively contribute socially and economically, hence they have the access to their own labor. However, the lack of access by some of the respondents was due to the low level in some of the variables in the welfare level of development like the housing and the income.

### **Assessment of Programs on Conscientization**

The data in Table 4 revealed that there was high awareness of the respondents about their environment. This was indicated by the grand mean score of 4.038. This result indicated that the programs had high (4.267) influence on the improvement of their attitude toward self. The respondents were also conscious on the beliefs and practices injurious to their development as well as the understanding on the negative beliefs and practices women indicated by almost high

mean scores of 3.297 and 3.920 respectively. It can be inferred from these results that the programs had sensitized and improved their level of awareness about their selves and that of the environment, which are significant to the development of personality. Once women have the realization of their problems especially the discrimination against women, this will help the bridge the gender gap caused by inequality. The results can be inferred that there would be a high level of development among women once the programs are modified specifically on variables that concern overcoming gender inequality, hence development starts from the personality of an individual.

### **Assessment of Programs on Participation**

The data revealed the participation of women was enhanced indicated by the grand mean score of 4.028, which is high. The participation of women means involving themselves into any development process in the community. It could be in decision making or in development projects. Their involvement has to do with the extent of encouragement by their male counterparts like the husband or the father. The support of the male figure in the family influences their participation. This was shown in Table 5, indicating a high (4.000) encouragement by the husband. Hence the evaluation scale used indicates that once conscientization level is high, the understanding of environment is also high. If this happens, there is gender equality at home. This means that the women would be able to gain the understanding of the husbands, which indicates that men are not impediment to their participation. This would likely build self-confidence among women to face the challenges of the environment.

### **Assessment of Programs on Control**

Development will not take place, neither empowerment through policies and programs if one has no control over resources. An empowerment that is devoid of control cannot be tagged real empowerment. The study revealed that control over possession was averagely (3.396) influenced as shown in Table 6. The control over their labor recorded an average mean score of 3.407. Certainly, even if respondents have high access over their own labor but do not have control over it, development will not take place. Equality of control means a balance of power between man and a woman, so that neither is in a position to dominate. It means women have power alongside man to influence their destiny and that of the society. There is increased in development and empowerment if such participation enables them to achieved increased control over the factors of production, access to resources and the distribution of benefits.

#### **Constrains of Policy Implementation.**

In the focus group discussion held, it was revealed that sound policies were formulated but failed at the level of implementation. Problems like inadequate definition of goals, over-ambitious policy goals, choice of inappropriate organizational structure in implementation of policies, lack of continuity in commitment to policy, lack of monitoring process, inadequate manpower planning, and non-inclusion of the target groups in the determination of policy were revealed to have contributed to failure of the policy implementation. Corruption was also revealed to be one of these problems.

Inadequate definition of goals makes a policy to lack clarity, internal consistency and compatibility with other policy goals. The successful implementation of a poly bedeviled with inadequacies becomes problematic. Over ambitious policy goals in policy formulation are muddled in ideological context that may confuse the actual problems involved in implementing them. Due to scope and comprehensiveness such policies may experience implementation

bottlenecks arising from any or combination of the lack of appropriate technology for implementation; inadequate human and material resources; over-stretching of available resources for maximum visibility and impact at the end of which nothing concrete may be achieved. The lack of continuity in commitment to policy, usually when there is instability in government, it results in unstable priorities particularly in Nigeria; where change of executive power always resulted to change of priorities and objectives. A serious problem is that of bribery and corruption which has contributed greatly to the failure of policy implementation. When huge amounts of money will get stolen by officers in charge of implementation, the problem is bound to arise.

### **CONCLUSION AND RECOMMENDATION**

Although the programs had some constraints in the implementation due to implementation gap arising from problems like in adequate monitoring process, inadequate manpower planning, corruption and non inclusion of target groups in the determination of projects to be established for them, the two programs have succeeded averagely in empowering women in all the five areas under the equality/empowerment framework. The women that participated in the programs were empowered economically because they were able to control their financial resources thus strengthening their income standing.

. The programs have impacted more on their involvement in many activities and had exposed them to the environment, which have great magnitude of changing their abilities to understand their selves as well as their relations to the society. The programs had improved women to develop positive attitude forwards themselves. They had been sensitized to the injurious beliefs and practices against the development of women. In spite of the inadequacies the programs have succeeded in achieving their objective primarily to sensitize women

economically. However, despite the high conscientization level of the women, their average control level over the resources could significantly retard their motivation in engaging themselves to group and societal issues around them because of a gap that exists between efforts and rewards. It is therefore imperative that any aim of developing policy addressing women, there exist a need to significantly consider overcoming gender inequality so that women will have power alongside men to influence their society.

## ABSTRACT

The vulnerability of the entrepreneurs to unethical or sharp practices erodes the trust and loyalty of consumers affecting the success of the venture. In light of this, the study examined the influence of Sharia, which is viewed as a way of life, a legal system enshrined by religion Islam on the small business practices in relations with consumer satisfaction. It attempted at determining the relationship between Sharia variables and consumer satisfaction in terms of consumer motives, participation, perception, and buying decisions. The study aimed also at eliciting the social and moral virtues essential to sustaining entrepreneurship success. The study was conducted in an Islamic community of Zamfara State in Nigeria. Questionnaires were administered in the enumeration areas to collect data from 387 selected head of families. Information on operationalized Sharia into perceived economic, socio-cultural, and political characteristics was measured by Likert scale, while consumer satisfaction variables were measured using 5-point scale. A focus group discussion was done to elicit entrepreneurial virtues inferred to ensue as influenced by Sharia.

The results revealed an influence of Sharia on the practices of small business in relation to consumer satisfaction. These were shown by a linear dependence of motives ( $R=0.237$ ), participation ( $R=0.336$ ), perception ( $R=0.485$ ), and buying decision ( $R=0.562$ ) on Sharia. The t-test also revealed a significant difference before and during Sharia in consumer satisfaction variables, such as motives ( $t=12.82$ ), participation ( $t=26.96$ ), perception ( $t=15.12$ ), and buying decision ( $t=42.83$ ). Social and moral virtues were revealed in the disposition to justice and humanity as important entrepreneurial virtues demonstrated by integrity, dignity, honesty, temperance, and humility among others. Social and individual responsibilities were among other issues considered as significant. In other words, for small business to sustain success, entrepreneurs must seek to reconcile all objectives and claims within the framework that recognizes the rights and needs of individual and the society. In this respect, entrepreneurial virtues must not be overlooked.

## INTRODUCTION

Globalization has indeed invited competition from all nations, which resulted to increasing smaller segmented markets. This progressing heterogeneous demand makes innovation more significant and a challenge to entrepreneurs. For a venture to succeed in this competitive environment, consumer satisfaction should be the ultimate goal of an enterprise. Consumer satisfaction is an emotional and cognitive responses focusing to a particular product or service at a particular period of time. These responses are influenced by factors such as the price of the product, the quality, performance and features of the product, the information about the product as to product's image and value, health and safety among others. In fact, efficient delivery of the enterprise' offers and the management of the factors associated to the offer is the crux of the business. This entails that the entrepreneurs are obliged to run the enterprise as efficiently as possible in such a way that all legitimate goals are obtained. This also stresses that the goal of efficient production of goods and services designed to satisfy human needs is a social goal. A social goal demands efficient management involving careful use of physical resource, worker morale, employee development, research, consumer welfare, consumer protection, and good relation with the community and the society at large.

