## ABSTRACT

*The purpose of this paper is to examine the important role of small start-up firms in creative destruction. We begin with the exploration of innovation in Abernathy and Clark's "Innovation: Mapping the Winds of Creative Destruction". We find that innovation, while admittedly an important driver of economic growth, is not a sufficient condition to bring about creative destruction. The type of innovation most closely associated with creative destruction, namely disruptive, discontinuous or radical innovation, is significantly more likely to occur in small or newly formed companies than in large incumbent firms. Hence, we argue first, that entrepreneurial innovation, that is, innovation by independent new companies, is the actual driver of creative destruction, and second, for a narrow definition of entrepreneurship that is limited to new independent firms.*

## INTRODUCTION

In 1985, William Abernathy and Kim Clark published "Innovation: Mapping the Winds of Creative Destruction" (1985). Their purpose was "to develop a descriptive framework that may be useful in categorizing innovations and analyzing the varied role they play in competition." The authors also wanted to "develop concepts that may prove useful in the effort to incorporate technological consideration into business strategy, and perhaps in developing appropriate public policies" through "intensive analysis of the technical and competitive history of the US automobile industry"(Abernathy & Clark, 1985: 4). In the process, though only briefly, they began to shed some light on the mechanics of "creative destruction" (Schumpeter, 1934). Two decades later we revisit the topic to shed some light on the distinctions between innovation and entrepreneurship, through exploring the role of each in creative destruction.

There has been a growing tendency in the entrepreneurship literature to conflate the concepts of innovation and entrepreneurship, rolling corporate innovation and new business creation together under the heading of entrepreneurship. Shane and Venkataraman, for instance, "argue that entrepreneurship does not require ... the creation of new organizations" (Shane & Venkataraman, 2000). This dilution of the concept of entrepreneurship also obscures the differences between ordinary competition and Schumpeterian "creative destruction". Abernathy

and Clark, arguing that innovation is the engine that drives creative destruction, give support to this conflation of concepts. We argue that innovation alone is not sufficient to bring about the process of creative destruction, but that the innovation needs to be both a specific type, disruptive, and occur in a new, independent firm. Further, we conclude that this distinction is important enough to narrow the definition of entrepreneurship to innovation which is associated with the creation of new firms.

### ***Schumpeter's Innovation***

According to Schumpeter, the innovative process creates market disruption which leads to the rise of new firms and the simultaneous decline of the large incumbent firms which they replace. This occurs through the introduction of "...the new commodity, the new technology, the new source of supply, the new type of organization (the largest-scale unit of control for instance) - competition which commands a decisive cost or quality advantage and which strikes not at the margins of the profits and the output of the existing firms but at their foundations and their very lives" (Schumpeter, 1942: 84). This is fundamentally different from general equilibrium theory, where competition is primarily price-based. In this model, competition ceases to be based solely on price, and instead is based heavily on non-price aspects of a product such as features and performance — shifting the basis of competition from cost minimization to innovation.

Mainstream economics, grounded in general equilibrium theory, began to recognize the importance of innovation for economic growth with the introduction of "new growth theory" (Solow, 1956, 1957; Romer, 1990, 1994). However, this model viewed innovation as occurring in a smooth, continuous manner, ignoring the variable nature of it. Further, it makes no allowances for the nature of innovation, nor the way in which innovation impacts competition. Abernathy and Clark recognize this and attempted to establish a framework for understanding innovation. However, despite the title of their paper, they did not describe the role of that innovation in creative destruction; in fact, "creative destruction" is only mentioned once outside the title in the whole paper. Rather, they explore the role of innovation generally as a basis for competition and economic growth.

Baumol (2002b) refines the role of innovation in economic growth, arguing that the routinization of innovation is the primary driving force behind growth in the capitalist system, and calling for "economists to devote more effort to discuss the process of innovation and growth" (Guarino & Iacopetta, 2003: 3). Schumpeter believed that the routinization of innovation would lead to the concentration of wealth in the hands of a few large corporations, leading to the decline of capitalism and the rise of socialism (Schumpeter, 1942: 132-134). However, Baumol apparently does not see routinization as posing a problem (Guarino & Iacopetta, 2003: 7).

So far, Baumol has been right: Schumpeter's prediction has not come to pass. At the same time, however, Baumol presents a persuasive argument that the routinization of innovation Schumpeter feared, is, in fact, occurring. Large companies have become very efficient innovators, yet their skill at innovation appears to be unequally distributed across the spectrum of types of innovation. We need to understand different types of innovation in order to understand why this is so.

### ***Types of Innovation***

In their attempt to develop a framework for categorizing innovation, Abernathy and Clark group innovations according to their effects on competencies on one axis and linkages to customers on the other. In their own words:

The differences in organizational environments in each mode of innovation implies that a transition from one phase to another may pose a significant challenge to established firms. This suggests the need to examine the impact of innovation on market structure during periods of transition, as well as implications for management. Historical evidence suggests that the creation and development of technology-based industries leads the industry from quadrant to quadrant. (Abernathy & Clark, 1985: 21)

They call their framework the “transilience map”. This framework is reflected in later work on innovation and technological change. For instance, Abernathy and Utterback (1988) deal primarily with the competency related issues of innovation, while Bower and Christensen (1995) focus more on the customer linkage aspects of “disruptive innovations”, yet each recognizes that both aspects of the theory are important.

In the transilience map, the four quadrants of innovation are “regular” on the lower left (conserves both competencies and linkages), “niche” (conserves competencies but disrupts linkages), “revolutionary” (disrupts competencies but preserves linkages) and “architectural” on the upper right (disrupts both competencies and linkages). In later work with Henderson, Clark presents a variation of the framework, with similar quadrants, although “architectural” and “radical” (“revolutionary”) seem to have switched places (Henderson & Clark, 1990). For many purposes, however, it is sufficient to use a single scale, which cuts diagonally through the transilience map from minimal to maximum disruption. Later authors use this type of categorization, with minimally disruptive innovations being called evolutionary, sustaining, or incremental, while at the opposite end are disruptive, discontinuous, revolutionary, or radical innovations.

Other innovation typologies are compatible with this basic model. For instance, in the “product” and “process” categorization (Utterback & Abernathy, 1975; Utterback, 1978; Abernathy & Utterback, 1988; Utterback, 1994), high levels of “product” innovation tend to be correlated with disruptive innovation, while high levels of process innovation tend to go along with sustaining innovation. The routinized innovation conducted in large firms tends to be predominantly sustaining and process innovation, whereas the innovation introduced by small firms is more likely to be disruptive and product innovation (Tilton, 1971). Here we begin to see evidence of creative destruction happening through technological change.

### ***Creative Destruction***

There is an increasing recognition of the importance of innovation in the economy (Foster, 1986; Scherer, 1999; Baumol, 2002b), but relatively little discussion of how that innovation, or more specifically, what types of innovation, contribute to creative disruption. Abernathy and Clark deal only briefly with this issue: “It is at these points of transition [between quadrants on the transilience map] that originating firms exit and are replaced by new firms better able to manage in the new mode” (1985: 21). However, they do recognize that radical change “is at the heart of Schumpeter’s theory of innovation and economic development in which ‘creative destruction’ is the vehicle of growth” (1985: 6)

Schumpeter believed that neo-classical theory did not properly explain the economic process, particularly in regard to innovation and technological change (Schumpeter, 1939). He described a process in which “new combinations [innovations] mean the competitive elimination of the old” (Schumpeter, 1934: 67) and referred to this process as a “perennial gale of creative destruction” (Schumpeter, 1942: 84). More specifically, for Schumpeter, innovators reform or revolutionize the pattern of production by exploiting an invention, or, more generally, an untried technological possibility for producing a new commodity or producing

an old one in a new way, by opening up a new source of supply of materials or a new outlet for products, by reorganizing and industry and so on (1942: 132).

Schumpeter emphasized how important this process is: (1942: 83)

The opening up of new markets, foreign or domestic, and the organizational development from the craft shop and factory to such concerns as U.S. Steel illustrate the same process of industrial mutation—if I may use that biological term—that incessantly revolutionizes the economic structure *from within*, incessantly destroying the old one, incessantly creating a new one. This process of Creative Destruction is the essential fact about capitalism. It is what capitalism consists of and what every capitalist concern has got to live in.

Christensen (Bower & Christensen, 1995; Christensen, 1997, 1998) Utterback (1994) and others have talked about the role of technological change in bringing about the fall of leading firms. While they generally do not mention Schumpeter and creative destruction, it is clear that what they are describing is the creative destruction process as viewed at the firm and industry level. Over and over again, they describe instances in which large, leading incumbent firms are brought down by their inability to change and adapt to radical new technology. A glance at economic history (i.e., Schumpeter, 1939) shows that this is not a new phenomenon, but has been going on at least as long as the Industrial Revolution, perhaps longer.

### ***Sources of Disruptive Innovation***

If disruptive innovation, as recognized by Abernathy and Clark, and demonstrated by repeatedly by others (see above) is the driver of creative destruction, it follows that we must identify the sources of disruptive innovation. Going back to the transilience map, we notice an interesting fact: in Abernathy and Clark's study of the automobile industry, the most disruptive innovations (which they call "Architectural") occurred early in the industry's evolution. In fact, these innovations all occurred before any of the other types of innovation, early in the lives of the firms studied. This is, in fact, the key point. Research has shown that new entrants are not only major innovators (Gellman, 1976; Futures Group, 1984), but also more likely than incumbents to introduce radical innovations (Tilton, 1971; Abernathy & Utterback, 1988; Scherer & Ross, 1990). According to Schumpeter, "new combinations [major innovations] are, as a rule, embodied, as it were, in new firms which generally do not arise out of the old ones but start producing beside them" (Schumpeter, 1939: 66). These new entrants are, of course, entrepreneurs.

It is not impossible for large firms to introduce disruptive innovations, but there are significant internal pressures, from risk aversion to organizational inertia (Burgelman & Grove, 1996) and external pressures, like the demands of existing customers (Christensen & Bower, 1996), that combine to make it much more likely for large firms to engage in incremental and process innovation. Routinized innovation, by its very nature, excels at these types of innovation. But it is in new, independent firms, missing the organizational constraints against radical innovation, where the disruptive technologies are most likely to be developed. **Furthermore, new independent firms do not have an existing group of customers demanding improvements to existing technologies.** Many of the most important innovations of the century, from the airplane to the zipper, occurred in small firms (SBA, 1995).

When an entrepreneur introduces a new (radical) innovation, the market for that innovation does not yet exist. The entrepreneur must go through the process of creating a market for the innovation, persuading new customers that the new technology provides a combination of price, performance, and features that fits their needs, which are different from the needs of the

customers in the established market (Moore, 1991; Christensen, 1997). Schumpeter recognized this as well: “It is, however, the producer who as a rule initiates economic change, and consumers are educated by him if necessary; the are as it were, taught to want new things, or things which differ in some respect or other from those which they have been in the habit of using” (Schumpeter, 1934: 65). As the entrepreneurs find customers who are willing to accept the risks associated with new products (Mansfield, 1968), the market for the innovation grows, and the technology matures to the point where it can compete with the previous technology on the same criteria that the established market values. When this happens, the new technology usually displaces the old technology rather quickly and the firms which produce the old technology disappear along with it.

### ***Impact of Entrepreneurs***

Evidence for the importance of innovation by entrepreneurs continues to mount. A 2002 study for the U.S. Small Business Administration found that “small patenting firms produce 13-14 times more patents per employee as large patenting firms” and that “small firm patents are twice as likely as large firm patents to be among the 1% most cited patents” (CHI Research Inc., 2002) Further, “in the modern economy, innovation remains largely the work of smaller firms. Though in the aggregate, NTBFs [new technology-based firms] spend only a fraction of what large firms spend on total R&D, they produce more than half of the innovations”(SBA, 1996). Small firms also contribute disproportionately to net new jobs (Birch, 1979, 1987; Kirchoff, 1994; Storey, 1994).

Given, as suggested above, that entrepreneurs tend to be more innovative than large firms, and that those innovations are more likely to be disruptive innovations, we can see why the entrepreneur, the “independent innovator” (Baumol, 2002b), rather than all innovators, is the driver of creative destruction.

It may be helpful to illustrate how this process might work. The following hypothetical example serves to illustrate the contributions of many of the above-cited authors. An employee at a large firm has an idea for a new product which differs substantially from the product line currently produced by the firm. His proposal is rejected as too risky, and is not funded for development. Our nascent entrepreneur decides that the product has enough potential that he quits his job to develop the product on his own. Soon, he makes enough progress that he is able to convince private investors (angel investors or venture capital) to fund the product and create a new firm to complete the development and commercialize the product. The product at first finds a small niche market, but is able to mature in this market and improve its performance. Eventually, the product catches on and moves into the mass market, where it now competes against products from the entrepreneur’s old firm, but offers superior performance at a lower price. The old firm finds itself rapidly losing sales to the entrepreneur’s new firm, and in spite of pouring resources into the old technology, is unable to match the performance of the new technology. As the new firm gains market share, it overtakes the old firm, and becomes the new market leader, while the old one declines.

### ***Entrepreneurship and Intrapreneurship***

Much of the literature on innovation and technological change recognizes that entrepreneurship is a danger to large firms, and seeks to offer advice on how to change the culture of those firms to make them more like entrepreneurs (Foster, 1986; Foster & Kaplan, 2001; Christensen & Raynor, 2003). This reorientation, which is sometimes known as “intrapreneurship” (Pinchot, 1985), can help revitalize large corporations and help them to take risks more like entrepreneurs. However, even if these incumbent firms are able to produce

disruptive innovations, they can still not produce creative destruction; as the incumbent firms, in order to do so, they would have to destroy themselves!

It is for this reason that we argue for the definitional distinction between innovation by new independent firms (entrepreneurship) and innovation by large incumbent firms (intrapreneurship). There are many who use a broader definition of entrepreneurship in their research (Stevenson, 1997; Wennekers & Thurik, 1999; Shane & Venkataraman, 2000), considering activities in large and small firms alike, but much early research on entrepreneurship studied the formation and growth of new ventures (Cooper, Hornaday, & Vesper, 1997). Some current researchers (Gartner, 1988; Bygrave & Hofer, 1991) also use a definition of entrepreneurship that includes the creation of a new organization. We hold that, due to the linkage to creative destruction discussed above, entrepreneurship inherently involves the creation of a new independent entity for the exploitation of an innovation. While innovation in large corporations is interesting, and deserving of study, the impacts on the economy are different from innovation by new firms, and the definition of entrepreneurship needs to reflect that fact.

### ***Conclusion***

We have argued that while innovation is a necessary condition for creative destruction, it is not a sufficient condition. Rather, the innovation must be both a particular type of innovation, namely radical, disruptive, discontinuous or revolutionary innovation, and the innovation must occur outside of the ranks of the incumbent leading firms in the industry at the hands of an independent new firm, an entrepreneur. While innovation generally, including routinized innovation, offers significant contributions to economic growth, it is disruptive innovation by entrepreneurs which brings about the process of creative destruction.

On this basis, we have further argued for a narrow definition of entrepreneurship as the creation of a new, independent firm to exploit an innovation. Although innovation is not the exclusive domain of new and small firms, the economic impacts, as discussed above, of impact in small and large firms are different enough to warrant specific attention by researchers. Hence, we reserve the term “entrepreneurship” for the creation of new independent ventures to commercialize an innovation.

Schumpeter feared that the entrepreneur was (Schumpeter, 1942: 132):

already losing importance and is bound to lose it at an accelerating rate in the future even if the economic process of which entrepreneurship itself was the prime mover went on unabated. For on the one hand, it is much easier now than it has been in the past to do things that lie outside familiar routine—innovation itself is being reduced to routine. Technological progress is increasingly becoming the business of teams of trained specialists who turn out what is required and make it work in predictable ways. The romance of earlier commercial venture is rapidly wearing away, because so many more things can be strictly calculated that had of old to be visualized in a flash of genius

He feared that this concentration of the innovative capacity in the hands of large corporations would eventually lead to a corresponding concentration of wealth, necessitating a transition to socialism.

Fortunately for capitalism, the innovative genius of the entrepreneur seems to be undimmed. Although the routinization of innovation has indeed proceeded (Baumol, 2002c),

one can offer the plausible conjecture that most of the revolutionary new ideas of the past two centuries have been, and are likely to continue to be, provided more heavily by independent innovators [entrepreneurs] who, essentially, operate small business

enterprises. In turn, these innovators, once successful, often establish firms of their own, joining [or displacing] the large enterprises that engage preponderantly in routine innovation (Baumol, 2002a).

As long as these “revolutionary new ideas” continue to come from entrepreneurs, the process of creative destruction will continue, and capitalism will remain healthy. Hence, to truly map the winds of creative destruction, one must study the entrepreneur.

## **ABSTRACT**

The passage of the Sarbanes-Oxley Act in 2002, an act of the US Congress in response to Enron and other corporate misdeeds, apparently had little thought behind it as to its impact on start-ups and early stage firms and their IPOs. From 2000-2003, particularly in the technology sector, IPOs, one of the effective ways chosen by many entrepreneurs world-wide to raise capital, were on the decline due to the world-wide recession. While technology based IPO numbers had begun to increase in 2004, many posit that going public has now become a greater challenge due to the Sarbanes-Oxley legislation. The now required complex record keeping and concomitant internal organization with associated high costs (\$1,000,000 or more for initial compliance and a like amount or more yearly) may have impacted the number of IPOs. The act, anecdotally, appears to have also served to increase the number of mergers, joint ventures, and acquisitions. This paper covers an initial survey of 79 entrepreneurial technology incubating firms and their views of the impact of Sarbanes Oxley on their future development.

## INTRODUCTION

United States Federal legislation known as the Sarbanes-Oxley Act (SOX) was passed in the wake of corporate scandals involving spectacular bankruptcies; inappropriate accounting practices; and audit firms that apparently closed their eyes to those practices. The provisions of the legislation were designed to “protect investors by improving the accuracy and reliability of corporate disclosures made pursuant to the securities laws, and for other purposes...” Although the legislation was designed to ensure a high quality of financial reporting by publicly traded companies, proposals to extend the legislation to privately held companies are now (March 2005) being considered at both the U.S. federal level and in some states. Also being considered is extending the legislation to “special interest” (not-for-profit) corporations. Even if the legislation is not extended, bankers and other stakeholders may begin to view SOX mandated practices as “best practices” and give preferential treatment to entities that are voluntarily SOX compliant.

Four of the areas addressed by the SOX legislation are: (1) defining appropriate relationships between independent auditors and the companies being audited; (2) specifying appropriate corporate governance practices and inappropriate corporate activities; (3) stipulating provisions with respect to corporate fraud and accountability; and (4) establishing requirements that companies implement and document internal control systems to help insure the integrity of financial information being reported to the public.

The fourth area of the provisions has received the most attention in the press because compliance related to internal control can be quite costly. This cost may inhibit firms from entering into the public markets to raise capital, or may cause firms that have been publicly traded to go private.

In turn, it has been speculated by the popular press that this may result in stunting creation of new jobs and products because firms do not have access to the large amounts of capital that they could have accessed in the public markets. Most of these claims are supported by anecdotal evidence citing only a few specific cases of companies that have decided not to go public due to SOX or have delisted.

## **BACKGROUND**

Today mergers and acquisitions appear to have taken the place of the traditional IPO for substantive capital creation. Mergers or acquisitions may relieve some of the capital needs of start-ups and early stage firms. However, independent entrepreneurs, though helped by having the senior level management in their new partner firms, may not be so easily managed or incorporated into the firm. The parent firm may also find itself diverted from its business activities due to the challenges presented by a merged or acquired younger firm. Creativity and innovation may likely suffer as well.

### **Review of the Provisions of SOX**

**Independent auditors** The first two sections of the SOX Act relate to auditors of publicly traded companies and relationships between the company and its auditors. Of particular concern to companies preparing for an IPO are the provisions related to limitations on the amount of consulting services that auditors may perform for clients; requirements that non-audit services must be approved by the company's audit committee; and requirements that the CEO, Controller, CFO, Chief Accounting Officer or any person in an equivalent position cannot have also been employed by the auditing firm during the 12 months preceding the audit. *Companies*

*considering an IPO will need to be in compliance with these provisions at least 36 months prior to the IPO.*

**Corporate governance** The SOX provisions related to corporate governance include requirements designed to improve corporate governance by (1) requiring specific actions that need to be taken by the company and/or its management; and (2) designating activities that the company and/or its management are prohibited from pursuing.

Specifically, Section 301 establishes a requirement that the company have an audit committee and states that each member of the audit committee will be an independent member of the board of directors. Although the Act did not require a member of the audit committee to be a “financial expert,” companies must disclose whether at least one member of the audit committee is a financial expert. A study by the Institute of Internal Auditors (2004) on the SOX affects on audit committees of non-publicly traded entities concluded that non-public companies could find it more difficult to recruit and retain qualified members to serve on audit committees.

Other corporate governance features of SOX require that the CEO and CFO must certify the financial statements; require that a corporate code of ethics be in place for top management; expands required disclosures about transactions involving the company and principal stockholders or directors or officers; and prohibits the purchase or sale of stock by officers and directors and other insiders during black-out periods. Companies considering an IPO need to have appropriate policies in place prior to the IPO. The SEC also is given the power to ban any person from serving as an officer or director of a publicly traded company.

## **Corporate Fraud and Accountability**

Titles VIII through XI of SOX relate to Corporate Fraud and Accountability and White Collar Crime Penalty Enhancements. Title VIII of the Act imposes criminal penalties for destroying, altering, concealing, or falsifying records where the intent is to obstruct a federal investigation or a bankruptcy proceeding; made debts incurred in violation of securities fraud law nondischargeable through bankruptcy; and extended the statute of limitations for private actions for securities fraud violation to not later than two years after discovery of the fraud or five years after the violation occurred. One implication of these provisions is that companies need to develop, implement, and periodically review document retention and destruction policies.

The Act also extends whistleblower protection for employees who provide evidence of fraud. Implications of these provisions are that companies need to implement or review whistleblower policies to ensure compliance with the requirement that employees have an avenue for “confidential, anonymous submissions” and to ensure non-discrimination against whistleblowers.

## **Reliable Financial Reports**

Section 404, related to management assessment of internal controls, and has probably received the most negative attention, due to the cost of completing the assessment and having auditors report on the company’s assessment. In July 2004 Financial Executives International (2004) surveyed 224 public companies with average revenues of \$2.5 billion to determine estimates of the cost to comply with Section 404. Results showed the average total cost of compliance was estimated at \$3.14 million or 62% more than the \$1.93 million estimate identified in FEI’s January 2004 survey. First-year compliance cost for companies with revenues of less than \$1 billion was estimated at \$1,000,000 or less. First year compliance costs for companies with over

\$5 billion in revenue had increased from an estimated \$4.6 million in the January survey to \$8 million in the July survey. These costs may be viewed as a significant deterrent for a company considering an IPO.

### **Venture Capital and Technology IPOs**

The number of venture backed technology IPOs declined from 245 in 1999 to a low of 28 in 2002. In 2003 the number of deals was up one to 29, but is up to 93 in 2004.

(<http://www.nvca.org/ffax.html>, March 8, 2005; and Gorton et al., 2003). Overall, technology firm IPOs did not fare better during the same time period. In 1999 there were 900 such IPOs. In 2000, 2001, and 2002 respectively there were 713, 77 and 71. In 2003 times were not better and there were only 20, but in 2004 there was a four fold plus increase to 88. As of March 8 there were 12 from the first of the year. (<http://www.hoovers.com/global/ipoc/index.xhtml>, March 8, 2005; Gorton et al., 2003).

### **Costs and Consequences of SOX**

The law firm of Foley & Lardner (Hartman, 2004a) conducted studies in 2003 and 2004 on the impact of SOX on firms. The survey found that the average price of being public had nearly doubled following enactment of SOX, from \$1.3 million to almost \$2.9 million for firms with revenues under \$1 billion. A significant portion of the increase was related to insurance for directors and officers (D&O). The study indicated that D&O insurance increased from an average of \$329,000 a year pre-SOX to an average of \$639,000 a year for FY2002, and \$850,000 annually for FY2003 post SOX.

As a consequence, there have been reports of companies that have delisted their securities and reports of companies electing to delay or cancel initial public offerings (IPOs). Of the 115

public company respondents to the 2004 Foley and Lardner survey, 21% indicated that they were considering going private, 6% indicated they were considering selling the company, and 7% indicated they were considering merging with another company as a result of Sarbanes Oxley requirements (Hartman, 2004a).

Companies currently listed with the SEC can avoid SOX by either going private or going dark. When a company goes private, its shares are no longer publicly traded in any venue. On the other hand, a company that elects to “go dark” will deregister its securities, which means it no longer has to file with the SEC, but shares will continue to trade in the over-the-counter (OTC) market. The decision by many companies to either go private or go dark has been attributed to costs to comply with SOX, as discussed below.

Linster W. Fox, Chief Financial Officer of Anacomp, a data management company that decided to go dark, was quoted as saying “complying with [SOX] would have added \$1 million to its annual costs” (Deutsch, 2005). Fidelity Federal Bancorp is another company that went dark. Donald R. Neel, Fidelity’s CEO, was quoted as saying “going dark will save \$300,000 a year, a substantial sum for a bank with just \$200 million in assets” (Deutsch, 2005). Max & Erma’s, an Ohio restaurant chain, is also going dark. Delisting is expected to save the company \$450,000 in the first year, and \$350,000 each year thereafter (Wolf, 2005). Other companies that have cited the cost of compliance with SOX as a reason for going private include Emergisoft, which estimated the cost of compliance with SOX as \$400,000 (Ligos, 2004) and Calloway’s Nursery, which estimated that the company would save more than \$500,000 a year in audit fees (Calloway’s Nursery, 2004).

Leuz et al. (2004) studied the reasons that firm “went dark” between 1998 and 2003. They reported that 67 companies went dark in 2002 (prior to SOX). That number jumped to 198 companies in 2003, and the numbers were expected to stay at about that level in 2004. Based on their study, the authors concluded compliance with SOX provisions was a reason firms “went dark.” These firms could still have their shares traded on the OTC markets without meeting SOX requirements. However, the costs of SOX compliance were not sufficient cause for firms to go private. Rather, additional motivations needed to be present to cause a firm to go private such that its shares were no longer traded on any market.

Articles published soon after the passage of SOX cited costs of complying with SOX as a reason companies delayed IPOs or elected to be acquired by other companies. Examples of specific firms cited to support these claims included Telica, an Internet phone provider, which had been set to file for an IPO but instead decided to be acquired by Lucent Technologies (Malhotra, 2004). PayMaxx, “the country’s sixth largest payroll service provider, shelved plans for a public offering, issued some convertible debt structures, and began stashing cash generated from its operations as a result of Sarbanes Oxley (Sarles, 2004). Rackspace, profitable web-hosting company delayed its IPO for at least two years, until “they hope to be so big that absorbing the extra costs [of complying with SOX] won’t be too painful” (Murphy, 2004).

An editorial in *The Washington Post* (2005) stated “Many new firms cannot go public to raise the capital to start on the road to possibly being the next Microsoft because of the compliance costs” SOX. (Deutsch (2005, p. 1). More recent claims include “The passage of SOX ... has served as a catalyst to make smaller companies rethink the idea of going public.” Charles

Schwab also expressed concerns, stating that “SOX may be keeping companies from going public” (Countryman, 2004).

Although the headlines are chilling, and cases where firms citing SOX as the reason for shelving IPOs have been reported, the evidence to date has been largely anecdotal or limited in scale. *The purpose of this study is to determine whether there is specific evidence related to early stage technology based firms to support the claim that SOX has had a significant negative impact on firms’ decisions to go public.*

### **Benefits of SOX compliance for smaller firms**

Finally, there is no doubt that the cost of compliance with SOX has made it more expensive to be a public company, which may deter smaller firms from becoming public companies and may also result in some firms electing to withdraw from the public markets. However, entrepreneurs need to be aware of SOX provisions to which private firms are subject and the benefits of voluntary compliance with SOX.

SOX impacts all companies, public or private, in the areas that relate to enforcement of federal laws and regulations. Specifically, the provisions related to criminal liability for document destruction, retaliation against whistleblowers, increased penalties for white collar crime, securities fraud, and blackout notice requirements relate to both public and private companies (Perkins Cole, 2004). While company executives and management may have no intentions of violating laws and regulations and therefore feel no need to worry about these provisions, having policies and procedures in place to establish compliance with these provisions could be “preventive medicine.”

Entrepreneurs that anticipate being acquired by a public company will also need to be compliant with SOX, if the operations of the acquired firm will have a material effect on the financial statements of the public company.

Other stakeholders may view SOX compliance as “best practices.” Companies that are not SOX compliant may discover that the cost of raising funds, either through venture capital or borrowing from financial institutions is more expensive than it would have been if the company is SOX compliant. David Katz (2003) reported that “some Chicago banks are requiring CFOs and CEOs to certify financial statements in their loan covenants with private companies.”

Robert Braun (2004) has suggested that insurance companies may also ask for SOX compliance “as a means for reducing the frequency and amount of claims, particularly with regard to errors-and-omissions insurance coverage.”

At the moment, private companies can selectively apply some of the SOX provisions related to relationships with auditors, corporate governance, and financial reporting. Foley & Lardner (Hartman, 2004b) surveyed private organizations about corporate governance. The results (based on surveys returned by 8 non-profit organizations and 22 for-profit private companies) indicated that 77% of the entities had been impacted by SOX. Most of the impacts (60%) were from self-imposed reforms. Many of them met the requirements for audited financial statements (87%), independent directors (63%), and disclosure of off-balance sheet financing and contingent liabilities (63%) prior to the issuance of SOX. Most of the actions that private companies had taken or planned to take involved CEO/CFO certification of the financial statements (44%), outside audit of internal financial controls (44%), board approval of non-audit

services performed by auditors (43%), establishment of whistleblower procedures (40%), and adoption of corporate governance policy guidelines (40%).

As long as compliance is voluntary, companies can weigh the cost versus the benefit of SOX compliance and pick and choose which SOX provisions to implement. However, federal legislation extending SOX provisions to private companies has been considered. Some state legislators are also considering SOX-type legislation that would apply to private companies. Therefore, entrepreneurs who currently believe that SOX does not apply to them may want to develop at least some familiarity with SOX and SOX-type legislation, even if they do not intend to take their companies public in the near future.

### **THIS PAPER**

As a result of the major decline in IPOs, including venture capital backed deals, and the authors' interest in the impact of SOX on entrepreneurial technology based firms, this study focused on US technology based business incubators and their firms. If these firms are to grow rapidly and create large numbers of jobs and wealth for a region, the import of SOX on the capital infusions historically needed and derived from public sale of stock is important for all of the US determining whether SOX compliance is inhibiting their pursuit of capital in the public markets, thus hampering the creative development of such firms and their new innovative products and services was another reason for this study. While largely anecdotal evidence of a negative impact abounds in the public periodicals and in private reports, surveying likely technology based IPOs was indicated. This paper reports on such a study and the implications relative to SOX.

## METHODOLOGY

### Sample

A random telephone survey of 79 technology based firms was conducted. All firms were US-based and housed in US technology-based incubators. By definition, then, these firms were entrepreneurial.

### Instrument

The survey was conducted in three parts: general firm information, an ethics survey, and a Sarbanes-Oxley survey. All respondents were asked to complete all three parts of the overall survey during the telephone interview. Survey questions included demographic information; a series of yes/no questions; and a series of Likert scale questions. Questions relating to knowledge about SOX; the impact of SOX on going public; and other issues related to SOX were asked.

The hypotheses and the related questions (See Table 1) are shown below.

---

**Insert Table 1 Here**

---

### Hypotheses

- *Hypothesis 1 Firms will not go public because of SOX.*
- *Hypothesis 2 Firms were not delayed from going public because of SOX requirements.*

### Comments on Methodology

The original data set had 79 firms, with the size of respondent firms as measured by employee numbers ranging from 1 to 285 employees. The average firm size was 8.75 (sd 9.22) after the

outlier with 285 employees was removed from the data set. The original data set had firms ranging in age from 1 to 38 years old, with an outlier of 38 years, which was also removed. Average firm age was 4.76 years (sd 9.12). Female respondents and their responses were tested between male respondents and no significant differences at the  $<.100$  level were found. Thus the data set was not split on the basis of gender and all respondents, except for the two noted, were included in the analysis.

Thirty-five percent (25/71) of the firms that responded to the question about their plans to go public indicated that they were likely to do so in the near future.

The data set is not overly large, which may lead to a lack of universal results for technology based entrepreneurs and their firms.

Finally, these results relate only to technology based incubating firms.

## **RESULTS**

The average education of the respondents included some graduate school, a result that is similar to that of other researchers in technology based firms (Teach et al., 1985). The entrepreneurs were predominately male (69 males and 10 females). The respondents were either CEO's, VP/COOs or others, including directors, scientists, engineers, etc.

The firm positions of the female respondents were not at the same level as the males; more males were CEOs or VPs/COOs than were females. More males had more advanced education than females.

The initial data set was reduced to 77 firms with the two outliers removed (one age (35 years old) and one size (235 employees). Two additional firms were removed because they did not indicate whether they had plans to go public in the near future. Four respondents did not answer the question asking whether they were familiar with SOX legislation, so these cases were also removed. The final data set consisted of 71 firms.

Not all respondents answered all questions, making multivariate analyses such as clustering, factoring or discriminant analyses not possible. Thus only means testing was used. While strategies are multivariate in nature, the results nevertheless provided some insight into how these firms thought about their future.

## **Hypotheses**

The results of the analyses are shown in Table 2.

---

**Insert Table 2 Here**

---

- *Hypothesis 1 Firms will not go public because of SOX.*

In order for SOX to be a deterrent to firms' decisions to go public, decision makers must be familiar with SOX legislation and the steps necessary to be in compliance with its provisions. Respondent firms were not very familiar with SOX, as shown in Table 2. The level of familiarity was not significantly different between firms that indicated they were likely to go public (1.68, sd 0.69) and those firms not likely to go public (1.76, sd 0.77).

Responses to the question about whether SOX had an impact on their decision not to go public were obtained from 34 of the 46 firms that did not have plans to go public. The responding firms

disagreed (1.71, sd 0.94) with the statement that SOX had negatively impacted their decision. The number of incomplete responses did reflect firms being unfamiliar with SOX and thus declining to respond to this question.

*It would appear that SOX had only a very minor role in firms' decisions to not go public, because the majority of firms either were not familiar with SOX or had no plans to go public.*

With only a few thousand technology firms publicly traded in the US, and with over a 1,000,000 technology firms cited in the 2002 County Business Patterns, US summary, ([www.census.gov](http://www.census.gov), March 12, 2005), perhaps there would be only one in a thousand firms that are considering going public. However, about 35% of the respondents indicated they would consider doing so and perhaps this is indicative of changes occurring in market dynamics, following the four years of challenges faced by technology based firms and their IPO needs (Gorton et al., 2003).

While the results are inconsistent with the prior literature cited, perhaps there are two reasons for the differences. The first may be that the firms discussed in the literature are not a cohort to the firms surveyed in this work. The second would relate to the paucity of actual anecdotal evidence cited in those reports and research papers.

- *Hypothesis 2 Firms were not delayed from going public because of SOX requirements.*

While SOX may delay firms from going public either because the firms do not have the necessary organizational or reporting structures in place, or because the firms do not believe that advantages of being public justify the additional cost to comply with SOX provisions, when firms were questioned about whether their decision to go public was delayed by SOX, firms disagreed with the statement that SOX was a reason for the delay, (1.76, sd 0.73). (Table 2)

Five of the firms that indicated they were likely to go public did not respond to the question of whether SOX had delayed their decision to go public. Again, these firms did not respond because they were unfamiliar with SOX. The 20 other respondents did indicate that SOX did not delay them.

Thus the hypothesis is supported, which goes against the conventional wisdom about SOX.

Anecdotal evidence (reviewed earlier) indicates that firms have delayed going public because they need greater size to absorb the costs of SOX and thereby reap the benefits of being public.

*Interestingly enough, the outlier that was eliminated due to size is the only respondent who responded “highly familiar” with respect to SOX.*

### **Challenges Posed by SOX**

Respondents were asked to identify challenges from a list associated with SOX requirements.

The responses (included in Table 2) demonstrate the view of SOX that respondent firms have.

Responses were received from firms not considering going public as well as firms going public.

Again, the limited number of responses is due to the overall lack of familiarity that firms have regarding SOX. None of the respondents mentioned “relationship with auditors” or

whistleblower protection provisions. Interestingly, the same number of respondents indicated

“prohibitions on loans to directors or company executives” and “assessment and reporting on effectiveness of internal control structures” as challenges. Also, more respondents cited

“financial statement certification” and “corporate governance” than “assessment and reporting on effectiveness of internal control structures.” Most of the publicity about the cost of SOX

compliance has related to cost of assessment and reporting on effectiveness of internal control.

Respondent firms did not seem to place the same relative emphasis on these costs.

## SUMMARY/CONCLUSIONS

The results of this study do not indicate that these entrepreneurs are factoring SOX compliance into their current thinking even though there are benefits associated with SOX compliance for non-public firms, and there are situations where SOX compliance may be required of non-public firms. *These firms did not indicate that SOX was preventing them from going public, and neither were they delayed from going public because of SOX requirements.*

About 35% of the respondents indicated they would consider going public. This may be indicative of changes occurring in market dynamics. After the four years of challenges faced by technology based firms and their IPO needs (Gorton et al., 2003), perhaps firms are once again starting to consider the public market for capital.

The challenges firms face to meet SOX requirements are diverse. While these challenges may not chill entrepreneurship to the level the authors initially thought, SOX thus remains more a myth than a reality for entrepreneurs until they and their incubator management “go to school” on SOX. As these entrepreneurs become more familiar with SOX, their level of concern about the impact it will have on their decision to go public may rise. Academics; periodical authors in the financial and popular press; and executives of companies currently subject to SOX may understand the implications of SOX.

And while the results of the analyses are relatively inconsistent with most of the prior literature cited, perhaps there are two reasons for the differences. The first has to do with the firms that the literature is discussing not being a cohort to the firms surveyed in this work. The second would relate to the paucity of actual anecdotal evidence cited in those reports and research papers.

Finally, the authors do not know whether the level of the “unfamiliarity effect” can be separated from the “no deterrence effect” for this sample.

## **ABSTRACT**

This paper analyses the learning and interfirm relation process in search for competitiveness of small enterprises located at a Brazilian footwear cluster, Sinos Valley, where the main Brazilian footwear production cluster is located. The enterprises analyzed are shoemaker's component suppliers. The investigation is focused on the formation and development of a consortium established for internationalization purposes. The findings are based on data that was collected through interviews held with the enterprises' managers and associations' leaders as well as on secondary data. The specific dynamics of the buyer-driven chains is taken as a theoretical support to the case analysis. The aim is to present propositions about emergent countries small business competitiveness. Three propositions are pointed as conclusions of the investigation: small business integrated as suppliers in a buyer-driven chain are in a threatening position if they do not upgrade to international competitors standard; small business integrated as suppliers in a buyer-driven chain can add value if they get closer to design, marketing and branding; on emergent countries, small business upgrading for competitiveness depend on collective action.

## **Introduction**

The development of the Footwear Brazilian Industry is related to the industrial reconversion process of the 60's, when intensive work industries moved from developed countries to more peripheral countries. International traders chose some regions in Brazil as potential producers. The most important of these regions is the Sinos Valley in South Brazil.

Sinos Valley has been considered a "supercluster" (Schmitz, 1995). The region concentrates a group of producers making the same or similar things close to each other. There is the division of labor and specialization among the firms; the provision of their specialized products and services in short notice and great speed; the emergence of suppliers, who provide raw material and components; the increase of suppliers who provide new and second hand machinery and spare parts; the emergence of agents who sell to distant national and international markets and the presence of associations, research and human resources training centers and superior education institutions.

This concentration of products and services related to Footwear production may suggest that entrepreneurship and small business establishment should be facilitated in this region. However this is not absolutely true. The Footwear production and retail is related to a complex chain. The model of buyer-driven commodity chains as proposed by Geriffi (1999) is very well adapted to explain the Footwear production and retail. A buyer-driven commodity chain refer to those industries in which large retailers, branded marketers and branded manufacturers play pivotal roles in setting up decentralized production networks in a variety of exporting countries. Buyer-driven chains are closely tied to relational rents, which refer to several families of inter-firm relationship, including techniques of supply-chain management that link large assemblers with small and medium size enterprises, the construction of strategic alliances, and small firms clustered together in a particular place and displaying elements of collective efficiency.

At Sinos Valley, as observed by Schmitz (1998), the fast growth of the export industry, especially during the 1970s and 1980s, developed to a deep structure of suppliers of products and services. Interdependence within the cluster increased. Bilateral vertical cooperation increased and multi-lateral cooperation was attempted. In a phase, which was considered the easy phase of globalization (1970s and 1980s), enterprises at all stages in the value chain have been sucked into global competition.

These features could suggest a good position of the cluster for relational rents through the integration of several small and medium sized enterprises in a similar action to the Italian Footwear cluster (Putman, 1996). However, as globalization became more challenging at the 90s, local inter-firm relationship did not become stronger. The main Sinos Valley shoemakers adopted the strategy of integrating with their main international buyers to attend market demands and reduce their dependence on the cluster for the supply of inputs (Schmitz, 1998).

How small industries dedicated to the shoemakers' supply of components and machinery keep a competitive position at this chain? How small enterprises achieve internationalization? How small enterprises fight for market share out of their dependence on the main local shoemakers? These are strategic questions for the small business entrepreneurs as much as for researchers who investigate development policies to support regional development to a historical industrial cluster such as Sinos Valley.

We describe in this paper the development of technology, marketing, design, achieved by 10 small machinery producers who participated of an export consortium. This consortium was organized by an association of components manufacturers (ASSINTECAL) helped by Brazilian government policies due to support exportation initiatives (APEX). The analyses focus on how inter-firm relations were achieved and contribute to individual learning and competitiveness of each of the enterprises, which participate in the consortium. The findings are based on the interviews held with the enterprises managers and ASSINTECAL leaders and secondary data.

In the following sessions we present: (1) an overview of the competitive environment related to the footwear industry; (2) the description and analysis of the case, which was investigated; (3) conclusions.

## **1 The competitive environment**

The global extension of the value chains must be considered on entrepreneurship related to the Footwear industry. This industry is generally based on global networks which links the full range of activities that are required to bring a product from its conception, through its design, its sourced raw material and intermediate inputs, its marketing, its distribution and its support to final consumer (IDS, 2000).

This scenery has been getting more and more accrue since the late 1960s when footwear manufacturers from industrialized countries closed down their factories, retained their know-how of marketing and design and started to shop around for low-cost sites in the developing word (Bazan & Navas-Alemán, 2001).

Sinos Valley inception into the global footwear value chain has been considered as the trigger to the vertiginous process of growth experienced by the whole Brazilian footwear industry. In two decades, the cluster transformed itself from a local footwear producer to one of the main footwear exporting regions in the world (Bazan & Navas-Alemán, 2001).

As shown in the Table 1 bellow Brazil has the third world position in footwear production.

---

Table 1 here

---

However based on low prices the situation of the suppliers of the main global buyers (US large retail chains) was not to be stable forever. At the end of the 1980s Brazilian producers began to suffer from the increasing competition of cheap footwear from China. In the last decade, alternatives to low prices strategies began to be developed as the searching for new markets and attempting to move up the value chain into design, marketing and branding (Bazan & Navas-Alemán, 2001).

At the last decade, some of the main Sinos Valley shoemakers began to search foreigners markets with own market strategies. Nowadays, Brazilian trademarks as Azalea, Via Uno and Dumont can be found in American and European retailers. They have small slices of these markets. Anyway, these enterprises are learning how to deal in the international market. The small enterprises that are shoemakers' suppliers have been strongly influenced by this competitive environment.

## **2 The molds producers**

The enterprises here analyzed are molds producers. There are around 200 molds producers in Sinos Valley. They are small enterprises and some of them are informal. As is common in small business, management and production processes are centralized in the manager's person who is aided by a small team of employees. The participation of members of the family in the company is quite common. Splitting is frequent as the companies enlarge.

In the Sinos Valley, the competence for molds production has developed for almost thirty years, associated to the increase of the production of footwear's with synthetic components. Molds are generally produced in aluminum or steel, through simple foundry or automated processes. They are destined to the production of footwear components as soles, ribbons, buttresses, printed leather, etc...

Molds production is very sensitive to the different strategies on footwear production. Large scale and mass production demands, which are typical for low cost products, don't need many different molds. Differently is observed in the fashion industry where small loads and many model variations, need a new mold for every single model. When the footwear industry improves, in the fashion industry, there is an increase in the molds production.

Outsourcing and the specialized knowledge needed for molds production are two important aspects on the molds business. The outsourcing of molds production has been one of the effects of the changes on footwear production. An increase on the outsourcing of molds production tends to be proportional to the closeness shoemakers are to the fashion industry.

A very specialized and partial tacit knowledge is necessary in the molds production. Learning about molds production depend on the training on the job, even when the production is partially based on automation.

In Vigevano, Italy, molds are produced in small shops similar to what happens in the Sinos Valley, Brazil. As independent enterprises, mold producers have opportunities and face challenges. They may be suppliers of other industries, in fact, some Sinos Valley mold producers also supply simple orders to local metal-mechanical chain, and they also have the opportunity to supply footwear molds to Peru, Colombia, Mexico and Argentina.

The entrepreneurs started to be challenged by global competitiveness. For example, a Sinos Valley shoemaker can buy molds anywhere. When they need more sophisticated and expensive models they can look for Italian suppliers and not at the local market.

The Sinos Valley mold producers are able to supply the local shoemakers, which are looking forward to improving with the adaptations of brand design in the intermediate market in terms of prices. However shoemakers complain they lose competitiveness on this market share because of they take too long to develop a product. As seen on an analysis of the Sinos Valley footwear chain, the mold production was pointed as the gargle for the delay on the launching of new products (ASSINTECAL, 2003).

Looking forward to facing these challenges, an exportation consortium of mold producers was established in the Sinos Valley. Below it is described how this consortium was established, its strategies and the observed effects on organizational learning.

## ***2.1 Molds by Brazil***

*Molds by Brazil* is the trademark created to represent mold producers who participate in the consortium created with internationalization purposes. It is one of the consortiums created upon a Brazilian Federal Government policy established in the mid 90's to

promote small business internationalization. The Agency of Promotion of Exports of Brazil – APEX has some rules to help small business with funds. The organization of consortiums was one of the conditions established by APEX to support marketing and promotion strategies.

The mold producers gathered in the consortium at the end of 2000, helped by their Association (ASSINTECAL). Ten enterprises belong to the group.

The agreement between *Molds by Brazil* and APEX favored two actions oriented to internationalization: (I) participation of International Trade Fairs and (ii) the certification ISO 9000. Other actions, oriented to local market, were also favored, for example, as the participation on National Trade Fairs and the sharing of management consulting.

Participation in International Trade Fairs favored the enterprises, not only to show their products, but also to learn from competitors and clients. The gaps Brazilian producers have from International standard and need to overcome began to be clearer. These gaps were mainly related to time delivery, product quality and technology. One of the first steps in the learning process was the awareness of these gaps. Propositive actions took place and they are highlighted below.

## **2.2 Time to Market**

The consortium *Molds by Brazil* created a project focused on technological development. The project was based on the assumption that mold production was the gargle on footwear production. Several studies had pointed that the achievement of competitiveness in international levels depends on the development of abilities, which could help in the response of companies to a very segmented, seasonal, dependent on variations of fashion and style demand. In such a scenery, technological and management innovation is needed. The time of product development was understood as a critical stage for the improvement of the performance of the footwear industry, considering the pressure the importers of the United States and Europe exert on the local producers. As shoemakers are looking for competitiveness in the fashion market share they need to reduce time to market (ASSINTECAL, 2003).

This project gathered producers, the producers Association (ASSINTECAL) representatives; the local University (UNISINOS); a public Association responsible for personnel training (SESI); a private group dedicated to technology innovation (CETA). A Brazilian ONG sponsored the project (SEBRAE).

The main stage of this Project was a technical mission focused on benchmarking with Italian mold producers. Representatives of the consortium, researchers, consultants went to Vigevano in Italy, in 2004, to learn from the main world mold producers. The group was in touch with different examples of footwear components and machinery production. Since the sophisticated project Euroshoe based on high automation technology and on a mass-customization principle<sup>i</sup>, until very prosaic and known handmade foundry.

Overall, the interaction with Italian mold producers highlights that the concept they have about their work is based on fashion. Italian mold producers define themselves as fashion designers, as stylists and never as foundry crafters.

The main Italian mold producers as Mobel Stampi, the Gatti & Piccolo and the FAE Stampi, all located close to Milan, support their work on sophisticated technology, but understand that their value is on their capacity of putting art on technical feasibility.

Finally, all observations and conversations during the Technical Mission converge to a new point of view related to the development of Brazilian mold production. The necessity of technological improvement based on modern machinery, software, trained personnel were confirmed. However, new suppositions emerge from this investigation, as follows:

- Time to market pressures will not find solution based only on technological improvement;
- Time to market is related to technology improvement but also on the position of the enterprise on the chain value;
- The closer the mold producers are to fashion and design, the more competitive they are in the footwear market.

### **2.3 Learning and actions**

Some points are to be highlighted from the Sinos Valley mold producers' case. Mold production is a Small Business integrated on a buyer-driver chain. Footwear as garments are globalized chains which gather enterprises located in different points of the world. These enterprises compete on a very segmented market. It is known from empirical evidence that on buyer-driven chain value come from moving up the value chain into design, marketing and branding.

Suppliers of a traditional industry, which for decades was focused only on production, and local market, are not prepared to compete on a global arena. Even supplying to already internationalized industries, local suppliers face several gaps related to technology and management when compared to international competitors. They need to overcome new challenges, improve technology and look for added value into their processes.

These actions depend on new knowledge that are hard to be acquired on their own. The experience of the mold producers' consortium shows that collective action among small enterprises to attend shared interests can bring good results in internationalization efforts.

With some support received from government the enterprises began to show up in International trade fairs. Some business were done, new clients appeared but overall they have given the first step towards the necessary learning processes for internationalization. The collective action motivated a technological improvement project. The purpose was to reduce the time of product development on all the local chain, focused on mold production improvement. From this project new actions and suppositions raised.

Specialized software was acquired with public funds. The producers association (ASSINTECAL) created a permanent *Design Forum* and made an effort to put component producers closer to fashion and design tendencies. This association is also working together with ABEST (Brazilian Association of Stylists).

A new concept of Brazilian fashion is growing based on the collective work of the producer associations who are investing on an alternative strategy for all the Brazilian

footwear industry. Getting closer to fashion, in the Brazilian case, does not only mean copying international style, but also developing a unique new style. In fact, Brazilian stylism has been getting good positions in International Fashion forums.

*Moldes by Brazil* was established as a collective trademark. It is a marketing strategy focused on added value to the Sinos Valley producers and to develop an image of Brazilian suppliers as a good alternative on molds for the footwear industry.

In summary, collective action and efforts to move up the chain into design, marketing and branding are observed as strategies to small business competitiveness improvement.

### **3 Conclusions**

The aim of this paper was to present propositions about emergent countries small business competitiveness. The questions we investigated were related to the understanding of the strategies and processes, which are helpful to put emergent countries small business on a competitive position in the international market. We analyzed especially small business, which are integrated to buyer-driven chains. This investigation took as a basic assumption that in a buyer-driven chain, value comes from relational rents and from design, marketing and branding.

We described the case of the Sinos Valley mold producers who created a consortium for internationalization. This collective action started of the learning process, which was shown to be positive to every member of the consortium and for the whole local footwear chain. The collective action allowed the achievement of international marketing and promotional actions. Collective action favored each one of the consortium participants to risk in the international market. The weaknesses and threats on this new competitive arena got clearer. New collective actions were developed to face the gaps local producers have toward international competitors.

The maneuvering among public policies, producer associations, Universities and other support associations must be highlighted as a clue network to achieve the individual results every small enterprise is looking for.

The propositions from this study are finally the followings:

- Small business integrated as suppliers in a buyer-driven chain are in a threatening position if they do not upgrade to international competitors standard;
- Small business integrated as suppliers in a buyer-driven chain can add value if they get closer to design, marketing and branding;
- On emergent countries, small business upgrading for competitiveness depends on collective action.

For further research, we suggest the development of this investigation in a survey to test these propositions in a statistical significant sample. This way cases from emergent and not emergent countries could be compared.

**ABSTRACT**

Family businesses contribute substantially on growth of economies. The present qualitative investigation extends research, suggesting nonsignificant differences between family and nonfamily fast growing SMEs in terms of business orientation, marketing capabilities, and firm performance. Qualitative research comparing family versus nonfamily fast growth enterprises is rare. In this light, how do these different types of enterprises attain market or competitive advantage and subsequently rapid growth? In line with our previous work, findings demonstrate a lack of substantial difference between these cohorts in terms of their leadership, firm orientation, culture, and marketing capabilities. Managerial competencies of entrepreneurs, which are integral, exerting a powerful impact on the direction of the business, and employees, appears to be an antecedent to firm business orientation. Consistent with previous research, these business orientations drive positional advantages in specific marketing capabilities: market-focused products and superior relationships. Customers need to regard these products/services of value, in order to purchase products, culminating in customer satisfaction and loyalty, and ultimately contributing to the bottom line through increased sales, profits, and fast growth (i.e., firm performance). Implications for managers and recommendations for future research are outlined.

## **ANTECEDENTS AND CONSEQUENCES OF MARKET, LEARNING AND ENTREPRENEURIAL ORIENTATION: FAMILY VERSUS NONFAMILY EMERGING FAST-GROWTH FIRMS**

Family businesses in Australia, and for that matter elsewhere, impact significantly on growth of economies through generation of employment, productivity, and innovation (Smyrnios & Walker, 2003). Despite their significance, there is a presumption that family firms are not growth oriented (Teal, Upton, & Seaman, 2003), employing conservative business strategies. In many aspects, family firms exhibit characteristics similar to their nonfamily counterparts, particularly in terms of business strategies (Teal et al., 2003), strategic planning practices (Upton, Teal, & Felan, 2001), and business orientations (Tan & Smyrnios, 2004b). Research comparing family versus nonfamily fast-growth enterprises is relatively scarce (Upton, Teal, & Seaman, 2003). In this light, how do these different types of enterprises attain market or competitive advantage and subsequently rapid growth?

There is little empirical evidence identifying antecedents and consequences of market, learning, and entrepreneurial orientations as sources of competitive advantage, let alone exploring similarities and differences, on these factors, between fast-growth family and nonfamily firms. A review of extant interdisciplinary literature (e.g., Chrisman, Chua, & Zahra, 2003) indicates that there is a complex array of factors associated with divergent sources of CA. However, these factors have not been made explicit (Packham, 2002). This failure can be attributed to a focus on public and large companies with scant consideration to emerging enterprises. The present qualitative investigation extends Tan and Smyrnios (2004b), suggesting nonsignificant differences between family and nonfamily fast growing SMEs, and that these orientations are driving tactical marketing capabilities (MCs), providing a position of advantage. As entrepreneurship and marketing involve a process of creating value by combining resources, this position of advantage needs to create superior customer value (CV), ultimately affecting firm performance. Given these considerations, the overarching research question is, are there certain aspects of business orientations and MCs that fast-growth family firms tend to select, compared to their nonfamily fast growth counterparts?

Our paper begins with a brief overview of the pertinent literature on family firms, what is meant by family business and fast-growth entities, the principal theory underpinning this investigation, followed by a description of the present methodology. Next, one causal network model, derived from an analysis of two detailed case studies are presented. Implications for researchers and managers are outlined, concluding with recommendations for future research.

### **LITERATURE REVIEW**

#### **Family Firms**

Gersick, Davis, McCollom, and Lansberg (1997) indicated that family enterprises account for up to 80% of businesses worldwide. Family businesses generate more than half of Australia's employment growth, and account for about 40% of Australia's private sector output (Smyrnios & Walker, 2003). Examples of well known international family-controlled companies include Just Jeans, News Corporation, and Harvey Norman in Australia; Estee Lauder in the US, Lego in Denmark; Tetra Pak and Ikea in Sweden, and Sainsbury in the UK.

There has been no accepted definition of what constitutes a family firm (Klein, Astrachan, & Smyrnios, in press). Definitional confusion is exemplified by varying degrees of specificity across studies, making comparisons of findings problematic. As a case in point, the percentage of family firms in one sample can differ between 15% to 81%, depending on the definition applied (Westhead, Cowling, & Storey, 1997). For example, Westhead (1997) defines a family enterprise as a business which is perceived as a family firm by the family (subjective view), and one when the family owns majority of the shares in the organization (ownership view). Other investigators (e.g., Chua, Chrisman, & Sharma, 1999) state that an enterprise can be viewed only as a family firm when a transfer to the next generation is intended. Astrachan, Klein and Smyrnios (2002) considers that a founder-run entity can be regarded as a specific case of a family firm. Despite these differences in viewpoints, all agree that succession adds considerable valuable business experience to a family and company. Another concern relates to investigators failing to operationalize what is meant by a family business (e.g., Kayser & Wallau, 2002).

Given these issues, a detailed review of definitions employed in studies reveals no clear demarcation between family and nonfamily businesses. *Artificially dichotomizing between family versus nonfamily firms when no such clear cut dichotomy exists creates more problems than it attempts to solve* (Astrachan et al., 2002, p. 46). Rather than simply dichotomizing, a key question involves when does the business become a family firm? In response to this question, Klein et al. (in press) believe that it is in part the influence of family that can make a difference. This concept is not new. What differentiates family firms from other profit seeking organizations is the levels of importance families place on the decision making and operations of the firm (Chrisman et al., 2003). Muhlebach (2004) linked family-business-individual interactions with resources resulting from the family influence as familiness. However, Klein et al (2002; in press) proposed a radical shift in the way that family and nonfamily firms should be regarded. These investigators suggested the application of the F-PEC scale, that is, firms should be considered along a continuum that incorporates three axes: power, experience and culture. It is the interaction between these factors that contributes to the familiness of a business.

Traditionally, family firms are not innovators (Upton et al., 2001). Ward (1997) posited that family firms are slow growing because once successful personal methods by the entrepreneur are in place, they are inflexible in seeking alternative ways for succeeding. They are also less likely to pursue wealth maximization as their dominant objective. Family firms are more likely to have important non-economic goals or constraints, such as maintaining family harmony or job creation for family members (Sirmon & Hitt, 2003). However, family businesses that display high levels of entrepreneurial orientation (Mustakallio & Autio, 2002), have a vision, and share information regarding actual company performance results versus goals or planned performance figures with all employees. They also tend to be growth oriented (Upton et al., 2001).

### **Fast-Growth Firms**

Sexton, Upton, Wacholtz, and McDougall (1997) acknowledged the economic contribution of fast-growth firms (FGFs) as *gazelles*: that is, companies that achieve a minimum of 20% annual compound sales growth over a 5-year period. Upton, Teal and Felan (2001, p. 61) define FGFs as *those willing to take risks, to be innovative, and to initiate competitive actions*. This definition seems to be identical to that of enterprises that possess an entrepreneurial orientation (Lumpkin & Dess, 2001). According to Birch (1995), *gazelles* comprise 3% of all small companies,

stimulating national employment growth and contributing favorably to global economies (Birch, 1995). In Australia, FGFs comprise approximately 10% of all SMEs, contributing substantially to national revenue (Gome, 2003, 2004). Similar proportions are reported for Europe and the US (OECD, 2002). Most net job creation and wealth creation seems to come from FGFs.

Rapid growth is often an indication of market acceptance and firm success (Timmons, 1998). Common forms of small firm growth include internal expansion (e.g., expanding capacity), franchising, mergers and acquisitions, exporting, and geographic expansion (Barringer & Greening, 1998). FGFs are not without problems, including dealing with managerial issues related to people, processes, and resources. People related issues originate from observations that these firms double/triple in size very quickly. Influx of new employees can herald high stress levels, and skill levels of new employees can be inadequate (Terpstra & Olson, 1993). Notwithstanding, Tan and Smyrnios (2005a) found that FGFs strive to target staff who have relevant skills and knowledge, as well as a distinct personality to fit firm culture. It is not surprising that employers or CEOs emphasize giving priority to individuals who are happy, creative, and likely to accommodate to an existing organizational culture.

Market orientation (MO), entrepreneurship and organisational learning constitute unique resources collectively for FGFs (Tan & Smyrnios, 2004a). Slater and Narver (1995, p. 63) argued that *MO provides strong norms for learning from customers and competitors, it must be complemented by entrepreneurship and appropriate organizational structures and processes for higher order learning*. These three sources of competitive advantage are discussed below.

## THEORETICAL CONCEPTUALIZATION

### Market Orientation

Narver and Slater (1990) defined MO as an organizational culture that comprised three behavioural components of equal importance: customer orientation, competitor orientation, and inter-functional coordination. While Kohli and Jaworski (1990) view MO as the implementation of the marketing concept, Hunt and Morgan (1995, p.11) advocate that MO is the *(a) systematic gathering of information on customers and competitors, both present and potential; (b) systematic analysis of the information for the purpose of developing market knowledge and (c) the systematic use of such knowledge to guide strategy recognition, understanding, creation, implementation, and modification*. MO is more than a reflection of the marketing concept and is considered supplementary. The marketing concept has a single-minded focus on customers. MO focuses on both customers and competitors. Marketing essentially puts customers on a pedestal (Webster, 1992).

### Learning Orientation

There are two types of learning. Single-loop learning occurs when errors are corrected without altering the underlying governing values (Argyris, 2002). This process is also known as adaptive learning (Argyris, 1977). An example would be learning from mistakes. When a firm launches a product and it is not successful, organizations will learn from reasons that cause products to fail. Double-loop learning, in contrast, occurs when organizational values are questioned leading to viewing problems from different angles, introducing ideas from other contexts, and experimenting with new approaches (Field & Ford, 1996). This type of learning should be utilized when environments are unpredictable and constantly changing. There are three main

components of organizational learning, namely commitment to learning, shared vision, and open-mindedness (Sinkula, Baker, & Noordewier, 1997).

Notwithstanding, a learning orientation (LO) is in itself difficult to implement, with many factors requiring consideration as an entire organization is affected. It has been argued that market-orientation is by itself, inadequate, and the ability of an organization to learn faster than its competitors may be the only source of competitive advantage (Dickson, 1996). Slater and Narver (1995) stated that possessing a learning oriented posture leads to superior outcomes such as superior new product success, customer retention, superior growth, and/or profitability. As an organisation learns to make sense of its markets, it develops rules for processing information about markets, which influences its internal and external organizational actions (Sinkula, Baker, & Noordewier, 1997). External actions refer to products and their promotion, distribution and pricing strategies, and tactics, all of which comprise marketing capabilities. Positive learning orientation directly results in increased market information generation and dissemination, which in turn, affects the degree to which firms make changes to their marketing strategies. Pisano (1994, p. 86) posited that *without learning, it is difficult to imagine from where a firm's unique skills and competencies would come.*

### **Entrepreneurial Orientation**

Entrepreneurship is the process of creating value by combining resources. Entrepreneurs are required to consider economies of scale, understand competitors' growth and strategies, take into account resource constraints, manage effectively internal financing abilities, and to balance customer and personal goals so that growth can be assured (Bhide, 1996). Entrepreneurial and MO are two major considerations that directly affect operational competencies. Tzokas, Carter, and Kyriazopoulos (2001) noted that these two orientations contribute synergistically to the emergence of unique marketing techniques and overall, firm performance. Lumpkin and Dess (2001) defined entrepreneurial orientation (EO) as those firms that are innovative, risk-taking, pro-active and competitively aggressive. Innovation, refers to seeking creative, unusual, or novel solutions to problems and needs and can be in the form of new technologies, processes, products or services. Risk taking involves a willingness to commit significant resource opportunities that may fail, although risks are usually moderated and calculated. Pro-activeness concerns initiating actions, and being often the very first to introduce new products or new ways of doing things (Lumpkin & Dess, 2001). Interestingly, Grant, Laney, and Pickett (1997) suggested that entrepreneurs are not risk takers, do not leave things to chance, and are willing to work hard and take action to cut losses whenever possible. Their focus appears to be on exploiting opportunities.