The entrepreneur is at the center of a network of relationships with people, groups and publics serving as the fulcrum aiming at meeting the objectives of the enterprise. The success of the enterprise in meeting its goal objectives rests on his ability to interact with his environment. In this premise, the entrepreneur must consider the impact of his action on all to which he is related in the industry. He must seek to reconcile all other objectives and claims within the framework that recognizes the rights and needs of both individuals and groups. In this respect, human relations in the business practice must not be overlooked.

Generally, there are certain traits of character that are essentially needed to make the most of what life has to offer. Hence people are not born with a fixed character, character traits are therefore acquired. It is imperative and more meaningful to acquire and keep those character traits that make the most of ones life called virtues. Moral and social virtues are essential in the conduct of business, without them, success is bleak and with them, entrepreneurs prosper so as external circumstances permit. Even when opportunities are abound for an entrepreneur to perceive economic opportunities and to put these to advantage depend on his character. Virtues play a crucial role in the choices or decisions, on what alternatives have to consider, what is regarded as best desirable choice, and to enable for a judgment to be efficacious. The virtues enable entrepreneurs to see aright and choose aright.

A good business practice contributes to the development of men and to the growth of the society as a fit place for men to exist. There exist therefore a need for a framework of entrepreneurial virtues that an entrepreneur may end up successful in his endeavor, otherwise he ends up as mediocre if not morally crippled individual.

### **RESEARCH PROBLEM**

In today's world of business, many values have eroded. In the pursuit of competition and the changed concept on what an ideal enterprise' goal should be, entrepreneurs are pressured to act unethically as they are challenged with competition. It has been observed that temptation for entrepreneurs to compromise ethical standards as they strive to grow is evident (Palich, et al, 2004).A special temptation exists for entrepreneurs who are strongly driven to make profit or on issues that directly affect profits. For instance, entrepreneurs may be tempted to rationalize bribery as a way of offsetting what seems to be a competitive advantage. This vulnerability of

the entrepreneurs to unethical and sharp practices erodes the trust and loyalty of consumers, suppliers, workers, community and other publics affecting the success of the enterprise.

In Islamic community, like other religious communities, religion has an important role in shaping the behavior of people., Religion is a form of belief that binds the spiritual nature of man to a supernatural being, as evolving a feeling of dependence and responsibility, together with the feelings and practices which naturally associated with it (Bassiounno,1988). Religion is a subset of culture that contributes to the cultural belief and values of men living within that particular society. Thus, these acquired values are reflected in the actions and decisions of men in dealing with his environment. According to Grief (1994), religion is described as a club and a mold of behavior. This was demonstrated in the work of Weber in (Hofstede, 2001). It was revealed that the Protestant reluctance to break contracts contributed to greater trust and willingness to honor contracts with strangers and thereby contributed to the spread of more extensive information that promoted growth and rise of individual capitalism. In this premise, Sharia as a way of life among Muslims, which is covering every aspect of their daily individual and collective living could have been guiding the business practices of entrepreneurs. In light of this, the paper investigated the practices of small business entrepreneurs in relation with consumers with the view of discovering the entrepreneurial virtues. It aimed at determining the attitude of consumers towards the business practices of entrepreneurs. It also attempted to examine the relationship between the business practices and consumer satisfaction in terms of motives, participation, perception, and buying decision in a Sharia system

### **FRAMEWORK FOR ANALYSIS**

Abundant evidence affirms that religious belief affects a wide range of behavioral outcomes, and religious activity can affect economic performance. The modernization theorists

such as Hoselitz (1960), McClelland (1961), and Hagen (1962) offered an understanding that traditional societies resist change, and innovative groups can be important in the process of modernization. They stressed that religious affiliation could serve as the base for group cohesion necessary to successfully challenge established practices. This understanding was established by Weber in (Hofstede, 2001) in his popular work “The Protestant Ethic and the spirit of Capitalism”. The Protestant reformation was critical to the rise of capitalism through its impact on belief systems.

Religion is that sublime and profound conviction within the soul, which compellingly admonishes man that it would be wrong for him not to believe in those morontial realities which constitutes his highest ethical and moral concepts, his highest interpretation of life’s greatest values and the universe’s deepest realities. Religion is simply the experience of yielding intellectual loyalty to the highest dictates of spiritual consciousness or super conscious part of human mind. The moral consciousness of man is the human recognition and awareness of those ethical values which duty demands that man shall abide by the control and guidance of conduct. It is the spiritual urge of religion that tends to cause man to project his estimation of moral values directly outward into the affairs of his fellow. Religion creates for the human mind a spiritualized consciousness by faith, derived from antecedent concepts of moral values. Faith becomes the connection between moral consciousness and spiritual consciousness.

Islam is the religion of the Muslims. Qur’an is a devine revelation or messages to reach humankind. Qur’an is the principal source of Islamic Law, the Sharia (Bassiouni, 1988). Sharia as a legal system was also considered as a way of life of the people living in the Islamic society and was viewed as a religion. As Bassiouini (1988) puts, ethics, morality, and religion are inseparable; while law enshrines ethical judgment of a society (Garrett, 1980). Sharia forms the

basis for relations between man and God, between individuals, whether Muslim or non-Muslim as well as between man and things which are part of creation. (Bassiouni, 1988). In Sharia, the preservation of a social order depends on each and every member freely adhering to the same moral principles and practices. It is founded on individual and collective morality and responsibility. Collective morality is expressed in such terms as equality, justice, fairness, brotherhood, mercy, compassion, solidarity, and freedom of choice. Social justice and individual justice are preserved in Sharia. It inculcates the search of justice and applies it to self as well as others. It stresses individual responsibility, which means an individual is accountable to his Creator for what he himself does or fails to do.

The economic aspect of Sharia contains prescription, proscription, recommendations, suggestions, general principles, and guidelines of all aspects of human endeavor and interaction. Because Sharia is described as a way of life, as a form of government, a social structure as well as regulatory norms for interpersonal relationships, business is not something different and apart from all those other aspects of social life. Thus, Islamic society preserves the notions of free enterprise and social solidarity, social responsibility and humanistic concern of all. Profit is recognized and legitimated provided they are lawfully obtained. However, profits cannot overshadow the duties of brotherhood, solidarity, and charity (Bassiouni, 1988). In the fulfillment of an individual in his society, respect for individuals is applied. Higher values are appealed to all in human relations and the most cherished attribute is dignity. Loyalty and fidelity are among the most highly regarded qualities. Rectitude likewise is expected. Rectitude in business dealings and human relations is as important as any other tenet of faith. Fairness in Sharia is both a means and an end, irrespective of the practical realities. Honesty is not a virtue but expected trait.