### **Marketing Capabilities and Firm Performance**

Chaston (1997) postulated that entrepreneurial marketing has a major influence on the performance of small firms. Vorhies, Harker, and Rao (1999) identified six processes whereby a firm's value added products and services can reach target customers. These capabilities are based on the principles of marketing, including market research, pricing, product development, channels of distribution, promotion, and marketing management. Vorhies and Harker (2000) examined the importance of learning processes in the development of MCs. MCs are attained via learning processes when employees repeatedly apply their knowledge to solving marketing problems (Day, 1994). Such developments create a set of processes enabling an organization to

achieve its strategic goals and to realize desired strategic position (Day, 1994). Firms with higher levels of product development and marketing implementation capabilities demonstrate higher levels of performance than those without these vital values (Vorhies, 1998). Hooley, Fahy, Cox, Beracs, Fonfara and Snaj (1999) observed that MCs are more important than operational ones in explaining superior performance.

According to Vorhies (1998), firm performance should be assessed relative to competing firms when multiple industries are represented in studies. Objective measures of performance will vary greatly in different industries, therefore, it would be desirable to measure factors other than economic performance. Performance measurement has been the subject of much debate in marketing literature (Hooley et al., 1999). Absolute performance figures such as return on investment and profit levels, sales volume, and market share are difficult to compare between firms that operate in different markets, using different accounting standards, and define their markets in different ways and different sizes. Market-based measurements such as customer loyalty and satisfaction should also be included (Day & Wensley, 1988). The following method section describes the present fast-growth participants, and measures and procedures adopted for our study.

## METHODOLOGY

### Participants

Participants are the 2003 and 2004 *BRW Fast 100* firms (Gome, 2003, 2004). Inclusion criteria involve: less than 200 full-time employees, turnover of more than AUD\$250,000 in 1999/2000, and a single customer must not account for more than 50% of a company's turnover. Companies provide signed audited turnover figures over four consecutive financial periods (1999-2003/2000-2004), in order to calculate average growth rates for ranking purposes. In 2003 (versus 2004), Fast 100 firms achieved an average turnover growth of 61% (versus 102%), while the top company attained a growth rate of 545% (versus 887%). The growth rate for the company ranked 100 is 32.2% (versus 35% for 2004). About 80% of companies in 2003 and 2004 operate in the services industry, which is consistent with Australian businesses overall, providing approximately 70% of Australia's GDP and 81% of employment. The average annual growth rate (1988-98) in the property and business services industry is 5.1% (OECD, 1999).

For the purposes of this study, growth is calculated via average turnover over a period of three years, using the fourth year as a baseline. For each financial period (e.g., 2000-1999), average turnover was calculated using the formula:

$$\text{Average Growth} = \sum \left[ \frac{(\text{Year 4} - \text{Year 3})}{\text{Year 3}} + \dots \frac{(\text{Year 2} - \text{Year 1})}{\text{Year 1}} \right]$$

Where Year 4 = 2004 turnover and Year 1 = 2000 turnover

70% (versus 73%) of the CEOs are aged between 31 and 50 years, with 92% being male in both years. 47% (versus 50%) of the CEOs have tertiary education. The main reason for starting their business includes saw a niche (43% versus 41%) and independence (22% versus 10%). 43% (versus 33%) note an ambition to dominate a niche, 29% (versus 15%) to be a global player, and 26% (versus 24%) to dominate the domestic market. About 52% (versus 56%) of the Fast 100

principals started their business with less than AUD\$20,000. While 72 % (versus 90%) of these firms are private companies. 20% of the 2003 and 2004 participants comprise family firms. For this study, 18 fast-growth CEOs were interviewed. Owing to word limits, only findings emanating from in-depth interviews from one fast-growth family and one nonfamily firm is included.

### **Measures**

An interview schedule derived from studies evaluating MO (Narver & Slater, 1990), LO (Sinkula et al., 1997), EO (Lumpkin & Dess, 2001), MCs and firm performance (Vorhies & Harker, 2000) was developed by the present investigators.

### **Procedure**

Tape recorded semi-structured interviews of at least 2 hours involved a checklist of areas (e.g., leadership characteristics; market, learning, and entrepreneurial orientations; MCs; CV; and firm performance compared to competitors) to cover rather than a list of pre-determined questions. Informants relayed stories and events, which were recorded, transcribed and analyzed extracting main themes and narratives. According to Hill and Wright (2001), qualitative research provides an opportunity to achieve a holistic view of complex events in organizations, and develop relevant causal network models (Denzin & Lincoln, 2000). The following section contrasts the business orientations and MCs adopted by these two types of firms, revealing their impact on business performance, and culminating in a conceptual model.

## **FINDINGS AND DISCUSSION**

**Fast Growth Family versus Nonfamily Firm: MC Labour Services versus Liaise Marketing**  
MC Labour Services (MCLS) is a supplier of supplementary labor in the commercial construction industry for the Melbourne market. Employing 9 staff, MCLS started trading in 1995. Ranked 90 and 76 in the 2003 and 2004 *BRW Fast 100* respectively, MCLS's 2004 growth rate is 44.79%, turning over AUD\$15.37 million in 2003/04. The present CEO/founder, Marc Lunedei, provides organisational direction, driving this family business orientation. Moreover, it appears that his exposure to a family firm's business environment as a child and young adult has influenced the way in which he leads his organization. Marc worked with his father in a local butcher shop, supermarket, and construction company. As a customer oriented firm, incorporating innovation and learning, this enterprise builds certain marketing competences. Their marketing advantage culminates in superior CV, ultimately affecting firm performance (see Figure 1). Below, we present a detailed discussion of the causal network model originating from this case study and that of Liaise Marketing (LM).

Marc comments that: *learning the politics of the construction industry is imperative because the union in Melbourne is one of the most militant unions in Australia.* This knowledge helped Marc to enter and consolidate his firm's position in the industry. He adds: *It's not a matter of a client ringing and saying, 'I need 2 laborers and a carpenter at my site'. All the political requirements need to be met as well. For example, they need certain union tickets.* MCLS specialises in the commercial construction industry of supplying supplementary labor, such as fork lift drivers, brick layers, and cementers. *There are a lot of large companies that just use supplementary labor. What has evolved is that we employ all the candidates. 2/3 of the laborers are employed by us, on a full-time basis, and we hire them out to our clients. As well as being our employees,*

*they are our products or assets, and that's what has been our specialty. A lot of potential workers come to us first to enter into the industry with a view that they might be directly employed by one of the construction companies as well. His early industrial experience, and knowledge of the type of builders that required labor hire has also contributed to his business success.*

MCLS is a first generation family firm. Initially running the business with his wife, other family members (sister, nieces, cousins) have been employed, at different times. According to Marc, there are different approaches that family businesses take compared to nonfamily firms. Coming from a family business environment, *I had to learn to employ someone for the purposes and delegate to them. When you are in a family firm, you tend to do a lot yourself. And after a while, it comes too much and you can't do everything. It was a mould that I had to change out of.* The issue of succession is also regarded as important. *There is a lot of sentimental value because of the effort, sacrifice and strain on the family. It affects the decision of selling, to keep it going, hand it over to the children, get them to carry on.*

As a point of comparison, LM was established in 1998 by Tony Merlino. Ranked number 47 in the 2004 BRW Fast 100, LM achieved AUD\$1.8 million sales in 2004, achieving an average turnover growth rate of 63.39% between 2000 and 2004. Previously employed as a retail buyer in two large Australian supermarket chains for 28 years, Tony began to question his professional and career status. *Why was I working this hard for a corporate? I thought to myself, if I worked this hard for myself, with the experience and knowledge I had gathered over the years, chances are, I will succeed.* Tony started the business with AUD\$2000. *You don't take ownership of stock, so we didn't need a lot of financial backing.* Being an ambitious person, Tony did not want to *stay in a boutique or a cottage industry.* He spends 80% of his time thinking about the business. *The only time I don't think of it is when I am sleeping.*

LM employs 50 staff and operates as a broker in the Australian supermarket industry. Typically, a broker represents manufacturers' products to a variety of prospective retail buyers. These buyers could be specialty stores, retail grocery chains, wholesalers, foodservice operators and distributors, drug chains, mass merchandisers, industrial users, or military installations. In trying to sell products and achieve a listing, a broker might make presentations to head offices of chains and wholesale groups. These may include merchandising (planning, promotions, keeping product on the shelf), computerized ordering, and data collection services. Brokers have personal contacts and established relationships with buyers. They also have expertise in select markets (Bosse, 2003).

LM offers the service of a sales manager and sales team to Australian manufacturers in the supermarket industry. *Manufacturers who are very good at what they do, but struggle with having a sales team, marketing manager, and all the expenses associated with having that infrastructure. We position products to cater for their growth. We work on the sizing, pricing, labelling, and conformity for the product. When the product is ready to market, we would visit the retail buyer with the manufacturer. My sales team also makes sure that products are on the best position on the shelf.*

Getting products onto the supermarket shelf is a difficult task. *You would be surprised how many competitors that you have to face when you launch a product. You may think you have an exclusive product, but chances are, someone has already been in the process of manufacturing the same thing, or has already got one in the market. One of the keys to success is to be innovative, either create a trend or product, or research overseas markets and determine whether that trend that has started to occur overseas will occur in Australia. That takes a lot of research and study.*

The supermarket industry has changed over the previous 4 years. When a manufacturer wanted to launch a new product, they would meet with retail buyers in all states. It was very costly and time consuming because the presentation and sales pitch was repeated 5-6 times. Currently, major retailers have centralized the system. If the buyer does not want to retail a manufacturer's product, the product does not make it to market. Centralization leads to a uniform shelf range nationwide. Similar to MCLS, Tony provides organisational direction, which drives firm business orientation and consequently, MCs. Their marketing advantage culminates in superior CV, ultimately affecting firm performance (see Figure 1).

Our research indicates that previous industrial or business experience is a key contributing factor for business start-up. FGF leaders are often passionate about their business, possess the desire to challenge the status quo and ultimately be the best (Tan & Smyrnios, 2005a), the qualities of which are a central starting point of any business. Consistent with this view, Lee and Tsang (2001) emphasized that managerial experience is a dominating factor affecting venture growth. High achievers have a strong desire to be successful, and setting challenging goals and standards for themselves. They are not easily satisfied with current achievements and strive to improve performance. This research also supports the contention that growth willingness is a decision largely made by owner/managers (Packham, 2002) and not dependent on whether the firm is identified as being a family or nonfamily firm (Cooney, 2002).

CEOs who possess energy, determination, and love for their business, drive the direction and strategy of their organizations (Tan & Smyrnios, 2005a). Weisner and McDonald (2000), found that environmentally sensitive interactions between management and employees provides opportunities for direct leadership, which can facilitate robust organizational cultures. Given that the majority of firms in our sample are young and emerging, without any excess baggage, these CEOs are in a solid position to shape their culture possibly more decisively. Therefore, we advocate that firm business orientation (MO, LO, and EO) proclivity is dependent on the leader's experience, and values. The next section explores findings relating to these dimensions.

---

## **Market Orientation**

**Customer orientation.** MCLS services 200-300 clients, including large Australian construction giants such as Multiplex and Grocon. These clients hold expectations with regard to the provision of hire skills and services, encompassing specific types of labor skills supplied at such short notice. *We've made sure that we are contactable live, all the time, 24 hours. Often we get calls at 10pm on a Sunday night where a site manager has just realised that he needs two guys*

*out on the site tomorrow. I think what was generally happening before, if someone had a requirement early in the morning, they would need to ring a company, and because it was after hours, they would need to leave a message, it might be an after hour service, they would have to wait for them to get back to them, and then give them the requirement. We have actually set ourselves up so we can service the clients quickly and promptly at short notice.*

Customer satisfaction is viewed as a high priority. Clients are constantly contacted for feedback on services provided. Most of the information is logged, and management analyses all data. Candidates with whom clients have reported dissatisfaction are not sent to that company again. *We have processes in place on our database, not to send certain people to our clients. We stress the importance of logging his information.* Customers are also usually quite happy and loyal. *We will make sure that they are happy all the time. Candidates that come to MCLS from competitors say that they don't get the same level that we provide them in terms of training etc. We train our full time employees.*

Customer focus and relationships are other foci, Marc states that *internally, we always discuss each manufacturers performance. Everyone is conscientiously responsible. The culture has been that we all support each other. There is a lot of joking and happiness. Probably because of my personality as a business owner, there is a very easy going mentality here. We are really focused on establishing relationships, not just to get the business from them now. There are probably 50 different contacts in the company. It's different sites, projects. I go through the list and think I'm going to call everyone from Multiplex and establishing that relationship with the site or project manager. The business consultant does that job.*

In contrast, LM caters to approximately 30 small-to-medium manufacturers of health foods, cooking ingredients, pet foods, telecommunication hardware, vitamins and fragrant aromatherapy oils. *Some of our customers just use my sales team to make sure the product is on the best position on the shelf. Sometimes we visit the retail buyers on the manufacturers' behalf and try to win contracts. For example, in any category, there might be up to 20 different manufacturers and all of them want the best position. You can influence the decision but you need to have strong arguments as to why you want your product in the best position. Generally, the buyer makes his own decision based on the profit contribution or size of packaging, visibility, or profitability. They have their own criteria.* Most of these manufacturers are long established. *Before us, they had other brokers. It was difficult to get their business but basically all we did is call them and say, this is what we can do for you. If there is an opportunity, please call me. I am trying everyday, in some form or another, just by talking to someone.* Other customers have used LM since they were first established.

Managers closely monitor levels of commitment of staff in serving customer needs. *There are a lot of barometers. Sales figures, market share, and store visit reports are evaluated to ensure my sales team are doing the right thing.* Speed to market (i.e., how quickly we can get it on the shelf) is also assessed. Measuring customer satisfaction is important. *Each individual team's performance is measured via various mechanisms. We measure their performance – each thing that one of our team members achieves in a store is recorded: movement/relocation of product, putting a product on a shelf that wasn't there before in a particular suburb store. That all gets*

*data entered and a report is given to our manufacturers on what we have achieved: whether it's a high or low achieving month - irrespective. A very honest report.*

**Competitor orientation.** Previously, MCLS dominated the whole industry, however, over the previous few years, the market has been in decline. One competitor has been trying to emulate MCLS in their success. However, the majority of competitors are working in middle trades and manufacturing, rather than the construction industry because of its volatility. In response to competitors, MCLS hired a consultant representative who visits construction sites. *We employed someone full time to visit as many construction sites as he possibly can. To see where the competitors are and what we can do to get there. They are talked about quite often lately because they have been quite aggressive.*

In the brokerage industry, there are approximately 200 brokers Australia-wide. Top brokers are at least 6-times larger than LM, employing about 250 people. *There is no documentation, journal, or written matter that indicates turnover for competitors. You hear little things along the way. I would put my company about 40<sup>th</sup> on the ladder of turnover. I guess it's measured by the value of the total sales that we look after.*

Sales people share information about competitors. Their activities are discussed in state meetings. However, competitors are not the focal point. *Contrary to what a lot of people think in business, we don't know much about our competitors. Some major leaders will testify to the fact that you need to know your competitors better than they do themselves, I know the grocery industry, but I don't know much about my competitors. I know what they do wrong, a lot of the times. It's quite visible at store level and also, because manufacturers do tend to change who they use, you find out from them.*

Being customer oriented does not entail just informing employees to behave a certain ways with customers. Customer orientation becomes impossible when employees do not perceive themselves as being there to serve customers, or recognize that a principal reason for being employed is to help the organization create value for customers (Judd, 2003). Donovan and Hocutt (2001) suggest that employees need to have a certain kind of personality to be good at service work. For example, courteous service is required, and friendly people need to be hired. It may be possible to provide employees with the technical skills necessary, but difficult to train them in how to be polite and caring. Being market oriented is a distinctive form of business culture, not a simple process and involves significant commitments in terms of time, training, and expenditure (Appiah-Adu, 1997). With respect to competitor orientation, it is necessary for MCLS to be vigilant of competitors because of market share decline, owing to industry restructuring and increasing number of competitors. In contrast, LM is not overly concerned about competition, an orientation similar to most other FGFs (Tan & Smyrniotis, 2005b).

### **Learning Orientation**

MCLS staff are encouraged to attend seminars/courses. Marc notes: *I've sent them on different accounting type courses, recruitment and consulting, and it helps them understand specific things. I think the need arises more as you grow. Learning to adapt is more important. I am open to new ideas, because I am looking to anything that helps improve our growth. You will never be at a point where you know everything and you don't need to learn from something.* In terms of

possessing a shared vision, however, Marc believes that it could be communicated better. *We are in the process of implementing and then we'll express them emphatically to the rest of the staff.*

For LM, in comparison, learning to keep ahead is considered to be essential. *We never stop learning in the grocery industry, there is always something new. New system, product, design, new this new that. We are always looking at different ideas.* Surprisingly, staff are not formally trained. *Our staff don't go on sales training, that's one of our weaknesses. We have an induction, but that's all. We discuss how each team can better themselves. Most of the team are very knowledgeable about the industry, so it's mainly, we try to teach them the humanistic side of things as far as dealing with people.*

LM makes a point of employing staff experienced in their field. *Because we are in such a steep growth curve, we can't afford the time to train people about the industry, we need them to be experienced. Most of them haven't gone to university, they have gone straight from high school into the grocery industry. A lot of them are like me, its good grounding to be able to work on both sides and if you start from the retail perspective, working on the shop floor, which is what most of our people have done, including myself, it gives you a very good understanding of the consumer and also the art of retailing I guess, and when you move out to the other side, it gives you the other side of the fence, different perspective. It makes you a more rounded knowledgeable person.* Employee turnover is low: *People don't leave this company, we probably have lost 10 people in 6 years.* Similar to MCLS, sharing an organizational vision seems to be a neglected area. *There should be a clearer direction. The only thing that anybody is aware off is how fast we are growing. I don't think everybody understands where we are going, and we have a conference coming up and one of the key agenda items in that conference is to actually detail our vision, so hopefully that will help.*

Although both firms acknowledge the importance of learning, the focus is more on individual learning rather than organizational learning. Individual learning practices are those that focus on enabling the acquisition of new knowledge, skills, and attitudes by individual employees (Birdi, Wood, Patterson, & Wall, 2004). Organizational learning, includes processes by which learning is shared vertically between individual, group, and organizational levels (Crossan, Lane, & White, 1999), the process of which is not evident in our research. Sharing an organizational vision seems to require further attention.

### **Entrepreneurial Orientation**

MCLS is a proactive business, being one of the first to introduce innovative services, such as standby. *We provide added security. Full-time employees are on standby which means if they have been on a project for 6 months and the project finishes today, and MCLS does not have a job for the candidate the next day, MCLS provides one day standby. They will be paid but need to be contactable because of the short notice requirements in industry. We know we are busy, and we have a lot of work, so we can commit to so many full time employees.*

Being a market leader also means staying ahead. However, being innovative in this industry is about getting into other markets. *There are new things like trying to find an area that is not outsourced.* MCLS is regarded as a specialist in the construction labor industry. When making decisions, each situation is systematically analysed, rather than adopting a bold “gung ho” or

aggressive posture. *For example, in terms of expanding to Sydney and Queensland, some people say that all you need to do is go and open an office there. I think, I need to thread carefully because I need to go there, pay rent, and employ people. There will probably be no returns for some time. We are more cautious rather than jumping boldly into it and saying, 'Let's spend the money and hopefully it would work!' We are doing initial enquiries about expanding to other states. One of our clients asked us before we could even ask them. Clients want to deal with one supplier nationally, and it would increase their buying power with us.*

By comparison, for LM, radical innovation is also not visible in the grocery industry. New lines have not been introduced. However, they have expanded geographical boundaries. *What has improved with us is our coverage. When we started we could only cover Victoria, now we cover every state with our own people. So it's not so much what we do, we do the same things but to a larger scale.* In terms of process innovation, LM attempts to approach its operations from different angles. For example, prior to start up, Tony asked for advice from brokers he had networked with previously. *They were kind enough to offer me advice. However, I didn't take on board a lot of what they did because I didn't agree with some of the things they were doing. I went about and did the reverse despite the fact that some of these companies were very successful. My belief that there was a lot of dissatisfaction from the manufacturing base and that these companies had succeeded despite themselves.* As an example, Tony did not follow suit by hiring part-time staff. *They only work 8 hours a week. Their numbers on the books look good, they have 250 people but if you add up the hours, it's not a lot of hours. A lot of part timers haven't spent a lot of time in the industry. Some of them are housewives, they have other commitments.* From Tony's perspective, full-timers are career driven, want to succeed, and are usually more experienced.

Tony states that organizational policies and guidelines for LM are developed in-house. *We create our own intellectual properties.* A specialised program was also developed to ease business practices. *We developed our own database. You can buy tailor made packages but that is restrictive in what it allows you to do, we keep modifying it too. There is certain information that needs to be collected from supermarkets. Both, of which we require internally and our manufacturers who we work for, also require certain elements of the information. We marry the two up, so we knew what we wanted to collect from the field. We weren't sufficiently enough computer literate to be able to build a program that will allow this data to be collected and deciphered. So we commissioned a computer expert, but we trained this person in terminologies and the ways of the grocery industry before we even got him to build the program. He was external and spent a year on it. It took us a long while for him to learn the grocery industry, and he then adapted it.*

Tony feels that LM is operating in a high risk industry. He elaborates, *when you are talking about a retail industry that has 2000 stores, you can imagine how difficult it is, you have to make sure that 2000 stores have got your clients products in stock, in the right position, in a saleable condition, with the correct ticketing.* Because the nature of their work is highly visible, a simple mistake can jeopardize a contract nationally. *All it takes is a couple of bad store visits from one of our clients.* Owing to the nature of the environment, keeping pace with the market is essential. *You can't afford to be timid or backwards. You spiral upwards in the grocery industry and you can't even stand still. It just takes you with it, like a wave. And the wave also breaks on top of*

*you, so there is always that potential. But what I have noticed is that if you are going to do something in the grocery industry, it's so big and there are so many different facets of it, from manufacturing, to selling, logistics, data collection, and merchandising. You can't help getting involved.*

By default, FGF owners are entrepreneurially oriented. As these firms grow organically, one route to growth is providing a differentiated service. Unless a product/service is *new to the world*, most of the innovation engaged by FGFs is process innovation (Tan & Smyrniotis, 2005b). Our findings are consistent with Oke, Burke, and Myer (2004) who found that there is a greater focus on incremental innovation (i.e., improvements to products, services and/or processes often in response to customer needs) than on radical innovation (i.e., new products, services and/or processes and/or new markets) for growth oriented SMEs.

According to Lumpkin and Dess (2001), an entrepreneurially oriented firm adopts a bold, aggressive, posture when confronted with decision-making situations involving uncertainty. However, in reality, different situations require leaders to adapt accordingly. Consistent with Grant et al. (1997), we find that fast-growth entrepreneurs spend time calculating risks and are not gamblers, leaving things to chance. Tony elaborates, *I have been known to be bold at times but only when I have been absolutely certain of something. But, generally, I am a bit conservative.* We have also found that FGFs in our sample do not possess a so called *undo-the-competitors posture*, which is a dimension of EO.

### **Marketing Capabilities**

**Products.** MCLS views their candidates (employees) as products. *We attract the best in industry. We have a lot of comments from people that they are amazed at how loyal people are to us. We have a reputation of being a great company to work for, we look after them. It's just about giving people individual time; treat them as a person, not as a number, and not talk down to them. People prefer to work for us, we clothe them with MCLS shirts and wind sheeters. People also like to work for us because we train them well. We send them for training and pay them for the day they are being trained. We try and establish a mind set in our guys, that they should be proud to work for our company. They need to show good representation and sell themselves to the clients. This will in turn create security for them because they are an asset, it's very performance based.* Candidates are not bound to MCLS. *Nothing is stopping the candidate from leaving. We pay them above the award. To keep them with us, we offer security, and train, more than what other companies do.*

**Relationships.** Relationships with clients and candidates are regarded as better than the competition. *With our candidates, we personally assist them. We've always believed in establishing relationships. Relationships create loyalty.* Similarly, MCLS has a close working relationship with unions, which is crucial. *We are probably the most union preferred company, which means a lot in this industry because the union is very influential. Our relationship has been established over many years. If we had a bad relationship with them, it would affect our business by 20%. However, once upon a time, 6 years ago, they were so influential and strong, they would make sure you had no work. Our approach has always been to look after the candidates, make sure they have everything. Reason for this is because they are our assets. A*

*happy satisfied worker will be a good worker, which will make the clients happy. MCLS has established themselves as the brand of being the employer to work for.*

**Services.** Services developed by LM, in contrast, are geared to increase sales for manufacturers. For example, staff are financially incentivised instead of being administration driven. *Other brokers are not truly sales focused, they are focused on recording information as to where the product is, how many facings it's got on a shelf, what the price is. Those functions aren't really driving sales. Our team members are sales focused: trying to improve the position of the product, build a display. We then reward them on sales. We pay our people a bonus incentive to achieve budgets. A lot of brokers don't do that. I think that is been one of the keys to our success. The managing director also stays close to the action. In my industry I don't know of any that has one owner one director and they are a national company.*

**Relationships.** LM possesses sound relationships with clients. *At times, it extends beyond business relationships. It becomes friendship. That sometimes is unavoidable as well. However, I don't know what sort of relationship my opposition has with their clients. I think we have a good work ethic which reflects on our image. We haven't lost many manufacturers in the last 6 years. Their relationships with other brokers weren't as close. We have a very personal touch here. People know of us because of word-of-mouth communication, and we have always been rated highly on our honesty level too. Interestingly, LM spends little time developing its' own MCs. We spend so much time marketing other people's products. It's like a car mechanic that fixes everyone's cars but his own car doesn't work properly. Strange isn't it. We don't market ourselves very well. Evident of that is the fact that our website isn't up yet. Its one of our objectives for 2005 definitely!*

MCs by their nature are difficult to duplicate. Relationships, like innovative services take time to build. MCs are characterized by high levels of tacitness and complexity, and are the product of ongoing exchanges that take place both within firms and with external stakeholders. Many of these exchanges are highly firm specific and path dependent, which prevents duplication by competitors (Reed & DeFillippi, 1990)

### **Customer Value and Firm Performance**

Finally, attaining an advantage in MCs does not exist in isolation. Prior to purchasing, customers need to perceive that services or products are of value. CV is a dynamic concept that evolves over time. Value is determined by customers' perceptions rather than suppliers' assumptions or intentions. It is not what the producer adds, but what the customer derive (Doyle, 1989). Superior CV culminates in superior firm performance (Tan & Smyrniotis, 2003).

MCLS offers value by providing customer service, which they consider to be superior (e.g., going out of the way to provide products/services under time constraints). *Customers want someone with the best price that they can, but the highest priority is the level of skill and service. They are going to need people at short notice, things are going to rise, and they need 5 guys there straight away. We guarantee them that we can provide them that. MCLS also ensures the best client-hire person fit. We have processes in place on our database, for clients, not to send certain people. We stress the importance of logging in the information.*

In terms of firm performance, MCLS remains profitable. *We are here to make money. When I look at some of the competitors rates, I think we must be more profitable.* In this industry, it is difficult to calculate return on investment. *Our investment is in our staff/candidates and it's not like, here is \$1m, I am investing in a business. It's my venture. So, it's a difficult.* In terms of market performance, customers appear to be satisfied with MCLS's offerings. However, *our marketing is not effective enough and I want to identify what would be a good marketing tool as well.* Marc attributes their success to the quality of his assets (candidates), network of relationships, and care for clients and candidates.

For LM, clients ultimately value an open and honest policy. *I try and engender the atmosphere where they are able to express themselves to see whether the value has been provided. That's about it. We both also value the same things: more sales.* In contrast to MCLS, LM has not always been profitable. *Only in the last 2 years, we started to become profitable. It is attributed to obtaining a very large contract 2 years ago, which was the break we needed. I had to build the base, meaning the infrastructure and then try and obtain contracts during the period of building the base. I wasn't making money, in fact I was losing money, that was inevitable...that needs to be done.*

#### **MODEL DEVELOPMENT: MCLABOUR SERVICES AND LIAISE MARKETING**

As elaborated earlier, management appears to be a central starting point, guiding organisational direction. For entrepreneurs, start-up is largely based on their industrial and managerial experience. A firm's proclivity towards a particular business orientation is dependent on leadership. Customers, learning, and remaining entrepreneurial are important, these values are shared throughout an organization. Logically, attaining knowledge and intelligence from the market, continually challenging assumptions, and creating innovative solutions places organizations in an advantageous position in terms of their MCs. The present findings indicate that firms that undertake process innovation are likely to develop superior products and services that customers require. After evaluating all MCs, we found that both MCLS and LM attain an advantage in terms of services provided and relationships established both internally and externally. Finally, an advantage in MCs is insufficient. Tan and Smyrniotis (2003) concluded that CA should be measured in terms of CV because customers ultimately purchase the products/services. A CV approach focuses on how people choose among competing suppliers (Gale, 1994). Consequently, superior performance is a result of providing superior CV (Tan & Smyrniotis, 2003). Firm performance is not limited to financial measures, but also market aspects such as customer satisfaction and loyalty (see Figure 1).

It is acknowledged that all variables investigated are dynamic, taking time to evolve and changes over time. Our results do not capture the dynamics of these changes as the present study is cross sectional rather than longitudinal. The current investigation is concerned with only two Fast 100 companies in different industries. Thus, findings can be generalized only to firms meeting specific constraints. Furthermore, variables examined represent a narrow set of possible predictors. Cragg and King (1988) highlighted that no study can reveal all attributes involved in making small businesses successful. Longitudinal data might be appropriate.

## IMPLICATIONS FOR MANAGERS AND FUTURE RESEARCH

Findings suggest that there seems to be no significant difference between family and nonfamily FGFs in terms of their leadership characteristics, business orientations, and MCs. This finding might relate to MCLS being a first generation entity rather than a multi generation firm involving a consortium of cousins and extended family members all contributing to the running of the business. The likelihood of running a successful business increases when business owners obtain relevant experiences prior to start-up. CEOs focused on growth are required to lead employees who can help their organization create value for customers. CEOs also need to develop and effectively communicate a vision while obtaining members' commitments to achieve that vision (Hagen & Lodha, 2004) and to become a learning oriented organization. Currently, these two FGFs only focus on individual learning. For family firms, the CEOs need to be conscious of employing staff who are suited to the job rather than relying on family members. Process innovation seems to be a differentiating factor between these FGFs and their slower growing counterparts. It is also important to constantly ask customers what they value and whether the organization provides that. Future investigations should focus on quantitative empirical studies exploring the role important entrepreneurial characteristics as antecedent to firm business orientation. Rigorous testing of key relationships obtained in this study should be pursued using larger data sets. Firms at different stages of the organizational lifecycle focus on building diverse MCs. Therefore, other drivers of MCs should be investigated along the growth continuum. Researchers should also consider studying the mediating role of CV, particularly between MCs and firm performance for slow-growth SMEs and their larger counterparts. Finally, researchers should also examine the role played by customers' perceptions of CV because customer and supplier views are not necessarily similar.

## **ABSTRACT**

This research investigates synergistic relationships between market, learning, and entrepreneurial orientations as sources of competitive advantage. These orientations are viewed as driving tactical marketing capabilities (MCs), providing positions of advantage. Disparities in growth trajectories between fast-growth firms (FGFs) and mature, medium-to-large companies highlight a need to study drivers of firm performance. Our paper compares fast growth entities with their Top 500 counterparts. Findings demonstrate that successful businesses have CEOs with particular leadership skills geared to grow their organizations, and an ability to empower employees. Empowering employees to make their own decisions and feel valued is essential for internal marketing. Moreover, FGFs gain success through continually challenging assumptions, articulating a similar vision, fostering solid relationships with stakeholders, and by providing innovative products in terms of customer value. Similarly, management drives organizational activities and ultimately firm success for medium-to-large organizations. Top 500 data identifies three principal findings: growth through acquisitions, MCs, and customer service. Specifically, participants aim to grow via acquisitions of local companies rather than having a global perspective. Growth through mergers and acquisitions can be attributed to these corporations operating in mature industries such as the floor coverings. It is not uncommon for Top 500 companies to attain advantage through the provision of superior customer service in order to maintain ongoing relationships. Furthermore, Top 500 companies are competitively aggressive seeking potential customers, utilizing distinct MCs, such as formal market research. Recommendations for future research and implications for managers are outlined.

## **BUSINESS ORIENTATION, MARKETING CAPABILITIES AND FIRM PERFORMANCE: FAST 100 VERSUS TOP 500 COMPANIES**

This investigation explores synergistic relationships between market, learning, and entrepreneurial orientations as sources of competitive advantage (CA). These orientations are viewed as driving tactical marketing capabilities (MCs), providing a position of advantage. As entrepreneurship and marketing involve the process of creating value by combining resources, this position of advantage needs to create superior customer value (CV). This study extends Tan and Smyrnios (2004a), suggesting that specific learning (i.e., shared vision) and entrepreneurial (i.e., being proactive & innovative) orientations along with particular MCs are significant predictors of Fast 100 firm performance. Specific MCs contribute to firm performance. Marketing management, pricing, promotion and marketing research are nonsignificant contributors.

Investigation of factors driving the success of entrepreneurial firms reveals no studies comparing fast growth entrepreneurial entities with their Top 500 counterparts. In Australia, fast growth firms (FGFs) tend to be emerging enterprises, usually less than 10 years of age, and comprise approximately 10% of all SMEs, contributing substantially to national revenue (Gome, 2004). Similar proportions are reported for Europe and the US (OECD, 2002). The *BRW Top 500*, by contrast, are medium-to-large private organizations, most of which were established over 100 years ago, and representing 6.4% (AUD\$143 billion annually) of Australian national revenue. Disparities in growth trajectories between FGFs and their mature companies highlight a need to study drivers of firm performance. The overarching research question addressed by this study is, in what ways are firm market, learning and entrepreneurial orientations related to organizational MCs and ultimately firm performance? Our paper begins with a brief overview of the pertinent literature, and theory underpinning this investigation, followed by a description of the methodology. Two causal network models, derived from an analysis of two detailed case studies are presented. Implications for researchers and managers are outlined, concluding with recommendations for future research.

### **THEORETICAL CONCEPTUALIZATION**

#### **Fast-growth Firms**

FGFs are like gazelles, their capabilities enables them to be nimble, quick off the mark, responsive to predators, and adaptive to changes in environmental conditions (Birch, 1995). FGFs are companies that achieve a minimum of 20% annual compound sales growth over a 5-year period (Sexton, Upton, Wacholtz, & McDougall, 1997). It is not uncommon for these enterprises to start from an initial base investment/capitalization of less than \$100,000.

Feindt, Jeffcoate, and Chappell (2002) suggested that founders play a crucial role in performance of fast-growth companies. These investigators reported that internal business processes are better organized than in low-growth companies, and growth appears to be primarily a matter of sound entrepreneurship. Nevertheless, management practices that facilitate rapid growth for larger, mature firms are different from fast-growth emerging firms (Barringer, Jones, & Lewis, 1998). There are a number of further critical factors contributing to growth, including a propensity to invest in future-oriented expenses such as marketing, building of distribution channels, and product research and development (O'Gorman, 2001). Moreover, reports indicate that FGF

owners regularly consult coaches and peer networks for advice, support, and direction (Fischer & Reuber, 2003). Exporting is yet another important characteristic. High growth and exports are often linked because most of these companies have a world-wide market. Perhaps surprisingly, exporting seems to be a precondition of growth processes (OECD, 2002). Not surprisingly however, the range and intensity of business networks are also markedly higher in firms that grow rapidly (Zhao & Aram, 1995).

### **Market Orientation**

Narver and Slater (1990) advocated market orientation (MO) as an organisational culture that comprising three behavioral components of equal importance, namely, customer orientation, competitor orientation, and inter functional coordination. Customer orientation is achieved when a firm succeeds in creating a superior value for its customers because the seller understands the buyer's entire value chain. A company needs to comprehend the cost and revenue dynamics of immediate target buyers and those of all markets beyond this point. Employees of market-oriented businesses spend considerable time with their customers, and realize a necessity of maintaining relationships with them as being critical to delivering superior CV (Slater & Narver, 1995).

The creation of superior value requires more than a focus on customers. Firms have to understand the nature of competitors, technologies and products that customers perceive as alternate satisfiers; and to identify and understand the principal competitors' short-term strengths and weaknesses and long-term capabilities and strategies. Generating competitive intelligence is the responsibility of everyone within the company (Slater & Narver, 2000).

MO also includes the coordination of personnel and other resources throughout the company to create value for buyers (Slater & Narver, 2000). For example, in the manufacturing industry, engineering and production staff should constantly discuss their capabilities and limitations with those in sales and marketing, so that capabilities can be leveraged and limitations avoided when promoting products/services (Slater & Narver, 1994). When all functions of an enterprise are geared towards enhancing buyer value in this manner, effectiveness and efficiency for customers are creatively realized.

### **Learning Orientation**

There are two types of organizational learning (OL): single and double-loop learning. The former occurs when errors are corrected without altering the underlying governing values. This process is also known as adaptive learning. An example would be learning from mistakes. However, the latter occurs when one questions an organization's values that lead to viewing problems from different angles, introducing ideas from other contexts, and experimenting with new approaches (Argyris, 1977). According to Baker and Sinkula (1999), a learning oriented firm, is an organizational commitment to higher level learning initiatives. Organizations learn as a result of experience, management development, and changes in the size of the organization. Basically, there are three main components of OL: commitment to learning, shared vision, and open-mindedness (Baker & Sinkula, 1999).

### **Entrepreneurial Orientation**

Morris and Paul (1987) stated that entrepreneurial orientation (EO) embodies three key dimensions, namely, innovation, risk-taking, and pro-activeness. Innovation, refers to seeking of

creative, unusual, or novel solutions to problems and needs and can be in the form of new technologies, processes, products or services. Risk taking involves a willingness to commit significant resource opportunities that may fail, although risks are usually moderated and calculated. Pro-activeness is an ability to implement and doing whatever is necessary to bring the entrepreneurial concept to execution. Lumpkin and Dess (2001) include competitive aggressiveness as part of EO.

MO entrepreneurship and organisational learning constitute unique resources collectively. Slater and Narver (1995) argued that MO provides strong norms for learning from customers and competitors. It must be complemented by entrepreneurship and appropriate organizational structures and processes for higher order learning. These three sources of CA are discussed briefly. Learning orientation (LO) and MO are mutually dependent factors that contribute significantly to superior performance (Farrell & Oczkowski, 2002). Given their iterative nature, these factors should not be measured in isolation. Weerawardena (2003) stated that entrepreneurial firms build and nurture MCs. Tzokas et al. (2001) also demonstrated that firms who are ready to take on risk and pursue innovative projects, and at the same time, give attention to market needs and competitiveness are more competent than those (especially smaller ones) without such qualities. Findings suggest that MO, LO, and EO are not sources of CAs independently, but rather, collectively contribute towards the creation of a unique advantage, as hypothesized by Hult and Ketchen (2001). Similarly, Hult, Hurley and Knight (2004) found that these business orientations are significant predictors of innovation, and ultimately firm performance.

### **Marketing Capabilities and Firm Performance**

Day (1994) identified the development of MCs as one of the major avenues towards achieving CA. MCs are conceptualized as an integrative process designed to apply to a firm's collective knowledge, skills, and resources to market related needs of its business, thus enabling it to add value to its goods and services. Organizational performance, in contrast, is a multi-dimensional construct, including financial, operational, and customer related performance domains (Kaplan & Norton, 1996). Given that an ultimate goal of an organization is to effectively deliver value to its customers (Day & Wensley, 1988), customer satisfaction can be regarded as an antecedent to profitability (Vorhies & Harker, 2000). For the present research, these three sources of CA were investigated to explore relationships between these three business orientations, MCs and firm performance utilizing a case study methodology.

## **METHODOLOGY**

Participants are two cohorts of CEOs/marketing managers: the 2004 *Business Review Weekly (BRW) Fast 100* SMEs and the 2004 *BRW Top 500* private companies. Respectively, inclusion involves a number of criteria, such as less than 200 full-time employees, turnover of more than AUD\$250,000 in 2000/01, and a single customer must not account for more than 50% of a company's turnover, and for Top 500 Companies, revenue of at least \$64 million. The Fast 100 cohort achieved an average turnover growth of 102% (range 35% to 887%). Revenue for the Top 500 ranged between AUD\$64 and AUD\$13,000 million. 8 fast-growth and 7 *Top 500* CEOs were interviewed. Owing to word limits, only findings emanating from in-depth interviews from one fast growth and one Top 500 firm are reported.

An interview schedule derived from previous studies evaluating MO (Narver & Slater, 1990), LO (Sinkula, Baker, & Noordewier, 1997), EO (Lumpkin & Dess, 2001), MCs and FIRM PERFORMANCE (Vorhies & Harker, 2000) was developed by the present investigators. Tape recorded semi-structured interviews with Fast 100 CEOs/founders and Top 500 marketing managers/CEOs of approximately 3-4 hours provided informants with an opportunity to relay relevant stories. Interviews were transcribed. This research utilizes case study and causal network model paradigms (Denzin & Lincoln, 2000). The following section contrasts the business orientations and MCs adopted by these two cohorts, revealing their impact on business performance, and culminating in two models.

## FINDINGS AND DISCUSSION

### **Fast Growth versus Large Corporation: Mor Cosmetics and Carpet Choice**

Mor cosmetics (MOR) is a supplier of body and bath products for the US, Australian, Asian and UK markets. Employing 30 staff, MOR started trading in 2000. Ranked 12 in the *BRW Fast 100*, MORs growth rate is 170%, turning over AUD\$4.68 million in 2003/04. MOR was founded by Deon Iuretigh and Dianna Burmas and launched at a Melbourne trade fair. Starting with 120 products, Deon stated: *We researched and done all the important business plans and the whole lot that backed the door, but sometimes you run on gut feeling as well. Getting into the market was relatively easy – it is about confidence and quality products. Being made in Australia adds a good flavour.* Deon and Dianna also spend time overseas, overlooking trends, however, being designers, *ideas come from within. Passion is what makes us competitive, we like what we do.*

In contrast, Carpet choice (CC) is an Australian national carpet retailer. Ranked number 330 in the *BRW Top 500* companies, turning over AUD\$350 million, and growing approximately 5% annually, CC was established in 1992 previously operating as both a furniture and carpet retailer. The current general manager joined the group when the company had substantial debts, and divested the furniture arm. The business started with a small base of 7 stores. By chance, another group collapsed and CC took control over 14 stores, virtually overnight. Currently, there are 130 stores nationally.

CC operates as a cooperative. Essentially, each retailer purchases a AUD\$4000 tranche of shares, and contributes AUD\$2000 per month for operating/marketing expenses. An average store achieves AUD\$1.5m of turnover, sometimes reaching AUD\$7m. Head office (HO) purchases floor coverings at a negotiated buying rate, which is a bulk deal process. Rebates are given for buying in bulk and dealing with 30 preferred suppliers. Internally, CC is run by 20 employees. There are 4 divisions: business development, marketing, information technology and finance. The organization grows by recruiting new members. The business development division *looks at individuals to see their ability to grow as a store.* According to Stoel and Sternquist (2004), retail cooperative groups increase purchasing power and gain consumer awareness through advertising and promotional campaigns.

Each CC store owner employs up to 10 employees, the majority of which are ex-carpet layers. *They don't know anything about fashion (because carpet is considered a fashion product) business operations, being proactive, and customer service.* However, people from other industries have begun to enter CC. *They are seeing it as a fashion product. They don't need to*

*know about the fibres and that sort of thing. A different attitude totally, the way they want to project their stores. It's about lifestyle images, making the customer feel fantastic in the store, beautifully lighting the store. Most retailers in industry didn't know that that was important.*

HO has to constantly educate their members to change their attitudes. For example, recently, one of the 130 stores was renovated. *Many people came in to see it straight after we did it, and this is not state of the art retail. It's a significant move from where it was. People said, "Oh, it's too up market, you've got to push the product price down, you've got to keep it cheap, it's all about cheapness". And now what's ended up happening is that he's doing very nicely, getting a lot of favorable comments from customers. Other CC stores are now embracing this new concept. It would take time but I reckon it wouldn't be in my lifetime, but in 10 -15 years you would start to see that those people who are bringing those skills into the industry and everyone else being forced to come up to meet it. You keep saying it, and they keep not listening and once they suddenly see it, they'll start moving up in their standards. It's a very trade oriented industry, it's almost like a timber type industry or very backward which is quite amazing given that it's a fashion product. I think it's starting to slowly change, we've lifted the bar a bit.*

Past work experiences can often determine the way organizations are run. For most SMEs, marketing tends to be informal, reactive, and conforming to industry norms. SME owners do not perceive themselves as marketing experts (Carson & Gilmore, 2000). Perhaps SMEs in general can learn from their fast-growth counterparts in terms of providing employees with opportunities for learning, or attracting better staff (Tan & Smyrniotis, 2005). Because each retailer is a small business, convincing members to adopt a certain business orientation is difficult. Harris (1998) postulated that in reality, the dimensions of MO may not be applicable in the small business sector. *Products purchased by the end customer are very similar across competitors, the only differentiation would be customer service.*

We posit that relationships between CA and firm performance is more complex than a simple direct relationship (Tan & Smyrniotis, 2004a). It appears that leadership is a pivotal driving force behind both types of organizations. Passion and ambition to grow and become a successful company influences organizational culture and experiences of employees. Such beliefs usually emanate from CEOs (Sinkula, 2002), elaborating that *such axioms serve to create a lens, with filtering capabilities no less powerful than those of religion, through which a business sees its environment* (p. 259). Accordingly, findings suggest that entrepreneurial beliefs, values and behavior exert a powerful influence on business orientation (i.e., LO, MO, EO).

Below we present a detailed discussion of the causal network model originating from these two case studies. For both firms, management provides organisational direction, driving firm business orientation. Being oriented towards its customers, innovation and learning, fast-growth enterprises build definitive marketing competences. For MOR, their marketing advantage culminates in superior CV, ultimately affecting firm performance (see Figure 1).

---

Insert Figure 1 about here

---

However, for CC, there are 130 individual stores operating independently and at the discretion of their owners. To a large extent, business success is dependent on owners' values. Operating in a so called *primitive* industry, products are similar, contributing to one main potential source of difference: customer experience (see Figure 2).

---

Insert Figure 2 about here

---

### **Market Orientation**

MOR communicates frequently with their customers, including end customers (prime demographics: 25-40 year old career woman), wholesalers, and retailers. *Our retail customers tell us everything. They tell us exactly what they like and don't like. On a consumer level, we keep a log of all emails and attend to them very quickly. If there is a problem with the product, you would have a phone call within the hour, and you get a return, and a few complimentary products to restore your faith. They will email us and thank us for the experience, now you have a customer for life.* Products are design driven, and customers are the focal point. Dianna explains that *inherently, we are very customer focused as a brand.* Deon adds *we are always leading our customers.*

Competitors are mostly foreign. However, competition is not only about companies in the body and bath industry. Competition is also about who you have to fight for floor space in a department store. Although competitor information is shared amongst employees: *We have an open office, and nothing gets passed anybody here, so it's a good thing from a communication point of view,* MOR does not base their decisions on what other people are doing. *I think we are pretty much lone rangers. We are too far ahead, our own competition is ourselves. We look at what we have done, and the standards we've set.*

For CC, there are two types of customers: cooperative members (individual CC store owners) and end-customers (i.e., commercial and small owner builders, the commercial sector, individual home owners). The primary objective for HO, however, is to *provide innovative services and solutions to the membership.* A secondary objective is to ensure that end customers buy. *They will be jumping up and down if no customers come in through the door.* Members are assisted in recruitment (e.g., analysing potential employee suitability for a job), sales training, market research, and other marketing activities that help members.

Similar to MOR, CC acknowledges, not being overly concerned about competition. *I don't think we sit there worrying about what they are doing. We certainly analyse the competition... We are very aggressive, and intensely competitive, but we operate more on leadership style than a follow me style.*

All functions in CC, are coordinated to deliver services that membership needs. *In the main, the structure and set up that we've got is pretty good.* Recruiting skilled personnel makes the process easier. *We have the critical mass that we can employ those people and justify the investment that*

*brings sophistication of the services that we provide to stores. Tenders for big business were put forward, and software programs were developed. These are things of that nature that we didn't previously do. The business is evolving and identifying new areas that need to improve. So you structure the business accordingly. I guess it's like a tight knit team, very intertwined. So if I make a marketing decision, I probably need to talk to the product area.*

### **Learning Orientation**

Being learning oriented recognizes the opportunities to learn from collaborations with customers, suppliers, and other potential learning partners. Deon elaborates: *We spend a lot of time overseas seeing trends, what is happening and we will get so excited about a little new technology, this new product. For us, it is to embrace technology that is coming through and different things that happen. It's really important to keep ahead.*

However, a learning oriented organisation is dependent on its employees (Tan & Smyrnios, 2005). Recruitment in MOR is about instilling a team environment. *People who work here really have to fit in and be passionate. Staff need to regularly update their skills as emphasized by Dianna: To get staff to the next level, we are always trying to nurture the staff to get them good at what they do. Everybody has their different strengths so, you try and identify their weaknesses and help them out with that too.*

Being able to reflect critically on decisions can indicate open-mindedness. Managers often need their world view to be questioned as one perspective might not be appropriate within a particular context. Encouraging employees to think outside the box and contribute original ideas helps organizations to move forward. Deon and Dianna encourage staff to question the way things are done through *healthy debates. The sales and production might disagree on something, and there would be a debate about it where all the extreme views are put on the table. It often achieves a better result, and then everyone gets excited about the next process.*

Possessing a shared vision within an organisation provides a road map for staff because they know where they are heading. Dianna adds that *it is important that staff know what they are working towards. Everyone is kept up to speed. They thrive on that: What new things are going to happen, new possibilities, and that keeps them informed. It keeps the goals common to everybody because if we were very private about that, people start feeling that there is a lack of communication.*

Similarly, CC places an emphasis on learning. *Learning is very important, both internally and externally. The general manager is encouraging us to do more learning particularly in our given fields of expertise to make sure that we get better at what we do. In the same vain, make sure that we pass through to our team members, the opportunities to better themselves with learning.*

In contrast to MOR, sharing an organizational vision seems to be a neglected area. *We are all guilty that we do the big picture ourselves. At a store level, the majority probably don't. We tend to run it as a management team and sometimes we forget that it's important to share what we are deciding on, and the visions, with all the other staff here.*

HO constantly reflects on all aspects of business. *From our lofty heights that we are at the moment, we tend to take a more positive viewpoint and say, How can we get better? What are the opportunities out there that the competition aren't doing? Should we look at our business and change its complete structure and model?*

### **Entrepreneurial Orientation**

MOR launches 120-150 new products each year, compared with 10-20 products for competitors. *We are building the range to provide retailers variation and depth.* Each retailer sells different products. Consequently according to Deon, *MOR penetrates the market better than any competitor ever would.*

In terms of process innovation, MOR also looks at different retailing avenues, that is, *going into new fashion areas: to align ourselves with fashion week. Fashion is a relatively new area for body and bath brands. We want to be associated with clothing, shoes and accessories, everything fits into a lifestyle.* MOR was contacted by Sabi, a lingerie shop, to retail the *Dolce* range, which is consistent with their product offerings. According to Deon, *We have never gone out to talk to potential retailers, we can't keep up as it is. Trade fairs are our showcase and that's it.*

Making bold decisions, such as entering the overseas markets showed that they are *not scared to try new things. It's not that hard, having the right people gets everything done.* While operations are handled internally in the US, Australia and UK, MOR uses distributors in Asia. In uncertain situations, advice from experts is regarded as essential. *In every area, whether it's legal, financial or business, we will always take advice, and if we don't have the right people, we find them.*

In contrast, the floor coverings industry is relatively conservative. Innovation is not evident in retailers' offerings to end-customers. *Customers always go for the very proven, conservative approach. For example, in terms of colors of the floor coverings, you can show some fabulous color innovations aubergines, radical things like that, but the customer won't go there.* However, CC provides innovative services to their membership. *We are seen as the initiator of most of the things. Initiatives that we do are more targeted at the store owner in terms of running his or her business, than the actual consumer that buys the floor covering.*

Firms close to their customers are well positioned to understand their market (Tan & Smyrniotis, 2004b). More importantly, for the FGF, firm orientation underpins development of market-focused products, and business relationships amongst stakeholders, contributing to perceived superior CV and firm performance. In line with this view, Smart and Conant (1994) found that business people with higher EO report greater possession of distinctive marketing competencies. Consistent with both of these perspectives, product development literature emphasises that a product advantage is a consequence of MO (Kok, Hillebrand, & Biemans, 2003). However, we contend that all three business orientations are required to drive product development success.

For CC, HO caters to 130 primary customers, who are viewed as the same entity by customers. In reality, CC is a large organization comprising many small businesses. Similar to MOR, our findings indicate that firm management drives a firm's proclivity to market, learning, and entrepreneurial oriented postures. For CC, these beliefs are disseminated easily to the 20 HO

employees whose focus is to deal with suppliers and members, and to conceptualize overall strategies. Like any large business, each department (e.g., marketing, finance, IT, business development) comprises qualified and trained expertise. Our findings, reflecting Heneman, Tansky and Camp (2000) reveal that CEOs/founders of SMEs are concerned with matching persons to firms (organizational fit) rather than utilizing traditional human resource practices, which focus on matching the knowledge, skills, and abilities, as reported to be the case in large organizations.

### **Marketing Capabilities**

**MOR's products.** Products can be more responsive to customer needs. For example, MOR has been approached by a Versace hotel to supply amenities for hotel bathrooms. Similarly, the Icelandic range was marketed to a retailer in Iceland. *Their girls are going to take it to Iceland air, and try to get products on the flights. They wanted to pitch it, and Icelandic is not even an amenity, it's just a line.*

Products do not just entail the physical body and bath products. Catalogues are an important selling tool. *We can send an 80 page catalogue to a store in another country, which costs \$7 to produce. People take us seriously. Just from the catalogue, clients would order cold from that. Our story is told through this medium.* In addition to producing quality products, each retailer carries different ranges, based on the target market. *We try and keep it as different as we can just so the customer gets options. We try and profile the customer according to the store.* For example, a store targeting younger people may carry the *Juice* range, which is *funkier*. If a store is salon based, they would carry the *Deluxe Spa* range.

**MOR's relationships.** Relationships with stakeholders are imperative for *smooth* running. For example, their UK distributor was unsatisfactory. *They didn't do store refills, were sloppy, and were over pricing the products.* When distributors misrepresent MOR, and do not *shape up*, MOR has the right to terminate the agreement. MOR is in the process of establishing their own office in the UK. For potential distributors, *we get 5 enquiries a week. We'd have a check list that they have to go through first, and see if they qualify. When they get that document, we usually never hear from them again. We have expectations: How you want to see the brand represented, your turnover, estimates of that sort of stuff. We're always prompt, active, always answering questions and getting things done for the distributors and retailers.*

MOR also has to constantly work with publicists. *We have some good relationships because we are based in Los Angeles and Hollywood, Beverley Hills, which is quite in the thick of celebrity land. You know someone, who knows someone.* For example, employees of retailers would inform MOR that Charlize Theron, Ivana Trump or Adam Sandler's wife has just come in and bought something. Oprah's producer has also contacted MOR on Oprah writing a full page on their Fig and Olive product. *We do not pay anyone for endorsements. We often get feedback from celebrities.* Thus, in terms of non-paid media, *it really has to do with our relationships. We have got close relationships with people in media, and we develop that. It's something that takes time and it's developed, you need to nurture that. Its all relationship based with the right people.*

While the focus has not been marketing at the consumer level, MOR is gearing up also in this direction. *We are trying to get better at that, and are investing money in that area. It's a*

*progressive learning curve at the moment. At the moment, MOR uses public relations to communicate with customers. We have special events where we invite them to see the new range. There was a big media event in Sydney held at a beautiful gallery for the media, where all the editors were wined and dined. There was nice food and we themed everything according to the products. So if we have food, we have elements of what the products are. Everything is connected so it's a nice experience for them and tells a little bit more about the image that we want to project. This gives them something to write about, and they learn more about the product on a one-to-one basis.*

For CC, all marketing aspects are viewed as important. Achieving the right marketing mix is essential. John Anderson, marketing manager of CC reflects this position when he said, *the way in which the products are placed in the marketplace means that you can have the very best marketing programs in the world but if the products are overpriced, they are just simply not going to fly. So, it needs to be the whole package, needs to be good quality, priced correctly, needs to be presented correctly in the store, and it needs to be communicated to the consumer.*

**CC's products.** In terms of product offerings for end customers, floor coverings from similar type retailers are not highly differentiated. They sell reputable products, which are *ultimately fluffy stuff that goes on the floor.* However, services offered by member stores are regarded as better than competitors. *We are better at providing services, we work harder at it. Most of the stores that we visited, because we also talk to our competitor group members of course, and ask them if they want to change over to us. Most of the ones we've spoken to have said they don't get the sort of services that we offer.*

One of the services provided by HO is to enhance store sales. Utilizing a profit analysis system, HO educates member retailers on ways to convert one floor coverings measure to a sale which might add an extra \$300,000 to the bottom line. *So you can show them all that in that model. The sales training manager we have here is not only telling them ways to sell in terms of giving feature benefits, how to convert your sale and things of that nature; but she also goes through product training, telling them the simple processes of taking the customer through the knowledge base without making it daunting, without making it too much information.*

**CC's market research (MR).** Competitors in industry traditionally do not conduct MR studies. Historically, high costs have deterred CC from investing in MR. However, *it's critical to carry out market research, doesn't matter what industry. In fact, in 10 years, we have done something like 3 research studies. However, over the last few years, we have employed more skilled people, and they bring their experiences. Our market research skills have definitely helped us develop effective marketing programs. Research tells us that we need to modify our behavior to make sure we meet their requirements and we are doing that currently.*

**CC's relationships.** Relationships along the supply chain are one of the most important aspects of the business. *We are told by our membership, we hear it from competitors, that we have a better relationship with our suppliers. It's a collective thing, the way in which we treat them. I think it's a very participatory relationship. It's not a 'them and us', we are not saying that product is too expensive, go away and get it cheaper. We work together. They come on our Magic Carpet Ride (a conference where all CC retailers and suppliers attend). We are giving*

*our total membership access to these suppliers to talk to, present their case. So there are a lot of things that we do to build their profile, and assist in building the relationship with our group.*

Quantitative studies (e.g., Tzokas et al. 2001) however, investigating relationships between MO and EO on firm performance with MCs as a mediating variable, contend that all MCs affect firm performance. We found that MOR emphasizes MCs specific only to their firm (i.e., product and relationship advantage). FGFs are a distinct population (Tan & Smyrnios, 2005), developing at a faster pace than the norm. Consequently, entrepreneurial marketing seems to be focused on providing products/services more responsive to customer needs and building business relationships for positive word-of-mouth. Marketing activities are dynamic, needing to evolve constantly in order to keep ahead of the market. As well, marketing practices are situation specific and dependent on several important factors such as the nature of markets served, growth stage and trajectory of the firm, types of products/services offered, and the quality of management (Hogarth-Scott, Watson, & Wilson, 1996).

In contrast, for a medium-large organization, there are certain MCs that tend to stand out. CC, for example, performs better than competitors when it comes to developing new services for their membership in order to assist retailers to attract more customers, undertaking MR on consumer behavior patterns, and relationships with suppliers. One distinct focus for this Top 500 firm is MR. Formal MR is mostly performed in large organizations. Our research supports Carson and Gilmore (2000) who reported that small firms differ to large firms in marketing because of limited resources, and specialist expertise. Suppliers are a crucial element in the successful running of any business, and good relations with suppliers is often considered to be as vital as good relations with customers (Carson, Gilmore, Grant, O'Donnell, & Cummins, 2000). In sum, there are two MC areas that both organizations focus on: developing new products/services along with building superior relationships with stakeholders.

### **Customer value and firm performance**

Finally, attaining an advantage in MCs does not exist in isolation. Customers need to perceive that services or products to be of value before purchasing. Deon and Dianna believe that customer's ultimately value beautiful pampering products. Customer perceptions are often different from retailer perceptions. *Your mind can make you feel healthy or sick. But these perceptions, it's all about a feeling as much as anything else.* CA is dependent on the values which customers attach to attaining the product/service, ultimately, CV is perceptual and dynamic. Superior CV culminates in superior firm performance (Tan & Smyrnios, 2003). In sum, all products have been successful. Feedback is provided by retailers and end-customers through emails, phone calls, and positive word-of-mouth. By all accounts, MOR is a profitable business that will continue growing, while reinvesting profits/knowledge gained in the process, back into the business.

For CC, HO provides its membership services unavailable elsewhere (e.g., sales training for retailers' employees, analytical software for monthly/yearly sales, recruitment, research data). Because many store owners were carpet layers previously, they possess limited knowledge in how to operate a floor covering business. However, if potential members are already a member of a competitor group, joining the CC chain can be complicated. It is easier, in contrast, for an independent carpet retailer to join the group. *It's just a mentality thing that says despite the fact*

*that they see and we can demonstrate all these things that we are willing to do for their business, getting them to actually make the quantum step to go out of another group into our group is very hard. Not so hard for an independent into the group. However, membership has continued to grow over the past few years. There is always the potential to take over another group which is a possibility. If we were to have a rapid rise of 50 or 60 stores, chances are, it would come from purchasing or merging with another carpet group.*

Buying carpet is also a daunting process. Because purchases are probably made every 15-20 years, end customers are bereft of knowledge when it comes to choosing floor coverings. Therefore, it is important for the salesperson to ease the process by recommending suitable products. Word-of-mouth is very important because customers rely on other people to recommend good carpet retailers. *This is largely due to a lack of information that people have. So I trust you, because I know you are not going to steer me wrong. Whereas, if I were to just go into the shop, and listen to the bloke selling it, I don't know whether he is selling the truth. Research has shown that customers are concerned that the salespeople are pushing their own barrow, for a better margin product or a trip to Bali, not necessarily giving the consumer the best advice. It's our job to try and fix that.* Therefore, sales training provided by HO helps educate shopfloor sales people to make customers feel that they are actually cared for.