Additionally, there exist the prohibition against flaunting of one's achievement in the face of others particularly the less fortunate. This reflects the value of equality and humility. Social responsibility is highly encouraged. It requires that property as not for personal advantage but also for the benefit of the community. In contracts and obligations, contracts are essentially predicated on the free will of parties and must manifest the true expression of their intent. It is emphasized that individual contracts, and contracts of adhesion are to be regulated in such a way as to enhance fairness, produce equity, protect the weak and the unwary, and promote social interests. The logical extension of these principles is that no one can enrich himself to the detriment of others.

For entrepreneurship to sustain success, religious influence in the practice of business should not be overlooked. Its influence must be recognized in the business practice in relations with consumers as shown in Figure 1.

## **METHODOLOGY**

The study was conducted at Zamfara State, Nigeria. Muslims are about half of the country's population, forty percent are Christians, and the other ten percent practice traditional indigenous Nigerian religions or no religion at all (Herman, 2001). Muslims are the majority in the northern part of the country. In Zamfara, Sharia was re-introduced in the year 2000, although it has existed since 19<sup>th</sup> century. From Zamfara, Sharia was then observed to have spread over the northern states.

The study used the multi-stage sampling technique in selecting the three Local Government Areas (LGAs) out of the 14 LGAs of Zamfara State and 129 respondents were selected from each LGA. Using enumeration areas, 387 respondents were identified. Structured interview was used in collecting the data aided by a pre-determined set of questions, the

questionnaires. The head of the family either male or female was qualified for the interview as respondent of the study.

The independent variable, Sharia was operationalized into political, economic, and socio-cultural characteristics on business practices. Statements were developed addressing the various practices of the enterprises in conducting business in relations with consumers. The information generated was based on the perceptions of the consumers with the aim of eliciting the characters or traits associated with the concepts being sought. The statements were measured using Likert scale. These concepts of Sharia were presented to a group of respondents to elicit characters and traits essential for entrepreneurship virtues. The dependent variable, consumer satisfaction was operationalized into cognitive, that is the knowledge or perception of consumers on the enterprises' offers, and the motivation, that is the motives, the involvement, and the buying decision of the respondents on the business practices of the entrepreneurs. These variables were measured by 5-point scaling method.

The data were analyzed using descriptive and inferential statistical tools. The variables were described by frequency distribution, percentages, means, and weighted average. Regression analysis was used to test the linear dependence of consumer satisfaction in terms of consumer motives, perception, participation and buying decisions on Sharia, while t-test was used to determine whether a significant difference existed in the relationship between consumer satisfaction and Sharia before and after the introduction of the later.

## **RESULTS AND DISCUSSION**

The results in Table 1 show that majority of the respondents were between 20 and 39 years of age (68%), males (73%), married (97%), tertiary level of education (74%), Muslims

(100%), and were civil servants (84%). The socio-economic characteristics of the majority of the respondents indicate the ability of the respondents for making decisions.

### **Perceived Business Practices in Sharia System**

The results in Tables 2, 3, and 4 show high mean scores in economic (4.7130), socio-economic (4.7790), and political (4.6663) variables used to measure the perceived business practices in relations with consumers in the Sharia system. These variables addressed many business practices. Among others are fair price, standard quality products, educative information, product availability, truthfulness in business transactions, no involvement in uncertainty trading, hoarding practice is unlawful, friendliness and honesty in all dealings, control of human greed, sales of prohibited products, selling and buying by lawful intention, individual responsibility, social responsibility, goodwill, health and safety, conspicuous consumption, consumer protection, contract regulation, social order, and fairness in all matters. The operationalization of Sharia into economic, socio-cultural, and political characteristics had the advantage of eliciting the characters and traits significant in influencing consumer satisfaction.

### **Intervening Characters and Traits in Sharia System**

The entrepreneurial experience is far more fulfilling when entrepreneurs understood the genuine purpose of business, which is the real reason of going into business. It has been observed that the creation of products and services for human satisfaction has been the core reason of business existence. In line with this perspective, relationships with the society are critical and characters are essential to success. It was observed in the group discussion that financial is important but it is only the yardstick to measure success. In fact, excessive focus on financial gain can quickly lead to distortions in business practices. It was further revealed that financial motive it is the root cause of many business failures.

Figure 2 shows the various characters and traits essential to entrepreneurial business practice, which were postulated, inferred, and identified to be associated with most of the characters and traits that could emerge as culture, moral and religion influence the entrepreneurial practices. Integrity was foremost revealed to be the most important in all of the virtues. Integrity is the key to man's character. It means a man that can be trusted. It means a man who is honest in all his dealings. In integrity, there is purity and moral soundness about the entrepreneur as a person. Another major character revealed was the sense of social responsibility and individual responsibility. This humanistic concern is very significant in entrepreneurship. The "early businessmen" has been described as the "slave traders". To them, value must substitute directly to money. The bottom line was profit maximization nearly at all cost. To them, preservation of the environment, welfare for workers, respect for nature, human right, consumer's right are considered wasteful and unwarranted expenditures. Humanistic concern includes friendliness, assertiveness, truthfulness, fairness, among others.

Assertiveness in negotiation is important to avoid sharp practices. Assertiveness refers to social intelligence and tact. It means expressing oneself clearly, directly and appropriately, and demonstrating fairness, dignity and honor. Assertiveness is not achieved by force but rather by behavior that clearly establishes honest thinking and feeling. Assertiveness, therefore, means self-respect. This is character of putting others at their ease, and never saying or doing anything to wound their sensibilities.

### **Sharia Influence on Consumer Satisfaction**

The results of regression analysis in Tables 5, 6, 7, and 8 on Sharia variables and consumer satisfaction variables namely, motives, participation, perception and buying decision respectively indicated the Sharia's influence on consumer satisfaction. In Table 5, a linear

dependence of consumer motives on Sharia variables indicated by  $R=0.237$  with an F value of 2.450 at 0.05 significance. Only 6 percent of the variation was explained by Sharia variables. In Table 6, a linear dependence of consumer perception on Sharia variables was revealed by  $R=0.425$  with an F value of 9.089 at 0.05 level of significance. Sharia variables contributed 18 percent of the variation in consumer perception.

The results in Table 7 show that consumer participation had linear dependence indicated by  $R=0.336$  on Sharia variables with an F value of 10.195 at 0.05 level of significance and contributing 12 percent to the variation, while perception had linear dependence on Sharia indicated by  $R=0.485$  with an F value of 9.089 at 0.05 level of significance as shown in Table 8. Buying decision had linear dependence of  $R=0.562$  with an F value of 15.267 at 0.05 significance level as shown in Table 9. It was also revealed that 31 percent of the variation in consumer buying decision was explained by Sharia variables. The t-test in Table 10 also revealed a significant difference before and during Sharia in consumer satisfaction variables, such as motives ( $t=12.82$ ), participation ( $t=26.96$ ), perception ( $t=15.12$ ), and buying decision ( $t=42.83$ ).