In CC, CV is measured via a paid mystery shopper. They would answer a set of criteria on the store experience: Is the store clean? Does it look good? Were you greeted within 30 seconds? They measure each store based on how each *fake* customer perceives the store. In terms of firm performance, the business is profitable. Profits are reinvested into the business to enhance services provided to their membership. *We hope we deliver value to our customers but we all can do it better.* Most customers are satisfied with CC, despite being *dissatisfied with the whole industry.*

### **MODEL DEVELOPMENT: MOR AND CC**

As elaborated earlier, management appears to be the starting point, guiding organisational direction. A firm's proclivity towards a particular business orientation is dependent on leadership. Because they feel that customers, learning, and innovativeness are important, these values are shared throughout an organization. Logically, attaining knowledge and intelligence from the market, continually challenging assumptions, and creating innovative solutions places organizations in an advantageous position in terms of MCs. For example, when employees are aware of organizational objectives, they will contribute to attaining organizational goals, they are better able to negotiate with other stakeholders, leading to sound relationships with retailers and distributors. Innovation with an ability to think and manage strategically are key factors that distinguish entrepreneurial firms from a small business venture (Beaver & Prince, 2002). The present findings indicate that innovative firms are highly likely to develop superior products and services. Innovation in a highly competitive arena may lead to organization success. Innovation essentially means that firms create new uses for products/services or new products. New products can be viewed in terms of their degree of newness, ranging from totally new, or discontinuous, innovation to a product involving simple line extensions or minor adaptations that are evolutionary or incremental in nature (Brentani, 2001). Finally, an advantage in MCs is insufficient. Tan and Smyrniotis (2003) concluded that CA should be measured in terms of CV because customers ultimately purchase the products/services. A CV approach focuses on how

people choose among competing suppliers (Gale, 1994). Consequently, superior performance is a result of providing superior CV (Tan & Smyrnios, 2003). Firms that hold a CV focus, which are complemented with appropriate resources and capabilities, are best positioned to attract the capital necessary for expansion of scale or scope of activities (Slater, 1997) (see Figure 1).

For CC's HO, the model is similar to MOR. Management influences firm business orientation, leading to an advantage on certain MCs. Their aim is to continually find ways to operate efficiently and effectively. Similarly, management influences individual store owners. In addition, owners are driven by their own ambitions and purposes, but cooperative groups have to maintain a standardized image among member stores and create a strong brand presence in the mind of consumers, using common strategies such as standard products and methods of operation. The goals of independent store owners might be different from those of the cooperative, creating conflict (Stoel & Sternquist, 2004). Owners' personal values and past experiences determine the importance placed on certain business activities, such as providing innovative services or extraordinary customer experiences. Ultimately, end-customers make purchasing decisions based on the level of services provided by stores. HO also contributes to perceived end-customer value aspect by providing retailers with services which enhance sales processes. Consequently, end customers engage in word-of-mouth communication, telling their peers of their experiences, influencing potential customers. Profits attained are reinvested back into the business to support growth (see Figure 2).

#### **IMPLICATIONS FOR MANAGERS AND FUTURE RESEARCH**

Findings suggest that running a successful business entails having a CEO with leadership skills to grow an organization, the ability to empower employees, and to maintain sound relationships with stakeholders. Empowering employees to make their own decisions and feel valued is essential for internal marketing. As evident in this research, MOR gains success through continually challenging assumptions, articulating a similar vision, fostering solid relationships along the supply chain and by providing differentiated products in terms of CV.

Similarly, for CC, management drives organizational activities and ultimately firm success. The cooperative system is unique, requiring coordination of many small businesses, similar to a franchise model. By contrast, individual owners are dependent on HO to perform market intelligence analysis and to undertake innovation, particularly in the services domain. Being a large organization, the only interface with the end-customer is via individual stores and sales persons.

Future investigations should focus on exploring the mediating role of MCs and CV on firm performance in large organizations. Clearly, further research is called for in the investigation of this area, including the application of in-depth case studies for theory building purposes. Finally, researchers should consider developing scales of CV and business orientation specifically for SMEs.

### **ABSTRACT**

In today's connective global environment, it is impossible to isolate change by borders or industry. Flatter organizational structures, scarcer resources, changing consumer demands, the information/technology revolution, and global competition are forcing changes in the way business is conducted worldwide. Researchers describe today's markets as “dynamic markets” that feature innovation-based competition, price/performance rivalry, decreasing returns, and the 'creative destruction' of existing competencies.

Researchers are discussing the need for a potentially new type of leadership to emerge, one that is ready to lead organizations in the face of these new challenges. Some researchers started naming this new type of leadership as “entrepreneurial leadership,” explaining that it exhibits both entrepreneurial and leadership characteristics and behaviors

The purpose of this paper is threefold. First, it provides a brief overview of the importance of entrepreneurship in today's organizations and how it will help them survive today's dynamic markets. Second, the paper explains the importance of leadership in helping formulate the organization's strategy, which should incorporate the role of entrepreneurship. Third, it merges both the fields of entrepreneurship and leadership in a specific manner to help define the new concept of “entrepreneurial leadership.” Ultimately, the paper concludes with a discussion of a real corporate example of what an “entrepreneurial leader” is not, using Carly Fiorina, former CEO of HP as an example.

### **INTRODUCTION**

In today's connective global environment, it is impossible to isolate change by borders or industry. Flatter organizational structures, scarcer resources, changing consumer demands, the information/technology revolution, and global competition are forcing changes in the way business is conducted worldwide. Researchers describe today's markets as “dynamic markets” that feature innovation-based competition, price/performance rivalry, decreasing returns, and the 'creative destruction' of existing competencies (Venkataraman, 1997; Santora et al., 1999; Teece, Pisano and Shuen, 1997).

Organizational strategies and structures that might have been effective in stable markets in the past will constrain the survival of organizations trying to compete in today's dynamic markets. Researchers, keying in on this unprecedented business environment, have stressed that the escalating ineffectiveness of traditional leadership approaches to organizational strategy calls for an entrepreneurial focus to enhance the firm's performance, its capacity for adaptation, and its chances of long-term survival (Brown & Eisenhardt, 1998; Bettis & Hitt, 1995).

Researchers are discussing the need for a potentially new type of leadership to emerge ready to lead organizations in the face of these new challenges (McGrath, 1999; Teece, Pisano & Shuen, 1997). Some researchers started naming this new type of leadership as "entrepreneurial leadership" explaining that it exhibits both entrepreneurial and leadership characteristics and behaviors (Ireland & Hitt, 1999; McGrath & MacMillan 2000; Meyer & Heppard, 2000).

The concern and call for a new type of leadership, "entrepreneurial leadership," is understandable because of the uncharted and unprecedented territory that lies ahead for businesses in today's dynamic markets. Yet, is it possible to combine two distinct concepts and research fields such as entrepreneurship and leadership to create a new integrated one called "entrepreneurial leadership"? Even if it is possible to combine such concepts, then what are the characteristics of this new phenomenon and is it the sum of both leadership and entrepreneurship characteristics and behaviors? Finally, is there a relationship between this new type of leadership and the type of organization needed to survive and compete in today's dynamic markets?

## LITERATURE REVIEW

### The Need for Entrepreneurship in Today's Organizations

In the 1980's, the field of entrepreneurship exploded and involved almost all the soft and management sciences, including sociology, behavioral science and strategy. Many researchers attempted to postulate various theories regarding some or all aspects of entrepreneurship. Cunningham and Lischeron (1991) suggested that the field of entrepreneurship be structured around six points: the "great man" school, the psychological characteristics school, the classical (innovation) school, the management school, the leadership school and the intrapreneurship school. Yet, as Mulholland (1984) pointed out, the link established by Schumpeter (1928, 1934) between the entrepreneur and innovation has remained a dominant feature of the discipline.

According to Churchill and Lewis (1986), more empirical studies involving the entrepreneur's characteristics and behaviors have been conducted than almost any other type of entrepreneurship research. Gartner and Carland (1988), in regards to the entrepreneur's trait research, suggested that the study of the personal characteristics of entrepreneurs offers little hope of furthering the field. In a similar argument, Bull and Willard (1995) state that there is no typical entrepreneur.

The revival in entrepreneurship research has lead to the exploration of a new entrepreneurial paradigms and levels of analysis. Covin and Slevin (1991) identified several advantages in looking at entrepreneurship research from a firm-level behavioral perspective. They presented the concept of '*entrepreneurial effectiveness*' and argued that it is a firm-level phenomenon. That

is, the effectiveness of an entrepreneur can be measured by their organization's performance. The assumption made is that the entrepreneur is also the leader of the organization. Yet, this argument can be made by stating that the organization, regardless of the entrepreneur, can be measured on its performance and in particular its '*entrepreneurial effectiveness*.' Thus, performance can be a function of both individual and organizational level behavior. Second, individual level behavior can affect organizational actions and organizational-level behavior is a better predictor of the key entrepreneurial effectiveness criterion – firm performance. Covin and Slevin (1991) argued that it is behaviors and not attitudes that give meaning to the entrepreneurial process. That is, the entrepreneur and their firms are known through their actions and their behaviors. Thus, behavior is the central element in the entrepreneurial process. In addition, behavior is overt and demonstrable, which allows for the reliable, verifiable and objective measurement of the entrepreneurial activity.

The ability to differentiate among levels of the organization's entrepreneurial behaviors is important in developing and refining knowledge of the entrepreneurial process. Thus organizational strategies, structures, systems and cultures can be changed to improve the organization's entrepreneurial effectiveness – hence firm performance. As mentioned by Covin and Slevin (1991: 8), "the process of entrepreneurship can be less serendipitous, mysterious, and unknowable." The following section explains a key area of the new research being conducted in entrepreneurship that is applying an organizational level analysis.

In this paper, it is argued that an entrepreneurial approach to strategy might be vital for organizational success (Miller & Friesen, 1983; Miller, 1983). The importance of entrepreneurship to the organization's strategy is that it allows the organization to extend its boundaries and capabilities and be able to surpass competitors (Zahra, 1993). Burgelman (1983) stated that firms need order and diversity in strategy for ongoing viability. While structure and planning provides order, entrepreneurial activity provides the required dynamism (Brown & Eisenhardt, 1998).

Various labels have been to define the fusion of entrepreneurship into an organization's strategy. They are: corporate entrepreneurship (Zahra, 1991; Dess et al., 1999; Barringer & Bluedorn, 1999), intrapreneurship (Kuratko et al., 1990; Carrier, 1996), entrepreneurial posture (Covin & Slevin, 1991), strategic posture (Covin & Slevin, 1988; 1989), entrepreneurial strategy making (Dess et al, 1997), and entrepreneurial orientation (Lumpkin & Dess, 1996; Knight, 1997; Wilkund, 1999).

This paper will adopt Covin and Slevin's (1988) definition of the organization's entrepreneurial strategy. Covin and Slevin (1988) state that the organization's entrepreneurial strategy or as they termed it, 'entrepreneurial orientation,' could best be measured by summing together the extent to which top managers are inclined to take business-related risks (the risk-taking dimension), to favor change and innovation in order to obtain a competitive advantage for their firm (the innovation dimension), and to compete aggressively with other firms (the proactiveness dimension).

The next section will discuss the leadership (individual) construct and its influence on the organization's strategy, which influence the three elements of risk taking, innovation and proactiveness.

## **Leadership and Organizational Strategy**

Strategic management theory states that top-level managers have a strong effect on strategy formulation (Katz & Kahn, 1978). Wilkund (1999) argued that the strategic orientation of the chief-executive-officer (CEO) is likely to equal the strategic orientation of the firm. If that is the case, then how do leaders influence others in the organization to agree to their business strategies? The explanation proposed in organizational theory is varied and diverse, yet most research agree that certain individuals influence the actions of others, both individually and collectively, as leaders and managers in organizations (Bass, 1990).

In the past thirty years, the study of leadership has focused on differences in leadership and how they influence the organization. One of the significant differences that emerged is the distinction between two types of leadership known as transactional and transformational leadership (Burns, 1978). Transactional leadership is based on an economic, or quasi-economic, means of exchange between the leader and the followers. Also, transactional leadership focuses on behaviors related to basic administrative and management tasks required for groups to function well in the short term. These behaviors include ensuring followers have the knowledge, skills, and resources required to accomplish their tasks (Rosenbach, Sashkin & Harburg, 1996).

Transformational leadership, on the other hand, is based on the leader's ability to recognize the followers' needs, demands, and motivation, and satisfy the followers' higher level needs in a way that utilizes the full potential of the individual. Transformational leaders create change in organizations through behavioral patterns that are different than those exhibited by transactional leaders (Bennis, 1980; Conger, 1989; Conger & Kanugo, 1987; Sashkin, 1990).

This paper will use Sashkin & Rosenbach (1998) definition of transactional and transformational leadership. Sashkin & Rosenbach (1998) have drawn from the leadership research, especially the work of Bennis (1984), and have developed an integrative approach to leadership known as Visionary Leadership Theory. Sashkin and Rosenbach (1998) defined transactional and transformational leadership measures through their Visionary Leadership Theory as: communication, trust-building; caring; and, creating empowering opportunities for behaviors and self-confidence, empowerment, and vision. The contextual factor is culture. Please see Table 1 for a better explanation.

**Table 1**  
**Sashkin and Rosenbach (1995) The Leadership Profile (TLP)**

| <b>Type</b>                        | <b>Measure</b>                            |
|------------------------------------|---|
| Transactional Leadership Behaviors | 1: Capable Management<br>2: Reward Equity |

| Type  | Measure  |
|---|--|
| Transformational Leadership Behaviors       | 3: Communication Leadership<br>4: Credible Leadership (trust )<br>5: Caring Leadership (respect)<br>6: Creative Leadership   |
| Transformational Leadership Characteristics | 7: Confident Leadership<br>8: Follower-Centered Leadership<br>9: Visionary Leadership  |
| Transformational Culture Building*          | 10: Principle-Centered Leadership<br>(*For simplicity, scale 10, which represents the leader’s culture building actions, is treated as part of the “characteristics” group.) |

Organizations that are entrepreneurial may have CEOs that exhibit similar leadership characteristics and behaviors. The potential for identifying and reliably measuring these similar leadership characteristics and behaviors may help define and operationalize in one way the concept of “entrepreneurial leadership.” Sashkin and Rosenbach (1995) identified ten measures of transactional and transformational characteristics and behaviors (see table above) that define a visionary leader. Covin and Slevin (1988) identified three measures that an organization exhibits when it is entrepreneurial. They are: innovativeness, risk taking, and proactiveness.

This paper proposes that some of the ten measures identified by Sashkin and Rosenbach (1995) may be exhibited by CEOs that lead these entrepreneurial organizations. The following are the hypothesized leadership characteristics and behaviors that this paper proposes that CEOs may have in common. They are:

### **Transformational Leadership Characteristics**

***Confident Leadership.*** Sashkin and Rosenbach (1995) argue that the first and perhaps most basic characteristic of transformational leaders is self-confidence. For example, why would a person who lacks self-confidence bother to attempt to transform people and organizations? More important, a primary means by which these leaders transform followers into more self-directed leaders themselves is by creating empowering situations in which followers’ successes build their self-confidence. In other words, transformational leaders need self-confidence not only to engage in such leadership to begin with, but also in order to transform followers into self-confident leaders. Therefore, it can be argued that an organization that exhibits a strong or high entrepreneurial orientation is largely based upon the prevalence of confident leadership and the transformation of its staff into self-directed leaders.

***Visionary Leadership.*** In the Sashkin and Rosenbach (1995) approach, vision is based on the ability to first mentally and then behaviorally construct the future. Leaders do this

by thinking through what's happening, to determine causes, and by identifying how complicated chains of cause and effect actually work. Only then can a person figure out how to bring about desired outcomes. Visionary leaders don't simply arrive at a vision and sell it to followers. The idea of vision aligns well with the organization's entrepreneurial orientation, meaning that the leader can develop a clear vision and communicate it with their staff, which will allow the organization to be more proactive, innovative and risk taking.

### **Transformational Leadership Behaviors**

***Creative Leadership.*** This leadership behavior dimension is called “creative” because it refers to the extent to which leaders create opportunities for followers to be empowered to succeed in achieving goals for which they have been empowered. This concept aligns well with the organization's entrepreneurial strategy. If the leader of the organization achieves the right balance, then their staff will be likely to take more business risks and be more proactive which translates in the organization being more entrepreneurial-oriented.

***Credible Leadership.*** To measure, behaviorally, the management of trust, Sashkin and Rosenbach (1995) observed that leaders establish trust by taking actions that are consistent both over time and with what the leader says. Trust, of course, exists in the minds and hearts of followers and is not an obvious aspect of leader behavior. But consistency over time and between words and actions produces trust in followers by establishing the leader's credibility. If the organization embarks on risk taking initiatives, it might represent the strong staff trust of the leader.

***Principle-Centered Leadership.*** Schein (1985) has observed that it may be that the only really important thing leaders do is construct culture. Sashkin and Rosenbach (1995) titled the culture component as Principled-Centered leadership and referred to it as the degree to which a leader is effective in inculcating values and beliefs designed to shape an organizations' culture. The relationship between Principle-Centered Leadership and the organization's entrepreneurial orientation is that organizations that exhibit high or strong entrepreneurial orientation also may exhibit a strong or high Principle-Centered Leadership. The values and beliefs of the staff and leader drive them to be more innovative, risk taking and proactive.

The following section of this paper applies our definition of an Entrepreneurial Leader to a real corporate example. We will attempt to explain why Carly Fiorina, former CEO of HP, did not succeed at HP through the lens of our definition of an Entrepreneurial Leader.

### **TESTING THE ENTREPRENEURIAL LEADERSHIP CONCEPT ON CARLY FIORINA**

Carly Fiorina was hired at HP not only to turn the business around financially, but to institute a cultural change. The tasks set out before her required the task-oriented skills of the Transactional Leader as well as the skills of a Transformational Leader. All the while, she was to inject

entrepreneurial energy and creativity into what had become a relative dinosaur in the technology industry (Lavelle 2005).

As pointed out by Lavelle (2005), Carly did not succeed for several reasons. And what perhaps caused her downfall more than anything else was the relative success of P&G, UTC and IBM, three large corporations that faced similar daunting challenges. So, why did Fiorina not succeed where others did? Three simple rules were ignored. They were (1) Make it about the company, not you; (2) Know your company inside and out; and (3) Hold people accountable – including yourself.

Fiorina's abilities as an "entrepreneurial leader faltered because she ignored the above three rules. One, she failed to follow the rule to "make it about the company, not you." Fiorina was an extremely high-profile executive, which might have placed undue pressure on her to succeed. She irked the mid and high-level executives as well as the low level programmers because she made HP the image of her. The entire company should have shared in her initial success – not just attribute any successes to one person.

In our definition of "entrepreneurial leadership," we discussed the importance of ***Principle-Centered Leadership***. We argued that the only really important thing leaders do is construct culture. What Fiorina did can be argued that she tried to change the culture of HP into the her image. By attempting to alter the culture of HP into her own image she managed to alienate her staff.

Two, she did not appreciate the importance of "knowing your company inside out". Fiorina did not have an engineering background. Either because of her insecurities or because of her management style, she did not have a strong #2 with a high tech background. For this reason she failed to grasp the inner workings of the company and was unable to make slim, needed changes.

In our definition of "entrepreneurial leadership," we discussed the importance of ***Visionary Leadership***. We argued that vision is based on the ability to first mentally and then behaviorally construct the future. We also stressed the point that visionary leaders don't simply arrive at a vision and sell it to followers. Even if Fiorina had a clear vision of what HP should be, she lacked the know-how on how to achieve it. Her lack of technical skills and her refusal to hire a person that could implement such a vision was the reason she was not able to communicate or influence the HP staff with her vision.

Three, Fiorina did not understand the rule of "holding people accountable – including yourself." She fired three top executives for not meeting expectations, but she apparently did not hold herself accountable for the relatively poor performance of the company.

In our definition of "entrepreneurial leadership," we discussed the importance of ***Credible Leadership***. We believe that trust is gained through consistency over time and through the words and actions of the leader. Fiorina fired three top executives when HP fell short of quarterly targets. There are definitely times when top level executives need to be fired, however, it was perceived that Fiorina did this to smooth over Wall Street and place absolute blame on the three officers. Our definition of "entrepreneurial leadership" would not include pointing the

blame unless blame was due, and by the reaction of the company, it is not clear that these executives were at fault. If Fiorina were an “entrepreneurial leader,” she would have done one of two things. First, she may have assumed some of the blame and turned the missed targets into a “we” thing, causing a strategic change; or if the three executives were truly at fault, she would have had an understandable and communicated rationale to support the firings. Either way would have proved to be more accountable than her actions she took. The staff interpreted her action as that of a CEO who does not hold them equally accountable and that breaks the trusting relationship that staff and CEOs need to build and maintain.

In our definition of an “entrepreneurial leader,” we believe the leadership part requires that the leaders fully believe in their cause, not as a means to the top or to personal wealth, but as a means to company success. Often it comes down to how a leader gains the support and trust of the employees, board members and owners. “Entrepreneurial leaders” work in a way that transforms those around them into leaders. Such leadership gives ownership and responsibility to the employees, but more importantly, it gives them worth.

## CONCLUSION

Clearly, much remains to be done in clarifying the role and characteristics of tomorrow’s leaders. New organizational designs, new thinking patterns, and new information systems will require new leadership styles. “Entrepreneurial leadership” offers one answer.

There are those who will argue that entrepreneurs are not necessarily “good” or successful leaders. Such doubters can find support in the literature for the iconoclastic characteristics found in many entrepreneurs that are inconsistent with “good” leadership characteristics. For doubters, the term “entrepreneurial leadership” is seen as an oxymoron, a combination of terms that is contradictory to what we have been accustomed in the past. Successful entrepreneurs, however, have provided the risk-taking, achievement orientation and creativity that have led to the birth and growth of numerous major firms in the U.S. and globally, and they continue to do so. Entrepreneurial thinking is being increasingly demanded in even the largest corporations.

As stated above, more research in this area is essential. For example, future studies may include surveys that contain rank order preferences of the characteristics of leaders and entrepreneurs. Such studies will permit a rank order or other statistical analyses of the characteristics of leaders and entrepreneurs, helping further to define what we believe are the characteristics needed for entrepreneurial leadership.

## **ABSTRACT**

Eliyahu Goldratt's Theory of Constraints and Thinking Process have been applied to numerous types of situations and processes in order to identify root causes of problems. This problem-solving approach is extremely useful in providing practical solutions to some of the problems faced by small business owners and entrepreneurs. In this case study, Goldratt's process is applied to a self employed, part time business run by a mother who is faced with the typical role conflict of taking care of children while trying to establish a customer base. The process involves a determination of the undesirable effects (UDE's) in order to construct the Current Reality Tree (CRT). The UDE's revealed in this case study support previous research concerning role conflict in women-owned businesses. The CRT reveals several conflicts between the above statements that need to be eliminated. Goldratt advocates usage of Evaporative Clouds (EC) in determining factors that solve the core problem. In this case, seven key factors (injections) were identified to help solve the root problem.

## **BUSINESS BACKGROUND**

The situation examined in this paper involves Linda, an Independent Beauty Consultant for Mary Kay Cosmetics. Linda is a stay-home mother of a two-year-old daughter and is expecting her second child within the next few months. Her decision to start a home-based business was made a year ago. The reasons cited were to supplement the family income and to do something for her.

Mary Kay Cosmetics is a Dallas based personal products manufacturer and one of the nation's largest cosmetic companies. The company is well known for selling its beauty products via direct selling. The sales agents are predominantly women and are referred to as "Independent Beauty Consultants". Each consultant works for herself and has control over her time schedule. They purchase the products direct

from the company at wholesale prices and sell them at a prescribed retail value. The profit made is kept by the consultants and there are no contracts other than a yearly minimum purchase requirement (currently \$100.00). There are about 170,000 beauty consultants worldwide.

Linda is determined that she will not work full time and not utilize her degree in forensic psychology until her kids go to school. She wants to be available to her kids at any given time and be a major part of their early lives. Her husband is working full-time for an oil and gas company, and the family has just enough income to support their family on one salary. For these reasons, she decided to work only part-time. However, she wants to sell more than the defined maintenance level to contribute to the family income and establish a viable business.

After almost one year in business, an assessment of the business revealed some problems. The business is struggling to generate sales and recover the initial investment. Like many women business owners, her plans to “have it all” by growing the business and raising children are at conflict (Lundstrom, 1999). With time and role conflicts, she has experienced an inability to diagnose the relevant tactics that will help her establish and grow her business given the self-imposed constraints.

The business was initiated in April 2003 with a moderate initial inventory investment. The marketing for the new business is done by calling family and friends and arranging skin care classes. The goal of these classes is to showcase the products and make sales. Another goal is to meet potential customers through the people who agree to host a class, and schedule future classes with the newly acquired acquaintances. Recruiting new consultants is another goal as the recruiting consultant gets a fixed commission of the sales generated by their recruits. This commission is paid directly by the company and has no effect on the recruits' earnings.

The initial success of this style of marketing was fair with the generation of fewer than expected customers mostly limited to family and friends. By the end of 2003, an assessment of the business revealed that the business failed to recover the initial investment, and failed to generate enough new customers to sustain the business. Attempts to change the outcome were implemented by the end of 2003 by focusing on selling the most popular in-stock products rather than accumulating large inventories. She also started to explore avenues through which she could be exposed to potential customers without spending too much time away from her family. Her husband was called in to assist with marketing and took a proactive approach by mentioning his wife's business every opportunity he had and distributing business cards.

## **METHODOLOGY**

While Linda was using these efforts to save her business, she was approached with the idea of applying the techniques developed by Goldratt (1992, 1994) to help

diagnose her root problems. Linda had no previous exposure to or training in the methods developed by Goldratt, but she was asked to develop the limiting factors (i.e., the problems she is facing in establishing her home based part-time business). These problems, Undesirable Effects (UDEs) were developed using input provided by Linda and another Mary Kay beauty consultant having similar family and business issues.

Linda clearly felt that she needs to dedicate more time to her business if she is to be successful in reaching her financial goals. This was an admirable, but conflicted with the decisions made by the couple about Linda's level of commitment to family and work. She and her husband agreed that she should not spend more time on her business, especially with the prospects of a new addition to their family approaching. They also strongly favored an approach that would use her limited time effectively.

The end-of-year assessment pointed out that the business needed more sales to generate enough cash flow to recover the investment, and sustain the business. This would also help to expand the business by allowing purchase of additional inventory without being financially over-extended. Given the current situation, more sales require more time spent on the business. Clearly unacceptable, the couple took on the challenge of exploring ways to increase sales without sacrificing the time Linda spends taking care of her family.

## **THE THEORY OF CONSTRAINTS AND THE THINKING PROCESS**

Eliyahu Goldratt (1984) introduced the Theory of Constraints (TOC) to a large audience. The TOC is a method for achieving better productivity by eliminating a system's constraints. This is accomplished by focusing on the system as a whole rather than focusing on specific components of a system. The TOC was originally developed for manufacturing plant environment but its application is versatile and can be adapted to many different situations and business environments.

The TOC answers the questions the following major issues in a system: What to Change, What to Change to, and How to Cause the Change. The steps in the process are:

1. Identification of the system's constraint,
2. Decision on how to exploit the system's constraint,
3. The subordination and synchronization of everything else to the above decisions,
4. Elevation of the performance of the system's constraint, and
5. If any shift occurs in any of the previous steps, re-start the process (Pastore, Sundararajan, and Zimmers (2004).

In TOC, the constraints or bottlenecks control the rate of the system's production. To maximize the system's productivity, such constraints have to be improved or be eliminated. The remainder of the system should be synchronized and regulated to

the processing speed of the constraint. The five tools that make up the Thinking Process are;

1. The Current Reality Tree (CRT)
2. The Evaporative Cloud (EC)
3. The Future Reality Tree (FRT)
4. The Pre-Requisite Tree (PRT)
5. The Transition Tree (TT)

According to Goldratt, the core problem of the system should be identified and attention should be given to eliminate it by taking logical and intuitive approaches. The focus of the Thinking Process is the continuous performance improvement by maintaining a process of ongoing improvement. The symptoms of a core problem are undesirable effects (UDE's) which are in reality caused by the core problem itself. Efforts should be directed to identify and eliminate the core problem. Goldratt suggests that, cause and effect type relationship should be employed in to link UDE's and help define the core problem. By doing so, one can generate a logically constructed Current Reality Tree (CRT) which highlights the core problem.

## **UNDESIRABLE EFFECTS**

The following undesirable effects (UDE's) were compiled as the first step in constructing a Current Reality Tree (CRT). These UDE's, developed based on interviews with the two Mary Kay Beauty Consultants, are present in the current system.

### **1- I do not want to have conflicts between the duties of being a mother and being self-employed.**

This type of conflict is very commonly faced by women business owners (MacEwen and Barling, 1988).

### **2 - I need emotional support from family to help ease my concerns.**

Linda is going through a very important stage in her life as a young mother and needs emotional support from her family on the decisions she makes. Such support is critical for women business owners (MacEwen and Barling, 1988).

### **3 - I do not want to have added stress (on top of maternal stress) due to starting a new business.**

Barnett (1982) points out "having a preschool age child typically indicates significant involvement in the role of mother, thus, at this stage of life cycle any negative effects of involvement in paid work on well-being should be apparent".

### **4 - I want to contribute to family income with minimal financial risk.**

"Individuals become self employed for a variety of reasons: to increase income, to be their own bosses, to establish job security or to develop their own idea" (Jackson and Goodman, 2000).

**5 - I need to choose my own hours and balance career and family without sacrificing either.**

Due to her determination of attending her family, any work Linda would do has to give her flexibility to choose her own hours. Many women who choose to align with Mary Kay Cosmetics feel that the company allows them to accomplish this in a supportive environment (Incentive 1991).

**6 - I want to raise my children even it means less financial security.**

Linda has a very traditional view of family and sees raising her kids at home as an investment for their future. She is determined to be available to them full time at least until they attend school. This brings some financial restraints on her family, but they can get by with her husband's salary.

**7 - I do not want any job that might make me unavailable to my children.**

This UDE is actually a complimentary statement to UDE 6. The driving idea behind Linda's decision to be a stay home mother is to be available to her children. This is important to many parents (Schellenbarger 1994).

**8 - I need time support from my family.**

Due to her husband's full time job, he is not readily available to take on family care responsibilities readily. Linda, on the other hand, is caring for a toddler, which consumes most of her time. This brings a shortage of time and energy to devote to the business.

**9 - I need to be comfortable and creative in marketing myself to potential customers.**

Linda has never worked in a sales environment before and lacks the experience of a sales person. Jurick (1998) reports that marketing was the most disliked and feared task of self employed home workers. It is stressful and is regarded as a distraction from real work.

**10 - I need to increase my exposure to opportunities to make sales and gain recruits.**

Because of Linda's reservations on self-marketing, she has a problem in creating opportunities for making sales and gain access to potential new recruits. This is a major obstacle for her in generating new customers outside her family and friends.

**11 - Majority of my existing customers are out-of-town.**

Linda moved to Midland three years ago due to her husband's job. Since their move, she did not have enough time or opportunities to make new friends and business contacts.

## **12 - I do not have enough cash flow as a part time business owner in a new town.**

The cash flow problem caused by limited sales is a major factor in recovering the initial investment. This problem is especially important for a home based part-time business (Schindebutte, Morris, and Brennan, 2003).

### **CURRENT REALITY TREE**

After the UDE's are established, the next step is to build a Current Reality Tree (CRT). Two or more UDE's which seem to be related are connected using effect-cause-effect relationships. In a CRT, the UDE's are placed in boxes with rounded corners. This process is repeated until all the UDE's are connected in a logical way. Sometimes clarities are needed between UDE's in order to make makes things easier to follow. Insufficiencies are also added to the UDE's in an effort to organize them in a logical and easy to follow manner. The clarities and insufficiencies are injections that help the construction of CRT. Once the UDE's and the necessary injections are completed, a CRT will emerge in the shape of a tree with the bottom UDE being the "core problem". That core problem is the source of the conflict in the system.

The Current Reality Tree analysis reveals that UDE 12, "I do not have enough cash flow as a part-time business owner in a new town' as the core problem and is located at the bottom of the tree. The core problem answers the first question, "What to Change". See figure 1.

The CRT is read from bottom to top by using "if - then" syntax.

- If I do not to have conflicts between the duties of being a mother and being employed, and if I do not want to have added stress (on top of maternal stress) due to starting a new business, then I need emotional support from my family to help ease my concerns.
- If I need emotional support from my family to help ease my concerns, and if I need time support from my family and if the family support is limited, then I can only work part-time.
- If I do not want any job that might make me unavailable to my children, and if I want to raise my children even if it means less financial security, then I need to choose my own hours and balance career and family without sacrificing either.
- If I want to contribute to family income with minimal financial risk, and if I need to choose my own hours and balance career and family without sacrificing either, then I need to be self employed with minimal financial exposure.
- If I can only work part-time and if I need to be self employed with minimal financial exposure, and if I do not have enough cash flow as a part-time business owner in a new town, then I need sufficient customers to generate necessary cash flow.
- If I need sufficient customers to generate necessary cash flow, and if I do not have them, then I need to be more visible to potential customers.

- If I need to be more visible to potential customers, then I need to increase my exposure to opportunities to make sales and gain recruits.
- If I need to increase my exposure to opportunities to make sales, and gain recruits, and if I do not know enough people (potential customers) in a new town, then I need to be comfortable and creative in marketing myself to potential customers.
- If the majority of my customers are out-of-town, and if making sales to drive back and forth for sales and recruiting is an issue, then again, I need to be comfortable and creative in marketing myself to potential customers.

## **EVAPORATIVE CLOUD**

Goldratt's process advocates usage of an Evaporative Cloud (EC), in eliminating the core problem. The EC is used in a fashion that challenges the assumptions underlying the conflict and tries to find solutions to it. If there is a core problem, then there is the opposite of the core problem. The core problem is solved by achieving the opposite of the core problem. This opposite becomes the objective of the EC. The EC is read from the objective at left to right utilizing, "in order to ... I must" syntax. See figure 2.

The objective of the EC is depicted to "have enough cash flow to support a part time business." This is the opposite of the core problem. In order to have enough cash flow to support a part time business, I must generate new customers, and at the same time customers must be available and aware of my services. In order to generate new customers, I must actively market my business and capitalize on opportunities while being part-time. Also, in order to have customers be available and aware of my services, I must be full-time. This brings out the obvious conflict that needs to be eliminated. These are solved with injections. Seven injections were used in order to break the conflict. See figure 3.

INJ 1 – Involve husband in marketing

INJ 2 – Work around husband's schedule optimize his time spent taking care of family

INJ 3 – Involve Linda's mother in marketing for customers in prior location

INJ 4 – Call existing customers regularly and follow up on their needs

INJ 5 – Make telemarketing calls to acquaintances

INJ 6 – Get involved in groups with potential customers (i.e., mothers' networks)

INJ 7 – Continue to work part-time

Once the injections of the Evaporative Cloud are implemented, the Undesirable Effects are converted into Desirable Effects and again applying cause and effect relationships, a Future Reality Tree (FRT) can be constructed.

## FUTURE REALITY TREE

According to Goldratt, it is the Future Reality Tree (FRT) that enables one to find a solution without creating new UDE's. The FRT is constructed by placing the injections into the appropriate UDE's thus converting them into desirable effects. Clarities and insufficiencies can also be used when extra information is needed. The FRT also applies cause and effect relationship to connect desirable effects. It tests the validity of the injections in a logical way and determines whether the proposed solution is achievable. The FRT is read from bottom towards top using "if - then" syntax similar to CRT and replaces the negative tone in CRT with a positive tone. See figure 4.

The FRT is read from bottom to top by using "if - then" syntax.

- If I work around my husband's schedule and optimize his time spent taking care of family, then I will not have conflicts between the duties of being a mother and being employed.
- At the same time if I work around my husband's schedule, and optimize his time spent taking care of family, then I will not have added stress (on top of maternal stress) due to starting a new business.
- If work around my husband's schedule, and optimize his time spent taking care of family, then I will have time support from my family.
- If I will not have conflicts between the duties of being a mother and being employed, and if I will not have added stress (on top of maternal stress) due to starting a new business then I have emotional support from my family to help ease my concerns.
- If I have emotional support from my family to help ease my concerns, and if I have time support from my family, then I can work part-time.
- If I continue to work part-time, then I can raise my children (even if it means less financial security).
- If I continue to work part-time, then I will be available to my children.
- If I can raise my children, and if I am available to them, then I can choose my own hours and balance career and family without sacrificing either.
- If I can choose my own hours and balance career and family without sacrificing either, and if I can contribute to family income with minimal financial risk, then I can be self-employed.
- If I involve husband in marketing, then I will have opportunities to increase cash flow.
- If I get involved in groups with potential customers, then I will have opportunities to increase cash flow.
- If I can be self-employed, and can work part-time, and at the same time have opportunities to increase cash flow, then I will likely to have sufficient customers.
- If I have sufficient customers, and if I make telemarketing calls to acquaintances, and if I call existing customers regularly and follow up on their needs, then I will increase my exposure to opportunities to make sales and gain new recruits.

- If I involve my mother in marketing for most out-of-town customers, then majority of my out-of-town customers are reached.
- If majority of my out-of-town customers are reached, then making time to drive back and forth for sales and recruiting is not any more an issue.
- If I get involved in groups with potential customers, then I will meet enough people (potential customers) in a new town.
- If making time to drive back and forth for sales and recruiting is not any more an issue, and if I meet enough potential customers in a new town, and if I increase my exposure to opportunities to make sales and gain recruits, then I would have optimized marketing to potential customers.

## **CONCLUSION**

As pointed out by the Future Reality Tree, many of the changes are easily applicable and Linda has agreed that these are immediately employable tactics. The injections provide clear guidelines to how to apply the changes and still be self-employed and work part-time while generating new customers and increase cash flow. This would allow Linda to fulfill her desire to be stay home mother while contributing to family income.

## **ABSTRACT**

This paper provides an examination of the various compensation systems that may be used to reward the Board of Directors, top management team, key executives, and other employees of a rapidly growing new venture. Drawing on the accounting literature, we first identify and describe six primary compensation and reward systems that have been used to motivate and retain corporate executives. These compensation and reward systems are (1) director stock option plan, (2) cash bonus plan, (3) future performance plan, (4) stock option plan, (5) stock purchase plan, and (6) 401(K) retirement plan. Next, we describe four key categories of the venture team to be considered in this research which include the (1) board of directors, (2) top management team, (3) key executives, and (4) most other employees. Through an analysis of Initial Public Offering documents of 126 rapidly growing new ventures we identify the type of compensation and reward systems offered to each of the key categories of the venture team. Shareholder value, a measure of firm performance, is used to classify ventures as “unsuccessful,” “marginal,” “successful,” or “highly successful” for each type of compensation and reward system across each category of the venture team membership.

## INTRODUCTION

How corporations compensate and reward their top managers is of increasing interest to stakeholders. Shareholders, the business press, and employees frequently complain that CEO's, members of the Board of Directors, and corporate executives are paid far in excess of the value that they have contributed to the corporation. Whether a CEO is leading a major corporation or a new venture, he or she is moving in uncharted territory and few, if any, signposts or manuals are available for guidance. What, then, is fair compensation for these leaders? While this question is complex and is likely to be debated extensively, an aspect of the question concerns the types of compensation and reward systems that are available for use.

The purpose of this paper is to examine the various compensation systems that corporations use to reward their top management teams. Drawing on the accounting literature, we first identify and describe six primary compensation and reward (C&R) systems that have been used to motivate and retain corporate executives. Through an analysis of the Initial Public Offering documents of rapidly growing new ventures, we determine the type of compensation and reward systems that were offered to the Board of Directors, corporate officers identified by name in the "Management" section of the IPO (Initial Public Offering), other key executives, and employees. The paper concludes with a report of these findings.

## BACKGROUND

Although there is much interest and talk about CEO compensation, these discussions frequently focus on large, multinational firms that have been in existence for many years. While the CEO and top management team of a new venture may not garner such interest from the business press, the compensation of these individuals is of great interest to those who work with entrepreneurs, such as venture capitalists and bankers, and those academic practitioners who study entrepreneurs. However, there are very few studies that have closely examined the compensation offered to the top management teams of rapidly growing new ventures. Further, other than the previous studies we have reported (Teal & Hofer, 2001) no studies have expressly examined the link between team compensation and new venture performance.

Factors such as the impact of the founding entrepreneur (Roure & Keeley, 1990; Roure & Maidique, 1986; Virany & Tushman, 1986) and available financial capital (Cooper, Gimeno-Gascon & Woo, 1994) have been suggested in the literature as having an influence on new venture success. Although some studies have found limited support for some of these concepts (Cooper, Gimeno-Gascon & Woo, 1994; Roure & Keeley, 1990; Roure & Maidique, 1986; Virany & Tushman, 1986), thus far there has been little *overall* empirical evidence documenting either the influence that "other" variables may have on new venture performance, or the magnitude of any relationships that may exist.

Gartner (1989) noted that, among other problems, the definition of the key variables in the study and how the traits, characteristics, and behaviors of the entrepreneurs were measured were sources of constant problems in many of the studies that he reviewed. In ground-breaking research Sandberg (1984:243) acknowledged that variables other than the ones that he examined might contribute to new venture performance. Both Gartner (1989), Sandberg (1984), and

Sandberg and Hofer (1987) have suggested that future research should focus on the behaviors of entrepreneurs, although all admit that such research is inherently difficult to accomplish.

This study is an extension of our previous research and is part of our continued attempt to understand the behaviors of entrepreneurs by examining a potential motivator for an entrepreneurship: the compensation and reward of the top management team of rapidly growing new ventures.

## **NEW VENTURE COMPENSATION AND REWARD**

In this study we analyze the compensation and reward systems of rapidly growing new ventures. Drawing on accounting literature (Larker, 1983) we consider the presence or absence of six specific types of C&R systems. These plans are (1) director stock option plan, (2) cash bonus plan, (3) future performance plan, (4) stock option plan, (5) stock purchase plan, and (6) 401(K) retirement plan. A director stock option plan involves the granting of a specified number of stock options to directors of the new venture. This plan is offered only to directors, and it is not necessarily the same plan that is offered to other categories of employees.

The other five compensation and reward systems may or may not be offered to all employees, and, if offered may be in varying degree to different categories of employees. Thus, in this study "employees" may refer to the top management team, key executives, or most other employees. A cash bonus plan is generally a quarterly or annual payment of cash that is based on the employee, team, or corporation meeting some specified short-term corporate goal. Payment under a future performance plan is based on meeting specified future, long-term performance goals of the corporation. A stock option plan involves granting employees the right to purchase stock in the corporation on some future date at a specified price, which is at or below the current stock price as of the date of the option. A stock purchase plan allows employees to purchase stock in the corporation directly without going through a broker, thus avoiding brokerage fees. The company generally facilitates this purchase of stock by collecting contributions from the employee's pay, pooling these contributions over some period, and then making a group purchase of stock. If offered, a 401(K) retirement plan must, by law be offered equally to all qualifying employees. A 401(K) retirement plan allows the employee to redirect a portion of their earnings (within certain guidelines) into a 401(K) retirement account. These deferred earnings may be "matched" by the corporation up to a specified amount. Although substantial penalties for early withdrawal apply, the deferred compensation is not subject to Federal income tax until it is withdrawn for retirement purposes.

Prior research within the field of accounting (Larker 1983:4-5) has categorized executive compensation as either "short-term" or "long-term." Using the guidelines that were developed by Larker, the cash bonus plan would be identified as a short-term compensation plan. The director stock option plan, future performance plan, and stock option plan would all be identified as long-term compensation plans.

The measure of C&R systems was designed to assess the type of systems in place at the time of a venture's IPO to provide for the compensation and reward of four categories of top management team members: the Board of Directors, the top management team, (both of which are identified

by name in the "Management" section of the IPO), other key executives (who may be identified by name in the IPO but are not generally so listed), and other employees.

Both the form and type of executive compensation is disclosed in the IPO. The specific C&R systems approved by each venture's Board of Directors are disclosed in the "Management" section of the IPO under the heading "Executive Compensation." Benefit plans, if any, and to whom they are offered (including employees) are also described in the "Management" section under the heading "Benefit Plans." These disclosures are regulated by law and are carefully screened by the SEC (U.S. Securities and Exchange Commission) during the IPO process. Thus, the inclusion of a description of C&R systems for directors and employees at the time of the IPO indicates that the entrepreneurial team recognized the value of such systems and developed them to support strategy implementation and growth.

### **SAMPLE**

The sample for this research was drawn from the 1992, 1993, and 1994 annual *Inc. 100* listing of America's fastest growing small public companies. The final sample upon which this research is based includes 126 new ventures, all of which have been recognized for rapid growth. The compound annual growth rate for these firms ranged from a low of 78% to a high of 403%. Thus, the firms in the sample were growing at a rate of twenty to one hundred times the rate of growth of the United States Gross National Product, which averaged 4.1 % from 1984 to 1991 (U.S. Department of Commerce, 1992).

Data for the dependent variable was obtained from Standard & Poor's COMPUSTAT. To calculate shareholder value for each venture, the researcher obtained the venture's stock price over a 24-month period as well as cumulative dividends and the related COMPUSTAT adjustment factor. Shareholder value was then calculated for each site and recorded in the database. To develop the data for the independent variables for this research, the researcher obtained and read the IPO of each of the 126 ventures and coded the required data in a "Data Collection Summary Form." This data was then recorded in the database. The measure of Shareholder Value was used to evaluate the performance of the rapidly growing new ventures. Shareholder Value (SV) was then classified as "Unsuccessful," where  $SV < -.05$ ; "Marginal," where  $SV -.05 \leq .05$ ; "Successful," where  $SV .05 \leq .30$ ; or "Highly Successful," where  $SV > .30$ . For a more complete description of the development of the sample, data gathering, and the calculation of the performance measure, shareholder value, please see Teal & Hofer (2001).

### **RESULTS**

Using this database of new ventures examined at the time of their Initial Public Offering (IPO) and a measure of performance over a 24 month period, we then evaluated the C&R systems in place at the time of the IPO to determine the extent to which each type of system was offered to each category of director, top management team member, key executive, and most other employees.

Although this study of the C&R systems of rapidly growing new ventures involved an extension of the research of Cooper, Gimeno-Gascon, and Woo (1994), Joyner (1995), Sandberg

(1984,1986), Roure and Maidique (1986), Roure and Keeley (1990), Stuart and Abetti (1987, 1990), and Virany and Tushman (1986), none of these prior studies had included a measure of compensation systems. Thus, none of the compensation and reward systems measures that were examined in this research had been examined in previous empirical research in entrepreneurship.

The following tables report the number of ventures providing the specified C&R system across the various categories of employees.

Table 1. Compensation and reward systems/ Director stock option plan

Note: This table includes three levels (top, key, & most) for each of the 126 ventures in the sample. Thus, there are 378 (126 x 3) total observations reported in this table.

## CONCLUSION

The next step in this research project will involve an analysis of the data. While our sample focuses specifically on new ventures that have exhibited rapid growth, compensation systems do not necessarily vary as a result of the age or rate of growth of the firm. Further, as indicated in the data tables, although the sample was made up of rapidly growing new ventures, the majority of the ventures (57%) are classified as “unsuccessful” or “marginal.” Thus, careful data analysis is required to determine appropriate findings in this study.

This study may be useful both to and beyond the entrepreneurship community as it provides a report of the C&R systems that were used by this sample of rapidly growing new ventures at the time of IPO. As a result of this study, we hope to provide a clearer understanding of the various types of C&R systems and the frequency of their use in rapidly growing new ventures.

## **ABSTRACT**

This decade one third of all SMEs in the European Union will engage a business transfer. We challenge the gloomy assumptions in research and government policies that transfer means crises for SMEs and a threat to economy and growth. We like to get a clearer sight on perspectives by policymakers and consultants. Finally we challenge family succession as the main focus in SME transfers.

We conducted three studies: a qualitative study, a cross sectional study on 1300 SME after transfer and a longitudinal panel study on performance after transfers. Our results indicate that transfers have a positive effect on turnover, innovation and productivity, but leads to less employment. The effect on profit is inconclusive. Family succession is less favourable for economy, because family successors tend to under perform.

There is a shared perspective: finding buyers, the lack of (financial) knowledge, financial resources for buyers and staff as and important stakeholder are shared concerns. All parties shy away from the emotional aspects of business transfers.

The consultants' role has neutral or even negative effects on the business success after transfer in The Netherlands. The consultancy style by working on commission stimulates a fast transfer time of 6 – 12 months. The emotional process of letting go is avoided, which may cause considerable delay in business transfers.

Explicitly for policymakers and researchers we recommend a focus on transfers outside the family, addressing the emotional aspects the owner faces in transferring the business and major improvements on capital conditions for buyers.

## **INTRODUCTION**

This decade one third of all SMEs in the European Union will engage a business transfer (European Commission, 2002). These business transfers may result in a major restructuring of many industries, and, they could lead to substantial destruction of (tangible and intangible) capital, in case successors and buyers cannot be found in sufficient numbers. Within this context, the European Commission tends to see business succession as a threat to the survival of small and medium-sized firms, and, as a threat to overall employment and economic growth.

This paper challenges the gloomy scenarios and typical assumptions in research on business succession in small and medium-sized firms. Three major themes are discussed:

- The complexity, the long time needed for the transfer and the hardships of the transfer process, which is supposed to be even more complex within family business (Miller et al, 2003).
- The focus on family succession in SME literature, research and policies (Howorth et al 2004). This seems odd, because only 30% of the transfers in the USA and an estimated 22% in The Netherlands are family successions.
- The endangered economic and employment capacities of SMEs after business transfers. One could argue with Dyck et al (2002) that change of ownership enhances the vitality and performance of SMEs and is an opportunity instead of crises.

These three themes are challenged by three independent and fresh studies. The first study is a HvU qualitative study on policymakers and consultants on problems and solutions with business transfer. The second study, a cross sectional ING survey among 1300 SMEs in The Netherlands, Belgium and Germany, deals with the success and development of SMEs after change of ownership. Finally the third study, a longitudinal EIM panel study of 100 transferred SMEs, looked into turnover, productivity, innovation and number of employees after transfer.

## **PERSPECTIVES ON BUSINESS TRANSFERS**

### **Introduction**

The aim of the HvU study is to get a clear picture on perspectives of policymakers and consultants on business transfer. Do policymakers and consultants have a shared vision on the main problems and solutions? There is reason to believe that different parties have different perspectives. Le Breton-Miller et al(2003) show striking differences in perspective between consultants/practitioners and theoretical and empirical articles from researchers/scientist. Consultants systematically give more attention to process and contextual variables. Does this apply in the Dutch situation?

And what is the average time of succession or transfer? Many authors agree on a lengthy preparation and a 5 year period or longer is recommend (Morris et al, 1997; Kommers & van Engelenburg 2003; Sharma et al, 2003; Le Breton-Miller et al 2004).

Sharma et al (2001) indicate that the business owner inability of letting go is the single most cited obstacle to effective succession. Kommers & van Engelenburg (2003) also mention the psychological aspect as the most decisive, but offer no suggestion or solution. How do different parties in The Netherlands deal with the emotional aspects of the entrepreneur passing on his business? We like to know this because research has shown that emotional aspect leads to indecisiveness and delays transfer (Landsberg, 1999; Flören, 2002).

### **Method**

15 senior officials were interviewed. They have strategic or leading positions representing the largest SME employers' umbrella organisations, the dominant government agencies, main research centres, major firms of business consultancy and one major bank. The interviews were held during the spring of 2004.

### **INSERT TABLE 1**

To prevent bias from dominant themes in theory and research the interviewers had no prior knowledge of the subject and worked with a set of open questions to start the conversation. The answers were categorised before having a scheme (van Teeffelen, 2004). Statements were not necessarily mentioned by all members of a category. In our overview we left out the bank because we had only one observation and no reference material.

To compare the answer with the EC expert report (2002) we selected Kommers & van Engelenburg (2003). They translated and deepened this report for the Dutch situation.

## Results

### INSERT TABLE 2

It is clear that Kommers & van Engelenburg categorisation is comprehensive. Lack of (financial) knowledge seems a common denominator. However they overlook factors as “finding buyers”, “insufficient buyers financial knowledge or resources” and “staff” as main problems. And surprisingly the complex legislation and procedures wasn’t seen as a main problem by any party.

The transfer time of 5 years was countered by the researchers and the business consultants. Researchers say it is done within a year. Business consultants stress that 6 – 12 months is the average time when owners are committed to transfer. All necessary steps can be taken in this period.

Only researchers and business consultants mention the emotional factor as a main problem. Especially business consultants and employers’ organisations are expected to have the ability to deal with this factor. They answer however that it’s not their business or they don’t deal with it.

Clearly researchers tend to focus on the owners side. Business consultants, as well as the employers’ organisations and government agencies, take more stakeholders into account like the buyers and staff. This confirms Le Breton-Millers et al findings that consultants have a broader perspective than researcher.

Staff of SMEs is considered as a major stakeholder by nearly all parties. Le Breton-Miller et al don’t mention this variable.

Researchers and government agencies see the importance of planning and preparations. Typically business consultants don’t mention this as an important problem. This is contrary to the findings of Le Breton-Miller et al The methods most business consultants use in our sample (question 5) account for our findings. After a few interviews they set out a plan with the business owner. If the business owner postpones necessary steps, business consultants tend to advice the owner to make up his mind and pause or even stop the assignment when this doesn’t happen. Most business consultants work partly or largely on commission and their financial interest is in a short transfer time.

Looking at the suggestions/solutions we can see that Kommers & van Engelenburg recommendations are shared by government agencies. They tend to focus on the proper conditions for the business owner and less on the business owners own attitude. Employers’ organisations and researchers disagree with their suggestions and focus more on the attitude and skills of the business owner and tax legislation for buyers/successors. Government agencies and business consultants are clearly service oriented but also have their own agenda. The government agencies offer advice but at the same time have to generate more proof of well spend money in

times state budgets are reduced. The business consultants don't like competition from government agencies.

## **Conclusion and discussion**

Our objective was to compare perspectives from policymakers and consultants in the field of business succession. Our small sample is common for qualitative research. By choosing persons on key positions, we tried to get valid information. We can't rule out personal opinions though. Triangulation with peers, colleagues in the same organisation and a somewhat larger sample would have strengthened the validity.

Within our sample there are shared perspectives: finding buyers, the lack of (financial) knowledge or financial buyers resources, staff as important stakeholder are main problems mentioned by most parties. Complex (tax) legislation and procedures is not mentioned as a major problem. And the transfer time is limited to 6 – 12 months or unknown.

There are also differences in foci. The results confirm Le Breton-Millers findings that consultants have a broader perspective than researchers. Researchers focus only on the owner, consultants involve staff, buyers and match making variables. This broader perspective is not unique. It is shared by employers' organisations and government agencies.

At the same time our results contradict Le Bretons-Millers findings. Researchers (and government agencies) instead of business consultants emphasis on planning and preparation. Business consultants prevent this problem by their methods and commission payment. National differences in routines and payment might account for this contradiction. Also a new stakeholder emerges: staff in SMEs.

Surprisingly all parties shy away from the emotional aspects, except for a specialised foundation. SME business owners experiencing a major transition in their professional and private situation seem a neglected group. Partly this could be explained by the attitude most SME business owners have towards external consultants in The Netherlands. They tend to be reluctant to involve external consultants in general, but for accountants (Silvius, 2003). The commission system of business consultants works out well for business owners in this respect. Also the considerable time involved (Reece, 2003) in coaching works against a short transfer time. And finally business consultants, having a financial or economical background, might lack the skills to coach business owners properly.

## **CHANGE OF OWNERSHIP: BETTER BUSINESS RESULTS IN THREE EU REGIONS**

### **Introduction**

The main purpose of the ING study (Geerts et al, 2004) is to understand developments in companies after the change of ownership. Change of ownership is defined as the transfer of the ownership of a company to one or more individuals or to another company who plan to continue the commercial activity of the enterprise. Does a change of ownership in fact give a new lease of life to companies in the SME sector? And what is the influence of the type of change - family

succession, management-buy-out (MBO), management-buy-in (MBI), takeover, merger - in this respect on success after transfer? And does family succession create more difficulties than other transfers?

Against the background of an ageing population and the fact that entrepreneurs are far less inclined than formerly to tie themselves to the same company for life the number of business transfers will increase further in the coming years. The number of companies transfers in the Netherlands, Flanders and Germany amounts to 100,000 (European Commission 2002). At the same time the ratio of business transfers within families to transfers to outsiders is declining. The share of family successions declined in the Netherlands from an average of 35% between 1994 and 1999 to an estimated 22% in 2003 (Kommers & van Engelenburg, 2003). Interestingly, the number of business transfers within the family still is significantly higher in Germany 50% of the total (IfM 2003). There are no further details for Belgium.

## **Method**

The study is based on the results of a large-scale telephone survey of the new owners of 1300 companies that changed hands in the last ten years in three regions, the Netherlands, former West Germany and Flanders. The research has been conducted using a random stratified sample, with stratification concerning sector and number of employees. The companies were either active in the business services sector or the manufacturing industry. With respect to company size we distinguished 5 groups (1-10, 10-50, 50-100, 100-200 and 200-250 employees). Within these groups the selection of respondents was at random. This approach produces homogeneous groups of companies which allows for a good comparison between the regions. The survey covers only companies that were still in business. This might create a bias. The gross sample was about 4.800 respondents, so the non response to the questionnaire was around 70%. The reasons for non cooperation were refusal to participate in research as company policy, the absence of the right respondent and the preference for written questionnaires. The survey was conducted during fall 2003

## **Results**

In the Netherlands and Flanders growth of turnover turns out to be the most important goal for the acquirer. Improving product/market-combinations is the most often mentioned goal in Germany. The type of transfer has an effect on the ambitions of acquiring parties. Family successors are often relatively less interested in growth and more in continuity. To gain insight in the relation between the ambition level (in terms of goals) and degree of success after the change of ownership we split up the sample in three groups; leaders, middling companies and laggards. The criteria used for ranking the respondents were first growth of turnover, then profit growth and then growth of the customer base.

Interestingly in the Netherlands and Flanders the decision to acquire a company with growth potential (starting from a loss-making situation of otherwise relatively inferior starting condition) positively affects the success of the change of ownership. In Germany no relation was found between starting condition and success.

The use of consultants by the acquiring parties differs from 83% in Germany, to 91% in Flanders and 94% in the Netherlands. While there was no relationship between the use of consultants and success in the Netherlands, there seems a positive relationship between the use of consultants and securing a place in the group of leaders in Flanders and Germany.

#### INSERT TABLE 3

Even the widespread use of consultants cannot prevent acquirers from encountering problems during the transfers. On average two third of all transfers meets difficulties. The most common problems in all three regions are financing difficulties and problems with the staff and culture. Legal regulations were hardly mentioned. This confirms our findings about staff as important stakeholder in transfers and legislations as minor problem in our prior quantitative study.

Especially entrepreneurs involved in an MBO or an MBI experience financing as a major problem. The rate of entrepreneurs with problems is lowest for family successors; the majority does not encounter any problems (especially in Flanders). The family successor has usually worked in the company and is familiar with all the ins and outs (culture) and normally has a good relationship with the former owner. This contradicts the assumption of many authors reviewed by Le Breton-Miller et al, 2004 that family transfers are more complex and difficult.

#### INSERT TABLE 4

Despite the difficulties experienced, the results achieved give cause for optimism. In the majority of cases the companies achieved growth in turnover, profits and new customers. With respect to employment the picture is less clear cut. The organisational restructuring after the acquisition often leads to a leaner organisation in the years close to the transfer.

Right after the transfer of ownership, around 80% the acquiring parties set their stamp on the organisation by implementing their new plans. In line with the low degree of appearance of problems, family successors tend to be more conservative and take less action than their counterparts. The actions taken by new owners of all categories mostly concerned the organisational structure, the (employability of) staff and the quality of products and services offered. We found that leaders show a far greater inclination to make changes than laggards.

Looking at the types of change of ownership on the basis of their results after the acquisition, we find that family successions and mergers are not in the group of leaders in any of the regions.

#### INSERT TABLE 5

### **Conclusion**

Our goal was to get informed on the developments in companies after a transfer of ownership. In our quantitative research we did not test on significance, but with these large amounts of observations even a small difference is likely to be significant.

The results for the three regions show that the intentions of the entrepreneur and his ability to implement fast changes in the company is the decisive factor behind the success of a business

acquisition. The ambitions stated in the goals of the entrepreneur already set the tone for the results. The use of consultants is widespread. In Flanders and Germany the use of consultants is positively related to success. In the Netherlands there is no relation.

Albeit that a majority of the acquiring parties is confronted with problems – for buyers financing, staff & culture, but no legislation - this does not stop them from becoming successful. Leaders do not encounter fewer problems than laggards. A vast majority of the new owners takes immediate action to improve the organisation, the personnel and the quality of products and services. Ultimately the efforts of new owners lead to more sales, profits and customers in most companies.

Family succession leads to a smoother transfer, most of them with no problems.

The ultimate breakdown between leaders, middling companies and laggards is interesting. When family companies remain in the family the percentage of leaders is clearly lower than when the acquirer does not come from within the family (MBOs, MBIs, mergers and takeovers). An important reason seems to be that in the case of acquisitions within the family the focus is overwhelmingly on the continuity of the company. This emerges from the answers received from family-owned companies in the three countries. The results show that after the business is transferred the family-owned companies often fall into the group of laggards (Germany and Flanders) or are among the middling companies (Netherlands).

## **PERFORMANCE AND PERFORMANCE INDICATORS AFTER TRANSFER**

### **Introduction**

The EIM-study investigates the consequences of business transfer on business performance (Meijaard and Uhlaner, 2005). Our objective in this study has been twofold: identify the performance of recently transferred firms, and to identify the determinants of the success of business transfers.

Success can have several dimensions. First of all, the survival of the firm is the ultimate success factor. Continuity of the business is a necessary condition for the transfer to be successful. Secondly, success may be determined by the degree to which different stakeholders are satisfied with the business transfer. The satisfaction with the business transfer corresponds to possible changes in the commitment to the business and the motivation of the different stakeholders to continue the business (Sharma et al, 2003). The third aspect is the success in terms of profits, sales and growth. Note that the subjective measure of success (the satisfaction with the transfer) and the objective measure of success (changes in firm performance) can yield very different results. For example, a business transfer that results in increased profits need not be perceived as satisfactory by all stakeholders.

### **Method**

The results are based on the analysis of a sample of 100 business transfers that occurred in the period 1998-2003. Data were available on the firms both before and after the business transfer.

For these specific firms we have a balanced panel of data between 1998 and 2004. Detailed financial data are available, because the firms participate in a survey based panel maintained under the commission of the Dutch Ministry of Economic Affairs.

## Results

In this section we discuss the results of the analysis of performance between 1998 and 2003 for the various firms. To improve readability the numbers of the estimates have been omitted and replaced by signs (95% confidence) and double signs (99% confidence). A 'sign' means significant difference from zero.

### INSERT TABLE 6

Firstly, employment in transferred firms shows a negative development. Apparently, in the first few years of new leadership jobs and employment are reconsidered. 1999 appears in this context to be an (coincidental) exception, probably due to the growth in the overall economy.

### INSERT TABLE 7

In terms of sales growth, business transfers show a positive effect, at least in the short run. In the longer run, the effect remain to be positive, but fading.