## **CONCLUSION**

A position that a business success premised on consumer satisfaction in this competitive environment, necessitates to refocus its development on human relations and its environment most especially in dealing with consumers. A need of character and traits that demonstrate a behavior of worthwhile business practices or the general concept of worthwhile living is imperative. Worthwhile living is affected by cultural influences but is not wholly determined by them (Hofstede, 2001), morality and religion are among others. A guide to good business practice may need to be rewritten, modified and updated in the light of cultural changes, but the core of morality, which is the cardinal virtues, is expected to remain constant as the basic

necessities of life. As Bassiouni (1998) pointed out that ethics, morality and religion are inseparable, thus the transformative potential of religion is accountable for the alterations in values, behaviors, and outcomes (Bowie, 1982). Thus, as religion operates to influence the business practices in relations with consumers, many of the characters and traits significant to satisfying consumers surfaced to influence the behavior of the entrepreneurs.

The insolvency causing stress, among the myriad of business problems suffered by those who act unethically is a strong ground why anyone in business has a reason to acquire virtues in life. Moral virtue is a disposition to blend emotion and judgment. Moral virtues are enabling. They enable entrepreneurs to feel as they should, to react emotionally to circumstances in an appropriate way. While moral virtues enable someone to act rationally and accordingly, to make choices on what should be regarded as desirable and permissible, social virtues promote peace in the community.

The moral virtues that seem most crucial in entrepreneurship are the dispositions to justice and humanity. Justice includes respect for people's rights and fair-mindedness. To understand people, one needs to have humanity. Associated with these virtues are temperance, courage, good temperedness, fairness, friendliness, and honesty. Temperance is not simply a matter of exercising self-control but possessing and showing sound judgment in the degree of importance. Obviously, those who are honest will demonstrate their attachment to honesty.

In sum, Sharia has influenced the conduct of business in satisfying consumers, which is the ultimate goal of an enterprise to remain competitive in the industry. It has molded the characters and traits of entrepreneurs essential to the disposition to justice and humanity, which is the key to entrepreneurial success. It is therefore imperative that the framework for entrepreneurial virtues be recommended.

## **ABSTRACT**

Marketing within SMEs is a contentious issue. SMEs are of course well aware of the importance and impact it can have, as well as the environment they operate within. However, one of the major problems that limits the use of the marketing function within SMEs is the lack of both sufficient financial and physical resources actually at their disposal. These resources will ultimately underpin any organisation's ability to utilise marketing in a professional and effective manner. The most researched area in services marketing to date is service quality and this specific interest in service quality indicates a requirement to improve total quality management and satisfaction throughout the business process.

The aim of this study is to examine whether the levels of service quality offered by a case organisation to its clients, as perceived by their clients, are dependent upon organisational size, geographic location and operating sector. Previous research undertaken with the service quality field through the implementation of the SERVQUAL framework emphasized the importance of recognising clients' combined expectations and perceived level of service in developing a level of service that would retain customers in the long-term.

The results of this research indicate that organisational size, geographical location and operating sector have an impact on some SERVQUAL dimensions. For instance, it was found that clients based in England perceived service levels to be higher with regard to the reliability and employee dimensions.

## **INTRODUCTION**

The contribution of the small and medium sized (SME) firm sector to the UK economy cannot be underestimated with it being both a major source of employment and income. With new and existing markets continuing to grow, the importance of the marketing function is therefore set to grow proportionately and will become a core activity undertaken by many, if not all firms in the SME sector.

In markets where there is a high degree of competition or a large selection of substitutes available to customers or businesses, customer retention is an aspect of the marketing function that can only be realistically controlled through services marketing leading to customer satisfaction (Wilson, 1998). Gaining strategic advantage through the lower price of products alone is not sufficient; quality also has a vital role to play in satisfying customers (Zeithaml & Bitner, 2003). Indeed, in a recent study, Carson (1998) identified that an approximate 5% increase in customer retention could lead to between a 25% and 125% boost in annual profits.

## **AIMS AND OBJECTIVES OF THE RESEARCH**

Delta Publications (a fictitious name) is a specialist publishing organisation producing a unique range of services since 1992. Delta Publications is based in Wales and operates within the leisure, tourism and entertainment markets, predominately producing town guides, maps and event guides, both in-house and in conjunction with local authorities and other commissioning bodies. Delta works with Town Councils and unitary authorities (local government areas) in Wales, in addition to numerous locations throughout England. Delta produces alternative services such as events guides for local theatres, and is currently launching additional new services such as corporate literature and printing. The organisation originally consisted of two employees when it was formed, and has grown gradually over the last decade to the extent where it now employs over ten employees.

The company wanted to discover whether or not its service quality is perceived in the same way depending on three attributes of its clients: their size, their geographical location and the type of their activity. Therefore, this research is exploratory in nature and attempts to find out

the impact of those attributes on service quality perception. In order to achieve this aim, three working hypotheses were formulated:

1. There are differences in SERVQUAL dimensions responses depending on Organisational Size.
2. There are differences in SERVQUAL dimensions responses depending on the Geographic Location of respondents.
3. There are differences in SERVQUAL dimensions responses depending on the sector that respondents are placed within.

## **LITERATURE REVIEW**

Definitions of service quality are generally based on the notion that it is the result of a comparison that customers are likely to make, through identifying their perceptions of how services are performed compared to their expectations (Grönroos, 1984, 2000; Parasuraman et al., 1988). Tenner and DeToro (1992) define service quality as co-productive, intangible and a non-repetitive experience. In addition, the authors believe that these encounters become personal experiences and require expectations and aspirations to be met in order for the relationship to continue.

An alternative view is that of Kotler (1997) who argues that clients are likely to purchase what they believe to be the highest customer delivered value. He identifies this as the difference between total customer value (benefits customers expect) and total customer cost. Kotler believes that customer satisfaction is maximised if customer value is high. This, in a way, concurs with the views of Tenner and DeToro (op. cit) albeit Kotler puts an emphasis on costs as a key element which influences the customer view of the service. As with all services that are provided there is the 'intangibility aspect,' and crucially clients would only wish to pay what they believe the service to be worth.

According to Brassington and Pettitt (2000), the key to developing a service is being able to provide one that is easily accessible. Christopher et al. (1994) however, argue that the challenge is to bring together quality, customer service and marketing to uphold customer satisfaction. Through identifying the attributes of service, Stone and Woodcock (1998) state that customers' views on the level of service typically include variables such as time taken to deliver the service, the extent to which the customer perceives the need to be in control, the effort required to receive the service, the relative importance of the service, the effort of the

supplier and the level of skill or professional expertise expected of the service staff. It could be suggested in reality that this is perhaps a limited selection of criteria, with little scope for determining alternative areas such as the performance level of communication systems or (importantly) reliability of service offered.

One of the most important ways of measuring service quality levels within an organisation is the SERVQUAL model. This model has emerged as one of the most popular methods used to measure service quality of an organisation and despite numerous criticisms, SERVQUAL continues to be utilised in many different industries even though it was initially utilised within the retail sector.

The SERVQUAL model as devised by Parasuraman et al. (1985, 1988, 1991), results from detailed studies based on focus groups that included representatives from four retailing sectors. The original components identified for evaluating service quality have been factored to five dimensions, which can be expressed as:

*Reliability*: defined as the ability to perform the service dependably and accurately.

*Responsiveness*: identified as the willingness of the service supplier's staff to assist customers and provide their service promptly.

*Assurance*: defined in terms of the ability, knowledge and courtesy of employees to inspire trust and confidence in how they deliver the service.

*Empathy*: defined as treating customers as individuals, through providing individualised attention.

*Tangibles*: The final dimension formulated is principally geared towards presenting the service in a physical manor. This includes facilities, equipment, personnel and communication tools.

The scale utilised with the SERVQUAL survey is based entirely on identifying clients' combined expectations and actual levels of service quality provided through determining clients desired level of service. Consequently, it will be impossible to examine clients' expectations individually, although results from the survey are likely to indicate their expectations are lower, the same, or higher than the service they have received. The level defined by the client will only be determined as positive when the service provided meets or exceeds the client's expectations.

One of the major advantages of SERVQUAL is that it can both determine the level of service expected by clients, combined with the perceived level actually being received. Therefore, SERVQUAL allows a direct measure of service quality through quantifying ratings for each attribute.

Even though there has been a significant amount of research conducted using the SERVQUAL, there are still a number of issues that it fails to fully address. Indeed the model fails to develop and recognise the expectations of consumers in an effective and constructive way (Cronin and Taylor, 1992; Carman, 1990). Over the past decade or so, many improvements and refinements have been made to help make the model both more effective and more reliable. One example is a the series of minor adjustments made to re-order the sequence of the items as well as reduce the number of factors and these have assisted in making the model more effective (Caruana, 2000).

## **METHODOLOGY**

A sample of 350 organisations was randomly selected, using a random numbers table, from the Delta Publications client database (approximately 35% of total clients).<sup>1</sup>

The modified version of the SERVQUAL by Gilbert and Wong (2003) was used to measure various aspects of Delta Publications services. The scale contained 24 combined expectation and perception items. These were placed within six service quality dimensions. The questionnaire is based on Likert alike scale ranging from one to nine, with one representing 'lower than my desired service level' and nine indicating 'higher than my desired service level'. Slight modifications were made to the scale such as the wording to suit the advertising industry context where the case company is active (see appendix). The second section to the SERVQUAL survey allows weighted scores to be taken into account, measuring the relative importance and rating the most important of all of the six service dimensions identified by clients.

The Questionnaire utilised within this study was 'piloted' to ensure it was unproblematic to complete, and to determine the willingness of respondents to answer sensitive questions.

---

<sup>1</sup> To ensure that the response rate was as high as possible it was decided that follow up telephone calls and e-mails would be made to encourage all respondents to complete the questionnaires after the initial two week deadline passed.

## DATA ANALYSIS & INTERPRETATION

### Response Analysis

The response rate for the questionnaires was initially just 31.1 percent (109 returned responses), which represents an average rate of return for this type of survey in the UK advertising industry. However, the follow-up phone calls and emails increased the response rate to 54.5 percent (191). After initial analysis of the questionnaires four responses were not completed appropriately and were consequently discarded. A total response rate of 53.4 percent (187 responses) was therefore available for more detailed analysis. With regard to non-response, the most common answers on follow-up were that clients stated that they either did not have the time to complete the survey or no specific interest in taking part in the research.

### Descriptive Analysis

The main variables examined here are the SERVQUAL dimensions in addition to those factors postulated to affect the service quality levels as discussed in the introduction. As stated above these are geographical location, organisational size and operating sector.

### Company Location

The analysis indicates that the majority of client responses (77 percent) were forwarded from Wales, while one fifth (20 percent) were based within England. Delta Publications primarily operates within Wales although has been venturing into England over the last few years to secure additional clients. The corresponding results are presented below in figure 1.

---

Figure 1 about here

---

### Size of Client Organisations

Figure 2 illustrates the mix of firm sizes that make up the client base of Delta Publications. This is a typical picture for the publishing and advertising sector, especially for companies

based in Wales. 51 percent of the client firms were ‘small,’ using the DTI definition: micro [0-9], small [10-99], medium [100-499], and large [500 and more] (Tonge, 2001). A further 38 percent were identified within the ‘micro’ category, with 9 percent identified as ‘medium sized’ and a final 2.1 per cent were large.

---

Figure 2 about here

---

### **Client Industrial Sectors**

The majority of Delta’s clients were identified within the Hospitality (24 percent) and Retail sectors (20 percent) followed by the manufacturing and construction together at 11 percent. The smallest category evident was the Finance/Insurance and real estate industries with 2.7 percent of responses recorded (Figure 3).

---

Figure 3 about here

---

### **Service Quality Attributes**

This section outlines descriptive results of the SERVQUAL dimensions for the whole sample of 187 respondents. The results are illustrated in figure 4 and show that reliability comes first with a mean of 6.37 followed by employees, tangibles and responsiveness with means above 5. This suggests some degree of satisfaction with these dimensions. The empathy and assurance means, however, are just 4.96 and 4.24 which is not as convincing. There appears to be a general feeling that staff are adequately responsive in reacting to clients’ needs, although it is evident that there is a lack of confidence in the employees’ abilities to answer client queries in a consistently courteous manor.

Figure 4 about here

---

## INFERENCEAL ANALYSIS

The main aim of the inferential analysis is to test the forwarded hypotheses of this study. In effect, the objective is to determine whether or not there is a difference in SERVQUAL dimensions (levels of service) responses depending on the selected three factors: geographical location, organisational size and operating sector.

### **1. The impact of organisational size on SERVQUAL dimensions:**

In order to test hypothesis number one, an independent samples t-test was undertaken to test whether there are significant differences when controlling for organisational size. To achieve this, micro and small clients were collapsed into one group ( $\leq 99$ ) and medium and large clients ( $\geq 100$ ) were collapsed into a second group. The means for the small and medium grouped are shown in Figure 5. The results of the statistical test, in Table 1, show that there are differences but are only statistically significant in terms of two dimensions: reliability and employees, where the levels of significance are 0.04 and 0.03 respectively. Figure 5 below illustrates the mean differences of SERVQUAL dimensions graphically.

---

Figure 5 about here

---

---

Table 1 about here

---

Preliminary observation of the results appear to uphold the findings of Kandampully (2000) and Beaumont & Sohal (2002), who identified that combined levels of expectations and desired service are essentially determined by the expectations of the service recipient, which in turn vary depending on the size of the organisation. It can be suggested that organisations that are larger in terms of employees, have overall higher expectations in the level of service for both the reliability and employees dimensions, which are actually being met. The mean

values presented within the group statistics clearly illustrate this. It is perhaps worthwhile here to note the views of Stanley & Wisner (2002) who suggests that there is a requirement on service providers to deliver a consistent level of service to all clients, regardless of their size.