### INSERT TABLE 8

Sales per employee (a measure of productivity) grows in the years after business transfer. Line of reasoning in this respect may be that the new entrepreneur manages to take away the most clear productive inefficiencies. More work can be done with less employees, but gaining new customers is a bit more problematic. The new entrepreneur manages to give the firm new youth.

### INSERT TABLE 9

The profit to sales ratio does not develop as positively after the business transfer. The entrepreneur has to make investments in restructurings, strategic refocusing and innovation, which lowers profits.

### INSERT TABLE 10

Most interestingly, the *innovativeness* of the firms clearly grows in the first years after the business transfer. Next to employment, sales and the other business processes will be tackled. Suboptimal and path-dependent imperfections may be taken away by the new management. Overall the revived innovation efforts are substantial.

### INSERT TABLE 11

Based on a linear regression analysis of factors influencing performance, it is clear that education, management experience and management training show positive effects on the success of business transfers. A written succession plan and planning in general deliver positive

results as well. Furthermore, such preparation decreases the negative employment effects of the business transfers. Contrarily, the use of external consultants in the transfer process has negative consequences on performance.

Notably business transfer within the family gives zero or negative effects on sales and productivity. This corroborates our ING findings that family transfers don't belong to the leaders in growth and turnover.

#### INSERT TABLE 12

In comparison to “regular” business start ups, recently transferred firms create less jobs, but they are much more productive and innovative (cf. Bosma et al, 2000). The better surviving rate of transfers approximately 96% (European Commission, 2002), compared to the start-ups of only 50% in five years (Kommers & van Engelenburg, 2003) secures employment better in transferred businesses.

### **Conclusion and discussion**

In conclusion, the dynamics in terms of business performance around the occurrence of business transfers appears to have positive, rationalizing and innovative effects.

Turnover, productivity and innovativeness increases. Employment and the profit to sales ratio don't develop as positively. The entrepreneur has to make investments in restructurings, strategic refocusing and innovation, which lowers profits and staff.

Even compared to start ups transfers lead to more productivity and innovation, less but more secure employment.

These results correspond to earlier studies into the development of productivity in small firms (Verhoeven, 2002, 2004; van Dijken et al, 1996). The business transition is accompanied by a rise in productivity. Growth of sales can be combined with a reduction in employment. Willard et al (1992), Huergo and Jaumandreu (2002), Bangma et al (2000) found similar patterns in the innovativeness and performance of firms. Also our ING study corroborates these findings.

From this sample alone, it is premature to conclude that business transfer within the family should be discouraged. But together with the ING study it indicates that family transfers are less favourable for economy. It is feasible that the effects are quite different in the long run. Nevertheless the results are notable.

### **CONCLUSIONS, DISCUSSION AND RECOMMENDATIONS**

This paper wanted to challenge the gloomy scenarios and typical assumptions in research on business succession in small and medium-sized firms. Our studies confirm Dyck et al (2002) that succession is a strategic opportunity instead of crises and even suggest it is a blessing to economy.

Our two quantitative studies indicate that business transfers have positive effects on turnover, innovations and productivity, but leads to less employment. The ING study shows increased profits. This could not be corroborated by the EIM study financial data which have been collected for many years. Since the ING sample is 13 times bigger, the EIM study might show a bias. On the other hand the EIM study is more focused and did not rely on ex post accounts on profits. Also transfers seem to have advantages over start-ups. They are more innovative, have better productivity and a much better survival rate, which secures employment.

Family succession might be less favourable for economic development. In our studies family transfers tend to under perform, although the transfers process itself is without the complications non-family successors witness.

From the ING and EIM study it shows that the consultants' role has a neutral or even negative effect on the business success after the transfer in The Netherlands. This might indicate a different style of working per nation, because in Belgium and Germany it was beneficial to success after transfer. We know from our qualitative study that the Dutch consultants seldom facilitate the emotional process. The Dutch business consultants may have a fine eye to pick out business owners who have made up their mind yet. Hence, the relative short period they report on the complete transfer process. Possibly there is also a correlation between the a priori performance of the firm and the use of external consultants in the business transfer process.

The complexity, the long time needed for the transfer and the hardships of the transfer process are set in a different light. Both the HvU and ING study indicate that there seems to be a shared perspective on problems of business transfer: finding buyers, the lack of (financial) knowledge or financial resources for buyers and staff as and important stakeholder. Complex (tax) legislation and procedures are not mentioned as a major problem.

There are also differences in foci. Le Breton-Millers findings are confirmed that consultants have a broader perspective than researchers. But at the same time business consultants put no emphasis on planning and preparation, which contradicts Le Breton-Miller. They solve this problem by their work methods and payment on commission. Instead researchers and government agencies stress the importance of planning en preparation. Not only business consultants but all other parties shy away from the emotional aspects. Not addressing the emotional aspects is known to delay the transfer process (Landsberg, 1999; Flören, 2002).

Given the revitalising capacities of business transfers to economy, policy attention seems all the more important. We like to highlight five aspects:

1. Build awareness regarding the revitalising capacities of business transfers to economy and its advantages over start-ups.
2. Stimulate transfer (planning) outside the family and research for non-family takeover models.
3. Improve general knowledge for buyers and sellers.
  - a) This could be done by connecting databases, marketplaces and work methods of business consultants. Improvements at the national level have priority (coupling various databases).

- b) It could be useful to create national and European standards for the information provided in such databases, including financial performance, client satisfaction and network ratings (of business consultants).
- 4. Provide and promote a national program or training which deals with the emotional barriers for succession for sellers to overcome unnecessary delay.
- 5. Improve financial knowledge for sellers and buyers and capital conditions for buyers. This could be done by:
  - a) Improving abilities for buyers and sellers to look into several scenarios to finance the transfers.
  - b) Stimulating banks to provide new entrepreneurs with the capital needed for business transfers. Survival rates are great.
  - c) Alleviating barriers to bring in venture capital for transfers and enable shared risk bearing.

### Abstract

Following the specialized literature, strategic alliances should be considered as an alternative mechanism to the traditional modes of organization that could improve business' performance under certain conditions. That is the reason why this paper has studied the implementation of strategic alliances by Thai firms, focusing on the relation among the behavior of partners, the governance structure and the satisfaction outcome of firms participating in them.

Regarding the theoretical framework, this relation has been developed integrating the Transaction Cost Theory (TCT), the Property Rights Theory (PRT), and the Transactional Value Theory (TVT). Based on this framework we wonder if collaborative alliances (Joint Ownerships - JOs) were more likely to be effective as the governance form when collaborations were highly complex in terms of uncertainty, whereas Separate Ownerships (SOs) were preferred when the level of trust was high between partners. We can also analyze if SOs were more likely to be selected when the highest probability for opportunistic behavior was compensated by the expected future benefits and, finally, we can also identify the role that reciprocity and ex-ante investments in assets can play in the selection of the structure for organizing a strategic alliance.

The hypotheses were contrasted on the basis of a survey to 503 firms in industrial districts in Thailand. Logistic regression and ANOVA analysis results generally supported the model and hypotheses. From our perspective, one of the most interesting contributions is to prove that firm's satisfaction with alliances is independent of the implemented structure when this has been selected taking into account aspects from the TCT, the PRT, and the TVT; in other words, when the selection takes into account ex-ante investment aspects, trust, reciprocity and future benefits.

## 1. INTRODUCTION

In Thailand, the external and internal factors led the Thai economy to an economic crisis, have motivated Thai industries to look for new ways of adjusting their strategies to compete with their rivals and to survive, strategic alliance has been seen as an important tool by which Thai businesses could be enhanced. Consequently, nowadays the industries and the strategic alliances within firms relationships are addressed from a wide array of disciplines and perspectives. However, in regards to developing countries, studies are still very limited in number despite their valuable contribution to regional development and specially to the need to become globally competitive.

Therefore, the focus of this paper is on the exchange relationship between firms, the structure of allied firms, and the one that account for the satisfaction of firms that enjoy strategic alliance. This aspect will refer to this partner or the allied firm as competitors' and/or customers. Finally, the study will examine the level of satisfaction outcome, and the perception of the partner's behaviour, whereas most prior studies have examined only one or two elements in this complex relationship. As a whole, this paper tries to answer five important questions that are; how many firms are engaging in strategic alliance activity; which are the types of cooperative relationships are chosen; is this activity related to firm size?; how satisfied are the firms with their efforts and results; and how is the degree of satisfaction influenced by perceptions of partner behaviour?

To answer these research questions, we operationalized integrating the Transaction Cost Theory (TCT), the Property Rights Theory (PRT), and the Transactional Value Theory (TVT).

TCT views alliances as intermediate hybrid forms between the extremes of markets and hierarchy (Williamson, 1985) that occur when transaction costs associated with a specific exchange are too high for an arm's-length market exchange but not high enough to mandate vertical integration (Hennart, 1988). From this view, a major assumption of transaction cost theory (TCT) is the bounded rationality and opportunism of human behaviour. Bounded rationality means the human behaviour is rationally motivated but also limited. Opportunism refers to a lack of candor or honesty in transactions. TCT argues that given the interaction of bounded rationality and opportunism, the organization must choose between markets (external purchasing) and firms (internal production) for input or output of goods or services. Transaction costs represented in an organization's procurement of external resources can explain the organization's decision regarding their preferences for either hierarchies or markets (Wey & Gibson, 1991). TCT can be widely applied to studies focused on strategic alliances for example; the structuring aspect, the aspect of choosing governance structures, the aspect of motivation of firms to interorganization & international venture, and etc. Although, the literature has reviewed the wide advantages of TCT, limitations have also been found.

The property rights theory has criticized transaction cost for presenting some limitations: accurate predications about the structure of the collaboration arrangement, for example when there are R&D activities implied in the relationship are not fully accomplished. Transaction cost generally anticipates structures closer to hierarchy but some empirical studies have not found this relationship at all (Rialp & Salas, 2000; Rialp et. Al., 2001). In other words, TCE has emphasized the costs of using the market to govern exchange, but has not provided a rigorous explanation of the cost of the firm as a governance structure, in this case, PRT approach. TCT perspective is also limited in its ability to explain interorganizational strategies. For example, TCT's neglect of the interdependence between exchange partners, as shown in an analysis of the transaction approach to vertical integration, and TCT's

intellectual kinship to another branch of the industrial organization literature. In this case, that TVT could be used advantageously to explain the long-term relationship between partners. In order to accomplish our proposed objectives, this paper is organized into three sections, following this first section delineates the problem statements, while the second provides theory and hypothesis used. The last section addresses the empirical part and discusses the findings of this paper concludes by identifying practical implications and future research.

## **2. THEORETICAL MODELS**

Before presenting theoretical framework, It is necessary to point out the classification of governance forms. In this study governance forms can be classified in two main groups attending to how residual decision rights are allocated:

- Separated ownership: ownership of the assets is distributed among transacting parties. Each party participating possesses decision rights individually over some of the assets participating in the relationship. The degree of involvement among the parties is not always the same when the ownership is separated. When this degree is high, although the ownership remains separated, the parties can agree to establish penalties for certain behavior or explicit dispute resolution mechanisms. Therefore, we could consider separated ownership with and without safeguards. For example, Oxley (1997) distinguishes between “bilateral” (less safeguards) and “multilateral” (more safeguards) contracts.
- Joint ownership: each of the two or more transacting parties has veto power on the use of the assets. A 50 – 50 equity joint venture between two firms will be a form of joint ownership. In this case, the fact that a new firm is created suggests that the joint venture is substituted in the market by the hierarchy. Notice, however, that this governance form differs from that of pure hierarchy (hierarchical governance) because, in the later, assets on both sides of the transaction are owned by a single party; single ownership.

Obviously, this classification considers two groups of collaboration agreements. In the literature, it is possible to find many of examples of this (see, for example; Parkhe, 1993; Osborn & Baughn, 1990). This classification is considered objective and allows for clarity rather than confusion caused by terminology. Furthermore, it fits perfectly with the theoretical framework presented in the next section because, as a component, this framework contains the property right theory.

### **2.1 The Transaction Costs Theory**

The concept of Transaction Cost is prominent in strategy and organizational theory research, especially with regard to why firms diversify, engage in joint ventures and multinational alliances, buy goods and services in the open market, and rely on informal agreements in conducting business transactions (Monteverde & Teece, 1982a, 1982b; Walker & Weber, 1984; Palay, 1985; Masten et.al.,1989; Osborn & Baughn, 1990). Gomes & Casseres (1989, 1990), for example, used TC arguments to explain that multinational enterprises will use foreign direct investment when it is inefficient to transfer capabilities through contracts.

Transaction Costs Economics (Williamson, 1991, p. 277) considers that transactions could be governed by three generic governance structures: market, hybrid or hierarchy. In this study the term “hybrid” refers to “interfirm collaboration”, defined as any non transitory relation among independent companies involving exchange and/or sharing of resources and capabilities to obtain mutually beneficial outcomes.

One type of hybrid form (which can be considered closer to the market because it presents similar rules for acting (see Imai and Itami (1987)) is based on simple contracts. In fact, contract is addressed as a governance device limiting opportunism by either party (Hallen et al., 1991). However, as uncertainty increases, for example under the presence of resources specificities which create bilateral relationships, intense interdependencies and high coordination is needed, contracts have to be necessarily more incomplete and exit can not longer protect efficiently against ex-post bargaining and opportunism (Oxley, 1997).

On the other hand, opportunism is one of the behaviours of the parties that has a significant influence in the results obtained in the collaboration relationship. It is defined by Williamson (1979: 234) as self-interest seeking guile. That is, businesses and individuals will sometimes seek to exploit a situation to their own advantage. Opportunism extends the conventional assumption that economic agents are guided by considerations of self-interest, to make allowance for strategic behaviour. As we have mentioned before, the behaviour of opportunism could vary depending on the form of contract chosen. When the likelihood of opportunistic behaviour is higher, a simple contract cannot be the most efficient structure for managing the relationship.

Consistent with these assumptions about opportunism, when contracts can no longer protect efficiently against ex-post bargaining and opportunism, one alternative for firms is to rely on some “voice” mechanism to induce the parties to participate in the transaction. Joint ownership, that could imply the creation of a new firm, includes voice rights and, at the same time, rights over residual income, so some alignment between individual and collective interests is also achieved. With joint ownership the likelihood of more complex collaboration being completed (those with a higher likelihood of opportunistic behaviour) increases (Kogut, 1988; Osborn and Baughn, 1990; Gulati and Singh, 1998). Therefore:

*H1: Joint ownership as a governance structure is likely to be more effective as a governance form when collaborations are highly complex in terms of uncertainty, resources specificities, interdependencies, opportunism behaviour, etc. (in other words: where incentive problems and coordination needs are highly severe).*

Low complexity implies that the attributes of the transaction are such that prices are sufficient statistics to guide adjustment and coordination, and individual incentives are compatible with global efficiency. A Contract is an efficient mechanism for organizing the relationship. The introduction of Joint Ownership would imply the use of resources to perform coordination, supervise activities and measure inputs or outputs (visible hand).

### **2.1.1 Role of reputation and trust**

One possibility open to an alliance partner is to rely on the record of its counterpart's cumulative past behaviour as a guide to future behaviour, or to use reputation as a proxy for knowledge of opportunistic intentions. Parkhe (1993) stated in his study that actors will try to avoid entering an exchange with another actor who has a questionable reputation and, if avoidance is not viable, they will demand that the potentially opportunistic party absorb bonding costs when they enter into an exchange with them. In addition, the other actors will have to bear monitoring costs in order to detect opportunism. The bonding and monitoring costs will absorb much of the expected benefit from the alliance, so that “the value created by exchanges involving actors of questionable reputation is significantly reduced by the need to set up safeguards to limit opportunism” (Hill, 1990: 505, emphasis in original). Nevertheless, frequently, information on a potential partner's past behaviour does not exist in the public

domain. Thus, in an environment of questionable reputation, or in the absence of any reputation at all, the design of appropriate governance structures should be a function of the perceived probability of opportunism.

Another possibility is trust. The term trust has widely varying connotations (Luhmann, 1979; Barber, 1983; and Gambetta, 1988). Doney et. al. (1998) stated that trust is a valuable contributor to many forms of exchange. In interfirm relationships, researchers credit trust with lowering transaction costs in more uncertain environments (Dore, 1983; Noordewier, John, & Nevin, 1990), thereby providing firms with a source of competitive advantage (Barney & Hansen, 1994). Trust also facilitates long term relationships between firms (Ganesan, 1994; Ring & Van de Ven, 1992) and it has been considered an important component in the success of strategic alliances (Browning, Beyer, & Shetler, 1995; Gulati, 1995).

Nooteboom (2001) claimed trust is neglected in the assumption that in the governance of relations we need to safeguard against opportunistic behaviour. Moreover, if opportunities for opportunism cannot be eliminated, one can aim to reduce inclinations to utilize such opportunities by reducing the incentives to do so in the governance form of relational contracting. Each governance form implies alternative ways of solving the coordination and incentive problems, different amounts of explicit resources employed in such solutions, and different residual or opportunity losses. The contribution of transaction costs and dimensions of the different governance forms, such that a reduced cost function can be identified relating transaction costs and attributes of the transaction, for each possible governance forms (Rialp & Salas, 2000). Consistent with these interpretations it is proposed that:

*H2: Joint ownership is less likely as a governance structure if the firm trust in its partner.*

In this paper, Trust as “a type of expectation that alleviates the fear that one’s exchange partner will act opportunistically” (Bradach & Eccles, 1989; and Gulati, 1995). Trust itself can be difficult to observed and measured. We agree with Gulati (1995) in using a factor that is likely to produce trust as its proxy, this factor could be prior alliances between the firms (Zucker, 1986).

### **2.1.2 Reciprocity and its role in strategic alliance relationships**

Reciprocity implies that one is morally obligated to give something in return for something received (Ring & Van De Ven, 1992).

Mauss (1925) surfaced the concept of reciprocity through studies of primitive societies grounded in basic “give and take” obligations. Malinowski (1926) agreed that give and take was the basis for the entire social structure in such societies. Alliance theory expanded on these early works and suggested that reciprocal exchanges represent not only the foundation of human social structure, but also the fundamental quality of the human mind. For instance, Levi-Strauss (1949) proposed a hierarchy of goods/services to be exchanged for a balanced exchange achieved without deliberate calculation by either party. Part of the balance may be made up of intangibles, such as political and territorial rights and relative prestige (Leach, 1951).

This study conceives the concept of Gibson et al (1997) that reciprocity encompasses the alliance partners ability to demand an equal exchange as a safeguard against potential opportunism. When high levels of reciprocity are built into cooperative relationships, the “fear of possible retribution against those who engage in self serving and devious behaviour”

provides a strong guarantee against opportunistic behaviour. The guarantee of an equal exchange of both benefits and penalties, while reducing a participant's willingness to behave opportunistically, also reduces expectations of cost associated with such behaviour from a partner.

The reciprocity can have advantageous governance structure benefits. For these reasons, it is therefore proposed that:

*H3: When partners expect low levels of reciprocity in a cooperative relationship, joint ownership is more likely as the governance structure.*

## **2.2 Property Rights Theory**

The property rights approach can be understood as an attempt to formulate empirically meaningful optimization problems by associating the utility function with the individual decision maker and then introducing specific content into the function. The PR approach helps to understand the cost of ownership. Some point noted is that PR do not refer to relations between men and things but rather, to the sanctioned behavioral relations among men that arise from the existence of things and pertain to their use. Obviously, it can include: (a) the right to receive the residual after all other inputs have been paid their contractual amounts, (b) the right, however qualified, to terminate or revise the membership of the team (i.e., the possessor of these rights is a central party to a set of bilateral contracts), and (c) the right to sell those rights specified under (a) and (b) (Furubotn & Pejovich, 1972). Some literature (Hart & Moor, 1990) related to PR emphasizes that "ownership matters," where the rights of ownership of an asset take three parts: the right to use the asset, the right to appropriate returns from the asset, and the right to change the form and/or substance of an asset. Once the issue of property rights is clearly agreed and set, it is commonly assumed that asset utilization will thereafter track the purposes of its owners. This will obtain if (1) the legally sanctioned structure of property rights is respected and, (2) human agents discharge their jobs in accordance with instructions.

In this sense, Rialp & Salas (2000) explain why sometimes it is more efficient, for example, to keep ownership of non human assets separate among the different transacting parties than create a new firm with each partner holding 50 per cent of the shares (joint ownership/JO): separated ownership (SO) induces more investment in ex-ante specific human capital than JO. Generalizing this assumption, it is proposed that:

*H4: when one party has made important ex-ante investments in assets, inter-firm collaborations that imply Joint Ownership are less likely than those which keep ownership of assets separate among the collaborating parties.*

From the PRT perspective, therefore, joint ownership may be less attractive than SO at high levels of complexity (uncertainty and resource specificities). Consequently, in the case of joint ventures (a clear case of JO), we may have to weigh the potential benefits of introducing administrative systems, which help to solve coordination needs, against the direct costs of these systems and with the indirect costs due to the choice of an inefficient governance form, from the point of view of the allocation of ownership rights.

### **2.3 Transactional Value Theory: The Effect of The Net Value Gains**

Under the TVT the selection of the structure for developing a collaboration agreement is more a function of anticipated value gains rather than anticipated losses due to the cost of constraining opportunism. Moreover, the TV framework considers joint value maximization, rather than single-firm cost minimization, and the process by which exchange partners create and claim value. Therefore, under this approach, the crucial issue in a collaboration is not merely a single organization's concern for minimizing transaction costs, but rather both organizations' concern for knowing the partner's preferences as a basis for exchanging and mutual gain. The partners in one alliance would like to discover ways in which similarities or shared interests can be exploited to maximize cooperative joint gains that would accrue to both parties (Zajac & Olsen, 1993; Rialp et al., 2001).

This crucial issue of the TVT fits perfectly with the concept of forbearance, which occurs when a partner presented with the possibility to engage in opportunistic or self-interested behaviour, declines such action. Behaviour associated with forbearance primarily emerges when alliance partners take a long-term view of their relationships and believe that future gains from present cooperative behaviour outweighs the potential immediate gains of cheating (Gibson et al 1997).

In summary, the basic condition for forbearance (tacit collusion) to be sustained would be for each firm to perceive that the payoff for engaging in tacit collusion or forbearance is likely to be greater than what can be gained by reneging on an implicit agreement and that other firms share the same belief (Jayachandran, 1999). When a firm trusts its partner (it is sure that the partner would not engage in opportunistic behavior), such perceptions will not lead to a organizing the collaboration agreement through joint ownership structures. In the same sense, when a firm perceives that its party is decided to act in the spirit of cooperation, not cheating, and not withholding helpful action (Smith & Barclay, 1997), therefore it is displaying forbearance from opportunism, such structures are not needed. Therefore it is proposed that:

*H5: when incentive problems and coordination needs are highly severe joint ownership is less likely as a governance structure, if alliance partners take a long-term view of their relationship and believe that future gains from present cooperative behaviour outweigh the potential immediate gains of cheating.*

### **2.4 Structure of The Collaboration and Satisfaction**

This criteria could lead to a position far away from the structure that should be selected under the criteria of the TCT and/or PRT i.e selecting the most efficient structure (Rialp et al., 2001). As Zajac and Olsen (1993) and Stinchcombe (1985) show, the pursuit of greater joint value could require the use of governance structures that are less efficient from a transaction cost perspective.

However, it is convenient to say that although the TV approach represents another theoretical framework, it is consistent with the implicit intent of the TCT in some ways. Transaction costs are a subset of total costs to be aggregated and compared with the set of total benefits/gains in an overall calculation of the value of the collaboration. In this way, the second aspect related to the approach of the TV (to consider the process by which exchange partners create and claim value) becomes relevant, because it can result in a transformation that leads to greater expected net benefits for both parties (Rialp et al., 2002). That is the reason why it can be said that the TVT should be complementing the explanations of the TCT

and the PRT of the selected structure for developing a collaboration agreement, and, thinking about the objective of this dissertation, the overall theoretical framework allows for behavior, structure, and satisfaction to be related (see Figure 1).

---

Figure 1 about here

---

It follows, then, that the type of analysis required is one that considers how parties attempt to create and claim value within a relationship over time (Lax and Sebenius, 1986).

Once the individual firms establish which is the preferred structure considering the characteristic of the collaboration *per se*, the investments required and their relationship with previous investments made by the firm, the characteristics of its partner, its reputation, the possibility of trust and forbearance and the expected value that they see in the relationship (firms engage in the process of projecting exchange into the future (Macneil, 1983), and constructing net present valuations of alternative collaborations); the implementation of this structure will determine the behaviour of the firms in the collaboration process. In fact, the processing stage decreases conflict issues, defined here as the perceived divergence of interest (Pruitt and Rubin, 1986). As a consequence, there is not obstacle to value maximization what is increasing the likelihood of cooperative relationship over multiple rounds (Axelrod, 1984). Partners will feel a growing confidence in the expectations of the future, trust is being developed, and they can behave as if the expected value of interdependent activity were stable over the course of an uncertain future. In other words:

*H6: Satisfaction of the firm with the collaboration should be independent of the implemented structure if it has been selected taking into account aspects from the Transaction Cost Theory, the Property Rights Theory and the Transactional Value Theory.*

### **3. EMPIRICAL ANALYSIS**

#### **3.1 Sample selection**

In Thailand, there are 28 industrial districts under the industrial authority of Thailand. There are 2,136 firms who have the right to run their business on these industrial districts but only 1,327 firms have established businesses there. This research has considered all these firms in these industrial districts as units to be analyzed. Therefore, the units for this study consist of large, medium and small size domestic and foreign companies.

With the purpose of testing the questionnaire, 20 firms in the northern industrial district were personally interviewed by the researcher and 2 trainees. Once the questionnaire had been tested, 1,307 questionnaires were distributed to all the firms that exist in the industrial districts nationwide by mail. In total, 1,327 firms were interviewed.

However, a lot of questionnaires have not been mailed back (in these cases they were followed up again by phone). This study found that some firms did not pay any attention but some did. Finally the valid number of firms participating in our research is 503.

## 3.2 Variables

### Dependent Variable

The dependent variable is the governance form of the collaboration. The coding of this variable proceeds as follows:

- i) Separated Ownership (SO) = 0, when the collaboration is an Exchange Agreement
- ii) Joint Ownership (JO) = 1, when the collaboration involves a Joint Venture.

### Explanatory variables

Table 1 summarizes the explanatory variables initially considered for being used in the analysis and provides basic descriptive statistics for each of them.

---

Table 1 about here

---

The number of independent parties involved in the transaction will affect the complexity of such a transaction as the number of potential interactions, and therefore interdependencies among them, will increase with greater numbers. So, the number of partners is considered to have a positive influence on the coordination needs. Furthermore, the problems of measuring individual contributions to the collective action, which facilitate free riding behaviour (Alchian and Demsetz, 1972), will also likely to be increased. Therefore, it will increase the risks of expropriation, compared with those between two firms. So, it is possible to associate these observed attributes with higher degrees of opportunistic behaviour.

The possible opportunistic behaviour of the partner/s in the alliance was captured by using three variables. Thai firms were asked if:

- i) their partners seem to feel that to do anything within their means that will help further their organization's interest is acceptable,
- ii) their partners carry out their duties even if they do not check up on them and,
- iii) their partners have promised to do things without doing them later.

Other attributes affecting the complexity of the transaction is the realization of R&D activities (1), compared with the absence of such activities (0).

One condition that favor reputation and social pressure effects as sustainable of implicit contracts, are proxies by the variables nationality of the collaborating part. Social norms are more likely in culturally homogeneous social communities. Moreover, geographical proximity will facilitate the observation of the behavior of the partners and check whether such behavior is consistent or not with the premises. The partner nationality variable is divided in two categories: Foreign (0) or Domestic and Foreign partner (1).

Two variables that could be approximating the possible reciprocity and the Thai firm consideration of the value of the financial returns produced through the collaboration relationships. More precisely, Thai firms were asked:

- iv) if their partners were smaller, larger or the same size. It was considered that when firms participating in a collaboration agreement were the same size none of them was in a disadvantageous situation.

- v) an assessment, in a five position scale (from extremely poor to extremely good), of the financial returns produced by the firm's alliance relationships.

### Control

- *Economic Sector*

The Natural sources, Services, Basic Manufacturing and High Technology sectors are widely represented. It is acknowledged that patent protection differs across industries (Oxley, 1997; Gulati and Singh, 1998), so the legal system will protect to a different degree the interests of the parties depending upon the economic sector where the collaboration is developed.

- *Age of the Firm*

The age of the firm may have an influence on the firm's ability to learn about allied firms relationships and their behavior. Also Kale et.al. (2000) emphasized that it could be argued that the greater the duration of the alliance, the greater the learning would be from the alliance partner. At the same time, the longer duration would also increase the likelihood of losing proprietary assets to the partner firm. Audio et.al. (2000) suggested that older firms may have an experience advantage, or, alternatively, younger firms may have a higher capacity to take in new knowledge. This study, consistent with these researchers, includes the age of the firms as a control variable.

- *Firm Size*

The size of a firm can affect its market power and thus its ability to dominate the partners in an alliance. Because of this, large firms are likely to seek different types of characteristics than smaller firms in alliance partners. Although different proxies could be considered for capturing the size of the firm, the total number of employees or the revenues are the most common. Furthermore, total number of employees is often highly correlated with total annual revenue. Therefore, the number of employees as a control variable has been used in this research.

### **3.3 Methodology**

Logit model has used to test the hypotheses. Let  $x_i$  be the synthesis of a collaboration agreement  $i$  where:

$$x_i = \beta y_i + \epsilon_i$$

The vector  $y_i$  includes all the variables (proxies) representing opportunistic behavior (together with possible control terms); the vector  $\beta$  includes the weights attached to each variable representing such opportunistic behavior; and  $\epsilon_i$  is the error term.

The theoretical model assumes that the unobservable variable  $x_i$  determines the choice of one governance form as it falls in one of the following discrete intervals:

- i) If  $x_i < \mu_0$ , Separated Ownership (=0) is selected
- ii) If  $\mu_0 \leq x_i$ , Joint Ownership (=1) is selected

The logit statistical analysis estimates the vector of parameters  $\beta$  taking into account the observed characteristics of the collaboration  $y_i$ . It assumes that the underlying probability distribution of  $\epsilon_i$  is normal. The logit choice model provides statistical methodology which is based upon the comparison of the utilities associated with each of the alternative governance forms, given a vector of the collaboration's characteristics. In probabilistic form, the model is expressed as follows:

$$P_{ij} = P(G = j / y_i) = e^{\alpha_j y_i} / \sum_k e^{\alpha_k y_i}$$

Where  $P_{ij}$  is the probability that collaboration  $i$  is governed by structure  $j$ ,  $j = 0, 1$ ;  $\alpha_j$  is a vector of coefficients which determine the impact of the explanatory variables on the probability that each of the governance forms will be selected. The variation of  $\alpha_j$  across governance forms is consistent with the assumption that the utilities are different for each of them.

To estimate the coefficient  $\alpha_j$  the utility of one of the alternatives is used as a normalization value. In this case, the alternative will be the Separated Ownership. Therefore, the parameters of the other alternatives have to be interpreted in reference to the omitted one. A particular value of one estimated coefficient  $\alpha_{ij}$ , indicates the extent to which the attribute  $l$  of the collaboration contributes to the utility of governance alternative  $j = 1$ , beyond the contribution that this attribute would have in determining the utility of the base option, Separated Ownership. If the base option for comparison is Separated Ownership, then it should be expected that the likelihood of choosing the other governance form different from the base option at lower levels of opportunism decreases. At the same time, the likelihood of choosing Joint Ownership compared with Separated Ownership, as opportunistic behavior increases, should increase; therefore,  $\alpha_l > 0$  is expected.

### 3.4 Results

The statistical package SPSS was used for the estimation. Table 2 presents the final explanatory variables considered in the analysis and their relationships with the hypotheses established in the previous section. Based on the previous comments about the content of the variables, the sign of the effect of the variable indicating if the probability of implementing Joint Ownership instead of Separated Ownership increases or decreases, is also indicated.

---

Table 2 about here

---

Three variables related to opportunistic behavior and reciprocity were measured in the Likert scale of seven positions. Basically, each respondent was asked to indicate the extent to which he/she disagreed or agreed with the given statement, such that 1 = Very Strongly Disagree and 7 = Very Strongly Agree.

When multiple-item scales are used to measure latent constructs and a composite score based on these items could be used in further analyses, it is important to assess the validity and reliability of the scales used (Gerbing and Anderson, 1988). Selection of scale items on the basis of prior literature, fieldwork, and pretesting of the survey instrument helped ensure content and face validity. Therefore, to assess scale reliability, Cronbach Alpha<sup>1</sup> was computed.

In fact, the three items measuring partners' opportunistic behavior presented a Cronbach Alpha equal to 0.676. Nunnally (1967) pointed out that the minimally acceptable reliability

---

<sup>1</sup> Cronbach's Alpha is a generalized measure of the internal consistency of a multi-item scale and it has become one of the foundations of measurement theory. Moreover, it is a generalized intraclass correlation coefficient, so it can be derived from the theory of true and error scores, as well as from the domain sampling model (Peterson, 1994). With these reasons coefficient alpha has been used as the measure of choice for estimating the reliability of a multi-item scale in this study.

for preliminary research should be in the range of 0.5 to 0.6 and these should be well above the cut-off value of 0.7 in each case (Nunnally, 1978; Peterson, 1994; Rialp, 2003). Therefore, it can be confirmed that the three items are referred to the same construct: opportunistic behavior of the partner. To avoid colineality problems in the logistic regression it is assumed that the variable representing “if Thai firms’ partners seem to feel that to do anything within their means that will help further their organization’s interest is acceptable”, will be the one reflecting the opportunistic behavior in the model.

To capture the idea of opportunism, avoiding colineality problems in the model, two variables are considered enough: number of partners and R&D activity. The coefficients of both variables are expected with a positive sign (H1).

Nevertheless, the presence of R&D activities are also being used for contrasting H4. For those firms collaborating in R&D activities, there are person embodied specific human capital investments. The theory predicts that separated ownership of physical assets would be more efficient than joint ownership. Therefore, a negative sign would be expected for the estimated coefficient of this variable finding evidence in favour of H4 formulated from the theory of the boundaries of the firm based in the property rights approach.

In fact, the results show, in the first column of Table 3, is partially confirmed. Therefore, Joint Ownership seems to be preferred over Separated Ownership as having more possibilities of observing opportunistic behavior<sup>2</sup>. This paper has just referred partially confirmed because the coefficient of “Number of Partners” is not statistically significant, so the variable does not seem to significantly affect the level of coordination problems, according to the data. However, in the line of H1, the positive coefficient ( $\hat{\beta}_{R\&D} = 3.45$ ) for the variable measuring the presence of R&D activities in the collaboration is obtained. Consistent with this hypothesis, the estimated coefficient means that those collaborations performing R&D activities imply a relatively high level of coordination problems compared with those which do not perform this type of activity, and consequently they also have a higher likelihood of incorporating hierarchical controls. On the other hand, this positive sign allows us to reject H4. In other words, this H4 cannot be supported as no significant relationship was found

Considering the estimated coefficients of the control variables, the probability of Joint Ownership in High-tech sector is significantly higher than in sectors related to Natural Sources and Basic Manufacturing.

On the other hand, for younger firms, Joint Ownership is less likely to be implemented than Separated Ownership.

Finally, considering the size, larger firms implement structures related to Joint Ownership, more than smaller firms.

---

Table 3 about here

---

The logit model is estimated to incorporate the idea of trust affecting the choice of the governance form, H2 (second column<sup>3</sup> of Table 3). When the alliance is established with a

---

<sup>2</sup> In other words: with more interdependencies, uncertainty, resources specificities and measurement problems.

<sup>3</sup> To estimate this second model, the control variable indicating the sector has not been added because it is related to the nationality of the partner/s participating in the collaboration agreement.

domestic partner or, at least, another domestic partner participates, JO structure is less likely to be selected, as it was supposed in H2. Firms seem to be more reluctant to choose SO with non-domestic partners, which would be consistent with this prediction that cultural, social and physical proximity are conditions which restrict opportunistic behavior because it is more likely to have social pressure from norms, and reputation is more valuable.

In the third column of Table 3, the model considering reciprocity, H3 has been estimated. In fact, the estimated coefficient for the variable measuring the reciprocity deviates from the prediction: being in a disadvantageous situation has a negative and significant coefficient. As a consequence, SO structures are preferred rather than JO when partners expect low levels of reciprocity in a cooperative relationship.

Finally, the idea related to forbearance, H5, is added into the model. The fourth column of Table 3 presents the model including the consideration of financial results as independent variable. The estimated coefficient for the variable measuring the financial returns is negative and significant. Therefore, SO structures are preferred rather than JO when benefits are considered.

Furthermore, the last column of Table 3 looks at the issue of possible complementarities between future value of the collaboration and opportunism. It appears that future results and technological activities increase the likelihood of SO. So this evidence reinforces H5.

Analyzing the global usefulness of the different estimated models, the last three models (Model 3,4,5) present the best results. More precisely, the fourth model achieves the best classification rate: globally 92.6% of the structures are well classified and this percentage is divided into 98.3% if we focus on SO and 90,4% when we talk about JO.

It can be answered that these results allow us to defend the theoretical model considering the TCT, the PRT and the TVT as a good theoretical framework for analyzing the selection of structures for implementing collaboration agreements. In the next section an attempt will be made to relate empirically the selected structure with the satisfaction.

#### Satisfaction with the implemented structure

Satisfaction was measured by three items. We used five Likert scales to measure, which each respondent was asked to indicate the extent to which he/she disagreed or agreed with a given statement, such that 1 = Extremely Poor and 5 = Extremely Good. The three items measuring partners' satisfaction present a Cronbach Alpha equal to 0.7418 (a value above the cut-off value of 0.7 - Nunnally, 1967, 1978; Peterson, 1994; Rialp, 2003). Therefore, it can be confirmed that the three items are referred to the same construct: satisfaction of Thai firms with their collaboration agreements.

With the aim of obtaining a measure of satisfaction, these three variables were summarized in just one new dimension applying factor analysis<sup>4</sup>. The eigenvalue of the new dimension is equal to 2.024 and the percentage of variance this new dimension explains of the initial three variables is 67.47%.

The assumption is that satisfaction with collaboration agreements must be independent of the structure of the agreement if the structure has been selected considering possible opportunistic behavior, property rights' aspects, trust, reciprocity and the possible benefit related to the collaboration. H6 is confirmed with the data (See Table 4).

---

<sup>4</sup> Although the number of variables is low, the KMO and Bartlett's Test of Sphericity allows this kind of analysis to be made (KMO=0.45; Sig Bartlett's Test < 0.01).

---

Table 4 about here

---

It can now be summarized here that hypotheses 1, 2, 5, and 6 were found to support these relationships and in the expected direction, while hypotheses 3 and 4 were not significant and were rejected.

#### **4. DISCUSSION AND CONCLUSION**

We have been written with the purpose to integrate the TCT, the PRT related to the boundaries of the firm, and the TVT to explain the choice of a governance form in interfirm collaborations. It is believed that this theoretical framework clarifies the costs of introducing what have been called hierarchical controls, and considers the value of the net benefits in the selection of the structure.

Logistic regression analysis results generally supported the model and hypotheses, suggesting the need for a greater focus on the TCT, the PRT, and the TVT to study the relationship of partners' behaviour, governance structure, and satisfaction of allied firms. Specifically, this study found that collaborative alliances (JOs) were more likely to be effective as the governance form when collaborations were highly complex in terms of uncertainty, whereas SOs were preferred when the level of trust was high between partners. The findings also showed that SOs were more likely to be selected when the highest probability for opportunistic behavior was compensated by the expected future benefits. This study did not find a relationship between JO and reciprocity, therefore it could be predicted that SO was preferred over JO when firms expected low levels of reciprocity.

This section and the results obtained, although encouraging in terms of opening new avenues for empirical work on the boundaries of the firm, have limitations due mainly to the nature of the data. The information relating to the collaborations is quite limited both in terms of the actual features of the selected governance form and in terms of the attributes which are identified as sources of complexity in the transaction. This difficulty is often recognized in the literature, Oxley (1997, p. 391), nevertheless it is important to recall it and introduce some caution into the conclusions. However, this paper hopes that the preliminary evidences presented in this sector will encourage future efforts to collect more data and verify the robustness of the results. Despite these limitations, this study contributes to understanding the satisfaction that firms can experience when they decide to participate in collaboration agreements. Specifically, this study suggests that the partners satisfaction with the alliance will depend on the characteristics of the partners themselves and other factors associated with the relationship. This study considers that, the relationship between satisfaction and the structure of the strategic alliance should not be directly analyzed because the structure is endogenous to the characteristics of the alliance. Based on these characteristics, the structure is selected. Therefore, no relationship can be obtained between one concrete structure and satisfaction.

This is a particularly interesting result because in light of all the programs available to help firms to establish Joint Ventures, for example, perhaps they are motivating the failure of the relationship between the parties because that structure is not the most appropriate for that relationship.

As a whole, it is possible to say that this study will enhance the current knowledge of strategic alliances in developing countries and the results can be useful for scholars who are interested in this field, and entrepreneurs will be able to apply this information to their business strategies.

## 5. FUTURE RESEARCH

Although the analyses in this research generally confirmed the hypotheses tested, and thus may provide a good starting point, there is definite conceptual and practical merit in moving towards testing more complex theories involving unanswered, deeper questions about causality. For example, how is trust between Thai firms and foreign firms generated inside a collaboration agreement? There are many other resources of the firms that have not been explored here, for example, the effect of human capital, and social capital. Godfrey & Hill (1995) argued that the best way to cope with unobservable in theory is “to focus on observable variables that determine the degree of unobservability of a rare and valuable resource”.

Future research could significantly raise the level of theory development in alliance structures by going beyond correlational analyses to path analysis and causal modelling that may permit a deeper understanding of the causal structure of relationships among crucial variables in interfirm cooperation. Moreover, as reviewed in many studies (e.g. Grant, 1996; Mehra, 1996; Miller & Shamsie, 1996) the theory, *resource-based view* (RBV) theory has been proposed to account for the emergence of strategic alliances as well as their operation. Some theorists (for example; Amit & Schoemaker (1993); Roth (1995; 1996); Mehra, (1996)) suggest that the RBV of strategic alliances could be a very interesting research avenue. This study believes that its application to strategic alliances is under-explored in the literature even though such alliances are rapidly increasing in importance in today’s competitive landscape (Doz & Hamel, 1989; Das & Teng, 2000). However, the application of the RBVs perspective to strategic alliances covers only limited aspects (e.g. Rouse & Daellenbach, 1999). Therefore, an aspect that could be very interesting to analyse is the possible integration of the RBVs perspective in theoretical framework.

**ABSTRACT**

This paper reports on an exploratory study of how Australian small to medium sized family businesses are approaching one key aspect of effective governance, namely the establishment and maintenance of functioning boards of directors. The research sample consists of a convenience sample of nine family business cases to represent a range of experiences with board formation and operation, and those with non-independent (family) directors and others which included non-family (independent) membership. From the study, it is suggested that advantages of established boards in the family business include: enhanced performance and compliance; providing reassurance to shareholders that there is an objective and professional

approach to the business and their assets; and augmenting management expertise by appointing people with complementary skills – usually, non-family non-executive directors. Disadvantages of formalised boards include: that they act as defacto management committees and more as mediating bodies to minimise tensions between family members; that owner/managers perceive that they will lose control of the business and flexibility of approach; and that the board function is considered a waste of time and money, especially where people – usually family members – are appointed without appropriate director's skills. In cases without established functioning boards, interviewees did not perceive that there were gaps in meeting their corporate responsibilities in terms of accountability to shareholders, setting strategic direction, monitoring of results or setting policy although interviews demonstrated that this perception may be incorrect.

# **DEVELOPMENT AND MAINTENANCE OF BOARD STRUCTURES AND PRACTICES IN SMALL TO MEDIUM SIZED FAMILY BUSINESSES: AN EXPLORATORY STUDY**

## **INTRODUCTION**

As long ago as 1948, Mace (cited in Castaldi and Wortman, 1984), claimed that the advice of members of boards was effective in widening the perspectives of managers of smaller firms and that outside directors with complementary experience and backgrounds could be helpful in complementing management's business capabilities. Few would argue against establishing board structures, systems and processes that facilitate outcomes such as effective and efficient work practices, harmony in work relationships, compliance and effective risk management, and the pursuit of shared objectives and values. Effective governance structures and practices, including boards of directors, can contribute to these outcomes, particularly in the small to medium enterprise (SME) sector (Zahra & Pearce, 1989; Lorsch, 1995).

In the legal corporate framework a board is the body charged with the responsibility for managing the company, which may include overseeing management where such responsibility has been delegated to a CEO or equivalent. However, corporate governance requirements for publicly listed companies are demanding and, partly as a result of recent corporate excesses, are undergoing reform in most developed economies. Governance requirements for the unlisted and smaller companies can be less stringent in some aspects. For example, the criteria for a directorship of an unlisted private company in Australia, are no

more than (i) to be over 18 years and (ii) not to have been declared a bankrupt, insane or have a criminal record.

It is becoming increasingly evident that many private companies, in striving to respond to a range of stakeholder interests and achieve success in a dynamic marketplace, will operate 'almost' as public companies and take on many of the more stringent protocols of corporate governance. Size, characteristics and structures of boards have been found to be important influences on the performance of large firms but the examination of their roles in SMEs has been less extensive and to date has not yielded such specific findings (Bennett & Robson, 2004).

While *formal* governance arrangements including the strategic planning, accountability, supervisory and monitoring responsibilities of boards of directors have received considerable attention in the research literature, *informal* governance mechanisms, including social interactions, family institutions, and shared visions, have received less attention (Mustakallio, Autio & Zahra, 2002, p 219). These informal mechanisms are particularly important for family owned small to medium enterprises.

Family members often play both managing and governing roles in the family business which, if not properly undertaken, may contribute to some blurring of governance responsibilities and relationships (Tagiuri & Davis, 1996). The extent to which the family and the business require separate but linked governance structures will depend on the effectiveness with which the family members are able to communicate with the business's governing body (such as a board). The family may consider it has adequate opportunity to communicate with the board both formally and informally through corporate and social forums. However, some

businesses – often, but not always, those with larger family shareholder numbers – find a separate family forum an effective interface between the family and the business.

Small to medium enterprises, most of which are family owned businesses, will benefit from effective governance practices and structures, particularly as they grow and as more family members become involved in the ownership and, in many cases, in the day to day management of the business. The unlisted family owned SME may choose to elect a board simply to comply with the law – in some cases, a single director board – however, those which elect a functioning board of directors may be rewarded with a smooth functioning company that excels in conformance and performance. A functioning board will facilitate the interests of both the ‘family’ and the ‘business’ ensuring that each is objectively considered and integrated into effective decision making.

This paper reports on an exploratory study of why some Australian family owned small to medium sized enterprises (SME) establish boards of directors and others do not, and if boards have been set up, whether the owners consider them to be valuable to their business.

## **BACKGROUND TO THE STUDY**

Family businesses are estimated to account for 80% of the number of worldwide business (Gersick et al, 1997). In Australia they are the largest employer group with about 3 million of the 5.5 million workforce, equating to over 50% of the private sector workforce (Smyrniotis et al 1997). While there is no single agreed definition of a family business, there is broad agreement that a business owned and managed by a family unit or their descendents is a family business (Chua et al, 1999). Accordingly, these figures are an indication of the

dominance of family owned businesses in world economies. As researchers become more attracted to undertaking empirical research in the family business arena, which has traditionally been perceived as being difficult to access (Litz, 1995), there is also an increasing interest in research about family business governance. Dyer (1986) highlighted the need for effective boards in family businesses and Ward (2001), deemed that the fundamental responsibility of successful ownership is effective governance. Hence, whether a family business is publicly listed or not, the complexities of the overlap between the family, ownership and the business inherent in the 'family business' entity, will be managed more effectively with a structured approach to governance issues, including the formation of a board of directors.

Drawing on agency theory, it is suggested that for the SME sized family business, the board may have a more important role than for larger businesses due to the wider information gap often prevalent between the owner/manager and the business stakeholders (Johannisson & Huse, 2000). Also, the board can be particularly useful in facilitating generational transitions in the family business: a time when the distribution of power needs clarifying and problem solving for the different generational groups is emotionally charged (Dyer, 1986).

An effective family business board is seen as one in which the advantages of family ownership can be balanced with the development of independent and professional governance practices:

“The (family business) board is elected by the shareholders and legally represents them in directing (the business). It typically comprises top management, family members, and, in the best cases, experienced business people from outside the

company. Ideally, a board will have a majority of independent, outside directors and will elect its own chairperson.” (Ward, 1988, p8).

Also according to Ward, for such boards to be effective in the family owned business, shareholders need to be prepared and educated for ownership roles and responsibilities. There is a need for mentoring and counselling those who may not have prior experience of governance issues, including the family member CEO, senior family and non-family management, family employees and other family shareholders not involved in the day to day management of the business (Ward, 2001).

The concept that a board should ideally include independent non-family directors has received considerable support recently. For example, Johannisson and Huse (2000), argue that the family business will be better served by incorporating external (non-family) members as they will create awareness of a wider range of managerial issues than would the family-only board members. Johannisson and Huse (2000) take this further by exploring the challenges of the *family owned* SME to attract and select the ‘right’ outside appointee/s for the board. In their view the emotions and politics of the family business may cause some degree of irrationality which may adversely influence the nature of board member selection in these businesses. They surmised that traditional defensive family businesses may be hesitant to invite external members onto a board whereas genuinely entrepreneurial firms may consider access to managerial competencies as just another resource to exploit when growth is aggressively promoted. The cases studied by Johannisson and Huse suggest that in practice the CEO, often a family member, made the final selection of independent directors and that decades of personal relations and ‘personal chemistry’ played an important role in the selection rather than the track record of the candidate. Berry and Perren (2001) support

this practice in finding that the appointment of non-executive directors should be made through sources trusted by the owner/managers. In their survey of over 5000 UK SMEs, they also found that non-executive directors were more likely to be appointed when the firm reached 50 employees.

Corbetta and Salvato (2004) take a contingency perspective and warn that boards in the family business will not lead to increased performance under all conditions because of the contingent situation created by family involvement. In their view:

“Family firms that explicitly take the extent and the quality of such involvement into consideration will develop boards of directors through which they will reap rewards by improving its effectiveness in providing both control and accountability, and resources which are vital to the firm’s prospects for success and survival.” (Corbetta & Salvato, 2004, p6)

Texts and treaties about the roles of boards of directors and their contribution to the governance of organisations abound. In one such publication Hilmer and Tricker (1994) summarise the work of boards as having four components: formulating strategy, setting policies, supervising executive management and providing accountability. Figure 1 (Hilmer & Tricker, 1994, p 287) depicts these responsibilities across four dimensions, internal/external (to differentiate between a focus on internal operations and on the external influences from the environment in which the firm exists) and long term/short term. This arrangement also enables the board’s contribution to the company’s performance through strategy formulation and policy making to be grouped on the right hand side, and its responsibility to ensure conformance to required results and maintenance of accountability to

the shareholders and other interested parties, to be grouped on the left hand side. While these dimensions have not been specifically developed for the SME sized business nor for the family owned business, they provide a useful framework for this study though which to explore how board functions are conceptualised in the family owned SME.

Cutting across all four dimensions is the board's responsibility for the selection of the chief executive and planning for his or her successor. The latter function is of particular interest in the family business which may or may not desire to have a family member in the position of chief executive. The challenges of appointing on merit, if this is the case, become complex.

---

Figure 1 about here

---

Boards of directors of family businesses are governance bodies that will both monitor management on behalf of shareholders and provide various resources to the business. (Corbetta and Salvato, 2004). Other roles performed by boards include ensuring legal and ethical conduct by the business and its employees (Lorsch 1995, Conger et al. 1998), and bringing ideas and perspectives of people from within the business and from outside it to contribute to more effective and responsive decision making (Gabrielsson & Winlund 2000). According to Gabrielsson and Winlund (2000, p314), "the main function of the board is considered to be its control role... (as it) is seen as a formal body for stakeholders or principals to control managerial behaviour". The board's involvement in the ratification and monitoring of decisions can make a significant difference to the development of the business. The board also acts as a service provider by giving valuable advice and networking opportunities for the management team through its accumulated knowledge and skills. These comments are directed at SMEs generally. However, in the family owned SME where

management and ownership often overlap, the monitoring body should ideally include independent directors and the board's service role can be invaluable in complementing scarce management resources.

In their research about boards in SMEs in the UK, Bennett and Robson (2004) highlight that the value provided by boards of directors in SMEs is difficult to identify and will depend on managerial needs and trading conditions often unique to each firm. They did not find any one board structure or system that could be offered as being more linked to better performance than another.

Fiegener et al's (2000) research about boards in small private firms in the USA proposed that CEOs of small private firms who have larger ownership stakes will tend to have smaller boards with more non-independent members in order to preserve their decision autonomy. While this proposition was generally supported by the research, they also found that in some cases, where there was more complex family/business overlap and greater potential for conflict between family and business needs, the CEO tended to expand the board numbers to accommodate greater family involvement in governance of the business. This was also the case when there was an imminent transition to the next generation of family management.

In summary, while there seems to be general agreement that functioning boards of directors will be helpful in some ways to small to medium sized family business, there is no single recommended composition, or agreement as to how boards will influence performance (including conformance) of the business. The focus of this study was therefore to explore why some family owned SMEs have established boards while others have not and whether

the boards added value to their business's operations. Where boards were not formalised, the objective was to explore how the usual governance responsibilities were undertaken.

## **RESEARCH DESIGN**

The study was necessarily qualitative as the focus was on why (or why not), family businesses established and maintained functioning boards of directors and, if so, how did this occur. A series of case studies were developed in which the emphasis was on the family business participant's attitudes to board formation and their perception of the importance of board function in the business. The study was based on one-to-one interviews with family and non-family executive and non-executive directors in family businesses. Family directors - executive or non-executive - are referred to as non-independent directors, while non-family directors are referred to as independent directors. A semi-structured interview guide was prepared to ensure interviews were on the one hand consistent, and on the other were flexible enough to probe specific aspects in the different cases. The following research questions were explored through the one-to-one interviews:

1. What are the current informal/formal board mechanisms in these family businesses?
2. Where a board of directors has been established, how is it structured?
  - a. What stimulated its formation and how does it currently operate?
  - b. Is the board considered to add value to the performance of the business?
  - c. What are the barriers to effective board function?
3. Where a formal board is not constituted, why is this so and how are governance requirements met in the family business?

Interviews were transcribed and qualitative software was used to organise data. Consistency of analysis was ensured by co-authors evaluating interviewee responses and comparing interpretations.

### **Research sample**

Data was collected through in-depth one-to-one interviews of ten family business directors across nine small to medium sized Australian family business cases (ie businesses with up to 200 employees) ranging from the first to the fifth generation of ownership and management (see Table 1). While family business cannot be viewed as an homogenous sector, for the cases in this study the family ownership stake was almost 100% providing the potential for strong family influence in the governance and the management of the business. In each case, there were family members in management positions and, in all but two cases, there were two generations involved in the business.

The ten interviewees across the nine cases included nine family members: eight family member CEOs/MDs, all of whom were non-independent directors, one non-independent non-executive director, and one independent director/chairman.

---

Table One about here

---

The following cameos outline the current board situation of the participating cases. Company names and details have been changed to protect confidentiality.

**Andersons** is a fifth generation family business owned by the fourth and fifth generations, and managed by a fifth generation cousin consortium. The board is active, includes non-executive directors from the family and from outside the family. The motivation for an active board stems from the third generation when the number of shareholders grew. The former fourth generation Chairman was instrumental in encouraging the board to include outside independent directors as he wanted some support for projects he thought would meet with resistance. Since then, independent directors have become an established part of the structured board which has non-independent directors nominated from four arms of the original founding family. The board includes non-independent executive and non-executive directors and independent directors with the non-independent directors being in the majority. The board is chaired by a non-independent director; it holds monthly meetings, focusing on reviewing sales results, marketing programs, employee issues, and bad debts. Any proposals for capital expenditure above \$50,000 require board consideration, along with any 'significant' proposed financial commitments.

**Boyds** is a fourth generation family business owned by a sibling partnership and managed by a third generation member, with fourth generation members working in the business. The board has only non-independent directors and is considered of nominal value to the business. It was constituted by the second generation owner who bequeathed the business to his five children. They are all still alive and attend board meetings, although in the view of the current CEO, none are very productive or have anything of value to add to board deliberations. The CEO would like to encourage

these now elderly directors to nominate qualified and knowledgeable representatives so the board may make a worthwhile contribution to the family business operations.

**Carmodys** is a third generation family business owned and managed by a second generation sibling partnership with third generation members working in the business. There is an active board with independent directors and an independent chairman. The board was formed by the owner /founder when the business was in its early stages and has been run almost as if it were a public company from its inception, paying attention to corporate governance requirements 'except for all the sub committees' (Interview transcript). Board membership includes non-independent sibling managers and independent directors and an independent chairman. There are equal numbers of non-independent and independent directors at present. Recently, the board considered its balance and agreed that it lacked an IT focus and headhunted a female board member to also partially redress the male dominance. That appointment was not successful as the appointee took too long to appreciate the particular business and industry environment to be able to make a meaningful contribution to the board's deliberations.

**Dawsons**, a fourth generation family business owned by a third generation former CEO and a sibling partnership, with the siblings managing the business. There is no active board as the third generation 'Chairman' fears loss of control with a formalised board and particularly doubts that any independent directors will understand their business sufficiently to make a contribution that would be worth the money it would cost to recruit 'him' (sic). He would rather meet around the kitchen table with his son and daughter. The sibling partnership is keen to establish a board in due course. In

their view, they are able to undertake the monitoring and supervisory roles of the board but miss out on the strategic focus and discipline that might be offered by a board.

**Howsons** is a second generation family business owned by a sibling partnership and managed by one of the second generation owners. There is an active board with non-independent and independent directors and an independent chairman. While this board is 'ideally' constituted according to the literature, it has some significant communication issues to address. The non-independent non-executive directors consider that the non-independent executive director (and CEO) is choosing the board members to suit his needs and they are not happy about the recent recruitment of the 'independent' chairman who in their view is a personal appointee of the CEO and not suitably qualified for the position.

**Kleemans** is a third generation family business owned by one second generation director together with a third generation sibling partnership, and is managed by a third generation member. The board was formed by the third generation CEO when his sibling resigned from the business and took much business knowledge with him. To avoid similar gaps in experience and competency, the third generation CEO formed a board with an independent chairman and he commented that the arrangement was working very well: "Before we had a board we relied heavily on our external accountant to advise us to 'comply with what we had to comply with'".

**Pauls** is a fourth generation family business owned by a third generation cousin consortium, managed by joint MD's from the third generation and including the

fourth generation in the management team. There is a board with non-independent directors and an independent chairman. The board acts more like a management team. “Certainly it does deal with the basic requirements of compliance and review of financials but even that, to a degree, I believe is compromised. I think our attention to risk management, to the organisational structure, to personnel, is all compromised . . .” (Non-independent non-executive director interviewee transcript)

**Smart**, a first generation family business, is owned and managed by a controlling owner with a board having an independent chairman. The board was formed when legal advisors suggested that to comply with various corporate regulations, a committee be formed for this relatively new business. The owner founder chose to form a board with an independent chairman who had (a) previous corporate experience and (b) an enquiring mind.

**Taylor's** is a second generation family business owned and managed by a controlling owner and employing a second generation family member. There is no active board. While the CEO is cognisant of the advantages of a board of directors, and considers directors could augment the range of expertise available to him in running the business, he is a sole owner/director so sees no immediate need.

Of the nine cases, seven had active boards of directors and all except one of these included independent non-executive directors. In all but one case, an independent director acted as chairman of the board. Two cases did not have formally constituted boards, one because it was owned and managed by an owner/founder/sole director, and the other because the third generation part owner refused to contemplate an actively functioning board. However,

performance of the boards varied and the perception of their value ranged from excellent to very poor.

## **IDENTIFIED CHALLENGES**

From an analysis and evaluation of the interview transcripts, several themes emerged which portray the key challenges experienced in the family business cases:

Motivations for formally establishing an active board

Perceived advantages in having a board

Perceived disadvantages in establishing a board

Board membership issues

Barriers to effective board operations

### **1 Motivations for Establishing Active Boards**

While the need for boards of directors to undertake responsibilities such as those articulated by Hilmer and Tricker (see Figure 1) was generally recognised and appreciated by interviewees, in this study several reasons for the board's existence *other than* carrying out those functions were identified. Reasons included: to reassure shareholders and other stakeholders (e.g. future buyers) that the business was solid; to cope with a particular crisis (including external crises and internal issues relating to family dynamics); and to help alleviate risks associated with the business that come with succession considerations, particularly if that succession might involve a family member.

## **2 Perceived Advantages of Boards**

Once boards were established, there were several perceived advantages identified for the family business including forcing the owner-manager to take time out of the day-to-day operations, enabling family owners to take a bird's-eye-view of the business, providing comfort or peace of mind for owner-managers that all aspects of the business are being actively addressed (“overcoming the nagging feeling that some things are being missed” Interviewee transcript), and facilitating better decisions because “more heads” are thinking about and discussing the business. Effective family business boards were also perceived as promoting a more professional relationship between family owner-managers and non-family management. A specific function was their delivery of objective appraisals of remuneration levels for family executives and thus avoiding another potential source of conflict between family members where relations may be already strained.

## **3 Perceived Disadvantages of Family Business Boards**

Reasons given for not setting up boards, or expressed disadvantages in their operation included that they are costly in time and money, that they would create additional work, that family owner/managers (and simultaneously, non-independent directors) were fearful of being judged naïve or ignorant – either by the other directors or by shareholders, that family owner/managers feared of becoming bogged down in bureaucracy and losing the ability to respond quickly.

Some expressed uncertainty about how to attract suitable (and willing) directors, were fearful of making a poor selection and not knowing what capabilities to look for or how to confirm

those capabilities. Fear was also expressed that independent directors might misuse sensitive company information.

#### **4 Issues of Board Membership**

All interviewees supported the inclusion of independent directors to ensure an external perspective is brought into the family business. However, these family business cases also commented on other roles of such appointees, which were necessitated because of the 'familiness' of the business. Independent directors were seen to be effective in minimising tensions between family members, as in the family business many family members were appointed directors almost solely because of their (or their close relatives') shareholding and they often lacked the qualifications needed to be effective as directors.

Independent directors were also advantageous in filling gaps in expertise and to encourage other board members to push the boundaries. However, they were often recruited because the family knew them, trusted them and could therefore agree upon the appointment. In no case was a rigorous, objective selection process articulated. Most often the appointees had been known to the family members for some time and they were comfortable with them as people and with their apparent potential to add to the board's expertise. Not having objective selection processes in place for the selection of directors from the beginning may be a weakness for family businesses, which leads them into stalemates over decisions on suitable board members and fuels any existing mistrust between family board members, in particular.

It was agreed in each case that independent directors, particularly those from outside the industry, add value by asking questions and forcing reflection on what might normally be

taken for granted. However, several interviewees suggested that care should be taken in recruitment to ensure that appointees from outside the industry would not take too much time to 'come up to speed' with the needs of the family business and the industry in which it operates.

## **5 Barriers to Effective Family Business Board Operations**

Boards in family businesses are sometimes set up for the wrong reasons, such as to provide representation for family groups or to fix management problems. In other situations, the role of a board is not respected and is viewed by some as an expense the company could do without.

While most family businesses prefer to structure their boards to give appropriate recognition to branches of the family, they need to fill those branch appointee board positions with appropriately qualified directors. Such appointees may be family or non family – and therefore non independent or independent – however, once appointed to the board, they are expected to act in the interests of the whole family business rather than to act in the interests of one branch of the family.

Family-only boards sometimes have operated for many years without paying attention to skill requirements with the result that those boards have acted more as management boards, mediating between family managers in the business. When an independent chairman is appointed to redress such a situation, much is expected of him or her to mediate between non-independent directors from different branches of the family, who do not necessarily have high

levels of trust between them. Such mediation is often beyond the scope of an independent chairman's role and will detract from effective board deliberations.

In only one case was appropriate training as a director an expectation, rather than a formal requirement, for ongoing board involvement. In another case a shareholders' agreement was being drafted to formalise such an expectation.

## **DISCUSSION AND IMPLICATIONS**

Overall, those businesses without functioning boards (two cases) or those with ineffective boards (three cases) could not be deemed to be satisfying the strategic role of governance nor adequately ensuring that the management team was monitoring the compliance of the company with laws and regulations. Two boards delegated decisions to the CEO/MD for employee matters, and appear to have, in effect, delegated much of their powers to the CEO/MD to run the business on a day-to-day basis. In such cases the governance responsibilities of the board cannot be assessed as being adequately discharged. These boards did not monitor general success measures (other than financial results). The boards had set little in the way of formal board policy, and have generally limited their monitoring role to that of financial results. Another board was acting as a defacto management committee and has had made little inroad to strategic issues.

In the less effective boards, compliance monitoring was not a focus of the board – instead there was reliance on external professional advisers (accounting, legal, OH&S) to ensure the companies operated appropriately in these areas, and was otherwise dealt with by management. Strategic planning for these firms was done in broad terms at the level of the

management teams, involving the CEO/MDs. There was a lack of formal board policy, but the CEO/MDs interviewed did not see this as a problem in the running of the businesses. These boards, as they operated, were not seen as covering the true governance roles other than financial oversight and considering specific expenditure proposals.

In the remaining four cases the functioning boards were perceived as being of value and each CEO/MD stated that they would indeed keep the boards going if they were given the choice. In three of these cases, there was a perceived lack of expertise (one in IT, one financial and one legal) which the CEO/MDs wanted to redress. However each of these boards were perceived as valuable in challenging executive management to think about their issues and decisions, and being good at identifying and asking unexpected questions. From time to time the boards had helped a great deal in deciding what to do on the bigger issues, including where these have related to family issues. In short, these boards have been functioning in each of the governance roles: setting direction, making policy and overseeing performance, with much of the decision making and implementation appropriately having been delegated to the CEO/MDs and executive team.

From the Hilmer and Tricker (1994) model of board roles, it could be argued that boards usually commence by identifying the key stakeholders of the organization, and where relevant, their relative order of importance. Having done that, the board's job is then to be clear about what these stakeholders define as success of the organization – how it is measured; what are the various aspects; which are the more important. In these family business cases, it was clear that family stakeholders were seen to be pivotal in the board's interactions, not always for the right reasons. The stated motivation for setting up boards revolved around family dynamics or the potential for dysfunctionality in some cases.

Membership comments focused on both the need to include a range of family appointees or the need to get non-family appointees to counteract the family dominance.

In this study there was less evidence of the board's role in setting standards and implementing strategies. The family business boards might well pay more attention to creating a framework for the management of the organization to undertake such roles, providing guidance and constraints on management. This would ensure an effective policy framework which would help clarify the relationship between board and management, which so often overlap in the family business. The family business boards would then periodically assess the progress of management against these plans and strategies, to identify where interventions (but not interference) need to occur, to best deliver the desired results.

## CONCLUSION

Overall, from this study, it appears that family owned SMEs that have set up functioning boards with appropriate board practices, appropriate appointees as independent directors, and have been serious about making the board function as a board, have found that those boards make a valuable contribution to the business. The experiences of these family businesses do not however suggest any one best way to constitute the board; various models have been shown to work, depending on the context. Setting up a board for the wrong reasons and without directors who are qualified to act as such, has generally led to unsatisfactory results.

While further research is needed before these findings can be generalised, this study suggests that *the way a board operates* and how it *ensures the competence of its members* should be important foci for advisors and trainers in the corporate governance field. Further research

might also explore how best to encourage more family owned SMEs to establish an effective board for the right reasons and to believe that the board will be a worthwhile investment rather than a wasted expense. Research could usefully identify the conditions under which boards could additionally add value to the family owned SME such as where trust is low between family members, the number of shareholders has increased with generational transfer, and/or information sharing is rare.

## ***Introduction***

In order to survive economic downturns, disasters such as 9/11, and other unexpected crises, larger sized companies must develop an intrapreneurial process within their companies.

Intense competition, within the United States and globally, have put the pressure on traditional companies to diversify, increase productivity, and develop new lines of businesses and new products. Basically, the traditional culture is restrictive: follow instructions, no mistakes or failures, do not take initiative, stay within your own sandbox, and protect your rear end. An intrapreneurial culture supports entrepreneurial spirit with emphasis on creating, experimenting, taking responsibility and ownership.

However, without the CEO's commitment, a company will fail in attempts to be more intrapreneurial. It takes a leader in top management that understands the importance of an entrepreneurial spirit to the company's bottom line. As Hisrich and Peters have described in their book, Entrepreneurship, an intrapreneurial leader should have the following characteristics: understands the environment, visionary and flexible, creates management options, encourages teamwork and open discussion, builds a coalition of supports, and persists. Actually, intrapreneurship, as a term, is not new. About twenty years ago Norman Macrae, in an Economist article, stated that corporations, in trying alternative ways of doing things in competition within themselves, had resulted in a confederation of intrapreneurs. A break-through occurred in 1992 when The American Heritage Dictionary of the English Language added the word intrapreneur to its dictionary: "A person within a large corporation who takes direct responsibility for turning an idea into a profitable finished product through assertive risk-taking and innovation". Ian Hamilton-Fazy, in a 1984 Financial Times article developed the term intrapreneurialism "What has become known as intrapreneurialism, where people within the corporation acquire more adventurous small business outlooks." In 1985 Gifford Pinchott<sup>1</sup> coined the term *intrapreneurship* to describe entrepreneurial activity within the firm where individuals (intrapreneurs) champion new ideas from conception to complete profitable implementation.

## ***Now is the Time for Action***

The economic downturn in US and the world has necessitated cost cutting in many firms, and layoffs for many employees, which has indirectly precipitated the growth of entrepreneurial ventures. The rapid evolution of knowledge and technology has promoted the growth of high-tech startups. The increase in double income families has also supported entrepreneurship where one member can take up risky ventures with the support of a spouse. The US venture capital market has also fostered the growth of many

---

<sup>1</sup> Gifford Pinchott, *Intrapreneuring* (New York: Harper & Row, 1985).

entrepreneurs from among the cash-strapped but passionate and motivated idea-rich individuals. This emphasis of entrepreneurship in the US has led corporations to encourage entrepreneurial activities within the company. Although most people look at entrepreneurship as an upstart against well-established bureaucratic policies, which cannot coexist peacefully, many researchers have also noted the growth of entrepreneurial ventures within the framework of an existing enterprise. This is what many researchers refer to as '*corporate entrepreneurship*' or '*intrapreneurship*'. Many companies like 3M, IBM, CISCO, ORACLE, Hewlett Packard, AT&T, GE have adopted entrepreneurship within their firms to explore new lines of businesses and boosted profitability through innovative processes. We believe that large corporations should not let go of this opportunity to become more intrapreneurial. A policy could be established, similar to 3M, which allows employees to work on their own creative ideas for at least 15% of their work time. This percentage could be higher or lower depending on the corporation's overall mission. Also, a corporation could develop intraprise competing teams to focus on a specific corporate goal or a needed improvement to an in-house process. Intrapreneurship involves creation of semiautonomous teams within an organization for leveraging the external and internal innovative developments, screening and assessing those new venture opportunities and nurturing the new ventures. Therefore intrapreneurship is incubative in nature and requires top-managerial-level commitment in order to survive and flourish. If an organization's structure and atmosphere does not encourage innovation, then intrapreneuring will probably not happen.

Over the past few years there has been a growing trend among corporations to adopt intrapreneurship (corporate entrepreneurship), as a strategy to leverage the innovative talent of employees, simultaneously enhancing competitiveness, augmenting profit margins and improving employee morale and retention. Although this formula seems very simple on paper, in reality it is difficult to implement, as it asks for radical changes in organizational framework and risk propensity. This desire towards corporate entrepreneurship has increased mainly for the following reasons:

1. The downturn in the world economy and stiff competition from rivals and small businesses. Dynamic innovation is now looked upon as a way to beat the competition, and thrive in uncertain market conditions.
2. Intrapreneurship is perceived as a way to avoid stagnation and decline.
3. The turnover of talented but frustrated and disenchanted employees due to the bureaucratic structure of an organization, and subsequent loss of intellectual know-how and potential loss of a promising business venture. This turnover is further intensified due to the rise in number, of venture capitalists, who are willing to take risks and invest in innovative projects as well as entrepreneurship's newly acquired appeal as a promising career.

One new business unit acquired space in its corporate headquarters. The key manager said, "By far the most profound lesson is how quickly you can create something good when you don't have the constraints of a legacy company and that comes from all angles: financial constraints, administrative constraints, and the 'that's how we've always done

it' constraints." Later this business unit or intrapreneurial enterprise (intraprise) became the mainstay of the corporation. One intrapreneur turned the leftovers of an internal abrasive-processing plant into a lucrative wire-saw business. Some intraprise projects could aim at improving certain current corporate processes from within, others could develop ideas into businesses, which sell, to the outside marketplace.

Some companies think they are operating as intrapreneurial corporations by merely dumping an idea into one of the corporation's venture divisions. The potential business becomes isolated and unable to use the resources of the mother company. Normally this results in failure. Most of the companies that set up like this in the 1980s and 1990s failed. We have analyzed and enumerated the traits of an entrepreneur and suggested ways to adopt intrapreneurship and reap its rewards.

Corporations need to take action to become more intrapreneurial because their good employees may get frustrated and leave. "The venture capital industry is producing 35 percent return on investment by taking frustrated R&D people and their rejected ideas out of large companies, and financing the commercialization of those ideas," states Gifford Pinchot, an intrapreneur expert. Therefore entrepreneurial attitudes and actions are necessary for firms of all sizes to prosper and flourish in the face of extreme competition.

### ***Traits of an 'Intrapreneur' and teamwork:***

It takes an entrepreneurial fire in the belly to start a business – and achieve success – and this fire is not readily available.<sup>2</sup> Although there is no definite way to find out if a person has the knack to be an entrepreneur, we do notice certain emotional and family traits in common among successful entrepreneurs. One of these attributes is that an entrepreneur essentially does not like to work for someone; he prefers to be his/her own boss. People who are successful at establishing their own company generally have had parents who worked for themselves, hence they had someone to look up to. Quite often these successful entrepreneurs have histories of being fired from their job due to unsatisfactory performance. Basically an entrepreneur is a person who can be effectively managed and motivated only by himself. He is generally very confident of his abilities and a risk taker, who does not worry too much about job security. Hence these types of people are often very indifferent about their personal finances. Thus they require some 'safety nets' to be able to experiment with their ideas and work towards their dream projects. Very often they have spouses who have secure source of income, so they are able to take risks as they have family support. There are, however exceptions to this rule.

A taste of early success sometimes leads people to retire early and then energetic and motivated people take upon entrepreneurial ventures to bring back some excitement and challenge in their lives. Sometimes fear of stagnation motivates people to try out lucrative new ideas with potential for business success. Overall, entrepreneurs are self-driven and

---

<sup>2</sup> 7 signs of an entrepreneur, Money Matters / Joseph Anthony, <http://www.bcentral.com/articles/anthony/187.asp>

extremely energetic. Having said that, it is also important to note that entrepreneurs also have a willingness to seek help from others, especially in areas where they do not have expertise. Finding friends, consultants, employees and family members with expertise in such areas, and enlisting their support, is an indicator of future entrepreneurial success. An intrapreneur is someone who is directed by the need for achievement and realization of his/her dreams, rather than a need for control over subjects and people. Intrapreneur's are not motivated by greed for material possessions or wealth. They consider the success of their mission as their reward. An 'intrapreneurial' company is the best possible environment for these individuals to thrive and remain engaged in what they are good at – relentless pursuit of innovation and creativity.

Gifford Pinchot mentions in his book that an employee may use 10% of her time to pursue ideas she believes may be useful to the organization. While this rule may suffice for all employees in general, we feel that there is a need to create intrapreneurial teams within an organization, the purpose of which will be to come up with new ways of doing things and creating innovative products and services. There should be dedicated teams for intraprisers and the team members can be any employees. This teamwork will be in addition to the normal duties of the employees. The team's effectiveness can be monitored using Pinchot's Team Expectations Checklist (see Appendix A). The benefit of the company is that it does not create overhead in order to start free intraprisers, and the benefit for the employees is that they get to pursue their dreams at the company's expense and if successful they also have a share of the profits. This creates the necessary win-win situation where an intraprise can thrive and drive the growth of large companies. Most importantly, the company gets to leverage the combined brainpower of all of its employees, by creating a channel to direct their creative juices. The ideas that were lying dormant within the minds of the employees can now get a fresh breath of air and be reviewed by peers and colleagues, before they can be approved for funding. This sounds like a haven for innovation and entrepreneurship, which in turn will be a haven for well being of all the involved members. This is the entrepreneurial revolution that will drive corporate America out of this economic downturn.

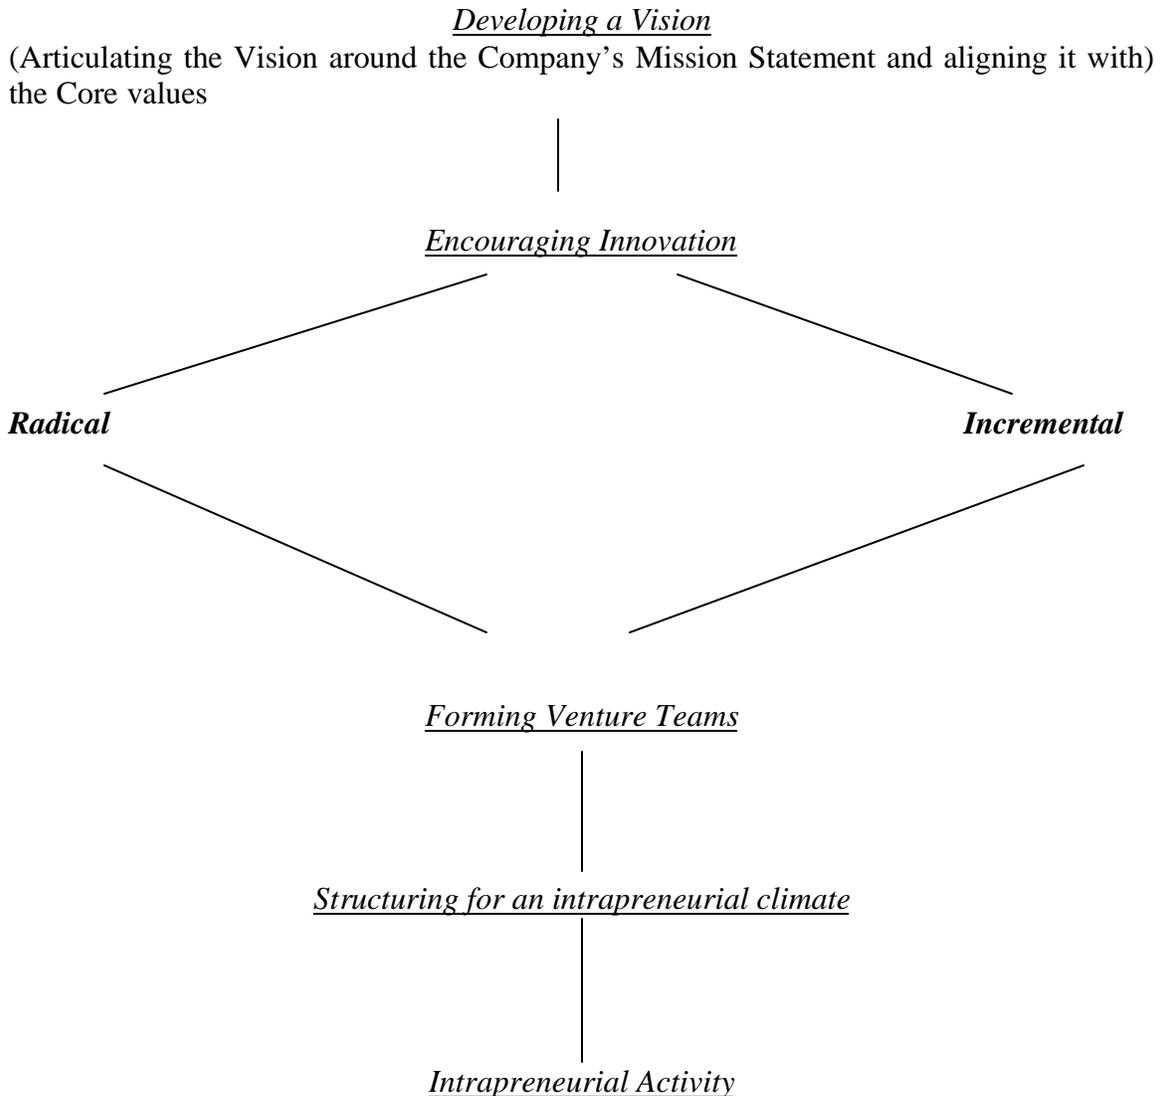

Nurturing intraprisers within a corporation can lead to corporate cost reductions, competitive advantages, new features and strategic thrusts, and new profit centers within the corporation. An intraprise can keep a corporation's standard brand from growing obsolete. For example, an intraprise could develop cellophane tape to the marketplace for the first time. Sometimes the initial purpose of an invention ends up being secondary. Scotch Tape was developed to improve the insulation for refrigerated railroad cars.

### ***Analyzing Intrapreneurship***

Intrapreneurship or 'Corporate Entrepreneurship' is a broad concept which consists of generation, development and subsequent implementation of innovative ideas and behaviors within an organization. This innovation can be a product, a new process of achieving some target, a new service or system related to the organization's business model. Basically intrapreneurship is the collection of formal and informal activities

aimed at creating new business opportunities within an established organization, by product, process, service or market developments. All these activities may take place at any level of the organization e.g. corporate, business division, functional, or project level, with the ultimate objective of improving firm performance and creating a competitive advantage over market rivals. Intrapreneurship is a process by which an individual or a group of employees, in association with an existing organization creates a new organization or instigates change or innovation within an organization. Therefore strategic renewal (major structural or organizational changes within a firm), innovation (introduction of a new product, service or process in the market), and corporate venturing (corporate entrepreneurial efforts that lead to the creation of new business organizations within the larger corporate umbrella organization), are essential parts of the intrapreneurship process. Figure 1 illustrates the process of intrapreneurship within an organization.

Flowchart showing key steps in developing an intrapreneurial Strategy

Source: Adapted from Harry S. Dent Jr., "Growth through New Product Development", Small Business Reports (November 1990)

Figure1

The first step in intrapreneurial planning starts with sharing the vision of innovation that the CEO or principal of a firm wishes to achieve. Since corporate entrepreneurship is a collective effort, every individual should know and understand the shared vision. This is critical to the success of the ultimate objective of their mission and action plans. Developing the shared vision requires identification of specific areas and objectives and formulating strategies and action plans to achieve the goals.

The next step is active encouragement of entrepreneurship, to leverage the combined innovative ideas and talents of employees. Innovation can be chaotic and unplanned as well as systematic, depending on the nature of innovation. Radical innovation is somewhat chaotic representing unprecedented breakthroughs like personal computers, post-it notes, ballpoint pens, overnight mail delivery, etc. These innovations are a result of determined vision and vigorous experimentation that cannot always be managed or systematized. However there is another type of incremental innovation where a product or process gradually evolves into a newer or better product addressing the needs of a larger market, e.g. frozen yogurt, microwave popcorn, two minute noodles etc. Sometimes incremental innovation takes over after radical innovation has initiated a breakthrough. However, it requires vision, support and nurturing to keep innovation alive. Such support must come from the top management. Every intrapreneurial activity requires a champion – a person with the vision and ability to share it. Managerial commitment is the key to intrapreneurship, however, it also requires a high degree of risk propensity. The intrapreneur manager should not only have tolerance towards failure, but also be able to learn from mistakes. Often it has been found that a failed idea led to the evolution of a new concept, which led to a very successful product. Our advice to managers is: When you lose, don't lose the lesson.

This is how 3M's entrepreneurial philosophy was born. Innovation is a numbers game, the more ideas you have, the better your chances of successful innovation. In other words, to achieve success, a company must be strong enough to tolerate failure. This progressive attitude towards intrapreneurship has paid off well for 3M. They have created world famous innovations like post-it notes, translucent dental braces, synthetic ligaments for knee surgery, antistatic videotape and many others. Altogether they have a catalogue of 60,000 products that have contributed to excess of \$10 billion in revenue.<sup>3</sup>

3M follows the following set of principles to encourage intrapreneurship:

Never kill a project: If an idea cannot be used in any of 3M's divisions, an employee can devote 15% of his time towards proving that it is workable. As many as 90 innovation grants of \$50,000 are awarded every year.

Tolerate failure: By encouraging risk taking and experimentation, a company has more chances of creating a successful product. 3M, defines its goals as 25% of a division's

---

<sup>3</sup> Russel Mitchell, "Masters of Innovation" Business week 10 April 1989

revenue must come from innovative ventures introduced in the past 5 years. This figure may be as high as 30%.

Keep small divisions: Too many cooks spoil the broth, so is the case with entrepreneurial teams. The team manager must know each person by name and when a division becomes too big (exceeding annual revenues of \$300 million), it is split up into two.

Motivate the champions:

Acknowledge the efforts of innovators by declaring awards and giving cash grants to accomplish their projects. Promotions and salaries should be tied to the progress of the innovative product. The champion gets the chance to head his/her own product division one day.

Stay close to the customer: Seek regular feedback and work on fine tuning the product to match customer expectations. Invite customers to brainstorm about new product ideas.

Share the wealth: When a new product or technology is developed, it belongs to everyone, so share the wealth obtained from a successful technology, with the team, by providing stock options or cash awards.

### ***Venture Teams:***

Venture teams are becoming increasingly popular in many corporations because of their huge potential to initiate radical innovation and start new business lines. Managers who introduced venture teams often describe this approach as revolutionary transformation of their business strategy. The teams are generally composed of high performers who are self-directed and self-managed. Thus entrepreneurship is not a top-down approach, or the sole responsibility of the CEO, rather it is diffused throughout the organization, with particular emphasis on the venture teams. Former US Labor Secretary Robert B. Reich has referred to this effort by using the term 'collective entrepreneurship', where individual skills are integrated into a group and their collective capacity to innovate becomes more than the sum of the parts.<sup>4</sup> Over a period of time the group members learn about each others strengths and find out ways to cooperate and help each other in working through difficult problems and approaches towards making a product. The best part of Venture Teams is that people are extremely motivated and willing to take advantage of each others strengths to reach a common goal. This brings in synergy which leads to successful innovation. Each member tries to improve the process and smooth the evolution of the project. The combined results of all these miniature innovations propels the organization forward and results in a profitable income statement. In short, intrapreneurship gives the opportunity to utilize the innovative talents of individuals but with a sense of teamwork.

---

<sup>4</sup> Robert B. Reich, "The Team as Hero", Harvard Business Review (May-June 1987)

Signode Enterprises formed a corporate development group to pursue markets outside its core business, but within the framework of its corporate strengths. Before launching this initiative, Signode's top managers identified the firm's global business strengths and broad areas with potential for new product lines. The goal of each new business opportunity suggested by a venture team was to generate \$50 million in business within five years. Additionally each opportunity had to exploit on one of Signode's strengths, e.g. its industrial customer base and marketing expertise, systems sales and service capabilities, productivity and distribution know-how, or any one of the various technological capabilities. The criteria were based on business to business selling, because Signode did not wish to deal directly with retailers or consumers. The basic technology employed for the new business had to exist and it should also have a strong likelihood of achieving major market share within a niche. Finally the initial investment in the new opportunity had to be less than \$30 million. Based on these rules of engagement, Signode began its experimentation with V-Teams. It took 3 months to select the first team members and each of the six teams had the following traits in common: high risk taking ability, creativity, and the ability to deal with ambiguity. Every team was staffed with multidisciplinary volunteers who worked full time to develop new customer product packaging ideas. The teams were composed of individuals from diverse backgrounds like design engineering, marketing, product development, and they set up a venture shop in a different rented location near the company headquarters. Although all the teams did not come up with marketable ventures, the efforts paid off hugely for Signode. One team developed a business plan to manufacture plastic trays for frozen foods that could be heated in both traditional and microwave ovens. Later, this proposal resulted in business in excess of \$50 million per year! Apart from this tangible benefit, there were many intangible successes – the Venture Team approach rekindled enthusiasm among the employees and improved morale throughout the firm. Most importantly, with the V-Team strategy working well Signode was now in a position to chart out its own destiny instead of chasing competitors. This innovative approach allowed Signode to invent its own future rather than wait for things to happen.<sup>5</sup> Figure 2 explains the individual (people) and organizational factors that influence intrapreneurship within an organization.

### ***Creating an Intrapreneurial Climate within an organization:***

In order to ensure entrepreneurial growth one of the most critical elements is the structure of a firm, which encourages the birth of new ideas and allows innovation to flourish. This concept when coupled with the other strategies of innovation can enhance the potential for employees to become venture developers. In fact companies should nurture their employees as a source of innovative ideas and business plans to realize future economic gains. This requires information sharing within the company and a transparent decision making process where good ideas are rewarded but failures are not punished. Instead employees are encouraged to learn from their failures and improve their odds of achieving success in future. Such an attitude will help innovative minded people to realize their full potential. Figure 3 shows an interactive model of intrapreneurship.

An Interactive Model of Corporate Entrepreneuring

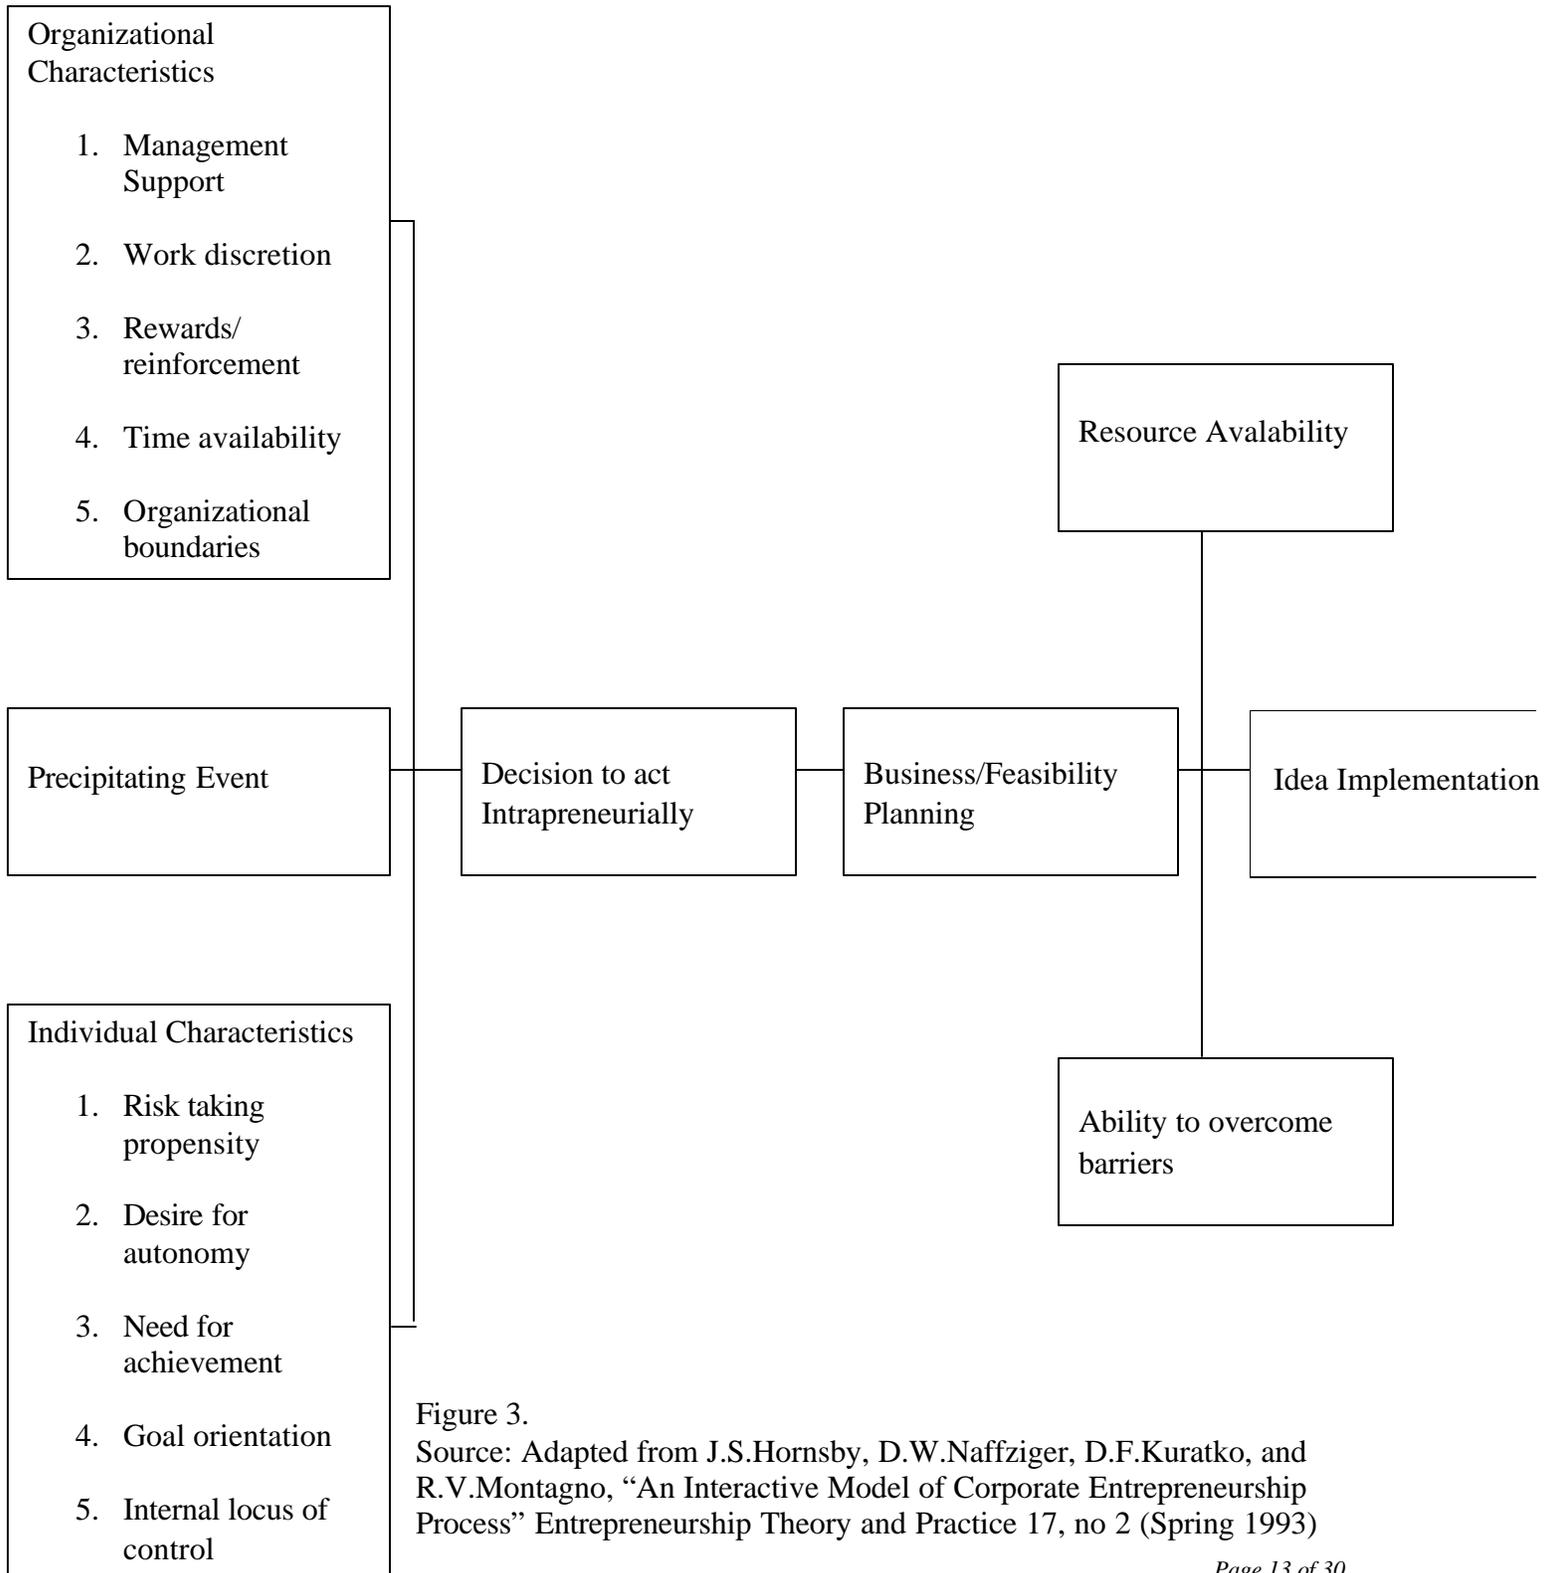

Figure 3.  
 Source: Adapted from J.S.Hornsby, D.W.Naffziger, D.F.Kuratko, and R.V.Montagno, "An Interactive Model of Corporate Entrepreneurship Process" *Entrepreneurship Theory and Practice* 17, no 2 (Spring 1993)

### ***Intraprise training:***

Training programs have been used by companies to develop key structures for creating a work atmosphere conducive for intrapreneurship. The objective of the training program is to train participants to be able to support intrapreneurship within their own work area. An intrapreneurship training program should consist of the following sub modules:

Introduction: Consists of a review of management and organizational behavior concepts related to entrepreneurship and a discussion of a few good intrapreneurship cases, to build up the interest of the audience.

Personal Creativity: This consists of many personal creativity exercises to help participants develop a personal creativity enrichment program. The objective is to define and stimulate personal creativity.

#### Intrapreneuring:

A Review of current literature on intrapreneurship as well as in depth analysis of several organizations intrapreneurial practices.

#### Assessment of current culture:

This is interactive in nature where a survey is administered to the training group for generating discussion about the current facilitators and barriers to organizational change.

Business Planning: Trainees are taught the process of developing a business plan and each specific element of a business plan is explained and illustrated. An example of an entire business plan is stated and illustrated.

Action Planning: This session requires participants to form groups and prepare action plans designed to bring about change in their individual work teams.

To validate the effectiveness of the training program, a corporate entrepreneurship assessment instrument (CEAI) questionnaire should be developed to measure key entrepreneurial climate factors. The responses to this questionnaire when statistically analyzed should identify factors, which are important for supporting entrepreneurship within the firm, e.g. management support for intrapreneurship, risk propensity, failure tolerance, rewards, resource availability, etc. These results indicate that firms intending to encourage intrapreneurship should focus on a certain underlying set of internal environmental factors: these are consistently stressed in leading management journals related to intrapreneurship. After a review of these elements it becomes apparent that a change in corporate structure and attitude is necessary to adopt intrapreneurship. In the process, people, corporate mission, and existing needs all undergo a change. This shows an organization can introduce intrapreneurship by relinquishing traditional controls and beating back bureaucracy.

The authors feel that intrapreneurship training, within the organization, will separate companies from their competitors. These candidate intrapreneur's are employees who have wonderful ideas, but need training to understand ways to start-up. This is a way to launch intrapreneur teams, i.e. via intrapreneurship workshops or seminars. A typical workshop could include: idea creation and nurturing the idea, researching the specific target market, competitor analysis, ways to develop funding support, selling tips, organizing an 'I' team and business planning. Most likely, by the time the workshop sessions are completed, teams will have formed.

The intraprise leader should develop an intraprise Business Plan that supports the Corporate Strategy. The plan should consist of the following: executive summary; the product, service, or process improvement; corporate fit; the marketing and sales plan; operations plan; summary of risks; targets/milestones; financials; managerial team.

It is very important that the idea fits with the company's strategic direction. Thus, the intraprise leader needs to respond to the following questions:

- Is there a reason to believe your company could be very good at the business?
- Does it fit the company culture?
- Can you imagine who might sponsor it?
- Does it look profitable (high margin – low investment)?
- Will it lead to larger markets and growth?

The intrapreneur leader could be more effective and efficient by following the intrapreneur's ten commandments (see Appendix B).

### ***Sample of Intrapreneuring organizations:***

Some organizations that utilize some form of intrapreneurship are listed below: The idea behind listing these is to generate curiosity and instigate creativity among readers – which, we hope will drive intrapreneurship among the intelligentsia. Also, it helps us to understand the one of the reasons behind the sustained successes of these large organizations and provides a pointer to managers for ensuring the same in their organizations.

Dupont – Establishes a '*Seed*' fund by which seed money is managed by committees for encouraging and supporting intrapreneurial ventures within the organization.

Fleischmann's – Sets up intrapreneurial new product teams to develop and commercialize new products.

General Electric – Emphasizes communicating openly and candidly. This helps in bringing out the ‘hidden’ talents of its employees and encourages generation of new ideas through a company wide ‘brainstorming’.

GTSI – Parts of the organization are divided into self-contained teams.

Head Ski Co. – Does whatever it takes to bring an idea into reality

Hewlett Packard – Believes in developing second-generation products well before the first generation enters the market.

Honda – Exploits its core competencies in many different businesses.

Motorola – sets tenfold improvements (10X), which seem to be impossible targets, yet the company achieves about 75% of its 10X goals.

Texas Instruments – Divides up seed money throughout the company. Emphasizes dedicated intrapreneurship.

3M – Project system using self-forming teams. 3M has 60,000 products and the company generates so many new products that 30% of their sales are new within the last five years. 3M is an example of intrapreneurship at its best.

CISCO<sup>6</sup> – Every 6 months or so, they have ‘best practices’ meetings where staff from various locations meet and discuss the best practices of their offices located all over the country. Thus the company leverages the strengths of their employees’ creativity by creating a common forum for exchange of ideas. If an employee has found a ‘cool way of doing a particular process’ he transfers this knowledge to his ‘virtual team’ and gets credit for his idea. The ‘Virtual Team’ of the related technology group, then discusses this idea in regular ‘place ware’ sessions or through teleconferences and if the idea is sound, it is sent to the product manager for approval. The managers always encourage active participation of all employees in the ‘place ware’ sessions of their Virtual teams, which helps in bringing out all the creative ideas hidden in the minds of employees.

The World Bank (IBRD<sup>7</sup>) --

The World Bank has decided to cut back on its bureaucratic procedures and encourage creativity and innovation within its operations. The ‘Development Marketplace’ is a novel way by which the World Bank patronizes ‘intrapreneurship’.

---

<sup>6</sup> Telephone Interview with an employee of CISCO, 8<sup>th</sup> December 2002.

<sup>7</sup> International Bank for Reconstruction and Development

The Development Marketplace is a program that promotes innovative development ideas through initial seed funding. It attempts to link social entrepreneurs with poverty fighting ideas to partners with resources to help implement their vision. Since 1997, the Development Marketplace has awarded more than US\$14 million to over 180 groundbreaking projects through Global Competitions and Country Innovations Days.

"The Development Marketplace is a real opportunity to come together, with no bureaucracy, with no preconditions, and no preconceptions about each other, just about ideas and trying to see how we can help people. It is, in fact, the very best of development: people-based, partnership-based, with development impact."

-James D Wolfensohn  
President, World Bank

### ***The 80/20 Principle:***

Think of what could happen to a corporation if the corporation applied the 80/20 Principle to its intraprisers. The 80/20 Principle asserts that 80% of results come from 20% of effort. Furthermore, 20% of products usually account for about 80% of dollar sales volume. So intraprisers would drive down the largely irrelevant four-fifths of the effort. This will increase the productivity of the corporation. The corporate strategic plan has to include the process of developing intraprisers or entrepreneurial organizations within the corporation. Gifford and Elizabeth Pinchot have ten basic principles for creating an entrepreneurial organization:

- 1) Give users of internal services a choice of more than one internal vendor.
- 2) Give employees the security of something akin to ownership rights in the internal intraprisers they create, as well as the larger corporation.
- 3) Demand and engender truth and honesty, marketplace feedback and marketplace discipline, to support widespread decision-making.
- 4) Give intrapreneurial teams responsibility for their own bottom line even if they are subsidized – as a profit center rather than a cost center.
- 5) Allow many options and diversity in personnel, in jobs, in innovation efforts, alliances, and exchanges.
- 6) Provide extensive training and education, and safety nets, so employees can develop and take risks as their organization develops.
- 7) Create an internal “bank account” for every internal enterprise.
- 8) Streamline systems for registering internal enterprises so they have standing in the corporation.
- 9) Establish a system for registering agreements and contracts between internal enterprises, so that people can give their word and trust the system.

- 10) Establish a justice system for adjudicating disputes between internal enterprises and between employees and enterprises.

***SAIC Case Study:***

The authors interviewed David M. Binns, Vice President of Beyster Institute in person at his office in Washington DC on June 2, 2004. The following is a summary of our findings.

SAIC (Science Applications International Corporation), a 6.7 billion dollar company founded in 1969, is the second largest employee owned company in US (the first being Publix- a grocery chain in the southern part of US). Beyster Institute is a non-profit organization affiliated with SAIC. They have a program called Beyster Institute Entrepreneurial Employee Ownership (BIEEO) to promote the idea of entrepreneurship among the employees of SAIC. They are responsible for fostering an entrepreneurial culture within SAIC. They are also actively involved in research, publications, workshops to train and educate SAIC employees with the latest trends and knowledge of the business world, e.g. corporate governance issues, Sarbanes Oxley rules and its implications for SAIC and similar other educational ventures. Thus their relationship with SAIC is informal and very valuable to SAIC.

Beyster works to educate the employees of SAIC on various business issues and helps promote an entrepreneurial culture which is the cornerstone of SAIC's business. We can understand the structure of SAIC through the following Figure 4, which will help us to appreciate the various factors that influence an entrepreneurial company and help it thrive.

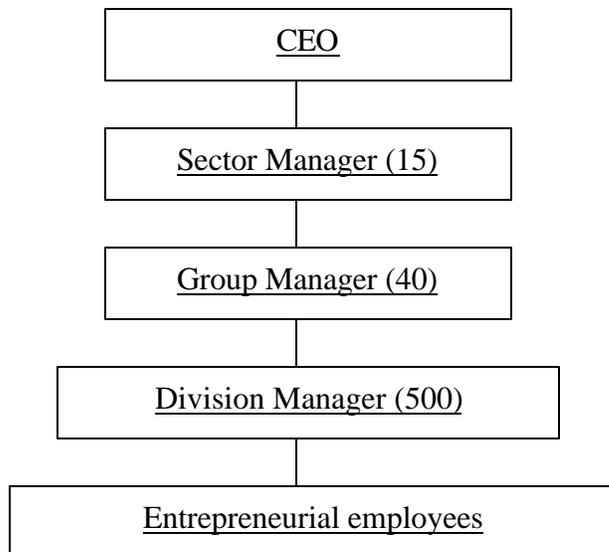

Figure 4:

The CEO has 15 managers directly reporting to him – from the various sectors (e.g. aerospace and intelligence, engineering and environmental, technology solutions, outsourcing, medical applications, etc.). Each sector oversees a number of groups each headed by a group manager, and each group is further subdivided into a number of divisions headed by a division manager. The division manager is solely responsible for profitability and bringing in new business. He has hire and fire authority over his employees. The division manager is incentivised by a 50-50 share in the profits. SAIC earns 6% of the total revenue generated from a project and 3% of this is returned to the division, for distribution among employees. This money can also be reinvested into the business of that division.

These division managers employ people who are entrepreneurial by nature and are constantly looking for new opportunities and keep themselves updated with the latest developments in their respective fields of interest. Thus the divisions of SAIC have transformed into competency centers that can compete with the best in the industry. By generating new business leads the division managers get promoted within the organization. There is no separate business development force – the scientists themselves are responsible for developing new business and maintaining customer relationships. The employees earn ownership of a project by doing high quality work – thus each division has become an individual profit center. This has also created some unnecessary internal competition within divisions, however the top management keeps dissensions under control by carefully underlining the rules of engagement and demarking each division's area of operation.

We believe that the freedom to choose their subject of interest and pursue the work they cherish, SAIC has created a truly entrepreneurial culture that is reaping huge dividends to its shareholders.

### ***The Future (Now –2015)***

The authors feel successful companies in the next decade will structure themselves so that the line structure is small but has internal suppliers (those who will provide input) to accomplish projects. We envision a number of line elements, each being a virtual profit center and each providing leadership for projects under its own mission and umbrella of responsibility. In other words from now through 2015, we shall see the 'intraprise' system winning out over the boring, typical and traditional line and staff organization.

This free intraprise system allows for flexibility and the capability to change or adjust to market demands. This next decade will require many organizations to meet the homeland security requirements. This is a complex maze of rapid change, which means an organization must bring order to chaos. The organizations that promote intrapreneurship will be on the leading edge to meet this vastly different market place. Those, heavy in bureaucracy will fade away and be on the rear of the competitive edge.

In our survey, Dendy Young, CEO of GTSI in Chantilly, VA, said,

“We divide many parts of our organization into self-contained teams that have P&L metrics. We grow by growing the teams and by adding new teams.”

Today’s business climate is impacted by layoffs, job freezes, companies renegeing on signed job contracts, the economic slowdown, 9/11, and changing lifestyle desires. Yet the corporations that have changed from traditional to intrapreneurial have overcome those impacts. Most people who are allowed to be free to innovate will not leave. They want to couple their dreams with action. So now is the time for corporations to join the intrapreneurial revolution in order to retain good employees and gain all the beneficial outcomes of intraprises.

In summary, the companies of this decade that structure an internal marketplace that allows intraprises to achieve corporate goals will survive. It’s a win-win-win situation. Employees win by being permitted to do something different and better, thus increasing their morale. The company wins by using intraprises to stimulate and capitalize on employees thereby gaining in overall productivity. The customer wins by getting a product or service that is needed in the marketplace.

Overall the major elements of an entrepreneurial strategy point to a change in the existing corporate status quo that’s leads to a newer, leaner and more flexible organization. It should be noted that such a strategy couldn’t be implemented at once. It must proceed through all the preceding steps as mentioned earlier in the paper. The following figure 5 shows the dimensions of entrepreneurial activity.

## The Intrapreneuring-Venturing Continuum

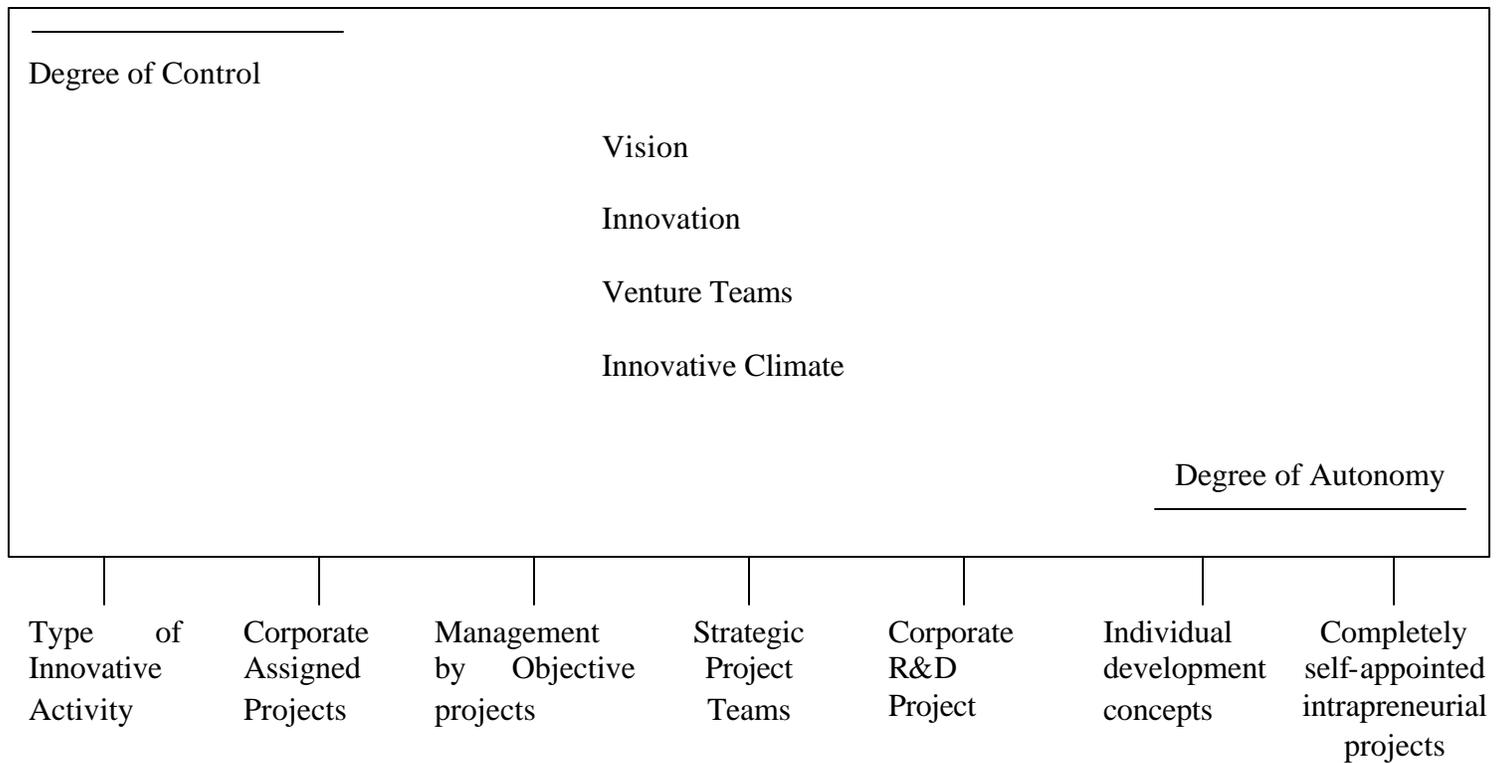

Figure 5:

Source: Adapted from Donald F. Kuratko & Harold P. Welsch, *Strategic Entrepreneurial growth*, second edition, 2003

Innovation plays a crucial role in the long-term survival of a company. The foundation of all innovation is creative ideas, and it is individuals and groups who generate, promote, discuss, modify and realize ideas. Although innovation is a complex and iterative process, the concept of innovation can be conceived as a composition of two major components. The first is creativity, which refers to the generation of novel and useful ideas in any domain and the second is implementation of the ideas within the work role, work group or total organization. Such innovative initiatives have bright outcomes like enhanced individual and group performance, employee morale, effective adjustment to change and unusual situations, higher quality of interpersonal relationships and cooperation, beneficial attitudes towards job, group and organization, psychological well-being etc.

There may however, be some negative effects of innovative behavior such as escalatory conflict and less satisfactory relationships with resisting colleagues, destructive hierarchical conflict with supervisors or subordinates who want to prevent innovative

change, work overload resulting from innovative effort going heavily beyond regular in-role work behaviors, unhealthy stress reactions at the individual and group level due to the insecurity and uncertainty surrounding innovation, etc. The Figure 6 tabulates the positive and negative outcomes of following an intrapreneurial strategy in an organization.

Having said that, we still feel intrapreneurship is by far the surest way to remain ahead of the competition and maintain a sustainable advantage over rivals.

Intrapreneurship is a risk, but it has to start somewhere – even if it starts small and moves slowly in small steps, under corporate control. Once initiated, there is a fair chance that people will become more comfortable with the idea and confidence will build up, results will occur, and gradually the corporation will become entrepreneurial. Very soon corporate assigned projects will evolve into more autonomous ventures and involve the innovative abilities of all team members. These key steps of vision development, mission articulation, encouragement of innovation, formation of venture teams and action plan, and emergence of an innovative climate need to take place each in its own turn, in order for intrapreneurship to happen. This gradual development approach is a realistic one which business managers and strategists should be aware of.

## INTRAPRENEURSHIP

| POSITIVE  | NEGATIVE   |
|---|--|
| <p>DYNAMIC INNOVATION IS THE KEY TO LONG-TERM SUCCESS OF A COMPANY.</p> <p>ENHANCED INDIVIDUAL OR GROUP PERFORMANCE.</p> <p>EFFECTIVE ADJUSTMENT TO CHANGE IN THE MARKETS AND UNUSUAL BUSINESS ENVIRONMENT.</p> <p>HIGHER QUALITY OF INTERPERSONAL RELATIONSHIPS AND COOPERATION AMONG COLLEAGUES.</p> <p>BENEFICIAL ATTITUDES TOWARDS JOB.</p> <p>GROUP AND ORGANIZATIONAL PSYCHOLOGICAL WELL-BEING.</p> | <p>POSSIBLE ESCALATORY CONFLICT AND LESS SATISFACTORY RELATIONSHIPS AMONG EMPLOYEES.</p> <p>POSSIBLE DRAIN ON COMPANY RESOURCES (TIME, LABOUR, CAPITAL), IF NOT MANAGED PROPERLY.</p> <p>WORK OVERLOAD RESULTING FROM INNOVATIVE EFFORT GOING HEAVILY BEYOND NORMAL WORK SCHEDULES.</p> <p>UNHEALTHY STRESS REACTIONS, BITTER HIERARCHICAL CONFLICTS BETWEEN STAFF DUE TO INSECURITY AND UNCERTAINTY SURROUNDING INNOVATION.</p> |

Figure 6:

Appendix A:

THE TEAM EFFECTIVENESS CHECKLIST

Take a reading on team effectiveness every week or so by having each team member rate the team's performance on the factors below. Use the following grades:

A: This is a major strength    B: We are doing quite well on this  
 C: So-so needs improvement    D: weakness in this area is serious

Date:            Date:            Date:            Date:            Date:

|  |  |  |  |  |  |
|--|--|--|--|--|--|
| Clearly defined outcomes                                       |  |  |  |  |  |
| Continuity of relationship                                     |  |  |  |  |  |
| Inspiring common purposes                                      |  |  |  |  |  |
| Measurable goals and deadlines                                 |  |  |  |  |  |
| Agreement on how and when                                      |  |  |  |  |  |
| A common fate (all go up and down together)                    |  |  |  |  |  |
| Competent and committed team members                           |  |  |  |  |  |
| Good communication, quick feedback, open information           |  |  |  |  |  |
| A strong network with other teams, intraprises and entraprises |  |  |  |  |  |
| Mutual support   |  |  |  |  |  |

Appendix B:

The Intrapreneur's Ten Commandments:

1. Remember it is easier to seek forgiveness than to ask for permission.
2. Do any job needed to make your project work, regardless of your job description.
3. Come to work each day willing to be fired.
4. Recruit a strong team.
5. Ask for advice before resources.
6. Forget pride of authorship, spread credit widely.
7. When you bend the rules, keep the best interests of the company and its customers in mind.
8. Honor your sponsors.
9. Underpromise and overdeliver.
10. Be true to your goals, but realistic about ways to achieve them.

## THE LOST ENTREPRENEURIAL TRAIT FOR SUCCESS: THE VIRTUE OF HUMILITY

Charles N. Toftoy and Rena A. Jabbour

Humility...has this ever been recognized as being a part of an entrepreneur's required traits? Our research shows that humility is a lost business ethical virtue. Therefore, the authors' strove to develop this unique paper, the first in the business ethics field that treats humility as a trait for success. We cover the following topical areas: the definition of humility, the misconceptions of humility, how to detect the counterfeit versions of humility, as well as research studies that prove the value of being humble. The level 5 leader is explained along with ways to become a humble leader. It is suggested that people can better themselves by improving twelve personal qualities, which includes humility.

We have provided ways to become more humble to make the new you move your company from good to incredible. The lost entrepreneurial trait of humility is one that should be a requirement for any of today's leaders. This virtue of humility allows for society to discover dignity. Others are placed before selfish thrusts. Humility allows you patience and self-control, while aiding you to overcome traumatic experiences that you may have experienced in your life. It requires one to fully transform himself/herself to develop humility. Grasping the virtue of humility is a goal that everyone should hope to achieve by the end of their life cycle. When the leader of an organization practices humility, the entire organization benefits; furthermore, it leads to the betterment of oneself.

**The Lost Entrepreneurial Trait for  
Success: The Virtue of Humility**

*Arrogance, pretentiousness, and the desire for attention are qualities that exist in some of our society's entrepreneurs. The success that you have been granted is a result of several traits such as your determination and the clear vision you have for your company. But, have you ever wondered if a lost trait exists that could shoot your company from good to incredible?*

**HUMILITY: THE LOST TRAIT FOR SUCCESS!**

According to Webster's Dictionary, humility is the state or quality of being humble of mind or spirit; it is the absence of pride or self-assertion. It will allow you to show a consciousness of your shortcomings. It is the most powerful virtue of all that is needed within every entrepreneur hoping to be successful. The virtue of humility has been described as "perceiving one's place in the world not according to one's own accomplishments but according to the intrinsic value of all individuals" (UO Stratics, 2003). Humility is not necessarily a quality you consider as being a required "entrepreneurial trait". Our goal is to help you refresh yourself and instill the virtue of humility that may help you to move your company further than it has already gone. Therefore, the purpose of this paper is to open up this lost entrepreneurial trait, humility, so that you can gain depth as a person and business leader.

A truly humble individual demonstrates a compelling modesty and feels somewhat intimidated with public praise. Such an individual acts with strong determination and motivates others, principally on inspired standards for the business. She/he cares about others first, and therefore attempts to delegate more responsibility to her/his employees and successors. She/he leads with motivation, inspiration, and ambition not for himself, but for the business as a whole.

This method of instruction, allows for the growth and success of your company to be shared by all the employees that have aided in the process. Taking such a path helps employees feel that they are not working to make only you successful, but rather the whole organization. The most significant characteristic of humility is the ability for you to assume responsibility of shortcomings, rather than blaming them on such external factors as other under performing employees or even sheer bad luck; “He looks in the mirror, not out the window”.

This virtue of humility allows for society to discover dignity. Others will now be placed before your personal selfish thrusts. It allows for patience and self-control, while aiding you to overcome traumatic experiences that you may have experienced in your life. To develop this trait of humility, you are required to fully transform yourself. Grasping the virtue of humility is a goal that everyone should hope to achieve by the end of their life cycle. We believe that when the leader of an organization practices humility, the entire organization benefits. Furthermore, it leads to the betterment of oneself. Our society perceives humility as a sacrifice, however this myth is often proved false: More is gained by humility than is sacrificed! “Humility is strong-not bold; quiet-not speechless; sure-not arrogant” (Estelle Smith, 2003).

### **HUMILITY IS NOT...**

Modern-day society tends to view humility with skepticism, fearing that it annihilates the entrepreneur. It is viewed as being embedded in the past, which cannot be used in the present society. Individuals seem to believe that there is not enough room for humility in our competitive and progressive civilization. This view can be seen throughout our society including academia. Have you ever heard of a class being taught about humility? Has the trait ever been recognized as being a part of an

entrepreneur's required traits? No. Instead, individuals take pride in believing that they are self-sufficient in knowledge and experts in all walks of life. You may find humility to be a needless trait and do not appreciate selflessness as among the finer facets of leadership.

From the time we are young, society teaches us to put ourselves first, making us believe that loving ourselves and taking pride in our talents scores over everything and everyone else. Generally, we will continue to feel this way until we encounter an event that makes us feel less capable than we thought we were and that will result in discontentment. As a result, this causes us to feel insignificant in a vast universe and thereby disables us from understanding how to deal with our shortcomings. It is at this point in time that we will be more receptive to humility; we may now realize the importance of this trait, and are better willing to forgo an arrogant, selfish, and egoistic behavior.

It is believed that people are inherently modest by birth. The irony is that this quality needs to be nurtured in order to develop and refine humility. This cannot be accomplished through self-revelation; it develops when an individual feels there is nowhere else to turn. This is a difficult proposition especially because individuals are inclined toward self-pride and admiration.

### **THE MODERN DAY COUNTERFEITS**

Never be fooled by those who you may think are humble. There are some that may pretend to encompass this virtue of humility that is only superficial, not truly within them. You should be aware that there are people who may attempt to fool you with traits that may appear to make them humble, when truly they are acting it out in an insincere way. The following scenarios provide examples of the modern-day counterfeits of humility.

**Satisfied with appearances**

This individual wants to superficially appear humble, whereas his inner-self is overflowing with pride and self-sufficiency. He is satisfied by putting on a humble front in hopes that the appearance of it will fool others. This purpose is usually one of self-gain.

**Protesting its unworthiness**

This individual consistently repeats to himself and others the unworthiness they experience. He believes that by saying how he does not deserve certain things in life, he will appear to be humble, however “true” humility makes no implication of being humble. A “real” humble person bears ridicule from others, and does not get irritated when others disrespect him.

**Afraid to Admit Talents**

This individual denies all talents and accomplishments in hope of appearing modest. If one is being told that he is a good writer, and the reply is “I am a scribbler”, that does not mean he is humble. Humility is truth. If someone is praised, a humble person will thankfully appreciate the ability to be successful based on other people’s assistance.

**Terrified of making mistakes**

Spurious humility is horrified at the possibility of making mistakes. When this is the case, the individual feels that he can no longer be the example for others. He does not look upon the amount of insight one can gain from making mistakes. Especially in the business world, as it may apply to small businesses, several mistakes must be made to learn how the world works. The fearless attempt to involve oneself in a trial and error period allows them to further themselves in understanding the needs of

consumers in the business world. Woodrow Wilson said, “A fault which humbles a person is of more use to him or her than a good action which puffs him or her up.”

### **WHAT HUMILITY CAN DO FOR YOU!**

There are several offshoots of humility, particularly peace of mind and dedication. Peace of mind allows for you to experience happiness leading you to treat others with kindness and consideration. Consideration and kindness are very important traits to run a particular business, and allow you to relate to your employees and understand the hardships they may face. Instead of scolding their feelings, you must use consideration and understand their experiences. An example of this is as follows:

*A woman receives a phone call that her husband has been in an accident, and is now in the hospital. The nurse told her exactly how to get to the room where her husband was, only to find out that when the wife attempted to find the room, it did not exist. The nurse had failed to let her know exactly what wing the room was in. After running around in circles looking for her husband, the lost woman ran into a doctor who was willing and able to help her on her search. Instead of scolding her for her inability to find the room on her own, he mentions to her how many months it took for him to finally understand the hospital layout himself.*

The example mentioned above shows how important it is to relate to one's feelings and downfalls. These qualities will help you to be cognizant and accepting of your mistakes. This realization, as a result, will allow you to better yourself as, both, the leader of your company and as a person.