The corresponding results possibly indicate both Delta and its employees aim to provide higher levels of service to larger organisations. This may well be evident as larger organisations are considered important clients that acquire high revenues for Delta. Providing higher levels of reliability to larger organisations that have monitoring processes to judge service quality is deemed essential. Zeithaml & Bitner (2003) confirms that “service providers that are not recognised as reliable fail their customers in the most direct way”. The ability of firms to develop relationships with clients is an objective achieved through the employees of the service provider. With results indicating higher mean values for combined expectation and perceived service levels amongst larger organisations, it is clear that employees aim to satisfy and provide higher service levels to this client grouping.

In examining the other dimensions, responsiveness, assurance, tangibles and empathy were all found to have no statistically significant difference between the two groups of organisations.

It is interesting to discuss why the remaining dimensions did not indicate a significant difference. It is possible that clients in the two separate groups did not identify these dimensions as important and consequently combined expected and desired values were not significant. There is certainly an indication that client expectations could have been influenced by past experiences of Delta’s or other organisations’ service, thus affecting the clients’ current perception of these particular service attributes. In addition, it is quite possible that implicit, explicit or exaggerated promises made by Delta are not being fully delivered to clients. These would take the form of personal and non-personal statements made by the organisation towards clients, in addition to the service cost and the tangibles that are utilised to present the service to clients. If these implicit and explicit promises have been well presented but the service provided does not match the clients’ expectations, lower service levels would be identified by all clients (Robledo, 2001; Zeithaml & Bitner, 2003).

## **2. The impact of geographical location on SERVQUAL dimensions:**

Once again, two independent samples t-tests were conducted to test whether geographical location has an impact on SERVQUAL dimensions. The two regions being tested for difference in terms of the attributes being Wales and England and shown in Figure 6. The results of the test shown in table 2 below indicate that the reliability, employees and responsiveness dimensions are significantly different, with the first two dimensions significant at 0.05, while the last is significant at 0.1.

---

Figure 6 about here

---

In discussion of these results, it is possible that these are attributable to the performance of the staff working in the England area. Delta Publications have only started recently to operate within new districts within this location and are keen to develop its service so a good perception of the company can be built up. The sales manager has been identified by the Delta management as being able to effectively communicate Delta's services in these locations. In addition, it is believed Delta Publications has prioritised these new locations in terms of distributing the service, in comparison to other areas in order to expand the client base within these regions.

---

Table 2 about here

---

In examining the remaining dimensions that did not show a significant difference, it can be identified assurance tangibles and empathy demonstrated lower levels of combined expectations and desired service within Wales. These results possibly indicate clients have lower expectations of the service provided in Wales due to previous experience of Delta's service and implicit and explicit promises not satisfying clients' expectations. This can be related to the views of Zeithaml & Bitner (2003) who suggest past experience is a key determinant of influencing client's current expectations and perceived level of service.

These results raise a further series of questions. For example, are Delta Publications attempting to satisfy English clients more because they want to get a foothold in the market? Or are clients in Wales more aware of Delta services, and do not expect and are similarly not satisfied with the service they receive?

Alternatively, it may be that service levels have weakened through Delta not matching client's expectations, through implicit and explicit promises made within Wales (i.e. the service responsiveness delivered has not met their perceived expectations)

### **3. The impact of activity sector on SERVQUAL dimensions:**

In order to test the last hypothesis, one way analysis of variance (ANOVA) was carried out to determine if any differences were apparent between organisation sectors (12 groups) and service quality. Table 3 below show that there is no one result that is significant at all. Further analysis was carried out where some small groups were collapsed but the results were not statistically significant as well. A t-test for the main two groups (retail and hospitality) was carried out and still the results were not significant. Therefore, it was concluded that we do not have enough evidence to conclude that the sector activity affects SERVQUAL dimensions.

---

Table 3 about here

---

These results are interesting. They appear to suggest that high quality of service is the general expectation of all clients regardless of their sector of activity. Given that significant differences were identified in terms of some aspects of quality for both geographical location and organisational size, this is clearly an area that warrants further investigation. Future work will attempt to identify for Delta Publications any differences that exist when the data is stratified by (a) organisational size and activity sector and (b) geographical location and activity sector.

## **SUMMARY AND CONCLUSIONS**

The main aim of this study was to examine whether certain attributes of clients affected SERVQUAL dimensions. In terms of Service quality, the level currently provided to clients

did vary between each of the SERVQUAL dimensions. Furthermore, the results clearly indicate Delta Publications is perceived by clients as being generally proficient in providing their services reliably through the fine performance of their employees.

The management of relationships is a key issue and one which has not been measured within this study; however it is an integral element in maintaining service quality levels (Zeithaml & Bitner, 2003). Ideally, Delta can achieve this through meeting client expectations and desired service levels, which can be formulated through accurately performing to the implicit and explicit promises previously made.

In discussing the primary areas related to service quality, the study principally focused on whether or not there is a difference in SERVQUAL dimensions (levels of service) responses depending on organisational size, geographic location and operating sector. These findings provided an extended perspective of possible influences of service quality in respect to the case organisation. It was identified through analysis that only the reliability and employees dimensions were dependent upon organisation size; larger organisations provided higher values, clearly suggesting that combined levels of expectations and desired level of service are essentially determined by the expectations of the service recipient, which in turn vary depending on the size of the organisation (Kandampully, 2000 and Beaumont & Sohal, 2000). In this case specifically, it is recognised Delta Publications and their employees aim to provide higher levels of service to larger organisations due to the financial means these firms ultimately provide.

Information collected in examining if there was a difference in service quality levels dependent on geographical location clarifies that only three dimensions were related (reliability, responsiveness and Employees). In general terms, clients based in England perceived service levels to be higher; this provides sufficient evidence to indicate that clients in Wales do not receive a service that is of as high quality. It may be concluded through applying the expectation model (Zeithaml & Bitner, 2003), that previous experience and word of mouth may have resulted in lower expectations being formulated amongst clients in Wales.

The analysis found no specific difference in service quality levels between clients in different operating sectors. It was acknowledged it would have been difficult to establish which sectors

were likely to hold more financially prominent and larger organisations that could undertake monitoring and analysis of the services they receive; consequently having higher expectations. It was also determined that each sector clearly held a mixture of organisations that were of varied sizes, financial stature and held mixed expectations of Delta Publications services.

It can be suggested that service quality problems often require major effort from service suppliers over a long period of time to resolve, since service quality is more dependent on people than systems and procedures. Attitudes and perceptions will take longer to transform than procedures alone, so it is difficult for managers to keep their attention focused on the problem and remove the root causes of quality deficiencies (Zeithaml & Bitner, 2003).

In examination of service level areas, there certainly needs to be a more consistent approach in developing all service levels and constantly achieving higher levels of client satisfaction. More specifically, developing relationships further with clients through being more responsive, empathetic and reassuring in dealing with client problems is a key area for development. Furthermore, employees need to be more consistent in satisfying all clients and not those who are acknowledged as more important to the firm.