In addition to piece of mind, qualities of dedication and encouragement must be recognized. These are two qualities that every individual in the business world should

experience. Dedication and encouragement allow for improvement within a business organization, for innovations to be made within a company whether it may be in the structure, the strategy, or the products of the firm.

Peace of mind and dedication allow for employees to confide and feel able to confront you, as their superior, with ideas they may have. It is a misconception that a manager has all the answers; surely, you depend on others in the organization to provide new ideas for improvement and growth for the company. Employees are the closest ones to consumers and they must be the ones to relay information to you and the remaining executives in the company. Through peace of mind, you will have ability to relate to your employees, and with dedication and encouragement, new innovations arise within the organization.

Humility, the trait that the authors' feel is an outstanding personal virtue, is and should continue to be a mandatory qualification for any individual assuming a leadership position. As an entrepreneur, you are subject to many learning experiences, however to amplify that experience, you should grasp the meaning and pure existence of humility. Humility is a requirement for learning; it gives you the opportunity to discover. Humility gives you the opportunity to listen. It is imperative to keep focus on every event that is occurring within your business, and realize the actions that must be done to strengthen the company's positioning in the market.

The success of a firm is related to the well being of the leader. Your energy, your vision, and your beliefs as a CEO are represented in the company's business ethic. The business environment should be one of comfort and understanding for both the employees and the consumers. The lack of humility will turn a comfortable and honest working zone into something in the likeness of Enron, Arthur Anderson, and WorldCom. The selfishness that has occurred within these firms makes the entire

community question the intentions of every company in the market. It is up to you to show how much responsibility you and your organization has to your clients, the most important individuals to the success of your company.

The advantages that humility can offer you are not to be taken lightly. You gain better employees that are eager to work for you due to the understanding you have. As a result of this, the employees become happier people because they are credited for each task they partake in. An example is set for these employees, which will be transferred to their clients. Since the clients will be receiving products /services they are in need of from an individual they enjoy to be surrounded with, the consumer walks away happy, and society is suddenly made aware of how magnificent your company is. Clients swarm into your firm, sales increase, and higher profits are made...the advantages follow through on every line of the business!

### **HUMILITY CAN IMPROVER YOUR BUSINESS...WE'LL PROVE IT!**

A five-year research project searched for the answer to what makes a company from merely good to truly great. The result of this project concluded that the most powerfully transformative executives possess a paradoxical mixture of personal humility and professional will. Under this study, a "Level 5" hierarchy was created to distinguish between the different types of leadership styles. (See Figure 1)

The figure shows that the Level 5 leader sits on top of the hierarchy of capabilities. This person is a necessary factor for transforming a small business into a great business. The research implies that it is not necessary to move sequentially through each of the different levels, however the Level 5 leader requires the capabilities of all the lower levels, plus the special characteristic of humility.

## **The Project**

The research project began in 1996 to determine how a good company can become a great company. To answer this question, companies that had shifted from good performance to great performance, and sustained it, were recognized. It was then necessary to identify the comparative companies that had failed to make a sustained shift. By doing this, it was possible to pinpoint the qualities that successful companies encompass versus those of unsuccessful ones.

Twenty-two research associates worked together to collect both qualitative and quantitative analyses data to test the hypothesis. As part of the qualitative analysis, 6,000 articles were collected, 87 interviews with top executives were conducted, and analyses were made of internal strategy documents. On the quantitative side of the research, financial metrics, an examination of executive compensation and observations of company stocks were made.

After the research had been conducted, there were a total of 11 companies that qualified as a company that experienced a good to great transformation. The data that resulted in this study was not what was expected from observers. Companies were researched over a 15-year period. It was recognized that no matter what state the company was in, whether in crisis or steady state, offering services and products, and no matter how big the transition was, each of the successful organizations had a Level 5 leader at the time of the transition. It was at this particular moment that the idea of a Level 5 leader was in contradiction to conventional wisdom and management theory of the modern-day society.

### **Level 5 leader profile:**

-Humility in conjunction with professional will leads to a successful transformation from a good to great company.

-The Level 5 leaders have ambition not for themselves but for their company and the executives.

-The Level 5 leaders want to set up the company for success in future generations, focusing on how the company will be perceived rather than how the company leader will be remembered.

-A Level 5 leader is always one to credit others for successes within the company, and if no person or event can be credited directly, then the leader will look upon good luck for the company's accomplishment. This type of leader will never blame anyone or anything (including bad luck) for any failures within the company.

### **CONVINCED? LEARN HOW TO BECOME THE “HUMBLE LEADER”**

There is a belief that individuals carry a seed within themselves that is in dire need of nurturing. You, like many others may either ignore it or do not realize that you have the capability of becoming a Level 5 leader. Under circumstances such as self-reflection, mentoring, significant life experiences, as well as other factors, your “seed” can slowly become nurtured. The following steps will help you to encompass the qualities of a humble leader:

#### **Assume any responsibility that you may bestow upon your employees!**

Whether you are dealing with the best leader in your company, or the janitor, you must always portray yourself as being on the same level as each employee. A truly humble individual will never look down upon the specific divisions of responsibilities. Make sure to focus on the importance of the employee's contribution, not what their specific contributions are.

#### **Put yourself in their shoes!**

Remember the Golden Rule: “Do unto others as you would have them do to you.” It should be one of your primary focuses in managing a firm. If you find yourself

unhappy with specific ways people may treat you, then you should never do that to one of your employees. Realize the actions that were of importance to you when working under another individual and relay those same actions to your employees. You should be cautious, however, not to fully implement your ideas at all times due to the differences in opinion people may have. Provide the employees with what you may find to make them happy, but also leave room for adjustments if employees are not content with your suggestions. The understanding of another person's feelings is the focus of this step.

### **Admit Mistakes!**

Not one person is born flawless, and no one can ever become flawless. The mistake that many leaders make is the idea that they know everything, and no one but themselves is right. Generally, a leader places himself on a pedestal. However to acquire humility, you should admit your shortcomings and mistakes. This will allow your employees to feel more comfortable working for a person that is only "human" and not a superpower. By doing this, you will subject employees into a more comfortable work environment, thereby developing close employee relationships. The employees will no longer be fearful of making mistakes, but appreciate the learning experience they have gained. You should use your their personal faults as springboards to higher things.

### **Give credit to those who have led to your success**

Placing full recognition upon the accomplishment of a leader has been a mistake in the business world for ages. You should continuously recognize that each employee has led to the success of your firm, and therefore led to the positive impression set of you, as the leader. A good, humble leader will consistently recognize the hard work and efforts of their employees, and recognize them in times of success. Idealistically,

the success of a firm is dependant upon many people, not just you. Regardless of how great a leader you may be, if the employees are not willing to work with you, the intentions will become inconsistent and blurry. As a result, the success of a firm is the outcome of a large workforce aiming to provide the best product or service. “Heroic Leaders give credit to all the people behind their success.” (Murphy, Emmett C., 1995)

### **Be an original**

Never try to be a carbon copy of what you think business professionals are supposed to be. By being your original self, you are exposing your company to behaviors that are new and exciting. Following in any predecessors’ footsteps will restrict you and may lead you into a path quite far from that of humility. As a unique leader with a unique vision, you be able to express yourself in an artful, creative, and innovative way. Consequently, your employees will be led to believe how important it is to have innovative ideas of their own. “If you can’t be creative at work, it may be time to move on” (Koonce, Richard).

### **Don’t take yourself too seriously!**

There is nothing that can ruin a person more than success. Success leads some individuals into egoistical behaviors that make it uncomfortable for others to be around. Regardless of how profitable your business is, or how important you are to the future, you should still not take yourself too seriously! Switch that egoism into humility and allow yourself to be more successful.

### **Listen Up!**

You may have assumed that as a leader you should direct your employees by telling them what to do, and how to do it, but be aware that this offers no opportunity for feedback from your employees. Behaving in this manner represents a selfish trait and

would be considered intolerable from a humble person's perspective; you should listen to others. Surprisingly, listening to others may give you more knowledge of topics that you may have ignored or overlooked. Your employees are the front-line people of your company, and you must be dependant on them to learn what is good for your clients. You may believe to have the best idea in mind, but not being so close to the purchasers may give you a blurry vision of what consumers may expect. Listen. Recognize the emotions of others and attune yourself to their needs and wants. Listening may assist you to better understand your employees, thus leading to the future success of your company.

**Take the harder right, than the easier wrong!**

Situations that have arisen over the past few years are examples of leaders taking an easier path that then leads to their wrongdoing. As mentioned earlier, many financial companies felt the pressures of outside forces to take the easier wrong and thus disclosed inaccurate, yet appealing financial statements instead of dealing with the harder right of disclosing statements that would make the shareholders unhappy. Sometimes it is easier to choose the wrong belief so that we do not have to struggle with trying to reach the right belief. Humility helps you make a decision; once it is acquired the harder right will always be chosen over the easier wrong.

**Have a role model**

Always look up to a higher authority than yourself. This higher standard will help instill a sense of humility, open-mindedness to new learning experiences. "Being oriented toward a higher power is more than just being aware of it-you have to love by the best light and knowledge you receive and be obedient to the higher law".

(Sherman Covey, 1996)

## THE NEW YOU !

Traditionally, entrepreneurs are expected to have certain personal qualities that will lead them to future success. Various papers, textbooks, and articles will always mention the ideal “base-line” characteristics an individual must have, thus portraying the ability they will have to maintain responsibilities that an entrepreneur will deem necessary. The authors’ believe that humility should be included in this list of entrepreneurial traits as one of the most important traits to help you experience and understand the true meaning of success. Today’s entrepreneurs should have an equal balance between each of these characteristics so that they may better serve their employees, their clients, and themselves.

The authors’ have developed the following traits based on many years of experience in the real business world. By assisting over 2,100 small to medium enterprises, from high-tech to low-tech, and having face to face contact with successful entrepreneurs including Ernst & Young Entrepreneurs of the Year awardees, it has been made possible to distinguish what traits you must encompass to be a successful entrepreneur. (See Figure 2)

**-Passion-** this is the most important entrepreneurial trait for success. After meeting over two thousand entrepreneurs, the authors’ conclude that the successful ones have passion. Some entrepreneurs show visible signs of self-assertiveness, are aggressive, and are powerful in appearance. Others are quite and soft-spoken yet remain silently forceful. The most striking quality of these entrepreneurs is the depth they have. By having depth, a sense of emotional drive is detected, and shows the spirit they have to accomplish something. They love what they do and find a way to make a profit through their business while simultaneously providing a contribution to society.

**-Enthusiasm-** this is the second most important trait. This inner sense of encouragement gives you the capability of inspiring all of those around you. When your employees see that you are eager to carry out their vision, they will attempt to follow in your footsteps.

**-Trustworthy-** you must be able to build loyalty with everyone surrounding you. This trait will show that you are dependable, reliable, and worthy of confidence. Bob Reiss, President of R&R, Inc. (a family game company) is a good example of a trustworthy entrepreneur. He took good care of everybody and made his employees feel good. Trustworthiness is a definite key to success that allows you to admit your mistakes and move on.

**-Creativity-** Your creativity and originality are what inspire others around you to be excited about a product and service. Generally, entrepreneurs that have this quality regularly participate in the research and development of products. A good example of a creative entrepreneur is Josh Frey, President of Granny's Goodies (a gift care specialist company). He studies everything in order to allow the company to move forward. The creative entrepreneur is one that likes to create a positioning for his company's venture.

**-Persistence-** The entrepreneur must be persistent! We all know that things are not always easy, and therefore must rely on persistence to become resolved. You, as an entrepreneur, should be indefatigable and refuse to give up when the situation becomes very tough. You should not be afraid to fail, and if you do, use that failure as a learning tool.

**-Responsibility-** You must have a strong sense of responsibility. By being responsible, you can feel a sense of achievement. The accountability that you have designates an emotional and liable attachment to your business, and therefore will be

taken more seriously. David C. McClelland, a Harvard psychologist, conducted a study, which concluded that entrepreneurs, on average, have a higher need for achievement than others of the general population. Prior to establishing your own firm, you are able to recognize the problems in starting a business, but believe that you can overcome those problems. The responsible entrepreneur is one that stays away from uncertain high risk, and usually likes to outsource everything.

**-Flexibility-** you must have the flexibility to adapt to changes in the market. This will allow for a long-life within the organization. You should be looked upon as a “Plastic Man” so there is enough mental toughness to rebound from adversity. (Charles Toftoy, 2000)

**-Self-confidence-**You must be confident in your actions and beliefs so that others may recognize them as being credible. This sets the tone for everyone else in your company. Your self-confidence will allow you to believe in your own strengths and apply a practical approach to accomplish nearly all tasks, including the overcoming of obstacles. Entrepreneurs perform best when they are confronted with nearly impossible tasks; they do not assume anything and seek out criticism in order to make improvements. Since they have such a high curiosity level, they are believers in continuous learning.

**-Perceptibility-**You must have an awareness and insight about people so that you will be able to hire and retain good employees within your organization. You can serve as a filter for the company in this position. Having the ability to perceive between right and wrong allows a proper direction to be set for your company.

**-Communicator-**You must be able to express yourself clearly and effectively. You should be able to convey your vision to the rest of the organization. Having this characteristic allows you to listen to others’ feedback to better improve the company.

The communicator method, allows for a face-to-face approach to be made to communicate with your employees while telephone, email, letters, and memos are only secondary means of communication.

**-Seller-**You must be artful in selling. You should believe in what you and your company are promoting and be able to promote the value of the product. Stephen Forte, President of Travelers Telecom, is an example of an entrepreneur who believes in his cause. The entrepreneur never accepts “no” but rather comes back with an alternate strategy or tactic.

**Humility-**Being affable, modest and gracious helps you to develop a mutual trust with others. This will allow others to easily approach you. Everyone is important regardless of what their occupation may be; you may learn a lot from others since they may be more knowledgeable in their own field. Humility also helps in controlling anger and ego, two characteristics that may lead to unwanted problems and mistakes.

We, the authors feel that you can become the “new you” by improving yourself through the traits mentioned. Self-examine yourself to understand which traits you may have as an entrepreneur, and consider the benefits that they offer you and your business. By being cognizant of these traits we have provided, you should become a better person, and a more successful entrepreneur.

### **Summary**

The practice of strategic humility is one that leads heroic individuals to the driving out of co-dependency within themselves and their organizations. Confrontation of the destructive habits of selfishness, pride, and the blaming of other is imperative. Characteristics as such, become the root of the problems that may cause the inability

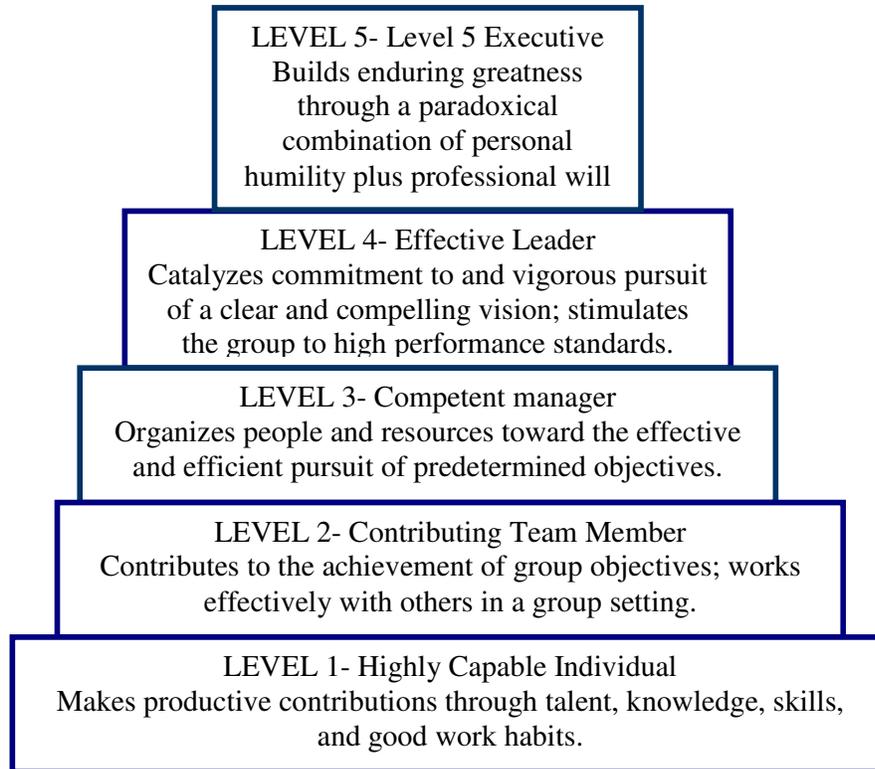

to make serious commitments, unwillingness to learn from others, and unwillingness to accept personal responsibility for any type of company failures.

The ideal leader is driven by a deep belief they have, and attempt to succeed regardless of the obstacles and possibilities of failure. When tough times arise, the leader turns to others with hope and optimism in finding solutions and ideas. It is understood that full responsibility will be assumed when a mistake has occurred due to the belief that personal achievement requires the competency that only personal accountability can teach. Humility allows a leader to feel self-fulfillment when they serve others and move beyond their personal ambition.

You may feel that much of this paper is ordinary common sense, but we believe that there is not much coverage on this issue. We want you to refresh yourself and present the lost virtue of humility, and how equally important it is to all other entrepreneurial traits. We have offered you with the definition of humility, the misconceptions of humility, how to detect the counterfeit versions of humility, as well as research studies that prove the value of being humble. We have offered you with ways to become more humble to make the new you move your company from good to great. The lost entrepreneurial trait of humility is one that should be a requirement for any of today's leaders. The gratitude that individuals feel for humble people is irreplaceable, and will portray an image of a company that no other person will be able to imitate. As leaders of our societal marketplaces, we should take the initiative to become and implement authority figures that are driven solely not by the selfish purposes of superficial profiting, but rather self-gain and fulfillment of providing a remedy to needs of the society. In the likeness of Abraham Lincoln, who signified the pure meaning of humility, we can walk into the betterment of our society, our company, our leadership, and our truly humane well being. It may be that John (Jay) McCloy said it best, "Humility leads to strength and not to weakness. It is the highest form of self-respect to admit mistakes and to make amends for them".

# **Entrepreneurial Motivation in a Multicultural Society: The Effects of Ethnicity and Entrepreneurial Self-Efficacy.**

Boris Urban

University of Johannesburg, South Africa. [Borisu@uj.ac.za](mailto:Borisu@uj.ac.za)

Jurie van Vuuren

In addressing entrepreneurial behavior in a multicultural country and how it is influenced by individual and environmental factors; self-efficacy beliefs and cultural values were predicted as producing the most salient affects on entrepreneurial intentions. The structural equivalence of the instruments used was established and primary data was collected from samples representing distinctive ethnic cultures in one national environment. The results indicate it would be inaccurate to describe South Africans as having high entrepreneurial intentions as a result of cultural values; even though SA cultural values tend to reflect the inevitable consequences of Westernization and modernization. What did matter however was the effect of self-efficacy, which continued to be statistically significant throughout our analysis; this means that the personal context and not the social-cultural framework is pivotal to increasing entrepreneurship. Despite social interventions designed to encourage entrepreneurship via centralized planning and coordination on a national basis, the success of entrepreneurs seems to depend more on the personal motivation and will to succeed. With knowledge on entrepreneurship evolving in SA, particularly where much is left unexplained, studying the impact of culture on entrepreneurship in a multicultural society under a political correct climate is often construed as officious and arrogant. Although the sophistic argument exists that all must be celebrated and no judgments or analysis is permitted, the point is to rescue cultural relativism from speculations and impressions and to establish it on more solid empirical ground as this study has done. Findings have relevance for entrepreneurs and policy makers seeking a competitive advantage for their products/countries, particularly when encouraging entrepreneurial mindset among multicultural populace.

## **Introduction**

South Africa is not only a culturally heterogeneous society, but because of its colonial and apartheid history different cultural values were hypothesized to influence proclivity towards entrepreneurship among major ethnic groups. According to GEM 2003, SA has the lowest total entrepreneurship activity (TEA) rate of any developing country (Orford, Wood, Fischer, Herrington & Segal, 2003), which means that entrepreneurial activity on a range of measures is extremely low in SA. This is significant in a country where entrepreneurial ventures account for one third of total employment. Moreover experts believe that entrepreneurial activity is affected by attitudes to discriminated groups and by cultural practices which hinder entrepreneurship in SA (Orford *et al.*, 2003). Uganda, which has the highest TEA of all countries surveyed in the GEM, suggests that low entrepreneurial activity is not an African phenomenon.

Conceptual arguments for the link between culture and entrepreneurship have existed for decades (Schumpeter, 1947; Weber, 1958; McClelland, 1961), with more recent empirical research (Hayton, George, & Zahra, 2002; Marino, Strandholm, Steensma,

& Weaver, 2002) suggesting mixed findings. Some studies suggest entrepreneurs share a common set of values regardless of culture (McGrath, Macmillan, & Scheinberg, 1992), while other studies support the notion that culture will affect entrepreneurship (Busenitz & Lau, 1996; Shane, 1994). Studies in Africa conclude that psychological variables (Frese, 2000), and race and ethnicity (Ramachandran & Shah, 1999) are important predictors of entrepreneurial activity.

Many individuals in transitional economies may have the desire to pursue entrepreneurial ventures but are not engaging not because they do not have knowledge and skills but because they are lacking in self-belief. However this general label, self-belief provides little point of reference for hypothesis testing, and for the purposes of paper was operationalized through the self-efficacy construct and related to culture and entrepreneurial intentions. By acknowledging the legacy of apartheid education it becomes apparent that damage was done to self-esteem, motivation, and creativity of individuals, with many schools and universities continuing in present day to inculcate a mindset that undermines entrepreneurship. Building entrepreneurial capacity requires inculcating a can do attitude as well as more people developing self-belief towards entrepreneurial aspirations and skills (Driver, Wood, Segal, & Herrington, 2001).

Economically disadvantaged communities often suffer from deficits in self-efficacy. Rabow, Barkman, and Kessler (1983) show that victims of poverty visibly reflect the symptoms of learned helplessness, which resonates with SA socio-cultural conditions and reinforces the vital role of self-efficacy in empowerment and capacity building.

Although there can be wide variety of contextual as well as individual factors that influence the entrepreneurs choice, the role of entrepreneurial self-efficacy has been emphasized as key antecedent (Boyd & Vozikis, 1994; Krueger & Brazeal, 1994; Chen, Greene & Crick, 1998; Markman et al., 2002). Unlike personality traits self-efficacy can be developed through training and modeling. Efficacy judgments are task specific and regulate behavior by determining task choices, effort and persistence. Self-efficacy also facilitates learning and task performance particularly early in the learning process (Stevens & Gist, 1997) and can also change as result of learning, experience and feedback (Gist & Mitchell, 1992).

Although Bandura (1986) reasoned that self-efficacy influence is partially socially constructed and that such construction may differ as a function of national culture, little direct evidence exists that may connect cultural values to self-efficacy. This controversy by whether historical and societal processes are responsible for creating distinct communities, that may render individual meanings as trivial, or what makes humans similar, is important for this study, since trying to study entrepreneurial motivation without insight into culture/ethnicity is an idle pursuit.

Self-conceptions embody both personal and collective affects although their relative emphasis may vary depending on the cultural values of their environment (Bandura, 1997). Efficacy beliefs have a similar multi-faceted character. Personal efficacy can serve varied purposes many of which subordinate self-interest to the benefits of others, e.g., Nelson Mandela provides a prominent example of self-sacrifice in the exercise of powerful personal efficacy. Cross-cultural research, (Earley, 1994; Erez & Earley, 1993), attests to the general functional value of efficacy beliefs; with cultural embeddeness shaping the way in which efficacy beliefs are developed.

A variety of studies lend support to the argument that cultural values influence entrepreneurial behavior. Much of the study of ethnic entrepreneurs is based on issues of culture, with a growing body of literature supporting the argument that national culture influences a variety of economic/ management behavior (Hofstede, 2001) and entrepreneurship (McGrath *et al.*, 1992).

Hofstede (1980) treats values as part of culture. Hofstede's statistical handling of IBM data at country level produced four empirical dimensions of national culture. The four are labeled as; power distance (which is related to the different solutions to the basic problem of human inequality); uncertainty avoidance (which is related to the level of stress in a society in the face of an unknown future); individualism vs. collectivism (which is related to the integration of individuals into primary groups); and masculinity vs. femininity (which is related to the division of emotional roles between men and women). A fifth dimension, as a result of focusing on Asian values, is long term vs. short-term orientation (which is related to the choice of focus for people's efforts, the future or the present) is also included (Hofstede, 2001, p. 29).

Several studies suggest that entrepreneurship is more compatible with certain cultures. Although empirical evidence is required to substantiate such generalizations, which are based on specific configurations of cultural dimensions, several African evaluations exist, for instance see Kinunda-Rutashobya (1999); Themba *et al.* (1999); and also Kiggundu (2002) for an illustrative summary about entrepreneurship and culture in Africa. Morris, Davis & Allen (1994) found that a balanced level of individualism-collectivism led to greater entrepreneurship in their multi-country sample, which included SA. Their study revealed that entrepreneurship declines the more collectivism or higher levels of individualism are emphasized. Such findings mean that entrepreneurial activity peaks at moderate levels of individualism, with extreme individualism promoting competition, and absence of team identification, all lowering levels of entrepreneurship.

In accordance with the aforementioned research, hypotheses are formulated with the following configuration of cultural values based on Hofstede's dimensions.

*Hypothesis 1:* Moderate individualism and collectivism and higher self-efficacy increases entrepreneurial intentions.

*Hypothesis 2:* Lower uncertainty avoidance and higher self-efficacy increases entrepreneurial intentions.

*Hypothesis 3:* Higher masculinity and higher self-efficacy increases entrepreneurial intentions.

*Hypothesis 4:* Lower power distance and higher self-efficacy increases entrepreneurial intentions.

*Hypothesis 5:* Higher long-term orientation and higher self-efficacy increases entrepreneurial intentions.

The article proceeds to describe the research methodology including sampling, and data analysis. We test the hypothesis and detail the results. The last part of the article provides substance in the form of conclusions, implications and imperatives for further research.

## METHODOLOGY

Highly relevant to this paper is that sub-cultures may form within a societal group, based on a distinct history or geographically based experiences that have influenced the values of the group (e.g., apartheid policy). Hence the justification for using ethnic groups, as a unit of analysis, at this sub-cultural level, is based on Hofstede's exhortations, as well as the precedent set by the GEM studies which describes entrepreneurial activity according to racial classifications (Foxcroft *et al.*, 2002). The basic assertion is that different racial/ethnic groups exist in SA. Because of SA's colonial and apartheid history there is a high degree of correlation between race, location, education, self-awareness, and gender elements of disadvantage (Klasen, 2002). This racial indicator is important and therefore accounted for in this study. Bornman (1999) regards ethnicity as a mode of social differentiation based primarily on perception, kinship, a common cultural focus, and an awareness of historical destiny. Although biogenetic heritage can play a role, definitions of ethnicity normally emphasize language, religion, and other cultural practices. In contrast, definitions of race emphasize phenotypical or external physical characteristics (e.g., skin color).

Although we are aware that ethnic / racial categorizations, as a primary definition of groups of people implies dogmatism, this is not intended as such, but is used strictly as a methodological convenience, in the context of social differences, for purposes of this study (using political correct or evasive euphemisms such as 'Zulu speaker' is also avoided). An attempt was made to capture as many ethnic groups as possible (even though SA represents a complex multicultural society), but a cruder version of Asian, Black, and Caucasian South Africans was used due to practicalities of sampling.

While the relationship between self-efficacy and entrepreneurial intentions has been extensively documented (e.g., Krueger, Reilly, & Carsrud, 2000; Krueger & Brazeal, 1994), this study seeks to extend this relationship by the introduction of cultural values. Using cultural values and self-efficacy beliefs to predict entrepreneurial intentions seems to be a more robust approach than using personality traits: values and beliefs are more proximal to behavior and intentions than the distal personality traits. Hence when the relations between the independent variables (IV) - self-efficacy and cultural values, and dependent variable (DV) - entrepreneurial intentions, are tested, the unexplained variance should be less and the correlations stronger.

### Instruments

The following instruments were subjected to item and factor analysis to establish structural equivalence: (1) Entrepreneurial intentions were assessed on a cumulative approach based on Ajzen's (1991) and Shapero's (1982) models as compared by (Krueger *et al.*, 2000). Previous estimates of internal consistency for the items in this model vary between .69 to .83). Our measure reflects this theory driven approach and comprises of items used in both models; these are: intentions, attitudes, expected utilities, and normative beliefs and motives (important for ethnic groups where only cultural differences are hypothesized in social norms). Global and specific perceived feasibility, which is empirically linked to self-efficacy, are measured separately with the self-efficacy measure (next section). In total 11 items were measured along a 5-

point Likert-type scale (1 = very high, 5 = very low). Principal component analysis (PCA) demonstrated a unifactorial solution with an eigenvalue of 9.28, which explained 87.3 % of the variance, with an overall alpha of .93.

(2) The items for the self-efficacy instrument are incorporated from Chen *et al.*'s (1998) entrepreneurial self-efficacy (ESE) scale as well as the revised general efficacy scale (GSE) (Chen *et al.*, 2001). More specifically the ESE sub-scales (slightly modified) will consist of roles /tasks, with respondents indicating degree of certainty (strength) in performing these roles/tasks on a 5-point Likert-type scale, as well as their magnitudes (yes /no). Self-efficacy magnitude (not measured previously by the existing ESE and GSE measures) and strength as separate non-combined measures appear to have generally weaker predictive validities and correlations than self-efficacy composites have (Lee & Bobko, 1994). In other words a composite measure of self-efficacy, which includes magnitude and strength, and measures general and specific levels of self-efficacy is used for this study. The initial results of PCA indicated that several of the original scale items did not load satisfactorily on any factors in the generated factor solutions. Items with maximum factor loadings less than .30 were omitted as well as items that loaded significantly on more than one factor. With these omissions further analysis yielded the following accepted 4-factor solution: Factor 1 (GSE); Factor 2 (ESE MARKETING); Factor 3 ESE (INNOVATION); Factor 4 ESE (FINANCE) with eigenvalues of 6.41; 2.21; 1.03; 1.04; that explained 44.8%; 17.7%; 16.6%; 15.6% of the variance, with Cronbach alphas of .91, .81, .89, .89 respectively

(3) The latest Value Survey Module (VSM 94) (Hofstede, 2001) which is considered the best-validated and most efficient instrument for arriving at an empirical replication of the five dimensions of culture was used. According to Hofstede the VSM 94 is relevant to respondents without employers, such as entrepreneurs, students, and housewives. Hofstede is adamant that what can be measured are only differences in the statistical distributions of scores for groups, sufficiently large (20-50 per group), and sufficiently matched, (i.e. similar in all respects except nationality). Hofstede's VSM 94 instrument was designed for comparing mean scores of two or more countries / regions / ethnic groups. Global correlations across all individuals and within society correlations are not the same as between society correlations. Confusion between within system and between system correlations is known as ecological fallacy (Hofstede, 2001). However it remains important to remember that Hofstede's indexes yield statistically significant differences when males vs. females are contrasted or when entrepreneurs vs. non-entrepreneurs are compared. Davidsson and Wiklund's (1997) analysis of cultural dimensions on the individual level also reveals a reasonably strong relationship between values and beliefs on the one hand, and entrepreneurial intentions on the other. VSM 94 consists of 20-content questions and 6-socio-demographic questions. Only 8 of the original 13 items from which IBM scores were based remain. The additional long term vs. short-term orientation dimension is included for the first time in the VSM 94. Computational formulas were followed as prescribed that allow comparisons of culturally determined value dimensions between people from two or more ethnic groups. In VSM 94 all 20-content questions have a 5-point structure (i.e., range from 1 = of the utmost importance to 5 = of very little to no importance). Initial PCA component analysis yielded 2, 3, and 4-factor solutions. Items were scattered among factors with loadings below .30 in some instances. After repeated analysis a 6-factor solution was obtained with 4-factors corresponding to four of the indexes. The Cronbach alphas for each cultural index was .79, .77, .69, and .49 respectively. Factor 5 and 6 had mixed items,

which were consequently collapsed into one factor representing uncertainty avoidance (UAI). Other replications using VSM 94 have also failed to support the five subscales as derived by Hofstede. Spector, Cooper and Sparks (2001) using 23 nations at the country level of analysis also found suspect internal consistencies in the VSM 94. Such findings together with the results we obtained prevent the unambiguous interpretation of the internal consistency of the VSM 94 instrument.

## **Sampling**

Primary data was collected across different ethnic groups (n=150), from a M.B.A. student population at a higher education institution. The objective was to use the students on a M.B.A. program and not the general population. The samples are relatively matched in all respects except ethnicity, in order to allow comparison between ethnic groups. Such sample comparability should minimize method bias (van de Vijver & Leung, 2001) such as response styles, and further represent distinctive ethnic cultures in one national environment. The control for socio-demographics is relevant to the hypotheses formulated since as predicted values generally differ between socio-demographic groups. The final sample consisted of 150 students of whom 69 % were men, 50 % are in the 30 to 40 year age group, 60 % have 16 years or more of formal education, 35 % work as academically trained professionals, and belong to one of the three major ethnic groups; Black (n = 50), Indian (n = 50), and Caucasian (n = 50) South Africans.

## **RESULTS**

### **Descriptives**

Table 1 shows the means, standard deviations and Pearson's correlations of the variables under study (N = 150). Entrepreneurial intention (entint) with a mean of 2.52 is a midpoint average of the 5-point rating scale, with a relatively low standard deviation of .73. In order from highest to the lowest mean score, the cultural dimensions are ranked as: IDV, UAI, LTO, MAS, and PDI. It must be noted that substantial standard deviation in all of the scores is evident. The mean scores for the self-efficacy factors are; GSE, followed by ESE marketing (mkt), ESE finance (fin), and ESE innovation (inn). The Pearson correlation coefficients are reported with the statistically significant exact probabilities (*p* values) asterisked. Correlations range from .00 to .85. The level of correlations is generally low even though in some instances they are statistically significant. The significant correlations are between entrepreneurial intentions and self-efficacy sub-scales. For the self-efficacy scores several relatively high intercorrelations between these variables are evident; this was expected since the individual self-efficacy composite measures add up to total self-efficacy composite.

[Table 1 about here](#)

### **ANOVA and multiple regressions**

Analysis of variance (ANOVA) was used to test the significance of differences in scores of the factors. The effects were interpreted as follows: (a) GSE is statistically

significant,  $F = 3.40$ ,  $p < 0.05$ . (b) ESE Inn is statistically significant,  $F = 3.21$ ,  $p < 0.05$ . (c) PDI is statistically significant,  $F = 3.19$ ,  $p < 0.05$ . (d) MAS is statistically significant,  $F = 4.64$ ,  $p < 0.01$ . (e) LTO is statistically significant,  $F = 6.14$ ,  $p < 0.00$ . However to determine which specific groups differ on which variables a post hoc test, Duncan's multiple range test (a more refined test than the omnibus F test) was conducted to complement ANOVA. Using this procedure significant differences were detected between the groups for the GSE, ESE Inn, ESE Fin, PDI, UAI, MAS, and LTO factors. Contrastingly for ESE Mkt, IDV and ENTIINT there are no significant differences between the groups. This is important for further analysis in that specifically no differences on the DV (ENTINT) are detected. This could be interpreted that urban (metropolitan) respondents represent a common entrepreneurial classification. The differences in entrepreneurial intentions by race are generally small between urban respondents.

Using a regression model, where all the factors were entered, a squared multiple correlation of 0.15 was obtained, indicating 15.83 % of the variation in the DV is attributable to variation across the levels of the 9-variables in this model. This is rather weak since 84% remains unexplained variance.

Examining the parameter estimates in this model - apart from GSE and ESE Mkt, other variables are not statistically significant. This means that the higher the GSE and ESE Mkt the higher will be entrepreneurial intentions. No cultural predictors exercised influence on entrepreneurial intentions. The next procedure involved entering the total self-efficacy composite variable (tsc), instead of the separate factors, since an overall measure might be more robust. The result was a deflated  $R^2 = 0.113$ . Stepwise regression entailed entering the statistically significant variables; ESE Mkt was entered first ( $R^2 = 0.08$ ) and then GSE ( $R^2 = 0.13$ ). The stepwise regression results indicate that few patterns of relationship between the variables can be established.

In summary, although findings are modest in correlations and regressions, they are not trivial. In relation to each of the hypothesis, no support was found for the effect of any of the cultural values on entrepreneurial intentions: further no interaction between cultural dimensions and self-efficacy was revealed by findings. However on the other hand results indicate there was a modest but statistically significant ( $p < 0.05$ ) effect of self-efficacy on entrepreneurial intentions, partial support was found, in particular that GSE and ESE Mkt effect entrepreneurial intentions. A possible interpretation of these findings, which reinforces a pattern of similar results, is that beliefs are more salient than values in determining individual cross-cultural behaviors (Leung, Bond, & Schwartz, 1995). Notwithstanding possible instrument inadequacies, our findings suggest that self-efficacy beliefs possibly eliminated the effect of cultural values, when these two factors were examined together in an entrepreneurial context.

## DISCUSSION

Broadly speaking it seems cultural values are not associated with, and do not predict entrepreneurial intentions in SA. There is a paradox here since certain configurations of cultural dimensions as measured across the ethnic groups (high IDV, low PDI) are generally indicative of an entrepreneurial culture. Low PDI can be interpreted that

equality is now highly valued in SA with more egalitarian views prevailing across ethnic groups. The high score obtained by all the groups on IDV is clearly the inevitable consequence of Westernization and modernization (Allik & Realo, 2004); so why is there no association with entrepreneurship? Some plausible explanations may be found in SA's historical roots, which may have inhibit an entrepreneurial mindset to develop. It could also be that entrepreneurship is not necessarily seen as a legitimate or desirable occupation (due to the traditional strong culture of wage labor in SA combined with affirmative action policies). Negative attitudes towards failure (Driver *et al.*, 2001) and a low risk-taking mentality could also be contributing factors. The general lack of entrepreneurial activity in SA seems to be further exacerbated by a low entrepreneurship status, and a general lack of entrepreneurial role models. As a matter of fact it has been suggested that entrepreneurship is a self-reinforcing process (Bygrave & Minniti, 2000). Entrepreneurship leads to more entrepreneurship and is a dynamic process in which social habits (entrepreneurial memory) are as important as legal and economic factors. Thus entrepreneurs act, as catalysts of economic activity, and the entrepreneurial history of a community is important. Indeed the different experiences of groups lying outside the dominant entrepreneurial culture of the US must be further investigated, especially in view of the notion that not every culture fits every dimension of culture in a precise way.

Conversely what our results do indicate is South Africans are in fact relatively motivated (high self-efficacy beliefs) to be entrepreneurs. This means that institutional obstacles and lack of support structures, that actually deliver results, may prejudice existing motivations and intentions to be entrepreneurial. Financial support is cited (GEM SA 2003) as the biggest obstacle to potential entrepreneurs and specifically a lack of financial administration skills among emerging entrepreneurs. So it seems despite social interventions designed to encourage entrepreneurship via centralized planning and coordination on a national basis, which are generally characterized by a lot of activity and little action, the success of entrepreneurs remains dependent on personal motivation, and will to succeed, as our results demonstrate.

The results have relevance for government and policy makers who are encouraging an entrepreneurial mindset among South Africans. Social interventions designed to encourage entrepreneurship need to take into account the culture values of the target population, since motivational differences across cultures can be salient. Inculcating self-efficacy among potential entrepreneurs requires more than teaching competencies, prospective entrepreneurs must internalize the competencies by experiencing mastery of skills. Not only can educators and policy makers help increase perceptions of feasibility for prospective entrepreneurs but also for community by increasing collective self-efficacy by emphasizing successful entrepreneurial role models. It would not be presumptuous to say that SA needs to empower individuals to have the potential to be entrepreneurs and to do this entail fostering empowerment amongst individuals (especially for sectors of population such as women and previously disadvantaged groups who could be perceived as lacking entrepreneurial traditions) by increasing perceptions of self-efficacy. For global entrepreneurs venturing into a developing market, the most useful aspects of understanding cultural differences and motivations are that it allows entrepreneurs to predict how ethnic groups may behave, consequently providing valuable clues about potential consumers and business partners.

## **Role Model Influences on Entrepreneurial Intentions: A Comparison Between USA and Mexico**

### **Abstract**

Most research and popular writing includes entrepreneurial role models as an important factor in the decision to start a business. Few, if any, studies compare the influence of business owner role models between two different countries. Further, studies cite the importance of role models for potential entrepreneurs but ignore how the role model process actually works. This study looks at activities that role models might engage in and compares their influence on respondents the US and Mexico. This is the first study that examines differences in role model influence between two countries. Ten of the variables are significantly different between respondents in the two countries. Nine of the differences were rated as being significantly more influential among Mexican students than US students while only one variable was rated as being significantly less influential. Results of the study, especially as related to the specific influence of role models on career intentions, may be relevant in designing entrepreneurship programs. The results may also be appropriate in courses that discuss entrepreneurship in different countries (e.g. international entrepreneurship). The results may also be relevant in family businesses where eventual continuity of family ownership through succession is desired.

## **Role Model Influences on Entrepreneurial Intentions: A Comparison Between USA and Mexico**

### **Introduction**

Most work in both the popular and academic press about the decision to start a business includes background or antecedent factors underlying the entrepreneurial decision. Included among those antecedent factors is the influence of role models on the potential entrepreneur's thought process. Studies have shown that 35%-70% of US entrepreneurs had entrepreneurial role models (Scherer, Adams, Carley, & Wiebe, 1989). Informal discussions with entrepreneurs and surveys of students in university entrepreneurship courses generally support this contention. Sharing wisdom and practical knowledge and include their children in the business at an early age. An affinity for and valuable knowledge about entrepreneurship is acquired through a person's interactions with role models. The purpose of this paper is to compare the influence of role models on entrepreneurial intentions between US and Mexican students. Specifically we look at the relative influence of role models on students.

### **Previous Literature**

Recent research regarding the decision to start a business has focused on entrepreneurial intentions. Built largely around the "Theory of Planned Behavior" (Ajzen, 1991) and the model of the "entrepreneurial event" (Shapiro, 1982), a number of researchers have shown that intentions are a predictor of behavior. Further research focused on the antecedents to those intentions. (Krueger, Reilly, and Carsrud, 2000).

### **Intentions**

Krueger et al (2000) asserted that intentions better predict entrepreneurship than personality traits (internal) and situations (external) and that "a strong intention to start a business should result in an eventual attempt, even if immediate circumstances . . . may dictate a long delay". As part of his development of intentions based models, he concluded that role models could affect entrepreneurial intentions if they changed attitudes and beliefs about a person's self-efficacy – their perceived ability to be successful in a new venture.

In a related study, Krueger (2000) used the intentions model to predict opportunity recognition. In this model, he posited that intentions were a function of perceived desirability of an act and perceived feasibility of the act. He asserted that perceptions related to desirability are learned and that perceived feasibility is a key to intentions. Noel

(2000) found that since entrepreneurial intentions were stronger among students with entrepreneurship majors, then entrepreneurship majors should have higher intentions to start a business within two to five years.

Douglas and Shepherd (2002) studied business alumni of an Australian university to determine factors influencing intentions to start a business. Their findings suggest that risk, need for independence, and income potential are important factors affecting career decisions, and that risk and independence are especially important for those intending entrepreneurial careers. They found that income is not a determining factor leading toward the intention to start a business.

Goals, motivations, and intentions are intertwined in predicting the entrepreneurial decision. Kuratko, Hornsby, and Naffziger (1997) suggested that individuals starting businesses have personally relevant goal sets to which they aspire. Extrinsic goals that concentrate on wealth and personal income and intrinsic goals, such as recognition, challenge, autonomy, family security, and excitement were important for sustaining entrepreneurship.

### **Career Planning**

Scott and Twomey (1988) proposed that parental role models and experience (work or hobbies) led to the perception of oneself as an entrepreneur. This self-perception, when added to a triggering factor and a business idea, would lead to an entrepreneurial career preference. They found that students whose parents owned their own business showed a significantly higher preference for self-employment and lower preference for a career in a large business or working in a small business.

Lent et al (1994) found that career-related decisions reflect a process in which beliefs, attitudes, and intentions evolve as we cognitively process our knowledge, beliefs, and experiences. Role models are important in this cognitive process, as association with the role model provides positive experiences for the individual.

Dyer (1994) developed a model of entrepreneurial career that included antecedents that influenced career choice, career socialization, career orientation, and career progression. Antecedents to career choice included individual factors (entrepreneurial traits), social factors (family relationships and role models), and economic factors. Dyer asserted that children of entrepreneurs are more likely to view business ownership as being more acceptable than working for someone else.

Baucus and Human (1994) studied Fortune 500 firm retirees who started their own business and found that networking, their view of departure (voluntary vs. involuntary), and prior employment experience positively affected the entrepreneurial process. Carroll and Mosakowski (1987) asserted that children with self-employed parents likely

work in the family firm at an early age. That experience, coupled with the likelihood of inheriting the firm, led the individuals to move from a helping situation to full ownership and management.

Scherer, Adams, Carley, and Wiebe (1989) and Schere, Adams, and Wiebe (1989) used social learning theory to investigate the link between parental role model and the development of a preference for an entrepreneurial career. They noted that no previous study had shown whether an entrepreneurial role model resulted in individual to pursue an entrepreneurial career. They contended that individuals will likely express a preference for an occupation if they have seen role models have positive experiences with that profession. As a result, individuals will pursue training in that field, have expectations about entering that profession, and evaluate their own skills (self-efficacy) necessary to perform in that field. They concluded that performance of the role model was not as important as the very existence of the role model.

## **Methodology**

### **Questionnaire**

A questionnaire was developed and pre-tested during the spring semester, 2003. Students at two Midwestern universities and one Mexican university were surveyed regarding role model influence on career decisions. A total of 213 valid responses were received from the US students and 87 were received from the Mexican students.

The students were asked to indicate and rate the overall influence on career-thinking using a 1-5 Likert scale (1 = influence a lot and 5 = no influence) of their most significant role model during their formative years. Respondents were then asked to rate the influence of 18 student-role model interactions on career intentions using a 1-5 Likert scale (1=strong negative influence and 5=strong positive influence). These twenty activities were based on both a review of previous literature and knowledge of role model relationships. The respondents were also asked to rank the extent to which they wanted to own their own business within ten years of graduation using a 1-7 Likert scale (1=strongly do not want to own a business and 7=strongly want to own a business). Additionally, the questionnaire asked if their role model was a business owner.

### **Analysis**

The data were initially summarized using univariate statistics (means and frequencies) to provide a better understanding of the respondents and characteristics of the data. The initial summary statistics included those relating to demographic information and the mean ratings of the relevant variables. ANOVA was used to compare the mean

ratings of the influence variable on career intentions between US and Mexican respondents. Statistical significance found by from ANOVA suggests that the amount of variation between groups is significantly different than the amount of variation within the group and that differences between the groups exist.

## **Results**

### **Respondent Characteristics**

US respondents consisted of 65.9% males and 34.1% female students. Approximately 42.5% of the Mexican respondents were male and 57.5% were female. The majority of the US respondents (96.3%) were undergraduate students (25.9% - freshman, 3.7% - sophomores, 14.8% - juniors, and 51.9% - seniors). Only 3.7% of the respondents were graduate students. All respondents from Mexico were undergraduate students.

### **Most Significant Role Model**

Table 1 shows the most significant role models for US and Mexican students. The father was the most significant role model for students in both countries. The percentage of respondents who indicated that father was their most significant role model was also very similar (US students = 61.90%) and Mexican students = 62.07%). Relatively small differences in the significant role model are evident between the respondents from the two countries.

The next most significant group of role models are more concentrated among Mexican students than US students. Another relative (11.49%), mother (10.34%), and teacher (9.20%) are ranked similarly by Mexican students while a much smaller percentage ranked sibling (3.45%), other non-relative (2.30%), and friend (1.15%) as the most significant role model. US students' most significant role models are evenly distributed among mother (7.14%) other relative (7.14%), friend (7.14%), teacher (7.14%), and other non-relative (7.14%). A very low percentage of both US and Mexican students indicated that a sibling was their most significant role model.

### **Role Model's Influence on Career Thinking**

Table 2a shows the mean ratings of the extent to which US and Mexican role models influenced the respondents' career thinking. The mean rating among US students (5.66) is significantly greater (1%) than the mean rating (5.26) among Mexican students. The result implies that role models have significantly greater influence on career thinking of US students than the Mexican students.

The data was also evaluated relative to whether the role model owned a business. Table 2b shows that having an entrepreneurial role model that owned a business had a significantly more positive influence on respondents' career

thinking among US students. However, Table 3 also indicates that business ownership resulted in no statistical difference between the rankings of the extent to which the role model influenced Mexican students' career thinking.

### **Interest in Starting Own Business**

Table 3a compares the degree of interest in starting a business within 10 years of graduation among US and Mexican students. The table indicates that Mexican students are significantly more interested (1%) in starting their own business (mean = 6.46) than US students (mean = 4.85).

The respondents' degree of interest in starting a business within 10 years of graduation was also evaluated relative to whether the role model owned a business. Table 3b shows that having a role model that owned a business significantly increased US and Mexican students' ranking of interest in wanting to start a business after graduation.

### **Mean Rating of Influence Variables**

Table 4 shows the US and Mexican respondents' mean rating of the model influence variables. Almost all of the US respondents' mean ratings are between 3.0 and 3.90. The only exception is comfortable lifestyle (mean = 4.20). The next three highest rated influence variables are discussed job with you (mean = 3.83), included you (mean = 3.68), and management details (mean = 3.61). The three lowest rated influence variables are another job then join (mean = 3.12), away from home (mean = 3.18), and assumed would follow (mean = 3.18). No mean ratings are below 3.10.

Almost all of the Mexican respondents' mean ratings are also between 3.0 and 3.9. The two exceptions are comfortable lifestyle (mean = 4.48) and included you (4.10). The next three highest rated influence variables are adv and disadv of job (mean = 3.98), discuss with family (mean = 3.92), and management details (mean = 3.86). Three lowest rated influence variables are, brought work home (3.03), away from home (mean = 3.07), and paid for minor work (mean = 3.10).

A comparison of the mean ratings between the respondents in the two countries shows several general patterns. The two highest rated influence variables are the same for respondents in both countries. The three lowest rated influence variables are different, but still rated low for respondents in both countries. US respondents rated 7 of the 18 variables as having more influence than Mexican respondents while the other 11 variables were rated by Mexican respondents as having more influence.

The ANOVA examined difference between US and Mexican students' mean ratings of variables. Ten of the differences in mean ratings are different at a 5% level of significance. Mexican respondents rated nine of the mean ratings higher than US respondents (discussed with family, included you in that discussion, attended professional meetings, comfortable lifestyle, ad and disadvantage of job, assumed you would follow, management details, encouraged joining, another job then join). US respondents rated only one variable (paid minor for work) as being more influential than Mexican respondents. Interestingly, the two highest rated variables among Mexican respondents are also rated significantly more influential than US respondents. The only variable rated significantly lower among Mexican than US respondents (paid minor for work) was also the lowest rated variable by Mexican respondents.

### **Discussion**

The results of this study demonstrate that role models influence career intentions for both US and Mexican respondents. This finding is consistent with a number of previous studies (Krueger et al 2000; Azjen, 1991; Shapero, 1982). The results provide evidence on the relative importance of specific types of interaction between role models and students. Role model activities that actively included the respondent were had more influence on respondents. Those activities that were more passive from the perspective of the student respondent were generally less influential. Thus, being gone from home, bringing work home at night, assuming that the respondents would follow in their footsteps, and even encouraging the respondent to join their business or organization were of less importance than the activities that included substantial interaction between the respondent and the business or organization. This finding was relatively consistent among students from both countries.

The combined influence of relatives, especially parents, on career intentions is greater in Mexico than the US. The respondents' father was the most significant role model for US and Mexican respondents. Mothers and other relatives were also more frequently the most significant role model among Mexican than US students. This finding is consistent with a widely held belief that the structure and influence of families is greater in Mexico than the US and that US children tend to be more independent of parental influence than Mexican children.

The results also showed that role models who owned a business had a significantly greater influence on the career intentions of US than Mexican respondents than role models that did not own a business. This result may also be consistent with the greater influence of role models external to families in the US than in Mexico, especially since

findings indicated that the influence of Mexican role models who owned a business was not significantly different than those who did not own a business.

Mexican students were also found to have a significant greater interest than US in owning a business within 10 years of graduation. This finding may be explained by the university culture context in which students are immersed. US students, especially business students, are commonly exposed to a curriculum that is consistently influenced by large company issues. Mexican students receive much more encouragement to consider business ownership in both their family setting and university curriculum.

Finally, the results also showed that specific role model variables generally had a greater influence on Mexican than US students. This result is consistent with the stronger influence of family relationships among Mexican students than US students. US students may be more evaluative of role model interaction and, as a consequence, independent thinking than Mexican students. Mexican students may exhibit more influence by family interactions, especially when family members are also role models, and accepting of role model influences than US students.

### **Summary and Conclusions**

This study examined differences in role model influences between a sample of 213 US and 87 Mexican students. Respondents were asked to report the influence of their most significant role model from an overall viewpoint and with regard to specific role model activities. ANOVA was used to identify trends as well as differences in role model influence by country.

The results showed that the respondents' father was the most significant role model for US and Mexican respondents. Role models were found to have a greater influence on career thinking among US than Mexican respondents. Role models who owned a business had a significantly greater influence on the career intentions of US respondents than role models that did not own a business. Whether or not Mexican role models owned a business had no significant difference among Mexican students. Mexican students were also found to have a significant greater interest than US in owning a business within 10 years of graduation. Interestingly, both groups of students indicated less interest in owning a business if the role model was a business owner. Finally, the results also showed that specific role model variables generally had a greater influence on Mexican than US students.

The results may be of interest to instructors who teach entrepreneurship classes, business owners, and consultants. Perhaps more important, the results provide insight into differences in role model influences among two

countries whose economic and social structure have been becoming more integrated. Understanding the influence of role models should be of interest to entrepreneurship programs in colleges and universities. Entrepreneurship programs and workshops may consider including business owners as part of their curriculum. The results suggest that greater interaction between the business owners and student/program/workshop participants may lead to greater entrepreneurship orientation of the participant. Another option might be entrepreneurship internships. If universities offer internships with entrepreneurs, this may strongly affect a student's interest in becoming an entrepreneur. Instructors may find the results especially relevant when discussing factors influencing the decision to launch a business, issues related to family business, and role model influence on aspiring entrepreneurs. Business owners, especially family businesses, can use the results to better understand what influences generational succession decisions. Consultants can use the information by providing information on how to positively influence entrepreneurial intentions. All of these areas may be especially relevant when working with young adults who are exploring or developing career options. A better understanding of these issues, especially relative to differences between the US and Mexico, can provide insight into social and economic country dynamics.

The limitations of this study provide opportunities for future research. The study was conducted during only one time period. Future students might examine the influence of role models over time. The samples were also relatively small and geographically limited. Future studies could be expanded in size and geographic location. Future studies could also expand the sample to other countries. A multi-country sample could establish a data base of information over time that could provide insight into cultural differences, role model influence, and career intentions.

This paper explores relationship between family firm incumbent owners and the chosen successor. In particular, the decisions made by the incumbent to invest in the successor's social capital and the commitment of the successor to the firm are the main focus. Game theory is used to investigate these issues to achieve optimal outcomes for the parties concerned including the firm. The main findings of this study are that commitment of the successor is important to the firm and the incumbent realising a return from the investment for the firm.

## INTRODUCTION

The transition of a family business from one generation to the next is often a complex process influenced by the dynamics of many different relationships. One of the most important and influential relationships to the outcome of succession is that between the incumbent and the chosen successor. The transition of ownership and/or control from the incumbent to the successor has been attributed with whether the succession is successful and the resultant performance of the firm. Many researchers have suggested that communication between the two parties minimises the level of turbulence resultant of the transition. Furthermore it has been suggested that the communication will provide harmonious continuity of leadership style, strategic direction and the sharing of values.

This view does not consider the fact that each party possesses its own social capital which it brings to the position of owner/controller of the firm. Furthermore the decision of the incumbent to share his/her social capital with the chosen successor and how much is shared will have consequences on the outcomes of the succession and ultimately the performance of the firm post transition.

With the increased levels of education and external training received by successors prior to the succession process many have ample opportunity to develop their own social capital independent of the incumbent and the family firm. The successor brings this social capital with them to the position. Where the values associated with the social capital differ with the values held by the incumbent the potential for enhancing the strategic direction of the firm can result or alternatively conflict with the incumbent may occur. The enhancement is dependent on whether the successor and incumbent can combine their social capital or whether the incumbent is resistant to accepting the social capital of the successor or resistant to sharing their social capital with the successor.

This paper aims to investigate the probable outcomes resultant of the decisions of the incumbent and successors to share or withhold their social capital. Specifically, game theory will be employed to investigate the various strategies that may be adopted by both parties and the potential outcomes resultant of the positions taken.

The relationship between the incumbent and successor is a central theme throughout the family business succession planning literature. The quality of the relationship between these two parties has been highlighted as an important factor that contributes toward the succession process (Fox et al 1996). Cooperation between the two parties has been viewed as being imperative for the succession process to be managed and for negotiations to occur. Furthermore the quality of the relationship has ramifications for the relationships with other key stakeholders in the business, including staff members, important suppliers and customers.

Fox et al (1996) identified several key factors that may become the source of disagreement or alternative views held by the incumbent and successor. These factors include: the leadership style, existing relationships with key staff, relationships with suppliers, feelings about the future direction, ownership and management of the business. Each of these areas can provide differences that lead to alternative strategies adopted by each party toward their relationship with the other. Miller et al. (2003)

identified three common relationship patterns - conservative, rebellious and wavering – in a survey of faltering family businesses.

In this paper we present a *bargaining* game that consists of two players (the incumbent and successor) who are involved in two stages of the game. In the first stage the incumbent invests in developing social capital and human capital in preparing the chosen successor. The development of social capital may be the result of sharing access to the incumbent's social networks with the successor or allowing the successor to develop his/her own. The investment in human capital can be manifested through formal training/education or allowing the successor to gain experience outside the firm. In the second stage, the incumbent makes an offer to the successor to own/manage the firm. The successor has two options – accept or reject the offer. The incumbent can only realise the output of the investment if the successor accepts the offer. Alternatively the successor rejects the offer and chooses to pursue options external to the firm. The main issue in this game is for the incumbent to determine how much he/she should invest in the successor to develop the full potential but without providing too much potential (opportunity) outside of the business.

## BACKGROUND

Wong, McReynolds and Wong (1992) have examined Chinese businesses in Chinatown of the San Francisco Bay area, where 90% of the businesses are family firms. According to them the development and operation of these Chinese firms are the result of a complex interactive process involving ethnic resources-such as traditional values, kinship relations and information networks. These family firms are the prime example of the *jiating*. The term *jiating* is a Chinese concept refers to an economic family unit "consisting of members related to each other by blood, marriage, or adoption and having a common budget and common property" (Lang, 1968, p. 13). These Chinese firms serve primarily Chinese-speaking clients and their hiring preferences are (i) family members (ii) kin (iii) members of the same lineage or clan (iv) Chinese who speak the same dialect. However, family members are mostly favoured because of the assumption that they will be loyal, dependable and trustworthy. More importantly, they are also economical. Hence, Wong et. al. (1992) argue:

*They were quite willing to hire outsiders if family members were unable to participate. Their constraints were economic rather than family related.*

These Chinese family firms are relatively short-lived, rarely extending beyond one generation. One of the reasons is that younger generations, who born and educated in U.S., have more opportunity for social and economic mobility than their parents. Moreover, these young generations often feel alienated from the traditional Chinese management style of their elders and may not even speak in Chinese. As Wong et . al. (1992) have explained:

*.....They have brisk business. A man and his daughter run the firm. The family business has been supporting the education of other children. Now the children are grown up and have found employment in American establishments. They have no intention of returning to family business.*

*Many Chinese family businesses are too difficult to run for young generations. They have to work long hours but receive little reward. The immigrant business is good for those who have no higher education and other opportunities.*

From the above, we have found the following observations:

**Observation 1:** The family business has been supporting the education of children.

**Observation 2:** Once the children are properly educated, they might get higher return from the outside option, hence, they have less incentive to join family business where they have to work long hours but receive little reward.

**Observation 3:** The family business is good for those who have no higher education and other opportunities.

These observations motivate us to develop the following model. The model incorporates the fact that by making transfer payment to successors (i.e. son or daughter), an incumbent (i.e. parents who own the family business) brings potential risk towards the succession process of family business. Indeed, this transfer payment opens up an opportunity to the successor of getting higher return from outside options, which might create disincentive for him to join the family business.

## STRUCTURE OF THE GAME

We consider a two-period game with two players: an incumbent and a successor. In the first period an incumbent makes a transfer payment ( $t$ ), to a successor and the successor gets skilled with that transfer payment. In the second period (also the last period), the return from investment (transfer  $t$ ) to the family firm is realised, this return mainly depends on two things: the level of skill of successor and the benefit generated from social capital, ( $N$ ). Once the return for the family business is realised, the incumbent makes an offer to the successor as a the share of the family business on return of the successor into the firm. The successor can either accept or reject that offer depending on both his inside and outside options.

Note that the more transfer payment a successor gets, the more skilled he becomes, which also increases his outside options. This also brings uncertainty in the succession process. The more transfer payment an incumbent makes, the higher the level of skill of a successor, which may also increase the return of family business. However, the higher level of skill increases the successor's bargaining power by increasing his outside options and this may lead a successor to reject the offer. Based on this trade off the incumbent decides how much transfer payment he has to make to the successor. There also exists the cost of making transfer payment to the successor. The more transfer payment an incumbent makes, the less social capital he can develop for himself – this is due to the resource constraint. We assume that social capital is costly and contains a marginal cost ( $c$ ), which is constant. Furthermore, we assume that if the successor rejects an offer made by the incumbent then this incident leads to an unsuccessful succession process.

In this situation we find that incumbent has always an incentive to have a successful succession process as this will increase the return for the family business, and

subsequently the share for each player (Lemma 1). Besides, when the successor is not committed to join family business, the incumbent can make the transfer payment to the successor in such a way that a successor will always accept that offer (Proposition 1). However, this outcome is suboptimal as in this scenario the family business will realise less return than when the successor is committed to join the family business. Figure 1 shows us the extensive form of the game:

---

TAKE IN FIGURE 1 HERE

---

### MODEL

There are two players: incumbent (i) and a successor (s). At period 0, player i makes a transfer payment (t) to a player s. Player s will acquire skill with that transfer payment. The return from the skill level (h) which itself depends on t, therefore, one can write h(t). We assume that  $h'(t) > 0$  and  $h''(t) < 0$  i.e. the return function is subject to law of diminishing return. Furthermore, the function h(t) takes the equational form:  $h(t) = t^{1/2}$ . The total return of family business is as follows:

$$\begin{aligned} \max \{t\} R &= [h(t) \cdot d_s + N] \text{ subject to } t + cN = r \\ \text{or,} \quad \max \{t\} R &= [t^{1/2} \cdot d_s + (r-t)/c] \end{aligned} \quad (1)$$

Where, N = social capital, r = resource endowment which is fixed, c = marginal cost of social capital which is constant,  $d_s$  = decision of a player s. We assume that  $d_s$  takes binary values i.e.  $d_s = 1$  if player s joins family business firm, otherwise  $d_s = 0$ . If we differentiate the equation (1) with respect t then from the first order condition we get:

$$t^* = 1/4 \cdot c^2 \cdot d_s^2 \quad (2)$$

Putting the value of  $t^*$  in equation (1) we will get the following :

$$R^* = 1/4 \cdot c \cdot d_s^2 + r/c \quad (3)$$

We are now able to develop the following lemma.