## **ABSTRACT**

This research focuses on the practices employed by both small and large firms to keep abreast of rapid change in a high technology industry. The challenge of remaining constantly up to date is especially acute for firms that provide technology services, so we selected the Information Systems Services Providers (ISSP) industry as subject. Since ISSPs face extremely rapid technological change and have high incentive to keep abreast, we feel they may well have developed keeping abreast “best practices” that are being revealed through this research.

Through case studies of fourteen successful ISSPs of both small and large size we determined that keeping abreast is best accomplished via a portfolio of nine approaches, each distinct in character. The portfolio includes traditional methods such as customer and vendor relationships, employed in new ways, and still evolving approaches such as tech labs and communities of interest. The best implementations of the portfolio involve considerable interaction and integration among the individual approaches, resulting in a keeping abreast “system” for the organization. We found that small firms are capable of employing the full nine-method portfolio, but tend to devote uniformly lower levels of resources to these methods. Since small ISSPs operate profitably and grow rapidly, they apparently enjoy efficiency or other advantages in leveraging resources to keep abreast. We offer some possible explanations. We believe that many of our findings can provide small business managers with insights useful in keeping abreast in a variety of industries and markets.

## **INTRODUCTION**

Small business organizations in high-technology industries face a significant challenge in keeping abreast of rapidly changing technologies, as do their larger counterparts. Small businesses must be equally up to date, with comprehensive awareness of how new technology can be exploited in pursuing new opportunity and solving the problems of their customers.

However, small businesses typically cannot afford to devote as many resources to keeping abreast as do their larger competitors. How do small businesses manage to hold their own in meeting the challenge of keeping abreast?

The organic model of organizations posits an active relationship between organizations and their external environments (Burns and Stalker, 1968; Galbraith, 1977; Kanter, 1984; Morgan, 1986). Very rapid change in the external environment causes environmental turbulence and a high level of uncertainty about the future (Daft and Lengel, 1986) that can constrain organizational success (Stinchcombe, 1990; Galbraith, 1977). Getting the right information – “the news” – about these uncertainties becomes a critical goal of organizations facing rapid change (Stinchcombe, 1990). Organizations that fail to interpret the environmental changes adequately cannot respond and often do not survive those changes.

In times of severe environmental turbulence, organizations gather and process more information about the environment and develop more lines of inquiry into it (Daft and Lengel, 1986; Lozada and Calantone, 1996), thus leading to the development of more formal systems to acquire and process that information (Stinchcombe, 1990). We reasoned that the emergence of these types of systems ought to be observable in both small and large organizations that are in a high-tech, rapidly changing environment.

## **RESEARCH DESIGN**

Our research involves case studies of fourteen corporate Information Systems Services Providers (ISSPs), including both small and large firms. For the purpose of the study, an ISSP was defined as a firm that, as its core competency, helps customers manage their business information through the design and implementation of information systems, telecommunications networks, and computer hardware. ISSPs were chosen as the study subject for two reasons: 1) because the information technology environment within which ISSPs deliver their services is a high-tech industry that is currently experiencing increasingly rapid technological growth; and 2) because this industry is central in supporting so many important rapidly growing firms.

The case study population is divided between small and large firms, allowing a useful comparison of the approaches taken to keeping abreast and the success achieved therein by the two groups. The small firms (four) ranged in number of employees from 120 to 570 and averaged 360 employees, while the larger firms (ten) were all larger than 1,000 employees. Seven of these fourteen firms have a customer focus primarily on the government market, while the other seven have either a split focus or favor the commercial sector. Customer focus distributes about evenly between the small and large firms.

Despite differences in size and customer focus, all fourteen ISSPs studied provided a full range of information technology services for their customers. These services included: advising on trends and specific technologies; procuring technologies; integrating technologies into systems; developing new software; and helping to maintain and update systems. The core knowledge required for the ISSPs to provide these services changes rapidly in this industry, requiring vigorous attention to keeping abreast in order to achieve business success.

An interview-based approach was used to explore the keeping-abreast approaches used by the subject ISSPs. An extensive framework of expected behaviors was developed based on the existing literature and this framework was used in constructing the interview guide. Several open-ended questions allowed for the exploration of several new behaviors identified by interviewees and these new behaviors were then added to the framework. Interviewees were the cognizant senior executives involved in technology management – CEO, COO, CIO, etc. – whether small or large firm.

## **RESULTS: THE KEEPING-ABREAST PORTFOLIO**

We have found that new approaches to keeping abreast of rapidly changing technology are emerging as the pace of technological change increases. The ISSPs in our study, whether small or large businesses, do not rely predominantly on a single practice or unit – for instance, an advanced technology group – to keep them up-to-date. Instead, the most effective ISSPs employ a variety of approaches, managing them as a portfolio of keeping-abreast activities that interact and reinforce one another.

We have identified nine distinct types of keeping abreast activity, all potentially available to well-managed ISSPs of any size. These approaches include only those present in the majority of our subjects and for which a spectrum of organizational commitment was evident from the interviews. The nine keeping-abreast approaches that met our tests and are included in the standard keeping-abreast portfolio are:

- Vendor relationship programs
- Technology gatekeepers
- Staff learning programs
- Communities of practice and interest
- Customer relationship programs
- Formal scanning units
- Technical laboratories
- Internal projects
- Research and development.

These methods are listed in the approximate order of their apparent “importance” to the population of fourteen ISSPs studied. Importance was judged on the grounds of the level of organizational commitment to the approach, as discussed below.

Several keeping abreast approaches that were mentioned in a limited number of cases do not meet the tests for inclusion in the standard portfolio. Professional networking is an example. Although mentioned quite often, none of our corporate subjects formalized or structured the use of this approach. Explicit objectives were not stated nor were personnel committed to managing the activities in this area. Other approaches mentioned but not included in the standard keeping abreast portfolio are corporate information centers, competitor intelligence, and participation on external standards committees. In time, or in other industries, some of these practices and others

may be found to be sufficiently wide-spread in their utilization that they would be incorporated in a standard keeping abreast portfolio.

## KEEPING ABREAST APPROACHES

**Vendor Relationships.** The intent of the vendor relationship is to get the news first about changes in the vendor's products in order to anticipate the effects that those changes can have on the implementation of the products. Key elements of organizational commitment include the assignment of a liaison to manage the ISSP's vendor relationship, the development of a contractual relationship (or some kind of shared expectations) with the vendor, vendor training, involvement in vendor user groups and attendance at vendor sponsored conferences, site visits, exchanges of marketing leads, and vendor certification programs.

An important issue for an ISSP is whether to focus on one or two key partners in each important technical category or to develop relationships with as many vendors as possible. Small firms may often prefer the former since it is more economical in terms of time and resources. This approach, however, can make the ISSP dependent on a particular vendor and in turn jeopardize the ISSP's ability to adapt to changes in the long run. The many-vendor approach, which is more easily practiced by a larger firm, allows broader coverage of the technology front.

**Technology Gatekeepers.** The intent of this popular source of keeping-abreast information is to provide trusted, highly-skilled liaisons between internal and external professionals and their technology communities. Key elements of organizational commitment include formal identification of gatekeepers; a budget allocation for gatekeeping activities, such as training and travel to conferences and vendor sites; and development of a career path that encourages senior professionals to serve in that role in preference to moving into a management role (usually horizontally).