**Lemma 1:** The family return will be higher if a skilled successor will join the family business.

**Proof:** The proof follows from the equation (3). If a successor joins the family business then  $d_s = 1$  and  $R^* = 1/4 \cdot c + r/c$  and if he does not join the family business then  $d_s = 0$  and  $R^* = r/c \equiv R^{**}$ . Clearly,  $R^* > R^{**}$ .

Implication of lemma 1 is straight forward. It means that if a successor joins the family business after acquiring skill with the help of transfer payment  $t$ , the return of family business will be higher. Therefore, a rational incumbent always has an incentive to make his successor to join the family business. Since the higher level of transfer payment increases outside options of a successor, thereby his bargaining power will increase, an incumbent has to make an offer such that uncommitted successor will accept that and join family business. In order to analyse that first we need to find out the disagreement point of each player i.e. what return each player will get if the agreement is not reached. Let assume that being a leader or Chief of a family business, a player get utility  $g^*$ . Hence, the disagreement point for each player will be as follows:

- Disagreement point of an Incumbent ( $D_i$ ):  $D_i = r/c + g^*$  i.e. if the agreement between an incumbent and a successor is not reached then the incumbent will get  $r/c$  as  $d_s = 0$  (follows from equation (3)) and his inside option  $g^*$  i.e. utility of being a Chief executive. Note that we assume that an incumbent has no outside option. This assumption is not too restrictive for our model.
- Disagreement point of a successor ( $D_s$ ): A successor has an outside option. For simplicity we assume that perfect competition prevails in skill labour market and the market wage for skill labour is  $w$ . Whether the successor will realise this market wage or not, depends on his level of skill which in turns depends on how much transfer payment  $t$  he gets from an incumbent. If the probability of realising market wage is  $\phi(t) \in [0,1]$ , then the return of his outside option will be  $\phi(t)w = t w$  minus  $g^*$  as he has to give up the utility of being a chief (if accepts an offer made by an incumbent). The function  $\phi(t)=t$  captures the fact that the more transfer payment ( $t$ ) a successor will get, he will realise higher level of wage which means his return of his outside option goes up. Therefore, one can write as follows:  $D_s = \phi(t)w - g^* = t w - g^*$ .

Having discussed these disagreement points, now we consider two cases:

**Case 1:** A Successor is not committed to join family business

If a successor is not committed, then an incumbent has to make the following offers (follows from Nash Bargaining Solution (NBS)):

$$X_s = D_s + \frac{1}{2} [R^* - D_i - D_s] = \frac{1}{2} [1/4c + tw - 2g^*]$$

$$X_i = D_i + \frac{1}{2} [R^* - D_s - D_i] = \frac{1}{2} [1/4c + 2r/c + 2g^* - tw] \quad (4)$$

Where,  $X_i$  and  $X_s$  are the shares of the return of family business of an incumbent and a successor respectively. The equation (4) follows from equation (3) and putting the values of  $D_i$  and  $D_s$ .

If the incumbent wants his successor to join his family business then he has to make sure that the following condition is satisfied:

$$X_s \geq tw - g^*$$

$$\Rightarrow \frac{1}{2} [1/4c + tw - 2g^*] \geq tw - g^*$$

$$\Rightarrow t^{**} \equiv 1/4 \cdot c/w \geq t \quad (5)$$

The equation (5) helps us to develop the following proposition:

**Proposition 1:** If the successor is not committed then the incumbent will make transfer payment ( $t$ ) to a successor such that  $t \leq t^{**}$ . By making such transfer payment an incumbent can keep successor in family business. In this scenario an incumbent and a successor will get the following respective shares:

$$X_s = 1/4c - g^* \text{ and } X_i = r/c + g^*$$

This is also a Nash Bargaining Solution (NBS).

**Proof:** The proof follows from equations (4) and (5).

The above proposition tells us that an incumbent can make transfer payment  $t$  in such a way that a successor will find that the return of family business is higher than his outside option, hence, a successor will join family business.

**Case 2:** Successor is committed to join family business

If the successor is committed to join the family business then an incumbent will make transfer payment  $t^* = 1/4 c^2$  (see equation 2;  $d_s = 1$  in this case) to a successor and each player will get the following share of the return of family business and this is also NBS:

$$X_s = X_i = 1/2 R^* = 1/2 [1/4c + r/c] \quad (6)$$

This follows from the equations (3) and (4). We also assume that if the agreement is reached between an incumbent and a successor then the disagreement points for each player will be zero i.e.  $D_i = D_s = 0$ .

We need to compare the two transfer payments:  $t^*$  (when a successor is committed to join family business) and  $t^{**}$  (when a successor is not committed to join family business). This develops the following lemma:

**Lemma 2:** if  $c > 1/w$ , then  $t^* > t^{**}$ .

**Proof:** We know that  $t^* = 1/4 c^2$  and  $t^{**} = 1/4 \cdot c/w$ . Putting  $t^* > t^{**}$  one will get  $c > 1/w$ . This completes our proof.

Lemma 2 tells us that if  $c > 1/w$ , then the incumbent will always make higher transfer payment in the case where a successor is committed to join family business.

We are now in position to develop our second proposition, which is as follows:

**Proposition 2:** If Lemma 2 holds, then the return for the family business will be higher when the successor is committed to join the family business than in the case when he/she is not committed to join the family business.

**Proof:** Put the value of  $t^*$  and  $t^{**}$  in equation (1). Then one can easily show that  $R(t^*) = [1/4c + r/c] > R(t^{**}) = [1/2\{(c/w)^{1/2} - 1/2 \cdot 1/w\} + r/c]$ , provided that lemma 2 holds.

Proposition 2 is very important for policy implication as it tells us how the succession process is related to the return of family business. The fact is that if an incumbent does not know the commitment of his successor – as to whether he/she will join the family business or not, the incumbent will invest less (i.e. make less transfer payment to the successor) which also reduces the return of family business and produces suboptimal outcome. In other words, uncertainty in the succession process has a negative impact on the return of family business. Furthermore, the marginal cost ( $c$ ) of social capital ( $N$ ) plays a crucial role in determining the family earnings on return.

The following numerical simulation (figure 2) illustrates our proposition 2. We normalize  $w$  to 1 and lemma 2 implies if  $w = 1$  then  $c > 1$ . Based on these we draw the following figure where  $w = 1$  and  $c = 1.1 \dots \dots \dots 100$ .

---

TAKE IN FIGURE 2 HERE

---

From figure 2 it is obvious that the return for the family firm is greater when the successor is committed to return to the family firm. However large investments from the incumbent would only follow when the incumbent is certain that the successor will return to the family firm. For the incumbent to know with more certainty that the successor will continue with the family firm, he/she might consider, if possible, making the family firm option more attractive than external options.

## CONCLUSION

A key contribution of this paper is contained in proposition 2. This proposition provides valuable insights for owner/managers of family businesses in determining appropriate strategies for succession planning, specifically when deciding on how much investment they should made toward the successor's development of social capital.

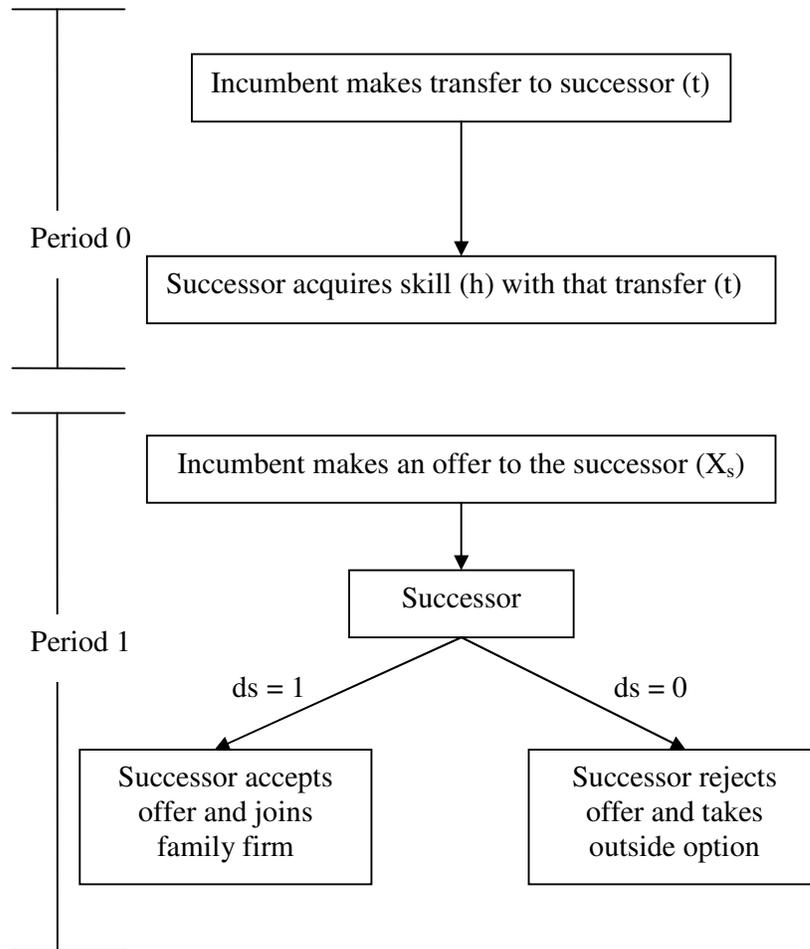

The commitment of the successor is imperative for the realisation of a return to the family firm from the investment in the successor's social capital (some of which is gained through education). To gain such commitment the incumbent should make the option of remaining with the family firm more attractive than external options. For

some firms this may be in the form of remuneration and financial incentives, for others it is important that the incumbents articulate both short term and long term benefits. Some times the long term benefits will only be possible if short term benefits are achieved and the long term benefits for the chosen successor may be manifested by them one day becoming the incumbent. In these cases perhaps the best strategy for the incumbents is to discuss the succession plans with timelines with the chosen successor.

### Abstract

The present study is based on two perspectives, by means of which we try to produce added value to discussion on SME-networking. These perspectives are a system view and a view that considers networks as entities. Previous performance measurement systems have focused on the level of single enterprises. *The objective of this paper is to create a network-level performance measurement system by presenting a theoretical framework for a network-level performance and by presenting preliminary measures in different parts of it.* A network-level performance measurement system emphasizes win-win situations in the network between the leader enterprise and the other members of the network.

The suggested framework for a performance measurement system is composed of the factors that enable action and success, of the processes, and of the productivity and profitability of activities. The issues enabling success are (1) the values and culture of the network, (2) resources, competences, as well as the (3) modes of action of the networks. The profitability of activities can be divided into (4) the profitability of internal processes, into (5) the customer satisfaction and into the (6) financial key ratios of the network.

Developing a performance measurement system for a network headed by a leader company is important from both a theoretical and a managerial perspective. These results are needed in order to understand the successful and the unsuccessful development and performance of vertical networks, and in order to develop an analyzing, designing and measuring tool for managerial needs in regard to SME networks.

## INTRODUCTION

### Gaps in the previous networking and performance measurement research

During recent years, the authorities have attempted to promote inter-firm co-operation very actively by trying to persuade small and medium-sized enterprises to enter different alliances. Nevertheless, the results are not always very flattering. Different promoters of networking have had limited knowledge about how to contribute to successful development in cooperative groups. Evidently, practitioners (consultants as well as entrepreneurs) do not have effective enough tools at their disposal when trying to form networks. It is very conspicuous that there has been hardly any research about the management tools and the holistic performance measurement of SME networks. For instance, network accounting has been approached mainly theoretically, introducing some evident problems (Järvenpää, Partanen & Tuomela 2001; Tomkins 2001; Kulmala 2003). Applying system level control mechanisms and performance measurement tools to a network is very important when managing networks. A network is not an intrinsic value but a tool to organize the operations between companies, and that is why there is so much interest in the ability of networks to succeed in their tasks. The companies in a network are interested in the benefits and costs of networking, the investors are interested in the revenue opportunities involved in a network, and the customers in the value chain are interested in the ability of the network to manage production tasks as well or better than an integrated single company.

The units of analysis in previous networking studies have varied all from an individual person (Birley 1985) to a firm (e.g. Tikkanen 1997), to a dyadic relationship (e.g. Vesalainen 2002a,b; Toivonen 2000; Malinen 1998; Holmlund 1997), to a network or a group (e.g. Varamäki 2001; Nummela 2000; Hyötyläinen 2000) and to a network or regional industry (Kalantaridis 1996; see also Oliver & Ebers 1998: 556). A great amount of research has, however, been done on dyadic or bilateral relationships between two partners in a vertical chain including buyer-seller relationships, channel dyads, buyer-supplier alliances, and distributor-manufacturer partnerships (Gulati 1998). However, new cooperative ventures involve increasingly multiple partners (see also Doz & Hamel 1998: 7) instead of only two partners. The system view of networks is currently becoming of theoretical interest. From a managerial point of view, applying system level control mechanisms and performance measurement tools to a network is very important when managing networks.

At the moment, the research on applying management accounting (MA) methods in network environment is in its early stage. Perhaps the most studied area in the field of network management control is *cost management* in networks (e.g. Kulmala & Paranko 2002; Kulmala 2003). Networking sets special challenges for cost accounting; single companies should be aware of their product costs. Furthermore, open book costing and wide dissemination of cost information is required. (Tomkins 2001; Kulmala & Paranko 2002). In this area, the overall goal is to minimize the total costs and to maximize the revenues in the network.

### Objectives of the paper

The present ongoing study is based on two perspectives, by means of which we try to produce added value to discussion on SME-networking. These perspectives are a system view and a view

that considers networks as entities. A network-level performance measurement system emphasizes win-win situations in the network between the leader enterprise and the other members of the network. In the present paper, *the objective is to create a network-level performance measurement system by presenting a theoretical framework for a network-level performance and by presenting preliminary measures in different parts of it.*

Ebers and Grandori (1997: 268) have indicated, among other things, that more research is needed to focus on certain types of networks and to assess and predict which models of networks produce certain results. In the present study, we are concentrating on SME networks headed by a leader company, because that model is the most common one in practice and research results have proven the fact that this way is also the most successful model of networking. In many cases, in vertical networks, co-operation between the leader company and the other cooperative members, which usually are subcontractors, resembles more a zero sum game than win-win co-operation. Our assumption is that not even a leader company can succeed in the best possible way if the network around it is not performing well.

We employ a *constructive research approach* developed by Kasanen, Lukka & Siitonen (1993), by working as an exceptionally large research team, which includes 13 researchers representing different disciplines of managerial research, such as accounting, management and entrepreneurship. The research project started in 2002 with a pre-study. This part was funded by Sitra (The Finnish National Fund for Research and Development) and during the project, a theoretical framework for the network measurement system was created. (Varamäki, Pihkala, Järvenpää & Vesalainen 2004). The project is now continuing with the financing and steering by Sitra, Tekes (National technology agency in Finland) and case firms. There are four case networks in the study. All of them are so-called leader-driven networks, including one strong leader firm. During year 2004, we have carried the theoretical pre-work needed and conducted case studies in network companies. So far, we have conducted 60 interview sessions, lasting approximately 1.5 to 2 hours per session. Additionally, we have conducted phone interviews, meetings and e-mail queries. We have gathered plenty of documents and detailed information from the case networks. Four networks actually include 20 different companies as case sites of this study.

## **A FRAMEWORK FOR A PERFORMANCE MEASUREMENT SYSTEM IN NETWORKS**

According to our pilot study (Varamäki et al. 2004), the suggested framework for a performance measurement system is composed of factors that enable action and success, of processes, as well as of the productivity and profitability of activities. The issues enabling success are (1) the values and culture, (2) resources, competences, as well as the (3) modes of action of the network. The performance of activities can be divided into the (4) performance of internal processes, into (5) customer perspective and into the (6) financial perspective of the network. The *values and culture* of the network describe the mental state of the network through trust, commitment, partnership values and communication within the network, such as interaction manners and openness. *Resources and competences* are connected in particular to the ability and capacity of the network to produce core output to the business effectively and, on the other hand, to create and to develop new modes of action. The resource base of the network is comprised of the

tangible and intangible resources of the individuals and the companies in the network, and of the compatibility, specialization / overlapping of those resources. The *modes of action of the network* describe the ability of the actors in the network to design and to exploit different modes of action in the network; for instance, the elements and models of bilateral and multilateral co-operation.

In the network, the above-mentioned enabling elements (values and culture, resources and competences, modes of action) are the *structural* and *operational choices, achievements* and *capabilities*, which are the seminal value drivers creating the base for the financial performance and profitability of the network. This performance could be evaluated by using the familiar logic of the Balanced Scorecard (BSC). In the causal logic of the BSC, it is generally assumed that a learning and well-being organization is 1) able to make innovations, and, furthermore, 2) effective and high-quality processes. Moreover, if these innovations and processes are customer-driven, the firm or the network will achieve 3) satisfied and profitable customers. This success in the eyes of the customer and customer profitability will be also reflected in the 4) overall financial success (profitability, solvency and liquidity) of the company/network, according to the logic of the BSC. In a well-run network, the profit is not divided in a zero-sum game, in which a profit increase in one part means a profit decrease in some other part. The framework is illustrated in the following figure.

---

Figure 1 about here

---

In the following, the different perspectives of the suggested framework for a performance measurement system will be conceptualized in more detail.

### **Values and culture in the network**

Market exchange is embedded in social relations; therefore, the social element has an effect on the different aspects of this exchange. In this study, network is defined as an intermediate form between markets and hierarchies. In line of the definition of a network, network culture is defined as a shared mindset of the actors in the network. The shared mindset is constructed on the basis of trust (relational dimension) and feeling of community (cognitive dimension).

As the measurement method for analysing the performance of the network comprises the dimension of values and culture, they are expected to support the performance of the network. The social dimension is argued to reduce transaction costs (partner search costs, negotiation costs and monitoring costs) (Gulati 1995; Zaheer, McEvily & Perrone 1998; Dwyer, Schurr & Oh 1987; Sako 1992), induce commitment (Morgan & Hunt 1994), induce customer loyalty (Foster & Cadogan 2000), support specialization, and to support information sharing and learning (Parkhe 1998; Ring & Van de Ven 1992; Hamel 1991). Here it is suggested that the network values and culture have an enabling role in the network. It enables profitability and growth by bridging and bonding the actors.

In this study, the social dimension is defined as network culture consisting of three sub-dimensions: relational, cognitive and structural (Nahapiet & Ghoshal 1998). The relational dimension mainly consists of the element of trust in this study. Trust is defined as a belief

consisting of eight different sub-beliefs. Trust as a belief refers to an attitude based on the cognitive rationalization of one's experiences and feelings. The sub-beliefs are the 1) capability belief, 2) predictability belief, 3) integrity belief, 4) benevolence belief, 5) honesty belief, 6) deterrence belief, and 7) reciprocity belief. The measurement of trust is based on these sub-dimensions. (McKnight, Cummings & Chervany 1998; Blomqvist 2002; Butler 1991; Butler & Cantrell 1984; Kee & Knox 1970; Swan, Trawick & Silva 1985; Coulter & Coulter 2002; Dasgupta 1988; Good 1988; Luhmann 1988; Rotter 1967; Coleman 1990; Gustafsson 2002.)

The cognitive dimension is based on the shared feeling of community between the actors in the relationship. This sharing forms the core element of the feeling of the community, the feeling that "*we're in this together*". This means the actors have a 1) shared vision, 2) shared mission and purpose, 3) shared goals, 4) shared rules and, to some degree, 5) shared values. This dimension does not suggest that the network should share exactly the same values, but the emphasis is rather on the first four dimensions, implying that the network needs a shared purpose and rules but accepts diversity among the actors. Still, shared values are often raised as an important factor of performance in the earlier literature. (Lewicki & Bunker 1996; Hart, Capps, Cangemi & Caillouet 1986; Coulter & Coulter. 2002.)

The structural dimension refers to the structure of network from the leader company's point of view. Typically, the core of the network structure can be described by measuring the number of the weak and strong ties or the number of the structural holes. Fourthly, the amount of communication is an interesting aspect to measure.

The measurement of the dimensions is based on a three-level scale: 1) calculativeness, 2) knowledge and 3) identification. The first and lowest level refers to calculativeness, meaning a typical market relationship, which is based purely on short-term exchange. In a calculative relationship, there often exist deterrence-based trust and trust in reciprocity. In these relationships, the parties expect to gain. The second level refers to a knowledge-based relationship, in which the actors have knowledge about each other. On the basis of knowledge, some indications of trust (trust in a) predictability, b) capability, c) integrity, d) honesty) and shared rules exist and can be identified. Trust is typically interpreted as knowledge-based. The third and highest level is based on identification. At this level, it can be expected that the actors trust each other's benevolent intentions and behaviour, but they also share the same purpose and values that drive their partnership and strategic network forward. Both the relational and the cognitive dimensions are difficult to measure, while the structural dimension can be evaluated more objectively.

## **Resources of the network**

When considering the resources in the network environment, the value of the whole network and its resources could be described as the sum of the (1) resources fit with customer needs, (2) the co-operation ability and willingness of the network and (3) the entrepreneurial capability of the network to reach new business opportunities. This means that the resources within a network are valuable only when particularly the leader company of the network is able to see the potential of the network resources correctly and is able to co-operate with the network resources and their owners and, at the same time, is able to coordinate the resources to fulfill the customers' existent

or potential needs. This model of resource measurement within the network aims to be a tool for analyzing the subjective value of the network resources within their own context. The purpose is not to find the absolute values or market prices for the resources. The main contribution of this type of tool and measurement process could be that it allows the companies to see positive or negative progress within the network by the aid of longitudinal measurements.

The value of a resource depends on the process it enables, and the value of the process is determined by the market where it takes place. Hence, the demand of the market and the competition among the companies in the market are essential value drivers. The ultimate value of the resource depends on the resources fit to the customers' needs. The process that the resource of the supplier provides must have interaction with market demand through the customer's acts - in this case, the leader company's acts. Without the willingness and ability to cooperate, the resources of the network will not have that interaction and the value adding potential will be lost.

From the customer's point of view - in this case, from the leader company's point of view - one additional requirement for the full utilization of the resources in a network is the ability to recognize and to evaluate the resources correctly. Without it, the leader enterprise is unable to use the resources in the strategy. If the leader company does not know the resources of the network or makes an inadequate evaluation of them, it is forced to build its strategy upon its own resources. The sum of the perceived value of the network resources for the leader company is the comparative value of the suppliers' resources in relation to the value of the resources of their competitors and the leader company's valuation of them. The better the valuation, the better the opportunities to bring the resources into interaction with market demand. Again, without cooperative skills and willingness to cooperate, the evaluation process of the network resources is often too demanding and likely to be inaccurate.

In our framework, the measurement of resources starts from the (1) evaluations of the resources of a single supplier, continues with the (2) evaluations of the awareness and familiarity, and with the (3) evaluations of the applicability of the suppliers resources and ends with the (4) evaluation of the allocation and development practices within the network. The logic in the measurement tool is that these dimensions will provide the assessment of the value and also value potential of the resources within the network headed by the leader company.

### **Models of action in the network**

By models of action in networks, in this study we refer both to bilateral and multilateral inter-organizational relationships, where the intensity of relationships is varying. This approach has been applied to dyad relationships between a customer and a supplier. Dyad relationships always form a ground for a larger network (e.g. Johannisson 1988) and although the level of analysis in our study is that of a *network*, it is evident that bilateral relationships between a leader company and suppliers have to perform well in order to guarantee success in the whole network. In addition to the quality of bilateral relationships, the quality of multilateral co-operation has to be taken into account in a system-level performance measurement. The assumption in our study is that inter-organizational relationships in a network are regarded as deeper if the links between parties are highly organizational, i.e. structural, highly strategic and more multilateral (see Vesalainen 2002a; 2002b).

When analyzing the models of action in a network, business integration and organizational integration between the companies are considered. Business integration is divided into two sub-dimensions, which are strategic integration and the features of the exchange between the companies. Organizational integration is divided into the sub-dimensions of structural integration and social capital. The basis of analysis of the network intensity of organizational links is about the same in the cases of bilateral and multilateral relationships, where the structural links (interface structures, system and process integration) are multiple compared to a dyad relationship. The organizational arrangements are just more challenging when there are more actors taken into account. The analyzing of social capital could be based on a study of trust between two persons or two organizations. The study should also include the consideration of trust in the group as an entity, interaction in the group, as well as cultural cohesion and the cohesion of objectives within the group.

Business cohesion at the network level is evaluated through joint development, joint products and joint public presence. Strategic integration and all its sub-dimensions are considered in the same way in both bilateral and multilateral relationships. In a bilateral relationship, the dependence between the actors is two-way dependence of a supplier and a client. Also in multilateral relationships, there is two-way dependence, but the dependence is between a single company and a group of the other companies. Strategic planning is roughly similar in both cases, but in the case of multilateral cooperation, strategy is the collective strategy of the companies within the network. In multilateral cooperation, the risk is also shared, but there are more than two partners to take the responsibility. Additionally, profit sharing and win-win policy between the partners has the same logic in both multilateral and bilateral cooperation, where success depends on the ability of the companies to enhance the volume or to produce more effectively.

### **Performance of processes in the network**

In a network, the above-mentioned enabling elements (values and culture, resources and competences, modes of actions) are the *structural* and *operational choices*, *achievements* and *capabilities*, which are the seminal value drivers creating the base for the financial performance and profitability of the network. This performance could be evaluated by using the logic of the Balanced Scorecard (BSC). It is generally assumed in the causal logic of the BSC that 1) a learning and well-being organization is able to make innovations, and, furthermore, 2) effective and high-quality processes. The outcomes will be realized as quality, speed, effectiveness, flexibility, innovativeness, etc. in a supply chain.

One major aspect in the development of network processes is optimization. Firstly, it is a question of synergies between the development attempts related with the different activities. Development achievements in one activity might lead to unfavourable results in some other activities. In this study, the development of the network process performance is further subdivided into product development and manufacturing processes. Performance is further categorized into external and internal efficiency. Internal efficiency is realized in the efficiency of the manufacturing process. Productivity and time-based measures play a key role here. External efficiency deals with the ability to develop and launch new and competitive products into markets. (Vesalainen 2004)

Manufacturing processes in networks are divided into 1) normal processes, 2) the development of normal processes, and 3) problem-solving processes. A problem-solving process is about handling disturbances in a normal process. Accordingly, the performance of the normal processes of a manufacturing process could be measured with terms of productivity and time. The two other processes - development and problem solving – have an impact on the performance of the normal process. A development process is aimed at improving a normal process and associated costs could be allocated annually into the normal process in the case of the developments related with continuous improvement. Larger development projects should be treated as long-term assets and allocated annually as depreciations at the first stage and in a normal process as overhead costs at the second stage. (see Vesalainen 2004)

### *Process measures; towards shared reality and learning*

Common measures of operation processes (order-manufacturing-delivery processes) are generally applicable also in network conditions, depending on the specific business of each network. What is important, however, is that there is a clear and shared strategy about the shared future and direction behind these measures. One key notion related with this is that the measurement of the network processes creates a shared awareness of the shared network alongside the network. The measurement clearly creates a socially constructed reality (e.g. Berger & Luckmann 1966; Hines 1988), which is most important to the meaningful management and development of the network as an entity.

Measurement of a network process raises the process as an object of control by directing peoples' attention towards it. The basis of network learning and its measurement is the examination of supply and value chains as systems of modularity in which different product, process and knowledge architectures are described as the antecedents of learning and the effect of learning on the effectiveness and the performance of the processes in a supply chain and on the ability of a value chain to yield positive economical outcome to all the participants in the cooperation network. The ability of a value chain to yield added value is examined as the ability of the cooperation network to yield added value to its customers, generated by the price and/or the properties of the product. The analysis of the cost structures produced by activity-based cost accounting indicates which are the factors affecting the added value in the value chain in a negative way. On the other hand, factors affecting the properties of the product in a negative way are discovered by an analysis of the product and production architectures.

### **Customer perspective in networks**

According to studies (e.g. Malmi 2001; Puro 2001; Toivanen 2001), the customer perspective is commonly judged as the most important perspective of strategic performance measurement systems. This is obvious, because customers constitute one essential stakeholder group, particularly because money is received from the customer and the success in the marketplace is determined by the customer. To some degree, customers' focus is thus an absolute necessity. Also customer-orientation and the quality movement in business life further underline the importance of the customer. The elements of the customer perspective are presented e.g. by Kaplan & Norton (1996)

The logic of the customer focus is simple. It is expected that customer orientation increases customer satisfaction, which, in turn, increases customer loyalty, which, in turn, increases profitability and improves shareholder value. Of course, this relationship is neither straightforward nor linear and has many limitations in real life. (cf. Tuomela 2000)

Customer satisfaction is not only an issue in the customer perspective, but this phenomenon is multidimensional. Customer satisfaction is not only an issue in the customer perspective, but this phenomenon is multidimensional. Some core measures suggested by Kaplan & Norton (1996) are market share, customer loyalty, customer satisfaction, customer acquisition and customer profitability. So far, there is no reason to expect that overall customer measures in networks differ from those in single companies. The challenge is merely to manage the network in a way that these critical success factors could be achieved from the customer perspective. This kind of measurement has thus the potential to visualise the end customer perspective in network conditions and, therefore, to create customer-oriented reality (Hines 1988) by quantifying the customers and making them calculable (Vaivio 1999).

### **Financial data and financial statement indicators in estimating the economic performance of a network**

In this part, a framework is presented for the measurement of the economic performance of the network and of the network member firms. The primary objective is to make an approach towards network financial statement analysis. This analysis consists of estimating and predicting the economic effectiveness of the network and the economic efficiency of its member firms, with the help of indicators based on the public financial statement information and the internal (intranet) financial data of the network firms.

The amount of internal financial statement information (openness) determines what and how reliable results are obtained from the analysis. However, the objective of the analysis is to create at least a coarse idea of the effectiveness of the network and of the fairness of the distribution of the economic advantage of the network between the member firms, irrespective of the amount of this information. The more reliable figures the member firms desire to have about these matters, the more they should invest in developing accounting systems and in the openness of information. Especially, the member firms should be able to separate their mutual network transactions from their other business.

The objective of networks-specific financial statement analysis is to estimate the effectiveness of the network and the efficiency of its member firms. The frame of reference developed in the study contains the basic factors of the economic analysis of the network and of relationships between them (a strategic map). In this approach, the *resources* of the network are considered as a starting point for the operation of this network. These resources will generate causal links towards three different directions. In the first direction, the *growth* and *concentration* of the resources of the network are analyzed between the member firms. In the second direction, both the *productivity* and the *profitability* of these resources are estimated. The third direction describes the *mutual (internal) flows* of the network (in other words, the business interaction matrix, BIM) between its member firms, containing inside the network the flows accomplished

by the resources. These flows are vital to the operation of the network and they also have an effect on its growth and profitability.

The variability of the flows, which is manifested in the interaction matrix, contains a *risk* related to the network. Information about growth (or concentration) and profitability makes it possible to make a coarse prognosis about the economic advantages produced by the network in the future, i.e. about the future flow of net income. When this predicted flow of net income (containing the separate effect of the network) is discounted at the moment of analysis with the interest rate adjusted for the risk, an estimate of the *value* of the network (network capital) will be obtained. The determination of the network value is one of the most central tasks of financial statement analysis because it shows in particular the economic effectiveness of the network.

---

## Summary

Next, in Table 1 we provide a summary of the perspectives and preliminary measures of the network measurement system created in this research project. In Appendix some examples of concrete measures of the framework are presented as well. The next step of the study is to define and implement systems for each single network and to define the general measurement model with general and network-specific measures.

---

## DISCUSSION

After the theoretical part, we will now continue our study by testing a network-level performance measurement system in practice with four vertical case networks. In this sense, our study aims to contribute both to a theoretical and a managerial perspective. These results will help us understand the successful and the unsuccessful development and performance of vertical networks in the spirit of a strategic map (Kaplan & Norton 2001). The potential benefits of this *total research project* for practical actors, entrepreneurs, small business managers, network promoters, authorities, and network investors will be the following:

1. It is possible to inform companies and other practitioners of how a network headed by a leader company acts “ideally” in different areas of networking.
2. Members of networks and investors in networks are able to use the “ideal model” for a network headed by a leader company as a tool to analyze, evaluate and to develop networks.
3. Within networks headed by a leader company, it is possible to utilize this model to consider suitable networking strategy and to choose the most suitable level of networking.
4. The “ideal model” to be developed allows companies, consultants, authorities, and investors to use it as a tool for education.

5. The “ideal model” will produce new innovative methods and ways of action.

## **APPENDIX.**

**Some examples of measuring Culture and Values in the network (Scale 1=strongly disagree – 5=strongly agree).**

1. Our partner acts in a double-dealing way.
2. Our partner provides aid for us when we need it.
3. Our partner does not overestimate their own capabilities to serve us.
4. Our partner acts are predictably in different situations.
5. Our partner is capable to fulfill the objectives we set.
6. Our partner does not betray us because of the fear of losing their reputation in the eyes of other suppliers.
7. Both parties of the relationship are trying to develop a common business process.
8. We feel we are “in the same boat” with our partner.
9. When meeting each other, both parties in the relationship are able to freely express their opinions about the relationship and its development.

## **Some examples of measuring Resources in the network.**

**Questions related to evaluation of the value of the resources of single companies (Scale 1=strongly disagree – 5=strongly agree).**

1. The technical service we offer our customers is rare in our region.
2. The integrated service package we offer our customers (delivery deadline, delivery reliability, price, capacity, extent) is rare.
3. In certain things, we are clearly better than our competitors.
4. The service we offer is essentially connected with our customer’s core know-how
5. Our customer’s activities are strongly dependent on our enterprise.
6. It is difficult for our competitors to copy our strengths.
7. Our relation with our customer would be difficult to replace by a new supplier.

**Questions related to awareness of others’ resources (Scale 1=strongly disagree – 5=strongly agree).**

1. We know very well our suppliers’ capabilities to serve us in relation to both quantity and quality.
2. We are aware of possible complementary know-how and resources with our suppliers.
3. We know the products and services offered by our customer well, regarding both quantity and quality.
4. We are aware of possible complementary know-how and resources with our customer.
5. We know the products and services offered by the other enterprises in the network, regarding both quantity and quality.
6. We are aware of possible complementary know-how and resources with the other companies in the network.

**Questions related to applicability of the resources (Scale 1=strongly disagree – 5=strongly agree).**

1. The products and services offered by our suppliers correspond well to our needs, also in the future.
2. In their activities, our suppliers concentrate on factors essential for our strategy (e.g. product development, price, quality, delivery reliability, flexibility, etc.).
3. What we primarily want from our suppliers is a priority also in our suppliers’ activities (e.g. price, quality, delivery reliability, etc.)
4. In our network (the other enterprises in the network), there is no significant overlapping know-how.
5. The know-how and resources of the other enterprises in the network complete our own know-how and resources.
6. The business activities of the other members of the network are mainly in lines in some way connected or touching our own activities..
7. The development of the resources among the members of the network would help us serve our customer better.

8. The joint development of the resources of the network is essential for the competitiveness of the network.
9. The joint development of the resources in the network would help us develop our own business activities.

**Questions related to allocation and development of resources (Scale 1=strongly disagree – 5=strongly agree).**

1. In addition to our enterprise's own strategy, we have a common network-level strategy, which also acts as a guideline to our own activities.
2. We feel we are "in the same boat" with the other enterprises in the network.
3. The enterprises belonging to the network have highly similar goals regarding their business operations.
4. The enterprises in the network are able to cooperate in a straightforward and fluent way.
5. Our suppliers adapt themselves rapidly to our changing needs.
6. We develop know-how and learn new things with the other members of the network.
7. We discuss the future investments of the network together with the other members of the network.
8. We seek to develop different roles for each enterprise within the network.

**Some examples of measuring Models of action in a network in terms of multilateralism**

**Common product development**

- |          |  |
|----------|--|
| 3 points | New products and services are developed in the business group in such a way that all the firms are involved, but none of them gets individual compensation; the results of development are jointly owned and utilized.   |
| 2 points | New products and services are developed in the business group in such a way that all the firms are involved, but none of them gets individual compensation; the benefits are mainly owned by a certain company in the group, but each of the companies is compensated when the product reaches the market. |
| 1 point  | New products and services are developed in the business group in such a way that all the firms are involved and also compensated according to their prime costs of the development process; the benefits are shared when the product reaches the market.   |
| 0 points | There is no common product development in the group.   |

Present state:  Objective state:

**Common brand and image**

- |          |  |
|----------|--|
| 3 points | The business group has developed a common image or a common brand for their products or services; the common image or brand is well-known in the market.   |
| 2 points | The business group uses a common brand or image, but each company has still their own individual brands and images; the common brand or image is not widely known in the market.   |
| 1 point  | The business group has joint public presence, common brochures or another kind of loose cooperative arrangements, but the group is not trying to build up a common image or a common brand for their products or services. |
| 0 points | The business group does not try to appear as a group.  |

Present state:  Objective state:

**Decision-making**

- 3 points      The decisions are made in consensus, i.e. all the parties must accept the important decisions.
- 2 points      The business group makes their decisions democratically, i.e. the majority makes the decisions
- 1 point        The business group makes their decisions hierarchically, and the leader company has the most important role in decision-making.
- 0 points      The business group does not have common decision making practices; all the decisions are made inside the individual companies or in the dyad relationships.

Present state:       Objective state:

### **Some examples of Financial measures in the network**

Network resources

Tangible assets / Total assets for each member firm and for the whole network

Network growth

Growth in net sales for each member firm and for the whole network

Network concentration

Distribution of net sales among the member firms in the network

Network productivity

Net sales / Total assets for each member firm and for the whole network

Network profitability

Return on investment ratio for each member firm and for the whole network

Network flow

Mutual sales and purchases (cash flows) between the member firms of the network

Network risk

Variability in mutual cash flows for each member firm and for the whole network

Network value

Discounted cash flow of net profit from the network for each member firm and for the whole network

### **ACKNOWLEDGEMENTS**

This paper is part of a broader research project, Pyranet, funded by Tekes and Sitra and the four companies involved. We thank all of them for their financial support for this research.

Associate Researcher

## **ABSTRACT**

This research's objective is to know and describe the predisposition factors, the unchaining factors and the maintenance factors in the development of the Entrepreneurial Career of a group of entrepreneurial professionals. The research was based in Dyer's Entrepreneurial Career developed in 1994, the career planning concepts of Schein and contributions from other researchers. The sample used was made of forty four Business Administration, Systems Engineering and Industrial Engineering graduates from three universities from the city of Cali, Colombia, who actually manage their own company or work for family business. The research used the "In-depth interview technique", carried out by psychologists, in order to investigate aspects like family environment, educational development, juvenile experiences, managerial development stages and many other psycho-social aspects related to the entrepreneurial process. From the results you can determine certain specific factors that supplement Dyer's pattern, especially it was determined that there are situational variables, deeply defined by family formative experiences and work experiences, that frame the whole model. In the same way, we could detect that formal education in Entrepreneurial Spirit, is more a complementary tool and a stimulant of previous situations than a fundamental variable of the entrepreneurial process.

## **INTRODUCTION**

A person's transformation process into a manager, has been a matter of study in which many researchers have worked through the years, giving birth to a body of knowledge on: Motivations (McClelland, 1962, Schein, 1978), Characteristics (Hornaday 1971), Processes (Shapiro 1980, Rostand 1985, Timmons 1999 Gibbs 1987, Vesper, 1980), Entrepreneurial Career (Schein, 1990), educational models, factors and many other aspects associated to that human transformation that permits the outcome of a new entrepreneur and of a new company.

The great majority of all those theories has been conceived in developed countries and many of them have not been validated in the Latin American environment. This investigation was oriented to validate and supplement Dyer's Entrepreneurial Career model, using a sample of

44 professionals, entrepreneurs, Business Administration, Systems Engineering and Industrial Engineering graduates, from three Cali city universities.

### **ANTECEDENTS AND METHODOLOGY**

During 1999 and 2001 and with the support of the Corona Foundation, the Center of Development of the Entrepreneurial Spirit from the Icesi University, carried out a longitudinal research of graduate students in Business Administration, Systems Engineering and Industrial Engineering, from three main universities of the city of Cali. The purpose was: to determine the percentage of those graduate students who have decided to enter new entrepreneurial activities, to characterize those organizations, to identify the motivational factors, to value the role played by the educational system and to determine the factors and facts that influenced their decision.

The results of the first two phases of this study were reported in Varela, Jiménez (2001<sup>a</sup>, 2001b). The third phase of this research that implied in-depth interviews to 49 graduates, is the objective of this work. First of all, a theoretical study was made on the topic of Entrepreneurial Career, based on Dyer's model (1994), which was supplemented with diverse theories, that permitted to establish a series of categories to organize the information given in the interviews and to identify some fundamental factors in the beginning, during the establishment and during the strengthening of the entrepreneurial career.

### **DYER'S ENTREPRENEURIAL CAREER MODEL**

W.G. DYER (1994) using Schein's concepts (1978, 1990) developed an Entrepreneurial Career model that is summarized in Figure # 1

|  |
|--|
| Figure # 1 Entrepreneurial Career Model. Dyers (1994) about here |
|--|

The model outlines 4 components: **Career Selection**, which explains the reasons for a person to decide to create a company, **Career Socialization**, that shows the personal experiences pushing the individual to assume the creation and managing of a company; **Career Guidance**, that describes the existing different development alternatives for those who opt to become an entrepreneur, and **Career Development**, that shows the different entrepreneur roles and his/her challenges, goals and conflicts arising through out their life.

The results of the analysis made to the interviews, based on the development of the present model, are shown bellow.

### **RESULTS ANALYSIS BY CATEGORIES**

Here is the method used to structure the results from the 44 interviews, which allows to consolidate the model outlined by Dyer (1994) in each one of its components. A new component that analyses the influence of the situational factors, outlined by Shapero, 1980, will also be presented like a contribution to the model.

#### **Career Selection**

Career Selection is defined as "the individual, social and economic factors influencing and guiding a person to look for his/her independence as an entrepreneur" (Varela,2000). Among those elements related to Career Selection, there are three identifiable basic factors: the individual, the social and the economical factor, which will be analysed at once.

**Individual Factors:** When Dyer’s model speaks of the individual factors, it emphasises on the relationship between a person’s attitude, his/her motivations and its cognitive style, factors guiding or pushing for a career selection. Among case studies, there are some comments like:

*“Since I was a little kid I’ve been restless and also a mediocre student, and have little social relationships”*

*“I was assembling and disassembling things all the time, I was curious about knowing how things functioned”*

*“I always wanted to be an inventor. Now I design and improve my own company machinery”*

Table 1. In-depth interview –Individual Factors. About here

Some of these variables may seem contradictory, however, it is necessary to keep in mind that each human being interprets every situation in a different way. Therefore, the value assigned to each act will depend on each individual's previous experience.

**Social Factors:** For Dyer, these factors were related to the family, economy and social environment conditions, same as the cultural and geographical differences and those of social support, to be the unchaining entrepreneurial actions ready to break up all those negative conditions, people sometimes go through. The results are:

*"Since I am a kid, I have seen a business family, not only for my father but also for my uncles and the different type of business we were in"*

*"My family has always motivated me. All the economic restraints we had, that pushed me to work harder and harder and to give more to my family”*

Table 2. In-depth interview - Social Factors about here

**Economic factors,** make reference to the financial reasons leading to the career decision, such as the economic crises that turned into a learning process. These crises were caused by administration errors, lack of knowledge and control of the environment and of the competition, or just by organizational restructuring processes. Here are some of the comments found:

*"We always had economic problems in the childhood. That’s how we got a living, doing whatever was at hand"*

*" Actually, violence forced us to get out from our land and start again someplace else”*

Table 3. In-depth interview – Economical Factors about here

### **Career Socialization**

Another important component of the Entrepreneurial Career, is the career socialization, defined as “the diverse experiences that prepare the person for his/her performance like manager” (Varela, 2000). These results grouped themselves in childhood, work, education, personal networks and the entrepreneurial experiences.

**Childhood Experiences,** are all those situations lived in early years specially related to the family and that family support offer or offered to the career socialization process. Here are some statements in relation to the childhood experiences:

*“I developed the ability to sell all kind of stuff and make money. I designed, made and sold kits and the money I made I used to give it to my mother”*

*“My father left home and then everybody else was forced to work to support the family”.*

Table 4. In-depth interview – Childhood experiences. About here

Work Experience. Many times these work experiences permitted us to find models or to assume influencing roles on the entrepreneurial career, as can be seen from the next statements:

*“I started working as a handyman in my uncle’s company, then I started to help organizing products little by little, and finally I got to the salesman position, I was doing very well”*

*“I was always ready to help in everything. I always wanted to learn how to do different things, I was always trying to bring new ideas in my job, things like home delivering products”*

Table 5. In-depth interview – Work Experiences. About here

Education. Results show that formal or non-formal educational processes offer the necessary tools, to access the technical knowledge needed for an entrepreneurial career. It is possible to identify a relationship between the needs and the search for alternative solutions in the continuing education. Next, some comments from the interviewees:

*“ I didn’t really like to study. I finished my high school because I thought it was important. It wasn’t only until my company started to grow that I thought about seriously studying a career. It happened many years later”.*

*“Formal education taught me to save time, money, and processes; I used to apply everything I learned”*

Table 6. In-depth interview – Education. About here

Personal networks like childhood relationships, university relationships and the labor ones, show contrasting results, since, while in some cases one could say that they have not been very significant, being replaced by a great influence of the family relationships, in others, they have been the success key of their organization.

*“ I learned about values and work performance value, through my uncle’s company manager. That gave me leads to my own company ethics”*

Table 7. In-depth interview - Personal Networks About here

The entrepreneurial experiences, where differences were found among the interviewees as a function of the type of work every one had. In family businesses the communication between generations it is very important, and also the progressive linkage of the organization itself with the family philosophy. When managing your own business you can see the efforts made to make better every day and you can see the search for support from friends or couples. We found some comments like these:

*"Somebody told me a business was for sale. My working partner and I became business partners and bought it. We paid off all the business debts and it was growing little by little. It expanded out and it had a horizontal growth"*

*" All others businesses were created for our families, so they could have their own Business too. We put all the principal"*

*" After I finished making myself up, we started to generate what is called "franchises". This has given us some difficulties, but it is a new business projection"*

|   |

### **Career Guidance**

Career guidance is defined as "the different roles and specific ways in which a person develops his/her own career" (Varela, 2000). Although not all the interviewees are clear as to what is their main motivation to determine their job linking, one can observe that it is more influenced by life circumstances, although some have it clear from the very beginning that they want to have their own business. In the interviews it is possible to identify: the importance of social support in the moment of the creation of companies; the difficulties encountered in the administration and in the generation of change alternatives, and the innovation, investigation, and the development of the organization and diversification.

The career guidance is one of the stages in which the process of the person's identification like a business owner, is fundamental. The elaborated structure allows to identify the moments the business owner goes through, from the time the company is born. The managerial behavior as a consolidation of his/her manager role, having into account that he/she must carry out different parallel processes, that he/she must correct his/her first management errors, and to initiate his/her own ideas about starting a vertical or horizontal company development, which will, somehow, consolidate his/her management skills.

|   |
|---|
| Table 9. In-depth interview - Identity Development about here |
|---|

### **Career Development**

After selecting a career and being a little clearer respect to the career's identity, three clear moments are identifiable in its development through out the years. According to Dyer, these three stages are: the starting point, the middle way and the end of the career. Results are as follows:

*"I thought it was going to be a conflict to work together with my husband, and it was difficult at times"*

|   |
|---|
| Table 10 – In-depth interview – career development about here |
|---|

The personal dilemmas bring the highest managerial career related information, especially with the conformation of the life's plan. The main managerial dilemmas arise from crisis due to robbery problems, people relationships, the closing down of the company or economic crisis.

Each one of the interviewees defines success as a function of their own priorities, some mainly identified with satisfaction from personal success (learning, creation of own company, etc), others identified with managerial success from their professional background, from

goals achieved (organization's own growth). As to family success, the overcoming of crisis and work family achievement, are mainly mentioned.

Table 11 – In-depth interview - Dilemmas about here

*"The fears from working as a couple were overcome and the couple's relationship was strengthened thanks to the much love we had for each other"*

*"I always dreamed of having my own business running. Now that I am 32, I have it made, I made it through; one is the company, all of us are the company"*

Table 12 – In-depth interview – Success about here

### **Situational Factors**

Situational factors are all those significant events that marks people's specific landmarks. This can be considered a breaking out factor, mainly because it determines life changes due to personal or family economic crisis (parents separation, moving out of the city, all sort of experiences, couple's own growth, etc); these situational factors may, in the same way, include aspects related to opportunities. Few of the interviewees who had made it clear, as to what their career was going to be, understand the importance of all the aforementioned factors, only understanding the influence on their own career development when they speak retrospectively of them.

One of the statements greatly supporting this factor is:

*"The main reason was the family crisis, then the displacement from our own land due to the violence, next my parents' separation and the economic necessities that were generated"*

Table 13 – In-depth interview - Situational Factors About here

### **CONCLUSIONS**

The results allow us to conclude that family and childhood experiences have been one of the fundamental aspects in order to make the decision of becoming business owners. These experiences have favored the development of skills and managerial attitudes, being the emotional crises by couple and family factors, something of a great importance.

During the career socialization it is possible to identify some biasing factors like childhood experiences, where incipient business creation behaviors or economic activities are modeled. Work projection related to the life plan, something sometimes not well defined, and the work background which brings models to be followed, are in many cases, the bases to start a business career.

The formal education helps to get a theoretical and methodological support in order to improve the business behavior, and to develop a humanistic vision in the process of creating new companies and to keeping them on the going.

Among the most influential elements in the Business Management career process, we find the emotional landmarks, the personal dilemmas and the personal success and that of the business. The interviewees are very aware of the economic crises and the ways to come out of them, looking at it not only from the company's point of view, but from the country's own domestic influential conditions.

The opposing results inside the analysis of the interviews show an emotional alternative, generated by family problems inside the process of the managerial career, which is in some cases, a reason for personal and business endurance in some cases, but a factor of personal lack of equilibrium and business bankrupt.

One of the contributions of the investigation is therefore the relevance given to the situational factors as promoters of the managerial process. It would then be important to deepen in them, to design methodologies or strategies able to develop skills, ready to confront their effect towards the development of a successful managerial career.

Keeping in mind some of the queries that Dyer proposes in his article " Toward a Theory of Entrepreneurial Careers" 1994, like a foundation to strengthen a theory of managerial career, we can write down that the obtained results starting from the in-depth interviews, allow us to suggest that we cannot determine a certain sequence of experiences of socialization of the managerial career, but rather that these experiences together with the variables mentioned in the investigation, are presented in a recurrent way, not in a sequential way, allowing to accumulate formation experiences that may not necessarily have a managerial meaning, just as the interviewees mentioned it at a certain time in life, like it is, for example, the childhood or the adolescence.

However, these same cumulative experiences along the life cycle, can be interpreted in a very different manner, when situational factors arise, which unchain the decision of starting up with a new company.

From all research results we can present an enhanced Business Career model, having Dyer's 1994 model as an example. It is suggested to do the model development analysis, in a cyclical way, which allows to value the influence of the situational factors in the different process stages, either as development promoters or as factors inducing the person to restart the cycle, according to the new outlined conditions.

## Abstract

This study is a part of a longitudinal research project which has followed the development of 200 SMEs in the branches of metal-based manufacturing and business services since their start-up in 1990. The paper concentrates on 86 survived respondents after seven years activity. We develop a model for testing the factors that differentiate growing new ventures from the non-growth companies. One half of the respondents (43 firms) appeared to be steadily growing (over 10 % annual growth in turnover). The combined model classifies correctly 89.2 % of observations. The high total classification rate is based on the successful classification of growing ventures. The model classifies correctly 39 of 43 growing ventures. Growing ventures are opportunity driven (pull motivation), and applying group management style, have increased their production capacity and their external network relations, and adopt a specialized product policy, i.e. are aiming to differentiate their products from the products of their competitors. Subcontracting and specialization as a firm's strategy were successful differentiators, too. The successful differentiators in the combined model did not include any statistically significant entrepreneur specific variables. It could be argued that the fit of entrepreneur is necessary but not a sufficient condition for successful performance. The implications of this study for academics, educational institutions, entrepreneurs, and other practitioners is encouraging. The most of those factors that differentiate growing ventures from non-growth companies could be taught and learned, and are dependent on strategic and operative choices of the entrepreneur.

## Introduction

Over the past twenty years, much research has been devoted to answering the question what factors explain the performance of the firm. Sandberg (1986) carried out one of the earliest studies integrating the effects of various forces on new venture performance. Sandberg and Hofer (1987) tested their model on a sample of 17 ventures drawn from the files of venture capital firms. They found no support that success would be based solely on entrepreneurial

characteristics but introduced the view that venture strategy and industry structure should be included in the venture performance model. Even if entrepreneur's characteristic were not supported in testing of their propositions they concluded, on the basis of venture capitalist's strong belief in the importance of the entrepreneur as a source of success, that some characteristics of the entrepreneur are important determinants of new venture performance but biographical data are not amongst those characteristics (Sandberg and Hofer 1987). McDougall (1987), and McDougall et al. (1992) set forth a model that explained a great deal of the variance in new venture performance. McDougall et al. (1992) demonstrated, parallel to Sandberg and Hofer (1997), that not only strategy and industry structure by themselves are important, but also the interaction between strategy and industry structure affects new venture performance.

Chrisman et. al. (1999) analysis of the determinants of new venture performance extended the model developed by Sandberg and Hofer (1987). Their extended model specified that the performance of a new venture was a consequence of a confluence of factors that encompass attributes of entrepreneurs, industry structure, business strategy, resources, and organizational structure, processes, and systems. They propose that new venture performance will be a function of the decisions and behaviours of entrepreneurs in recognizing environmental opportunity, assembling resources needed to pursue opportunity, developing a strategy to align resources to exploit opportunity, and designing an organization capable of putting the strategy into action. But as Shane and Venkataraman (2000) note the attributes that increase the probability of opportunity exploitation do not necessarily increase the probability of success.

As an essential part of new venture performance firm growth has been studied widely starting from the terms of management and the development of new activities as well as the reformulation of a firm's problems and goals. However, several authors have noted that there is no single theory that can adequately explain new business growth (Gibb and Davies, 1990). According to Gibb and Davies (1990), previous studies on growth have included four main types of approach: the impact of the entrepreneur's personal characteristics, the strategic factors affecting the firm's performance, sectoral and broader market-led approaches and organisational development approaches (e.g. Smallbone et al., 1995). Cooper et. al. (1994) studied the determinants of high growth versus marginal survival and found that the chances of both survival and high growth were positively associated with having a higher level of education, greater industry-specific know-how, and larger initial financial resources. Davidsson and Wiklund (2000) state that a lot of studies focusing on new firm growth have been completed within last 20 years but these studies have several theoretical and methodological shortcomings and are generally lacking longitudinal designs.

Based on the problems of testing wide models we decided to test the impact of different variables separately and there after include their interaction. First we studied the impact of entrepreneurial characteristics, motivation and environment as well as their interaction as differentiating factors between growing and non-growing firms (Littunen and Virtanen, 2004). The results were parallel with Sandberg and Hofer (1987) otherwise but analysis suggested that the age of the entrepreneur could be personal characteristic to explain the performance, meaning that experience induces growth. Vocational training was also dis-

covered to be a statistically significant explanatory variable. The form of motivation (pull motivation) to seize the opportunity was discovered to be the most effective differentiator between growing and non-growing firms. This analysis reformulates the model including only those entrepreneurial characteristics found to be statistically significant with motivation (push and pull) factors and including also the decision and behavioural variables (business strategy, style of management, changes in production and markets etc.).

### **Theoretical background and hypothesis**

The purpose of this study was to investigate which factors involved in the firm's birth, start-up and the first seven years' development differentiated growing from non-growth firms. As suggested by Sandberg and Hofer (1987) we build our analysis on contingency model of performance. According to contingency theory, the start-up and growth of firms cannot be examined in isolation from their specific context and environment (Gilad and Levine, 1986). The analysis of start-ups by utilizing contingency theory makes it possible to evaluate the factors affecting the birth of new firms on a broad scale (Gilad and Levine, 1986; Storey, 1994) and including the founder's phase of life at start-up in the analysis. Moreover, contingency perspective takes into account uniqueness and discontinuity which are the typical characteristics of entrepreneurial markets by suggesting that universal theories cannot be applied to organizations because each is of them is unique. Virtanen (1997) suggests that we should use different theories in different contexts. But if we have longitudinal data about growth of a firm we may have different contexts in the same model and thus contingency approach seems to be the most appropriate one.

The various situational factors that describe the founder's phase of life at start-up can be seen as reflections of the overall situation of the economy, and these provide the link between founder's previous experience and the start-up situation (Littunen, 2000; Littunen and Tohmo, 2003). Situational factors link the success of new firms with the kinds of entrepreneurial knowledge and skills considered to be important to growth (Cooper and Dunkelberg, 1987; Cooper and Gascon, 1992). Different management styles are seen as central factors in the entrepreneurial competence of the individual. The contingency theory framework notices the changes of situational factors, for example changes in the strategies of a firm, too. In this study we analysed the situational factors at start-up and the changes of those situational factors during first seven years of development.

The entrepreneurial motives ( $E_m$ ) for founding and running a business could be divided into 'push' and 'pull' factors (Gilad and Levine, 1986; Storey, 1994). The model distinguishes those entrepreneurs motivated by a positive idea, those with specific knowledge of a market opportunity, and those primarily forced into entrepreneurship. The motivations of those attracted by the opportunity are in accordance with conventional economic theory and in the core of the current entrepreneurship research (e.g. Shane and Venkataraman 2000). A "forced" motivation exists when the founder feels to be pushed into starting a firm under the pressure of circumstances. Individuals may be dissatisfied with their present jobs or promotion aspects or may also be faced with the prospect of unemployment. Psychological "pull" factors, like a desire to work independently or to realise own ambitions are included also in the entrepreneurial characteristics which were studied separately. The founders of

growing firms might have had different motives for setting up and running a business compared to the founders of non-growth firms. Thus the variable “Motives at start-up”(external push and pull factors, internal motives) was constructed to reveal the motives behind founding a business.

The strategy of a new firm must be designed to utilise its management capabilities in order to attain its goals and ways of realising them (Sandberg and Hofer, 1987). According to Mintzberg (1987), the strategy of a firm can be conceptualised as a plan, position in the market, vision concerning the future and the firm’s state or as a model for actions in the stream of decisions. In this study the basic strategic choices of firms were studied as models for actions. The conceptualization of a firm’s strategy as a model for actions is based on the view in which the business plan and the operative management are connected. One purpose of this paper was to study how changes in the competitive situation of a firm affect its growth. Thus the action is approached from the point of view of the firm’s market orientation. Four categories based on the firm’s market orientation were formed: a) sales as a sub-contractor (co-operation), b) concentration on local markets, c) specialization and d) internationalisation. The firms which had reported specialization as their strategy were further classified into those specializing in products and those specializing in satisfying customers’ needs, as the resources connected with these two strategies are very different. These strategies and management actions were studied in relation to products and markets, changes in ownership, changes in product and marketing policy, changes in production processes and changes in networks (Storey 1994).

On the bases of the above reasoning we developed a model for new venture growth:

$$(1) \text{ NVG}_{1...j} = f(\text{Es}_{1...j}, \text{Em}_{1...j}, \text{F}_{1...j}, \text{IS}_{1...j}, \text{St}_{1...j}, \Delta\text{St}_{1...j}),$$

where NVG is growth a firm and j stands for the number of firms,  $\text{Es}_{1...j}$  includes the characteristics of entrepreneur discovered to be statistically significant in our previous analysis,  $\text{Em}_{1...j}$  describes motives,  $\text{F}_{1...j}$  demonstrates financing and  $\text{IS}_{1...j}$  industry sector up,  $\text{St}_{1...j}$  represents the strategy variables of firm, and  $\Delta\text{St}_{1...j}$  the changes of strategy variables during first seven years’ development. Based on the above discussion and former studies we derived the following hypothesis and tested each group of variables separately before combining the model.

H1: Experience factor (age) differentiates growing new ventures from the non-growth firms.

H2: Skills and education (vocational training) of an entrepreneur or entrepreneurial team differentiate growing new ventures from the non-growth firms.

H3: Motives at start-up situation differentiate growing new ventures from the non-growth firms.

H4: Financing at start-up situation differentiates growing new ventures from the non-growth firms.

H5: Management style of an entrepreneur (entrepreneurial team) differentiates growing new ventures from the non-growth firms.

H6: Strategic orientation of the venture differentiates growing new ventures from the non-growth firms.

H7: Change in the strategic orientation of the venture differentiates growing new ventures from the non-growth firms.

### **Description of the data**

This study is a part of a longitudinal research project which has followed the development of 200 SMEs in the branches of metal-based manufacturing and business services since their start-up in 1990 (Littunen, 1992). The owner-managers were personally interviewed for the first time at the beginning of 1992. Follow-up data were collected annually through telephone interviews held between 1993 and 1996 and in 1998. In addition, each year the second author conducted 20-25 interviews personally in order to spot possible inaccuracies in the telephone interviews. For the first personal interviews, 200 firms were selected as subjects from the SME register of Statistics, Finland.

The sample consists of 138 metal-based manufacturing firms and 62 business service firms from all over Finland. At the seven-year follow-up 86 firms responded, 55 firms had closed down and 59 firms refused to participate in the follow-up. We classified the respondents into two growth groups on the basis of their performance during 1990-97 (e.g. Smallbone et al., 1995). This paper concentrates on the 86 survived firms where from 43 firms were discovered to be growing (average annual growth rate more than 10 % in 1990 – 1997). About one third of the growing firms (14 firms) could be considered to be the so called gazelles whose annual growth was more than 25 % per year (4,8 times the turnover in seven years).

The studied firms were mostly small: about 60 percent had less than five employees at the start-up. The connection between the firm and the entrepreneur was strong and the studied firms were often dependent on the entrepreneur's own labour and that of his/her family. The strategy of the firm was chosen by the entrepreneur. Over 45 percent of the entrepreneurs in the study had basic education no higher than elementary school. Empirical studies suggest that new entrepreneurs start their firms by relying on work experience gained earlier as employees in a firm owned by someone else. The most of the new entrepreneurs had come from SMEs and in the most of the firms the selection of products was in the first place based on the entrepreneur's previous work experience, too. Other important factors affecting the choice of the firm's product were a combination of previous work experience, vocational training and identification of the needs of customers in the market.