For the smaller, more resource-constrained ISSP businesses, it is important to make use first of all resources that are close at hand (Strandholm and Kumar, 2003). Since gatekeepers arise naturally in most organizations (Nochur and Allen, 1992), they are available to have their expertise tapped by the strategic planning group. A number of the larger ISSPs we studied have enhanced the technical career path so that technologists can rise to the same levels of respect and compensation as managers. This may often be less of an issue in small businesses because of the greater tendency for key professionals to "wear many hats."

**Staff Learning.** The intent of staff learning is to develop keeping-abreast ability and responsibility within each professional staff member. Organizational commitment is driven primarily by the understanding that the individual's own ability to keep up with change will eventually determine the organization's ability to keep up. In addition, as the management literature over the last decade indicates, the interplay of individual and organizational learning is a source of innovation and organizational growth. Elements of the staff learning approach include the creation and management of individual development plans, annual quotas for required training for each employee, incentives for advanced levels of training and education.

Small businesses may have difficulty devoting the resources to establishing formal programs for integration of a training plan with career path counseling. Large firms, which can more easily afford to integrate training and career progression, have another kind of problem, though. They often look to training as an early source of cost savings, and tend to make such decisions more remotely and less selectively than can small firms. Thus, in the overall sense it may be easier for a small firm to align training with the firm's strategic direction.

**Communities of Practice/Interest.** The intent of this approach is to provide a way to use natural and field-centric social structures to maintain intimate contact with particular technology sub-sectors. Brown and Duguid (1998) describe communities of practice and interest (COP/I) as groups within the organization that share meaning and sense-making about the "know how" aspect of a particular subject. Particularly important to ISSPs are technology areas core to the ability of the firm to deliver services or those representing a developing trend or emerging technology. Our interviews indicate that COP/I are gaining in importance and formality within ISSPs.

Large firms appear to have some clear advantages in this area. One large firm we studied has structured technology focus groups (TFGs), and had seventeen of them functioning at the time our interviews were conducted. These TFGs coordinate through the firm's technology resources center and are responsible for maintaining the area of the corporate knowledge base that is dedicated to their subject of interest. Small firms today are not far different from large firms in their ability to access scientific and technical information. Topical Internet forums represent a virtual professional COP/I that levels the competitive ground. In addition small firms, or small units of large firms, may be able to exploit the oft-cited small business advantage of greater responsiveness to change in their use of COP/I. For example, one firm we studied described one of their processes as: "Communities of interest spring from the bottom up and are all totally on their own in terms of resources." Moreover, small firms have a potential advantage over large firms in that their strategic planning groups have easier access to knowledgeable technologists who may have unique technology strategy insights. Key professionals are easier to identify and typically much closer to the level of the decision maker in small firms. Large firms can compensate to some degree if their COP/I can play an accumulator role, gathering input from the members of each community, extracting and validating the important elements from the accumulated knowledge, and passing the results on to the planning group.

**Customer Relationships.** Customer relationship management plays an interesting role as part of the keeping-abreast portfolio. The intent in this approach is for key customers to take the lead in important developments. The elements of this approach include identification of "lead users" (Von Hippel, 1986), assignment of a semi-permanent customer representative within the ISSP, mechanisms to gain input from the customer for use in planning, and mechanisms to get feedback from the customer for use in improving service delivery. Resources committed to the customer-relationship approach include the time of the customer representatives, infrastructure support in terms of information systems and communication for managing customer contacts and feedback, expenses for travel to customer sites, and potentially expenses for bringing customers together with the ISSP to work on specific ideas in larger groups.

Small businesses have the potential to leverage their traditionally-motivated customer relationships – those intended to promote customer satisfaction and loyalty – to enhance their success at keeping abreast. In small businesses it is not unusual for technically sophisticated employees or technology managers to be closer to the customer than in large firms. This comes about through purposeful or expedient structuring of units that manage traditional customer relationships so as to also facilitate customer access for their technology developers and applications specialists. In large firms customer relationship management tends to be more protected. Units established to build customer satisfaction, for example, may be organizationally distant from and not particularly friendly to those that exist for the purpose of gaining technology learning from the customer. We found examples in large firms of very mature, highly structured customer-relationship management programs that have little or no relationship to the ISSP's keeping-abreast activities.

**Formal Scanning Unit.** The intent in this case is to establish a unit that has formal responsibility for scanning and evaluating technology trends, for making recommendations for adoption of new technology, and for providing input for longer-term planning. The unit may reside in a stand-alone group dedicated to scanning or it may be attached to some other organizational unit, such as the technology laboratory (see below), the planning organization, or the ISSP's IT architecture group. The unit will have some dedicated staff and in many cases will have a required reporting connection of some sort with the planning process.

Small businesses appear to have a fairly strong disadvantage relative to large firms in this keeping abreast approach, in that the amount of resources devoted to the effort is more limited. On the other hand, a small business may choose to assign responsibility for some of the more sophisticated scanning activities to a working professional on a part-time basis. This can offer a much more insightful quality of scanning compared to a large firm's scanning staff who would typically have lesser technological qualifications.

**Technology Laboratories.** The intent of this approach is to provide a dedicated unit that stages IT products and offers a ground for experimentation, demonstration, and learning. Various roles for the technology lab include a demonstration center for customers, a setting for the installation and testing of new products, and infrastructure and support for experimentation and integration. The elements of the technology laboratory include dedicated space for the laboratory, hardware and software required to run the various applications, staff and budget assigned to the maintenance and operations of the laboratory, and specific metrics and expectations for governing the lab's performance during the year.

Some organizations have entertained the idea of a technology laboratory and rejected it. This decision may be based on economic rationale, as in the case of one of the small business ISSPs we studied ("I can't imagine getting enough value out of it to warrant the expense of creating and staffing it"). Or based on experience, as in the case of one of the large business ISSPs we studied ("We used to have a dozen labs but decided we could get more bang for the buck by distributing the resources to the people who need them most – the projects.") The tech lab is one of only two keeping-abreast approaches that show evidence of having been tried and then rejected. (The other is the research and development approach described below).

**Internal Projects.** The intent of the internal projects approach is to develop superior understanding of the product in real-world applications and then to transfer newly developed skills to other work. The elements of this approach are: 1) projects that are intentionally selected for learning; 2) staff who are assigned for the specific purpose of learning and assisting in transferring new technology; and 3) mechanisms developed for transferring learning from the specific project to other parts of the organization. Internal projects may be undertaken for business reasons that have nothing to do with keeping abreast, per se, but because of the newness of the technology to be implemented, they still offer a keeping-abreast opportunity. Or projects can be selected because the ISSP wants to learn a new technology internally before assuming the risk of external failure by offering it to a customer.

Internal projects have been cited as one of the important sources of new information and innovative ideas for the organization (Leonard-Barton, 1995). Nonetheless, the ISSPs in our sample, whether small or large, gave little evidence of having evolved this approach to a high level of organizational commitment.