The data were analysed by grouping the features of the respondents and their firms by means of cluster analysis. The aim of these groupings was to unify the rather varied interview data. The management styles of firms were described according to four different dimensions: a) group management (2 items), b) action planning (6 items), c) innovativeness (4 items), and d) interactivity (2 items). Using cluster analysis the firms were classified into three categories portraying styles of management, according to the participation in the firm's management of different interest groups. The *situational style* of management characterizes the entrepreneur who takes an independent position and does not make very much

use of personal networks. In the *network building style* the entrepreneur has obtained ideas about how to manage a firm through discussions with customers as well as with his entrepreneurial and other business contacts or with specialists. In the *group management style* the key affairs of the firm are managed by a group of people (see Littunen and Tohmo, 2003).

Logistic regression analysis was used as statistical technique in locating differences between growing (growth of turnover more than 10 % annually) and other firms and their owner-managers in the selected attributes. We chose logistic regression analysis because it captures synergistic relationships between variables but does not require as restrictive assumptions as e.g. discriminant analysis. The purpose of the analysis is to find out those variables which differentiate growing ventures from the non-growth firms. With logistic regression we also avoid one impediment identified by Davidsson and Wiklund (2000). They state that using current variables to predict past process breaks with the principle that the cause must precede the effect. By using logistic regression we do not explain the growth process but are trying to find out which factors differentiate growing firms from non-growth companies.

## Results

First we tested entrepreneurial characteristics, the motives, the importance of management capabilities in terms of internal/external networks, and the importance of strategies for the growth separately. The estimated models explained the location of the observations rather well classifying correctly about 69 % and 76.5 % observations. In separate testing age (experience) did not appear to be statistically significant but vocational training and motives for establishing a firm were discovered statistically significant factors. This means that H1 should be rejected whereas H2 and H3 got support from the analysis. In the second model the statistically significant factors were: financing at start-up (H4 supported), firm's strategic choice (H6 supported), change in product policy and change in target market (= old versus new customers, H7 supported). Management style of an entrepreneur (entrepreneurial team) did not appear to be a statistically significant differentiator between growing new ventures and the non-growth firms suggesting that we should reject hypothesis 5.

After separate testing we combined the model to include all the variables and experimented several different versions to reach the best model. Table 1 presents our selection as the best logistic regression model describing growth of firms as function of the following start-up variables: age, vocational training, motivation, main product selection, financing and industry sector. From these variables motives and industry sector appeared to be statistically significant.

-----  
Table 1 about here  
-----

Style of management, strategy variables including firms strategy choice and change in product policy, in production process, in target market conditions and in external personal networks were the variables selected in the model from those variables collected after the third year of operation. From these variables style of management, firm's strategic choice,

change in production process and change in external personal networks were discovered to be statistically significant. Change in product policy, in production process and in target market conditions after seven year of operation were also included in the model. From these variables change in product policy was the only statistically significant variable. The results suggest that group management style was emphasised in the growing firms whereas situational style and network building style were linked mostly to non-growth firms. The combined model suggests that we should accept hypothesis H3, H5, H6, and H7 but reject H1, H2, and H4.

The estimated model explained the location of the observations in the growth/non-growth firms very well. Over 89 per cent of observations were classified correctly by the logistic regression model. The high total classification rate of the model was mostly based on the successful grouping of the growing firms (92,1 %) which means that 40 from 43 growing firms were classified correctly.

## **Conclusions**

This study has examined what factors differentiate growing firms from the non-growth ventures. Doubling of turnover during 1990-97 (over 10 % annual growth) was used as the criterion of continuous growth. Contingency theory was used as the starting point in the study. First we tested separately the start-up factors including entrepreneurial characteristics (experience, skills and training of the entrepreneur), motives, financing, product selection and industry as explanatory variables. Thereafter style of management and strategy variables and changes of those variables were tested.

As a separate testing education (vocational training) and motives of the entrepreneur (positive situational and “pull” motives) were discovered as statistically significant differentiating variables whereas experience (age of the entrepreneur) was not significant. The results suggest that we should accept our second and third hypothesis but reject the first one. The second partial model included management style, strategic choice and changes of strategic characteristics (product policy, production process, target market, networks) of a firm.

The growing ventures of this study come more often from the branch of metal-based manufacturing, are opportunity driven (pull motivation) and applying group management style, have increased their production capacity, have increased their external network relations, and adopt a specialized product policy. In most cases active strategies, particularly with respects to markets, were necessary to achieve growth over an extended period. Change in product policy (developing new products) in the seventh year of operation was statistically significant. Obviously, the best performing new firms are aiming to differentiate their products from the products of their competitors. In addition to above strategy variables the subcontracting and specialization as a firm’s strategy differentiated growing firms from non-growth companies. However, the signs of these explanatory variables were conflicting so that this relationship needs further investigation.

The study suggests that those variables which quite successfully differentiated growing ventures from non-growth firms in the combined model did not include any statistically

significant entrepreneur specific variables confirming the results of e.g. Sandberg and Hofer (1987). However, some biographical variables appeared to be statistically significant when they were tested separately at the start-up phase. Thus it could be said that fit of the entrepreneur is necessary but not a sufficient condition for successful performance. The implications of this study for academics, educational institutions, entrepreneurs, and other practitioners is encouraging. The most of those factors that differentiate growing ventures from non-growth companies could be taught and learned. Moreover, the most of them are dependent on the strategic and operative choices of the entrepreneur.

Even if the combined model succeeds very well in differentiating growing from non-growth firms (total classification rate 89.2 %) we need further information and data on these relationships to be able to interpret all of the findings. For example, the management style was not statistically significant in the second separate model but appeared to be statistically significant in the combined model. Overall, in interpreting the findings of this study and planning future research, certain limitations need to be kept in mind. Entrepreneurs and the processes they use in starting their firms will vary by line of the business, by region and in background and aims. Since the study was restricted to firms in two industries, caution must be exercised in generalising the results across other sectors. At the time the research was conducted the Finnish economy was in the middle of a recession, which undoubtedly affected the results. Future studies, conducted during a less turbulent time period and with larger samples from a wider-range of industries and regions, would yield more conclusive findings.

### Abstract

An examination of U.K. and U.S. small- to medium-sized enterprises (SMEs) reveals that SMEs are not constrained in their access to financing. We show that SMEs do not, in the first instance, seek external funding for growth, and when they do they usually receive the funding they seek. The entrepreneur's level of educational attainment, age, net worth, and number of years on-the-job inform us about the SME's likelihood of applying for external capital. We conclude that the market for distribution of capital works well for the SME sector and that SMEs are contented with their access to financing.

### I. Sources of Small Business Financing

How do SMEs obtain funds to finance growth opportunities? Unlike publicly held businesses, unlisted businesses are not required to provide private information to prospective investors, regulators, creditors, and customers (Ang, 1992). In the absence of transparent disclosure, SMEs are less able to send credible signals to venture capitalists, banks, or trade creditors. This lack of transparency implies that SMEs have limited access to external funds due to informational asymmetries. Further, the difficulty with gaining external capital impedes SMEs' accumulation of revenue-generating assets and potential growth. In general, this has been labelled as the finance gap for privately held businesses (Storey, 1994; Deakins, 1996).

Berger and Udell (1998) advocate a complementary concept for explaining SMEs' capital structure decisions. In their framework, SMEs are viewed through a financial-growth cycle paradigm where different capital structures are optimal at different points in the cycle. Most SMEs rely on internal sources of funds in their early years of operation. As SMEs grow in size and age, they ought to have better access to external sources of funds. This is due to the fact that bigger and older SMEs have better collateralizable assets and technical sophistication to reduce informational opacity. Using a sample of more than 500 SMEs, Rutherford and Oswald (1999) document empirical evidence in support of the financial growth cycle: firm size, industry type, owner age, and organizational form are found to be important discriminators of financing sources. However, the degree of informational opacity and firm age are not relevant in characterizing the financing patterns of small businesses. In terms of financing sources, Ou and Haynes (2003) find that internal equity, as opposed to external equity, is the main source of finance for SMEs. Most SMEs rely on internal sources of funds (owner's starting capital, owner's loans, and retained earnings) and external debt from financial institutions to finance their business operations and real options for growth. This suggests that there appears to be a pecking order of SME finance from insiders to financial institutions, then to non-financial lenders.

While these studies suggest that SMEs experience a finance gap as compared to listed businesses, it is not clear if SMEs inevitably have limited access to external funds to the point that their growth aspirations are frustrated. In our analysis, two conditions are required for SMEs to be financially constrained.

- Firstly, the typical SME owner ought to hold high growth ambitions such that retained profits are insufficient to fulfil investment plans.

- Secondly, given the importance of ongoing social relationships for the supply of capital, the potential impact of loan denial is greater for growth-oriented SMEs. Thus we would expect these firms to apply for new loans less often. Further, if the finance-gap hypothesis holds true, growth-oriented SMEs are less likely to acquire loan approval to fund growth opportunities.

These two conditions are indispensable because finance is a constraint for SME expansion if and only if SMEs want growth finance *and* growth-oriented SMEs cannot obtain external loans to finance venture outlays. Also, it is assumed that most owner-managers are aware of the finance gap, if it exists. Growth-oriented SMEs potentially upset the well-established social relations with the existing creditors with loan denials. We would expect owner-managers to self-select and apply less often for new loans in times of growth, in order not to damage their access to capital. Following this line of reasoning, SMEs whose growth ambitions are above average are said to be financially constrained if and only if their loan applications are least likely to be approved. This critique motivates our empirical examination of the finance-gap issue.

Discussions of the finance gap have been on-going since the 1931 report of the Macmillan Committee identified that the financial needs of small businesses were not being met by the existing financial services institutions (Jarvis, 2000). Within the U.K., the persistence of the ‘Macmillan gap’ was reported in subsequent Government enquiries (Bolton Report, 1971; Wilson Committee, 1979), though more sophisticated analyses re-conceptualised the ‘finance gap’ more accurately as a function of market failure or credit rationing (Stiglitz and Weiss, 1981; Storey, 1994). Successive reports suggest a narrowing of the finance gap over the past thirty years, as policy initiatives have sought to reduce small business barriers and smooth capital market imperfections (Jarvis, 2000). Recent questioning of whether the finance gap still exists (Deakins, 1996) has been disputed on empirical and theoretical grounds (Harrison and Mason, 1995), while others point to special cases (such as new technology based ventures, ethnic minority owned firms and women owned firms) as continuing evidence of market failure (Timmons and Sapienza, 1992; Storey, 1994; Timmons and Bygrave, 1997; Brush, Carter, Greene, Gatewood and Hart, 2001; Ram, Smallbone and Deakins, 2002).

This paper examines the alternative hypothesis that SMEs obtain sufficient funds to fulfil their growth ambitions. This hypothesis works if and only if the two conditions discussed above are not met. In support of our hypothesis, there is evidence within the literature to suggest that most SMEs do not opt for rapid growth (Curran, 1986; Hakim, 1989; Headd, 2003), and also that SMEs whose growth ambitions are above average have better access to external finance (Storey, 1994). We investigate these two statements through secondary analysis of two pre-existing large-scale datasets. In the next section, we use a U.K. dataset to examine the demand for growth finance for U.K. SMEs. Thereafter, we use a U.S. dataset to investigate the sources of growth finance for U.S. SMEs. While these two survey datasets are uniquely different, the results are complementary and help ascertain the robustness of the alternative inference discussed above.

## II. Analysis of U.K. SME Financing

### II.A. Descriptive and univariate analysis

The U.K. data is derived from the third biennial membership survey of the Federation of Small Businesses (FSB), undertaken in 2004 (Carter, Mason and Tagg, 2004). With 155,000 members, the FSB is the largest voluntary membership business association, and its biennial membership survey the largest business survey, in the U.K. For the 2004 survey, 18,635 responses were received, a response rate of 12.02%.

### II.B. Logistic analysis

To see if U.K. SMEs face limited access to external sources of funds, we run the following regression:

$$\begin{aligned}
 MSF_i = & \beta_{YRbusi} YRbusi_i + \beta_{OwnAge} OwnAge_i + \beta_{GrowthAmb} GrowthAmb_i + \beta_{\ln S} \ln S_i + \beta_{SG} SG_i + \beta_{PG} PG_i \\
 & + \sum_{i=1}^5 \gamma_{1,i} OrgForm_i + \sum_{i=1}^{10} \gamma_{2,ii} SW_i + \sum_{i=1}^7 \gamma_{3,i} MainCus_i + \sum_{i=1}^6 \gamma_{4,i} MainMar_i \\
 & + \sum_{i=1}^3 \gamma_{5,i} OwnGender_i + \sum_{i=1}^7 \gamma_{6,i} BusiObj_i + \sum_{i=1}^3 \gamma_{7,i} Rate_i
 \end{aligned} \tag{Eq 1}$$

It is found that both the number of years owning the business and the main owner’s age are negatively related to SMEs’ access to more than two sources of funds (p-values less than 0.0001). This implies that the accumulation of experience and wisdom exacerbates the owner’s level of loss aversion. In turn, this increase

in loss aversion leads to a lower propensity to seek alternative sources of capital. Indeed, this finding also reflects the fact that older and more sophisticated SME owners are less likely to seek alternative fund contributors. For U.K. SMEs, it is easier to ask for more capital from the existing lenders (as compared to new creditors) due to the establishment of social networks and firm reputation. Furthermore, it is found that entrepreneurs who have higher growth ambitions are likely to access more sources of finance (p-value less than 0.0001). This finding contradicts the finance-gap hypothesis proposed by Ang (1992) and Berger and Udell (1998). Contrary to the conventional wisdom, the significantly positive association between growth expectations and actual access to multiple sources of funds suggests that SMEs do not experience a severe finance gap. Instead, entrepreneurs who anticipate expansion for their businesses are able to gain sufficient finance to fulfill their expectations. Thus, the efficient mechanism of SME financing ensures that growth is not limited by the provision of capital.

In addition to the above, we observe a size effect. That is, bigger SMEs have more alternative sources of funds. This is because bigger SMEs usually have superior track records to convince prospective creditors and angel investors for loan approval. While size implies survival for SMEs, it also indicates healthier access to alternative financing means. Moreover, we find that there is a significantly positive relation between recent sales growth and access to at least three sources of funds (p-value equal to 0.001). Sales growth translates into greater cash flows, which can be directed into investments in capital goods, internal training, and quality control. All these factors help SMEs broaden the network of refinancing sponsors. Further, it is found that recent improvements in profitability help dampen the need for keeping multiple sources of funds (p-value less than 0.0001). This is consistent with the pecking-order notion that profitable firms have abundant internal cash flows to finance investment plans and thus are less likely to seek alternative funds (Myers and Majluf, 1984).

Next, we independently assign ranks to the sample SMEs according to the corresponding values of sales growth and size (sales). We then form four growth-sales groups for comparing the implied propensities to maintain multiple sources of funds: low-growth and low-sales (LGLS), high-growth and low-sales (HGLS), low-growth and high-sales (LGHS), and high-growth and high-sales (HGHS).<sup>8</sup> In this subsection, we would like to see if growth-oriented SMEs face the so-called finance gap due to lower propensities to have multiple sources of funds. Table IV summarizes the mean estimated probabilities – denoted as  $\pi$  – of having more than two sources of funds for the four growth-size groups. Also in this panel, we compute a) the differences in  $\pi$  between the high- and low-growth groups in the vertical right-hand column, b) the differences in  $\pi$  between the high- and low-size groups in the horizontal bottom row, and c) the difference in  $\pi$  between the LGLS and HGHS groups in the bottom-right cell. The respective medians, standard deviations and t-statistics are also reported in the table. It is found that high-growth firms are more likely to have multiple sources of funds in a probabilistic sense. For the two size groups, the differences in  $\pi$  for high- and low-growth SMEs are 18.2 and 18.3 percentage points (t-statistics equal to 66.57 and 81.35 respectively). Also, we observe a reliable size effect: the differences in  $\pi$  for big and small SMEs are 3.4 and 3.5 percentage points for the two growth groups (t-statistics equal to 15.77 and 12.97 respectively). Combining the growth and size effects together, we find that HGHS firms are more likely to maintain multiple sources of funds than LGLS firms by 21.7 percentage points (see the difference in  $\pi$  down the diagonal cells). Figure 1a gives a graphical illustration of the difference in  $\pi$  for the two extreme growth-size groups. For U.K. SMEs, the growth effect magnifies the size effect. In sum, we claim that there is sufficient evidence to reject the finance-gap hypothesis. Alternatively, we find support of our happy story that SMEs are able to obtain finance required for new investment plans.

To verify that our happy story is not only descriptive of SME financing in the U.K., we replicate the same logistic methodology on U.S. data. The use of the 1998 U.S. Survey of Small Business Finances (SSBF) not only helps us ameliorate data-snooping bias, but it also helps ascertain the robustness of our happy story outside the U.K. In the following section, we show results that are substantially similar to the U.K. case.

### III. Analysis of U.S. SME Financing

#### III.A. Descriptive and univariate analysis

We use the 1998 Survey of Small Business Finances (SSBF) to examine the finance gap for SMEs.

#### III.B. Logistic analysis

Ou and Hayes (2003) find that most SMEs rely on internal funds such as retained profits, owners' equity, and loans from stockholders while too few SMEs (34 out of 3,561 firms) acquire equity from external parties. This suggests that the use of external equity appears to be an exception, rather than a rule. Thus, we assume away the use of external equity (as opposed to debt) in reconciling the finance-gap issue. That is, we re-

examine whether finance is a constraint for SME expansion via an examination of SMEs' probabilistic access to external debt. In our analysis, two response variables are used to indicate the degree of SMEs' access to external debt. These variables are drawn from the following questions in the 1998 SSBF survey:

- MRLR3 Did your firm apply for new loans for one time or more than one time in the past three years?
- MRLR4 Was the recent loan application always approved?

### III.C. Frequency of Loan Applications

It is found that Dun and Bradstreet's risk scores fail to attain statistical significance in capturing SMEs' propensities to apply for external loans. This means that entrepreneurs may have quite different perceptions about the risk-return payoff. In a sense, exposures to manageable risks are irrelevant in SMEs' decisions to seek outside debt. Also, most financial traits such as revenue growth, return on assets, and net profit margin are unimportant discriminators of new loan applicants. Among the financial variables, only firm size (natural logarithm of sales) conveys information about SMEs' propensities to apply for outside loans (p-value less than 0.0001). At least two reasons are responsible for this. First, the track records of sustainable growth for bigger firms are above average and thus help justify loan applications. Second, size means survival for SMEs, and so most SMEs self-select to scatter their shots for finance everywhere. This does not mean that SMEs choose to grow faster because inherent growth requires a clear orientation towards expansion. Instead, the persistent size effect reflects the fact that SMEs apply for external debt to minimize the likelihood of distress or involuntary exit.

Among the firm characteristics, only firm age is crucial in singling out loan applicants (p-value less than 0.0001). Unlike young firms whose capital needs are greater, old SMEs are less likely to apply for outside debt. This evidence suggests that entrepreneurs often value control more than business expansion. Apart from firm age, none of the firm characteristics (management responsibility, family involvement, operational focus, female ownership) are important discriminators.

Moreover, the net worth of the main owner(s) does not help capture SMEs' propensities to apply for new loans. Apart from this variable, most of the owner characteristics are found to be important discriminators of loan applicants. Both the SME owner's level of educational attainment and age are negatively associated with the propensity to access external loans (p-values equal to 0.0053 and less than 0.0001 respectively). This suggests that the accumulation of wisdom induces SME owners to be reluctant to acquire funds from outside parties. Also, higher education heightens the burden of overconfidence bias on the part of the entrepreneur. Consequently, this creates disproportionate weights to the SME owner's personal involvement vis-à-vis outsiders' interests. It is also found that entrepreneurs whose equity share of the business is high tend to avoid external loans (p-value less than 0.0001). These phenomena confirm previous studies that most SME owners prefer to retain control by not applying for external capital (Curran, 1986; Jarvis, 2000). With no a priori knowledge of the median objective for SMEs, it is hard to judge whether entrepreneurs' reluctance to access external funds is detrimental to the business. We suggest that these behavioural phenomena simply reflect SME owners' shift in focus from wealth maximization to utility maximization. That is, if control helps raise the level of entrepreneurs' contentment, SMEs' dormant financing policies need not harm their long-term sustainability.

We calculate the mean estimated probabilities ( $\pi$ ) of having applied for new loans during 1996-1998 for the four groups. Contrary to the finance-gap hypothesis, we find that high-growth firms tend to apply for new loans more frequently than low-growth firms. For the two size groups, the differences in  $\pi$  for high- and low-growth SMEs are 2.8 and 6.2 percentage points (t-statistics equal to 4.4 and 7.2 respectively). In addition, we observe a strong size effect: the differences in  $\pi$  for big and small SMEs are 14.8 and 18.1 percentage points for the two growth groups (t-statistics equal to 20.6 and 23.5 respectively). Combining both of the growth and size effects, we find that HGHS firms are more likely to apply for new loans than LGLS firms by 20.9 percentage points (t-statistic equal to 28.3). Figure 2 clearly shows the difference in  $\pi$  for the LGLS and HGHS groups. This evidence rejects the conventional wisdom and supports our happy story.

### III.D. Probabilistic Likelihood of Loan Approval

Next, we turn to the probabilistic likelihood of loan approval. The relation between Dun and Bradstreet's risk scores and SMEs' propensities is significantly negative at any reasonable level of confidence (p-value equal to 0.017). While Dun and Bradstreet's risk scores do not convey information about SMEs' propensities to apply for new loans as discussed in the previous subsection, these risk scores indicate that potential creditors are less likely to lend funds to riskier SMEs.

Firm-level attributes such as management responsibility, family involvement, and operational focus are not important in characterizing the likelihood of loan approval. We find that firm age is critical in screening out successful loan applicants (p-value 0.012).

Also, we examine the roles of owner characteristics in singling out successful loan applicants. Similar to the previous subsection, we find that both the SME owner's level of educational attainment and age are negatively associated with the likelihood of loan approval (p-values less than 0.043).

Moreover, the associative relation between the accretion of work experience and the likelihood of loan approval is significantly positive (p-value equal to 0.006).

We report the mean estimated probabilities ( $\pi$ ) of successful loan applications for four growth-size groups. It is found that high-growth firms tend to have more successful loan applications in probabilistic terms. For the two size groups, the differences in  $\pi$  for high- and low-growth SMEs are 1.7 and 4.4 percentage points (t-statistics equal to 3.68 and 5.43 respectively). Also, we notice a strong size effect: the differences in  $\pi$  for big and small SMEs are 15.9 and 18.5 percentage points for the two growth groups (t-statistics equal to 25.7 and 28.6 respectively). Combining both of the size and growth effects, we find that HGHS firms are more likely to obtain loan approval than LGLS firms by 20.3 percentage points (see the difference in  $\pi$  down the diagonal cells; t-statistic equal to 29.8). Figure 3 gives a graphical illustration of the difference in  $\pi$  for the two extreme growth-size groups. Once again, our evidence rejects the finance-gap hypothesis but supports our happy story.

### IV. Conclusions

We first conclude that growth is not the primary objective for SMEs because too few SMEs view profitability, expansion, or other financial measures as the most serious problem of the business. Our findings show that the vast majority of SMEs receive utility from simply being in, and remaining in business. Most SMEs are 'happy' with the level of their existing operations. Further, SMEs that seek external funding usually get what they want. They, too, are 'happy'. Since most entrepreneurs value control and so prefer not to access external debt, lower propensities to acquire outside funds need not imply financial constraints for SMEs. In contrast, our happy story suggests that control creates contentment for entrepreneurs. Our findings reject the conventional wisdom first of the existence of a finance 'gap' and second that informational opacity deters SMEs from acquiring external funds to take advantage of their growth opportunities (Ang, 1992; Berger and Udell, 1998). Few seek to grow beyond their ability to control such growth, and those who do seek external sources of funds usually get them. This describes a financially satisfied, or sustainable form of business. Our evidence shows that human elements are more important than financial attributes in quantifying SMEs' propensities to obtain funds from external parties. Owner characteristics such as the entrepreneur's level of educational attainment, age, amount of personal investments, and number of years of on-the-job training convey information about SMEs' likelihood to apply for external loans. Only two firm characteristics (firm size and age) are found to affect SMEs' probabilistic access to external capital. This is different from the analysis of publicly held firms where firm characteristics are viewed as vital discriminators (Fama and French, 1992, 1996; Daniel and Titman, 1997; Berk, Green, and Naik, 1999). In other words, it could be argued that SMEs are not financial clones of publicly listed businesses (Vos, 1992). We await future research to unveil the key dimensions for assessing the performance of SMEs.

It is the human condition to be aware of our connectedness. Entrepreneurs, as human beings, understand the need to establish and maintain their networks and connections. To understand our findings, the value of the connections can help explain why SMEs are happy. It is commonly established that social relations are crucial for SMEs to broaden the available sources of funds (Petersen and Rajan, 1994, 1995, 2002). For instance, Cole (1998) shows that potential lenders are more likely to extend credit to SMEs in the presence of pre-existing transactions. This is due to the fact that previous banking relations help convey private information about SMEs' near-term financial performance. Conditional on past experiences with viable and trustworthy small businesses, lenders perceive further loans to be less risky (Diamond, 1991).

In conclusion, our results are consistent with the alternative hypothesis that small- to medium-sized businesses are not subject to severe financial constraints. Direct comparisons of access to funds for SMEs

with and without above-average growth expectations support the happy story of SME financing. SMEs are found to be able to finance new projects from a sufficient number of external sources. This inference is robust across the U.K. and U.S. markets.

**ABSTRACT**

In this paper, the concept of resilience is used in the study of career and entrepreneurial sustainability. This research contends that resilience can be thought of as a ‘set of qualities’ and as such, an entrepreneurial resilience construct can be thought of as an amalgamation of behavioural characteristics. Behaviours that have been identified in the construct are: *flexibility* displayed through a high tolerance for ambiguity and adaptability; *motivation* reflected in self-efficacy and a need for achievement and autonomy; *perseverance* as in being very accepting of situations, determined and responding well to problems or adversity; and *optimism* demonstrated by a positive outlook and viewing failure differently.

To test the nature of the entrepreneurial resilience construct, working entrepreneurs (owner-managers of SMEs) were interviewed about their experiences in building a sustainable enterprise. The study involved intensive interviews with the entrepreneurs, based on the interview framework developed by Timmons (1999). Content analysis was applied to the data by codifying the resilience factors. Results identified strong resilience factors among study participants predominantly in respects to *Holistic Positivism* (optimism), *Motivation* and *Perseverance* and to a lesser extent in *Flexibility*; and within each construct specific patterns of behaviour were determined.

**INTRODUCTION**

The concept of resilience is often used in the study of career sustainability and transition to describe how individuals overcome set-backs to career aspirations. This resilience construct has recently been used by Green & Campbell (2004) to describe a characteristic unique to New Zealander’s in their demonstration of entrepreneur activity in action. As the existing entrepreneurial theory has evolved from the traits perspective of entrepreneurs to encapsulate the process model which focuses on actions and outcomes as a means of defining entrepreneurs (Aldrich & Martinez, 2001) to further assess the nature of the ‘entrepreneurial resilience’ construct, this research views resilience as a ‘process outcome’. As such, resilience results from life experiences, rather than being an inborn personality trait.

This research takes a qualitative approach to studying entrepreneur’s resilience behaviour and contends that resilience can be thought of as a ‘set of qualities’ rather than a specific characteristic. As such the construct can be thought of as an amalgamation of other personality

and behavioural qualities. Identified qualities, which are to be tested, are: flexibility, motivation, perseverance and optimism.

## LITERATURE REVIEW

### Entrepreneurship

Small and medium sized enterprises (SMEs) account for about 95% of businesses and 60-70% of employment in most economies (Ministry of Economic Development, 2004). International comparisons of the SME impact on a country's development, however, are often difficult to make due to the different methods used to collect data and different firm size classifications. Business creation and the entrepreneurs at the heart of such ventures have, never-the-less, gained significant international attention from researchers.

Aldrich and Martinez (2001) suggest that entrepreneurial thinking has moved away from the figure, characteristics and intentions of entrepreneurs themselves to concentrate more on their actions and outcomes as a means of defining them. Morris (2002) supports this contention in saying that taking the entrepreneurial plunge has something to do with psychological and sociological characteristics, but that the sustainability of a venture, which encompasses the true entrepreneur, is more a matter of various behavioural capabilities. Davidson, Low, and Wright (2001) add further weight to this argument and suggest that, today more emphasis is placed on behavioural and cognitive issues rather than personality characteristics. Moreover, they assert that conceptual contributions to the field have clearly de-emphasised 'characteristics' of small business owners and their firms in favour of behaviours associated with 'emergence.' This emergent quality encompasses part of what is meant when we say that a person is 'resilient'.

### Defining Resilience

Resilience can be thought of a 'set of qualities' rather than a specific characteristic (Cooper, Estes, and Allen, 2004). As such, the construct is asserted to be an amalgamation of other personal and behavioural qualities including: flexibility, high motivation, perseverance, and optimism. Each of these is examined in more detail below.

Resilient People are Flexible: London (1993) asserts that the resilience factor is related conceptually to the notion of flexibility (Lofquist & Dawis 1984, as cited in London). Flexibility is demonstrated when: the individual shows a high tolerance for ambiguity (Hagevik, 1998), demonstrates that they are adaptable to changing circumstances (Cooper Estes & Allen, 2004, London, 1993); and welcomes rather than resists changes (London). According to Hagevik (1998) a resilient person is a flexible person who views change as a manageable process – he or she feels empowered by transitions (Cooper et al.), welcomes changes, and looks forward to new and different situations (London). According to Green and Campbell (2004) a resilient person will apply a number of different strategies to deal with a challenge.

Resilient People are Highly Motivated: Another aspect of resilience is a strong motivation for achievement (McClelland, 1965 cited in London, 1993). Resilient people are not satisfied with achieving only one goal however – once reached; attention turns immediately to the next goal, and the one after that – in a cycle of continuous improvement. In addition, it might be proposed

that resilient people have differing reward needs that go beyond extrinsic motivators such as money and include intrinsic motivators such as pride in self and satisfaction from helping others. Another dimension to motivation that a resilient person possesses is a driving need for autonomy (Benard as cited Cooper, et al., 2004) – wanting to be in control of one’s environment and able to directly influence outcomes. Benard says that a resilient person has a strong sense of purpose – they are goal seeking. In approaching their goal, a resilient person possesses a high level of self efficacy (Bandura, cited in London, 1993). In essence, resilient people have a ‘hardiness’ about them (Kobasa, Maddi & Kahn, 1982 as cited in London) that comes through in their willingness to work hard in order to reach their goals and aspirations.

Resilient People are Persevering: London (1993) asserts that the resilience factor may be related conceptually to the notion of perseverance (e.g. the amount of time an individual will continue on in a situation in which rewards do not match needs). Resilient people demonstrate determination in their quest for success particularly when encountering a major challenge (Green & Campbell, 2004). In doing so, they will often respond to problems with ‘more power and more smarts’ (Cooper, Estes & Allen, 2004).

Resilient People are Optimistic: One of the components of resilience is a positive outlook - remaining positive when encountering a major challenge (Green & Campbell, 2004) and working to improve a situation beyond simply doing what’s expected (Hagevik, 1998). Resilient person views failure differently – they often see it disguised as opportunity (Green & Campbell) and demonstrate ‘constructive reactions’ to disappointment or failure (Educational Leadership, 2004) by actively learning from their mistakes. In this way, a resilient person shows a strong learning orientation and ‘proactive’ personality (Hagevik, 1998).

In summary, the concept of resilience can be seen to be made up of multiple attributes that work together to give a person a reservoir of skills, knowledge and abilities to draw on as they face ongoing challenges in their business venture.

If resilience is believed to be a critical factor in understanding the entrepreneur’s capacity to sustain the business venture - it is appropriate to look at this quality as it may manifest in entrepreneurs who are successful in their ventures. In looking at entrepreneurialism through an emergent lens whereby qualities of sustainability in a small to medium sized business venture are a function of learning over time, it can be expected that the concept of resilience can be assessed by looking at behaviours and thought patterns exhibited by successful entrepreneurs.

## METHODOLOGY

To test this theory of the nature of the entrepreneurial resilience construct, entrepreneurs (New Zealand SME owner-managers) were interviewed about their experiences in building a sustainable enterprise. Respondents were required to meet the criteria of (1) the GEM definition of an entrepreneur (Frederick & Carswell, 2001) ‘*someone who creates workplace settings for him or herself and for others*’; (2) at least three annual cycles (financial years) of current business activity to ensure substance to the entrepreneurial activity; (3) operating with less than fifty FTE which constitutes 98% of all business in New Zealand and increases the likelihood of immersion of entrepreneur in the day-to-day activities of business. A random sample of twenty entrepreneurs was selected from a database of one thousand SMEs previously established by the

researcher (de Vries, 2004). Of the twenty entrepreneurs contacted, thirteen met the criteria and agreed to interviews.

This study utilised a biographical approach requiring narratives from entrepreneurs from the aforementioned sample. As entrepreneurship is imbedded in social relations, networks and biographical processes (Kontos, 2003) each participant was asked to: sketch a broad narrative of his/her background emphasising those relating to self-employment, outline elements of their business performance and future aspirations, and reflect on the business environment and their personal experiences. Each face-to-face interview was recorded on audio tape and then transcribed. Content analysis was applied by codifying the resilience factors: motivation, flexibility, perseverance and optimism.

## RESULTS

As shown in Table 1, the results of the qualitative analysis of the interview data suggest strong support for the overall resilience construct developed from the literature review. The four main themes that emerged were an emphasis on: holistic positivism, motivation, perseverance and flexibility. Each of these four main factors is discussed in detail below.

---

Insert Table 1 about here

---

### 1. Holistic Positivism (Optimistic)

This characteristic was represented strongly in the interview data. However, as a result of the qualitative analysis it was decided that optimism about the business alone was too narrow a description and that a more holistic view of the concept was required. The study identified that all (n=13) SME entrepreneurs demonstrate an ability to focus on goals for the business or themselves. The majority of participants have a strong sense of purpose in their goal setting and focus on the overall aims of being in business in the first place. They also mentioned behaviours that suggest they have an ability to shift focus as necessary. While not as clear at the beginning of their business start-ups their goals became clearer as time went on. Overall, their goal focused orientation can be thought of as emergent – they were focused on what their needs were for the business or themselves at the time.

Their positive outlook was also reflected in the finding that learning is important to respondents (n=10). There were differences however in the type of learning they felt was necessary with some interviewees viewing knowledge development through more education as important, while the majority emphasised the importance of ‘hands-on’ experience and understanding the marketplace.

The majority of respondents (n=10) indicated a willingness to take a chances and some seem to get a sense of enjoyment and thrill out of taking risks where there is some level of uncertainty about how things will turn out. Others, while not comfortable with the uncertainty, were accepting of risk as a necessity. Interviewees were opportunistic about their ability to take advantage of situations. They are adept at tracking trends and keeping a record of their ideas

with the aim of following them through to their obvious conclusion – a profitable business venture.

A large number of respondents expressed a positive attitude toward risk taking (n=8), in that they see failure and problems as part of the successful business process. The entrepreneurs recognise the cyclical nature of the business with its inherent highs and lows. Given that, experience has taught them humbleness in their success knowing that failure is a potential in the future. While they see failure at some point as inevitable, they have learned to manage the stress that comes with uncertainty.

## **2. Motivation**

The study identified that all the SME entrepreneurs interviewed (n=13) have a high need for continued achievement and seek further fulfilment with each step of the process. Underpinning this achievement focus was that the majority of SME entrepreneurs look beyond extrinsic rewards such as money for fulfilment. Many spoke of the satisfaction they felt with building something meaningful and that gave them their identity. This self identity helps them build a sense of self worth. The entrepreneurs interviewed indicated that they also view intrinsic rewards such as helping others develop and providing job security for their employees as important. Overall, they experience a sense of self confidence and pride in their accomplishments. This pride is often tempered by a sense of humbleness as they recognise that times could become difficult in the future.

A desire for autonomy was also featured among all interviewees as a motivating factor. Many reported going into business because of the freedom and flexibility entrepreneurship offered. This is accompanied by a desire to have ‘control’ over their work and, by extension, control over the rewards they receive. However, three respondents identified some negative effects from their desire for personal control. As a prerequisite to autonomy and control, the majority of the entrepreneurs interviewed display a strong sense of personal purpose – they know who they are. They were able to easily identify their strengths and what they were good at. Similarly, they recognise the things that are not their strengths. They do not perceive barriers limiting what they can achieve and are not hesitant about simply getting ‘stuck in’. This perhaps accompanies their willingness to take risks as they are not hesitant to try new things even if they are unsure how they will work out.

Most of the respondents (n=10) conveyed a strong sense of self-confidence and belief in their own abilities. By their own admission some respondents possess large egos. They demonstrate strong people management skills, seeking to understand people and build relationships, and often attribute their success to being able to deal with people.

## **3. Perseverance**

Analysis of the interview data identified that all the entrepreneurs exhibit a sense of “hardiness” which is demonstrated in their willingness to endure consistently long and hard working conditions. Nearly all of the respondents (n=12) discussed the personal costs of being in business for themselves. The biggest cost incurred is the time commitment it takes to grow the business – a condition that has increased as the business has grown. To offset this increasing demand, many

have put systems and people in place to reduce the time demands placed on them. Even so, many entrepreneurs reported working 60 or more hours per week. While the hours are long, they work hard out of choice and are accepting of the costs. In addition to time lost with family, there is a 'bleeding effect' of work and family life in which there is no 'leaving it at the office' – work is wherever they are.

Most of the respondents (n=10) take a long-term view to business activity and recognise that there may be short-term costs, set-backs and obstacles to be overcome. Even when success has been achieved they show sustained determination. Once a target is reached, respondents report that they generally set a new one. They use one success to help them reach a new goal. As part of this characteristic, half the respondents identified situations where they responded positively to adversity. Two of the entrepreneurs clearly showed their ability to bounce back from significant adversity by re-conceptualising their business or themselves.

#### **4. Flexibility**

The study identified that the majority of respondents demonstrate a high tolerance for ambiguity and are adaptable to changing circumstances in their business environment (n=9). They are accepting of changing circumstances even if they do not know what's going to happen. Even if they are not happy with a situation, they manage to deal with it and, though they have long term aspirations, tend not to lock themselves into 'fixed' long term planning. This adaptableness is underpinned by a common view among interviewees that change is a manageable process which they have some control over. Furthermore, they commonly feel empowered by transition, in essence, many looked forward to change. Overall, it can be said that the entrepreneurs adapt by trying to manage the change process.

### **CONCLUSIONS**

This pilot study attempts to quantify the entrepreneurial resilience construct and offer a 'resilience model' for measuring such behaviours among entrepreneurs operating in the SME environment. The research concluded that resilience can be thought of as a 'set of qualities' rather than a specific thing and that a pattern behavioural factors influence the propensity for resilience in business activity. The study also concludes that all factors identified in the literature *flexibility, motivation, perseverance optimism* were evident, to some degree, among those entrepreneurs interviewed. Prominent features among the respondents were their goal focus (holistic positivism), need for continued/unmet achievement and personal control (motivation) and strong work ethic and acceptance of personal costs (perseverance).

A limitation of this research is its small sample size. However, given the nature of the study – exploratory – results provide insights that may be used in the development of an entrepreneurial resilience scale to be used in future research. Future research therefore will continue to build on this research through further testing and defining of the resilience construct. Further studies will also be undertaken to identify differing construct patterns among entrepreneurs' differentiated by national classifications and a comparative study of entrepreneurial and corporate resilience factors is proposed.

## **ABSTRACT**

This paper explores the performance measures selected by family firms. It is theorized that the importance of various performance measures shift based upon extant family conditions. Nine propositions are advanced using variables identified in the family business literature as being associated with performance indirectly through conflict.

## **LITERATURE REVIEW**

For the family firm, continued survival and success of the founder's vision is considered one of the most important organizational achievements (Ward, 1987). The sense of achievement in family businesses is affected by a critical factor that can act as a double-edged sword -- the family dynamic (Bork, 1986; Cohn & Lindberg, 1974; Foley & Powell, 1997; Janssen & Graves, 2003; Tagiuri & Davis, 1992), which may be at least a partial explanation as to why fewer than one third of family businesses survive into the second generation of ownership (Aranoff & Eckrich, 1999). An interesting paradox exists where the very factors that can launch and sustain a successful new family business may harbor the seeds of destruction as the family business matures and the family increases in size over generations (Beckhard & Dyer, 1983; Cohn & Lindberg, 1974; Ward, 1987). We assert there may be differences between how the founder of the family business views success versus the definition of success and the performance measures used to gauge business performance by family members in later generations of family business ownership. It may even be that the founder's definition of success drifts over time.

Family business is rightfully viewed as being different from other businesses in that it is a system created by the overlapping subsystems of ownership, management and family (Bork, 1986; Dyer, 1986; Tagiuri and Davis, 1992). Gersick, Lansberg, Davis and McCollum (1997) extend the thought of the Tagiuri & Davis Ven diagram by pointing out that in this diagram there are seven critical overlap areas that may be the source of friction points for the family business; each of the variables (family, business, and ownership) may suffer conflict as well as the combinations of ownership-family, ownership-management, family-management, and ownership-family-management.

In their study of conflict in family firms, Sebor and Wakefield (1998) found evidence for carry-over relationships between business and family as hypothesized by several scholars. These carry-over relationships may be most salient at the friction points identified by Gersick, Lansberg, Davis and McCollum (1997). Wakefield (1995) discovered that families that interacted positively in social settings also interacted positively inside the business. Therefore,

when functioning smoothly, a cohesive family unit may be a source of strength to the organization, however a family consumed with internal conflict can result in insufficient attention focused upon business needs and increase the chance of failure (Kets de Vries, 1993).

Due to the seven critical conflict zones within family business, constant fine-tuning is essential to keep the business healthy and the family healthy. Over time, changes in the family, ownership of the business, and/or the business itself can create problems for the entire system. For example, a family business entering its third generation of ownership may experience multiple family members tied to one another by a variety of familial relationships, and each of the relationships will experience carryover between family interactions and business interactions. Each individual's role may become unclear, and each family member may bring his or her own agenda into the business. As a result, who decides what and when becomes murky in later generations of the business, absent clear managerial direction (Wakefield, 1995), but may reflect how the family normally operates, and this approach spills over into the business.

If decisions become complicated in the family business, we may expect that performance could suffer. Hershon (1975) suggested that the family dynamic affects the performance of the family firm in both positive and negative ways. Indeed, the performance measures selected as the most important to the family firm may be affected by family dynamics and the family situation.

The performance in a typical publicly traded firm is straightforward and relatively easy to measure; the focus is on financial measures such as profit, ROI, ROA and EPS. For family firms, profit, of course is essential, but other concerns may override the drive for profit maximization. For example, employment of family members, or service to the community may score high on the set of objectives for the family firm. Moreover, there may be family carry-over relationships that enhance or inhibit organizational performance. If the family has major expenses, cash flow may become the dominant priority. If the family is interested in wealth creation and passing on the estate to future generations, then building illiquid assets and ownership of the maximum possible amount of stock may be the focus for the business.

Determining the most appropriate measures of performance can be problematic because of each family's unique set of objectives. Additionally, since most family firms are privately held, accessing financial data is often impossible. Given this dilemma we will attempt to solve the problem by allowing family firm leaders to determine their own performance concerns. These measures will comprise the dependent variables.

It is the aim of this paper to determine the performance measures family firms select, and the antecedents of the performance measures selected. As Sebor and Wakefield (1998) discovered, there may be conflict over a variety of issues in the organization: strategic vision, managerial control, ownership, and money. Hershon (1975) presents the belief that conflict in the family will influence family firm performance in an inverted "U" relationship. We accept Hershon's proposition, and we further argue that the variables that predict conflict in the family firm may also determine performance measures considered most important by leaders of the family firm.

In addition to key family characteristics that Wakefield (1995) found to be significant predictors of conflict (number of generations in the business, number of family members working in the business, age of the incumbent, level of education of the incumbent, and the presence of outside boards of directors) other variables will also be considered: owner's gender, year's incumbent has held office in the organization, the amount of debt held by the family

business, the percent of family ownership of the firm, and the overall level of family support for the business.

### **PROPOSITIONS**

Review of the family business literature seems to show interesting linkages between performance and family firm characteristics. On this evidence, we offer nine propositions. Wakefield (1995) found significant support for the number of family members working in the family business. As a corollary, we offer the following proposition:

P1: The perceived importance of firm performance increases with the number of family members who take part in the business.

An interesting finding in Wakefield (1995) is the inverse relationship of age to conflict. Because of experience the older incumbent may be better at controlling the conflict friction points in the organization. However, the older incumbent may also have multiple objectives, perhaps conflicting, for organizational performance toward the end of his/her tenure with the organization. The incumbent may want increase cash flow in preparation for retirement, yet simultaneously maximize wealth creation in the form of assets to be passed on to subsequent generations. The second proposition is:

P2: The perceived importance of firm performance increases with age of the owner(s).

Previous research demonstrates that there is a difference in the way male owners and female owners both view and run their organization (Singh, Hills, Hybels, and Lumpkin, 1999, National Foundation for Women Business Owners; Butner & Moore, 1997; Gillian, 1982; and Kamau, McLean and Ardishvili, 1998). Male owners tend to be more competitive, have larger networks, and want to “keep score.” Female owners, on the other hand, are more nurturing and supportive in the work environment (Butner & Moore, 1997). While financial performance is important for survival, the female owners may see the need to “keep score” in financial terms irrelevant to their primary objectives for the business. Therefore, the third proposition is:

P3: The perceived importance of firm financial performance is higher for male owners than for female owners.

Brockmann & Simmonds (1997) make the argument that success is positively correlated with age. It follows that the firms led by successful managers must also experience success in terms of performance. Thus, the fourth proposition is:

P4: The perceived importance of firm performance is positively related to the leader’s number of years in office.

Sebora and Wakefield (1998) discovered a surprising positive relationship (opposite of the hypothesized direction) between education of the incumbent and conflict over money, management control, and strategic vision. Also, educated incumbents may have been exposed to a higher level of financial analysis than their less educated counterparts. Congruent with Sebora

and Wakefield's findings, and the heightened analytical capabilities of educated incumbents, our fifth proposition is:

P5: The perceived importance of firm performance is positively related to the leader's years of education.

Lack of organizational slack may be a significant cause of conflict in organizations, while an abundance of resources may lead to a sense of complacency among organizational members (Bourgeois, 1981). The amount of debt could heighten concern among members that there are scarce financial resources, and that improved financial performance is imperative in order to meet the debt load. Therefore, the sixth proposition is:

P6: The perceived importance of firm performance varies positively with the amount of firm debt.

Schwartz and Barnes (1991) concluded that outside boards are helpful in providing unbiased views of the organization and force management accountability, while Ward and Handy (1988) in a non-random survey found that 88% of firms using outside board believed their boards to be useful and valuable, compared to 68% of those using inside boards expressing the same opinion. Proposition seven reflects the expected influence of outside boards of directors on the perceived role of performance:

P7: The perceived importance of firm performance is positively related to the number of non-family board members.

The amount of ownership of a family firm held by family members creates a vested interest in firm performance. Congruent with Hershon's (1975) theoretical construct of the inverted "U" between conflict and performance, Davis (1983) suggests that family members will create a work environment and culture that leads to superior organizational performance. The more family members that rely on the family business, the more that family members may exert pressure on the organization to produce positive results for their investment, since the family members may realize the opportunity cost of their capital. Proposition eight:

P8: The perceived importance of firm performance is positively related to the percentage of ownership of the business by family.

Perceptions of whether the family and business share similar values, family support of the business, family loyalty to the business, and whether or not the family is a positive influence can carry-over and impact workplace effectiveness. Family influence on business performance may be mitigated by strong leader characteristics, based on Hambrick's and Mason's (1984) Upper Echelons Theory (for our purposes, technical skill, tenure, educational background, financial skill sensitivity, general management skills, and people skills) and/or

P9: The perceived importance of firm performance is positively related to the family support for the business.

## METHODOLOGY

The authors use a database commissioned by and available from Massachusetts Mutual. The sample size is n=1059. Descriptive statistics and regression will be the primary methods of investigation.

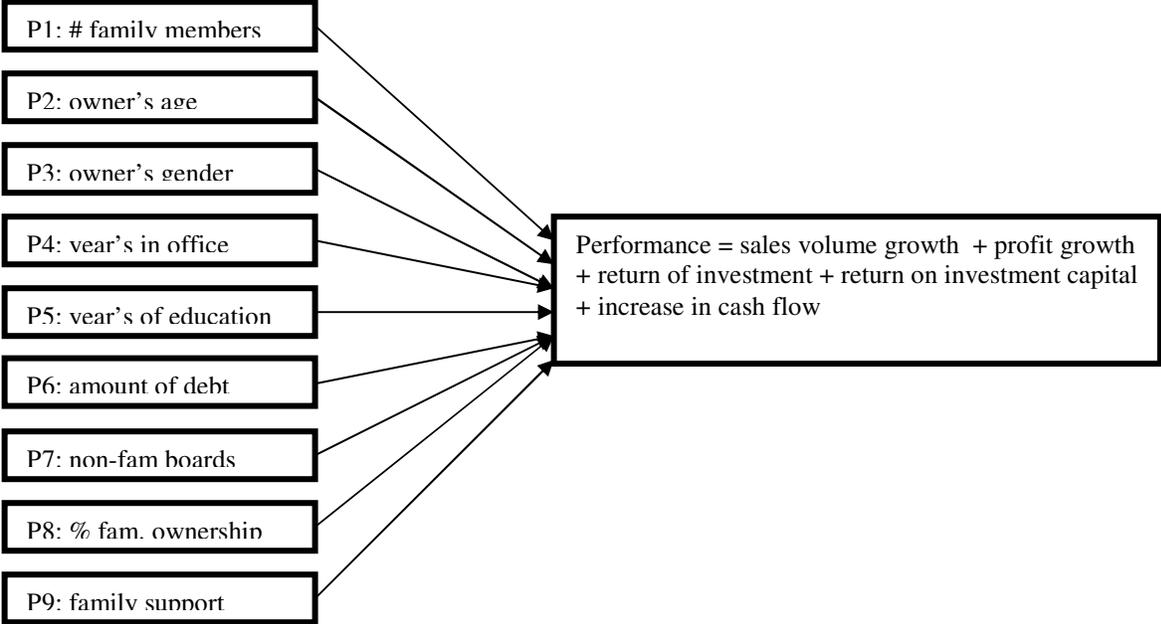

Traditionally, firm performance has been measured on the basis of ROI, ROE, ROA, sales, profitability and others metrics (*Dun & Bradstreet Industry Norms and Key Business Ratios*, 2005). Rather than asking the Mass Mutual Family Business Survey respondents to volunteer financial information, respondents were asked to rate the importance of sales volume growth, profit growth, return of investment, return on investment capital and increase in cash flow. As these are clearly subjective views, it may be that the best overall measure of performance would be all indicators taken cumulatively. Thus, the method of canonical correlation analysis is well suited for this approach, with the dependent variate composed of measures of sales volume growth, profit growth, return of investment, return on investment capital and increase in cash flow will be regressed against the moderating effect of the variables in the prepositions presented above. The relationships proposed by these prepositions are summarized in the conceptual model of interactions (see Figure 1) between the variables: sales volume growth, profit growth, return of investment, return on investment capital and increase in cash flow.

## CONCLUSION

This paper examines the preferred performance measures of family firms. It is our expectation that the data will demonstrate a shift in the perceived importance of selected financial performance measures depending on the characteristics of the key family members involved in the family business. The database used has a single category of “other” that may include both financial measures not mentioned and non-financial measures. Future research should examine the range of relevant non-financial performance measures and the role non-financial measures play in goal setting for family business. Another extension of this research should explore the relationships between family members, conflict, selection of performance measures and organizational performance relative to the performance measures selected.

**ABSTRACT.**

Unemployment remains a serious concern in any country. Although South Africa has experienced political stability, the economy is characterized by a relative low growth rate and high unemployment rate. If these aspects are not addressed effectively political stability can be deter. Many communities, especially in rural areas, are living in poor conditions. By stimulating economic activities, this problem can be alleviated. Efforts should therefore be to stimulate economic activities by involving members or local entrepreneurs and at the same time keep the generated wealth in the community.

Much emphasis is often placed on the small business sector to create jobs and alleviate poverty. The small business sector can undoubtedly make a contribution to economic development as long as obstacles in its way are bridged and the many difficulties faced by small businesses are eliminated or addressed effectively. One way to do this, is for entrepreneurs to form cooperative alliances. Many entrepreneurs in the same industry

have been forced by these difficulties to organize and to form cooperatives. Not only does this strengthen the position of small businesses to compete with big businesses, but it also contributes to community development. Earnings produced by cooperatives are returned to the member/owner and the end result is that this wealth is kept within the community. Thereby the goal of job creation and uplifting of communities are reached. Looking at the definition of the cooperative, namely an autonomous association of individuals united voluntarily to meet their common economic, social and cultural needs through jointly owned and democratically controlled enterprises, it is obvious why this is the ideal type of business to support and develop communities. The ability to take advantage of the economies of scale, while retaining individual identity, is appealing to entrepreneurs.

The cooperative will only be successful if it promotes the wealth of its members and provide competitive products and services. This will only be possible if the cooperative can survive, innovate and adjust to changes in the economy. The aforementioned can be achieved if there is an effective combination of the entrepreneurial skills and the cooperative type of business with the advantages it can offer. The entrepreneur and the performance of the cooperative are therefore closely linked.

The presence of collective entrepreneurship can offer the cooperative the opportunity to capitalize on individual talents together with wisdom and collective energy. All this will contribute to a competitive advantage and a successful cooperative.

This paper also reports on a model in South Africa where a cooperative alliance has been formed between an existing small business and entrepreneurs in the informal sector. This cooperative model allows unemployed people to participate with an existing entrepreneur who acts as their trainer/mentor. Not only are jobs created, but unemployed people are prepared and equipped to become part of the main stream economy.

## **INTRODUCTION**

Unemployment in South Africa is a matter of serious concern for its effect on economic welfare creation. (Competition News, 2002:1). The economy has also been characterized by both low growth and investment (Makgetla : 2004). Although South Africa has experienced political stability, the high unemployment rate, if not addressed effectively, can deter political stability. Research shows that there is a positive relationship between the level of unemployment and the crime rate and that crime will be mostly efficient controlled by addressing the employment and income earning issues (Blackmore, 2003 : 439).

Many rural communities in South Africa are living in poor conditions. By stimulating economic activities, this problem can be alleviated. Communities must become self-sufficient and initiatives for achieving this should stem from the community itself.

Much emphasis is often placed on SMEs to create jobs, alleviate poverty and contribute to economic development due to the fact that large businesses focus more on shareholder return and not necessarily on job creation. These businesses withdraw money from the

community and the main beneficiaries are those outside the community (Hazen, 2000). Efforts should therefore be to stimulate economic activities in rural communities, involving members or local entrepreneurs in the process of producing that wealth and at the same time keep the generated wealth within the community. By keeping wealth within the community, the desired goal, namely job creation and the uplifting of communities, will be reached. This can be achieved through the creation of worker-owned cooperatives (see discussion later). Earnings produced by cooperatives are returned to the member/owner in proportion to the business conducted with the cooperative (Scarini, 2003:14).

In a developing country, the small business sector is widely regarded as the driving force behind job creation and economic development (Lunsche & Barron, 2000 : 1). SMEs can undoubtedly make a contribution to economic development, as long as the obstacles are bridged. If the small business sector wants to realize its full potential the small business must become a major role player in the mainstream economy, be able to compete with large businesses and become fully sustainable. However, not only the formal sector can contribute to economic development, but worldwide the importance of the informal sectors is being realized and strategies to integrate this sector into the mainstream economy are being developed (Luiz : 2002). The bulk of new employment in recent years, particularly in developing and transition countries, has been in the informal economy, because people find it difficult to get jobs or start businesses in the formal economy (Haskell:299).

The business model which will be discussed later can serve as an example of an effort to include the informal sector into the mainstream economy through cooperation amongst unemployed individuals and formal entrepreneurs.

Entrepreneurs as the driving force behind the small business should be supported and assisted enabling them to fulfill their essential role in economic development and restructuring (Glass & Drnovsek : 2001). Unfortunately, the small business sector faces many difficulties and these difficulties have encouraged entrepreneurs in the same industry to organize and create cooperatives (Scarinci, 2003:12). The purpose and flexibility of the cooperative appeal to many small business owners. The ability to take advantage of the economies of scale, while retaining individual identity, is appealing to many entrepreneurs and convince them to establish cooperatives. Some of the advantages offered by the cooperative form of business are access to services and supplies at a more favorable rate, volume discounts, availability of credit and improved delivery since these are required by a group rather than an individual (Scarina, 2003:14). Cooperatives can indeed have a significant and positive impact on the communities in which they are located. They create and retain local jobs, have a more long-term commitment to remain in the community and provide local leadership and development (Zueli & Cropp, 2003:77).

The use of cooperatives to stimulate rural economies is a worldwide phenomenon (Hazen, 2000; Campbell, 2004). A good example of the utilization of the cooperative can also be found in India where the government has laid emphasis on the strengthening of

the movement to generate employment and reduce poverty. Cooperatives played a significant role in promoting rural development and cooperative development was taken up as a national program in this country (Anon, 2004). This effort might be the reason why there are currently 446 784 agricultural cooperatives in India, compared to the 27076 in the United States (Zeuli & Cropp, 2004:13), and 1264 in South Africa (Scholtz, 2001). Greater support for cooperatives has, however, also come from the South African Government, which has realized the potential of this business form, (Makgetla, N S. 2004) although the sector has not reached the momentum as elsewhere in the world.

## **WHAT IS A COOPERATIVE?**

Cooperation is not a bargaining game in which one person's success is achieved at the expense or exclusion of the success of others. The constant aim is mutual benefit (Thorn, 2000).

Looking at the definition of a cooperative, namely an autonomous association of individuals united voluntarily to meet their common economic, social and cultural needs and aspirations through a jointly owned and democratically controlled enterprise (DTI, 2003:5), it is obvious why the cooperative is the ideal type of business to support and develop communities. Cooperatives are about people doing good work to benefit themselves. But even more basic, it is people working with other people to make themselves better off. It is people recognizing that together they can do more than they can do by themselves (Haskell, 2003a:2).

Cooperatives can either be client-owned or worker-owner cooperatives. In the case of worker-owner cooperatives members are both workers and employers. Client-owned cooperatives are established by members that have their own enterprises or households. The members use their cooperative to obtain goods at more favorable prices or they use the cooperative as a marketing instrument for their products (DTI , 2003:6).

As is the case with any other type of business the application of proper business principles also applies to cooperatives. Cooperatives must be managed effectively in order able to survive. The fact that the members are also the owners and are jointly responsible for the success of their businesses, places a responsibility on each participant in the cooperative venture. It is expected from members to act like entrepreneurs and to apply their business skills in the cooperative. If cooperatives want to be prominent role players in the economy and increase their ability to make a difference, they will require enhanced internal capacities, professional management, commitment, general membership education and training, and constructive support from government. A study done in South Africa (Van der Walt, 2003) indicated that a large percentage of non-agricultural cooperatives are not operational any more. Some of these cooperatives have not even been operational after they had been established. There are different reasons for this phenomenon although a proper understanding of the nature of the cooperatives and the responsibilities by members play an important role in these unsuccessful efforts.

Research on alliances amongst small enterprises (Hoffmann & Schlosser, 2001:372) also stresses the importance of proper planning and sufficient knowledge regarding the alliance during the strategic and analysis phase of the alliance. Alliances need to be

professionally planned and organized for the full potential of the cooperation to be realized. Individuals interested to establish cooperatives or considering to participate in cooperative alliances should be assisted before committing themselves. This assistance should preferably come from people who are familiar with the cooperative venture. A failure to understand cooperative complexities can lead to inappropriate assistance and advice. Finding developers and other parties who can assist cooperatives and who are familiar with the cooperative model may be challenging (Zeuli & Kropp, 2004:78).

Research in South Africa (Van der Walt, 2003) also indicated that cooperatives, especially newly established cooperatives in rural areas, have a substantial need for training and managerial assistance during the establishment phase. Once the cooperative is in operation, continuous member education is critical to keep members committed to and involved in the cooperative. This education does not only entail knowledge regarding cooperative principles and practices. Haskel (2003b:2) stated that during this education process it is critical that the cooperative form of business is completely understood. It is also important that cooperative education initiatives adequately deal with today's complex business, marketing and financial issues. Training should also be provided to directors and management to improve their entrepreneurial and business skills (Zeuli & Kropp, 2004:78). These training efforts should also extend to youth and the general public (Haskel, 2003b:2). To have an active and vibrant cooperative sector, people in all walks of life should be informed about the nature and advantages of this type of business. It is also important that this education is based on research, otherwise it will be flawed and dated (DES, 2003:8).

In the USA, university-based cooperatives centers plays an important role in this regard. Unfortunately, such centers do not exist in South Africa.

Research that documents positive and negative cooperative practices can form the basis for future cooperative development. Cooperatives may, however, not be in a position to establish their own research centers and will have to rely on other parties to do and finance these research activities. The establishment of such centers is an important part of creating and enabling a sustainable environment for the long-term development of cooperatives, (DES, 2003:8). Currently, limited research on cooperatives are conducted in South Africa.

## **SUCCESS FACTORS FOR EFFECTIVE COOPERATIVES**

In order to have a vibrant cooperative sector, an environment conducive for cooperative development should be created and certain aspects should be addressed. The following factors play an important role in the effectiveness of cooperatives and also the ability to survive.

- *Effective management.* Cooperatives should be managed effectively. Conflict between members and management, including the board of directors, must be avoided (Zeuli & Cropp, 2003:50, Von Ravensburg, 1999:25). The advantages of cooperatives will only be realized if the cooperative continues to operate as a sustainable form of business.

- *The initiative for the cooperative must come from its members.* Those who will eventually enjoy the advantages of the cooperative, must initiate the establishment of the business. Therefore a bottom-up approach should be followed (Bhuyan & Olson, 1998:8).
- *Member support and commitment.* The cooperative will only succeed if continuous commitment and support by its members exist. (Randall, 2001:1). Members must realize that the cooperative basically depends on them for its existence.
- *Entrepreneurial mindset.* A factor often ignored when addressing cooperative success is the entrepreneurial mindset of members (Röpke, 1992:15). Environmental factors influencing the business sector also apply to cooperatives. In order to address the changing needs of members, all role players (including members, management and directors) must be creative and innovative.
- *Cooperative education.* The cooperative as a form of business must be completely understood and education should also deal with business, marketing and financial issues (Haskell, 2003; Campbell, 2003).
- *Government support.* Although a cooperative is member-driven, government support is indispensable. Government should provide the policy conducive to cooperative development (Von Ravensburg, 1999:23, DES, 2003:5).

Cooperatives should not be used as an instrument of the government but must be able to act autonomously (DES, 2003:6).

## **ROLE OF THE ENTREPRENEUR**

To be viable the cooperative should promote the wealth of its members in order to meet these requirements, the cooperative must provide benefits to the members that will exceed the benefits if they had not established a cooperative. Although it is expected from members to support the cooperative (Zeuli& Cropp 2004:50), the expectation that members will automatically support the cooperative is not always valid (Hogeland, 2004:27). Von Ravensburg (1998:25) is of the opinion that the absence of members' involvement can lead to a situation where it is difficult for the cooperative to make a positive contribution to its members and any contribution towards economic development would also not materialize.

Cooperatives compete with other businesses and must provide competitive products and services. Otherwise, the important factor, namely member support, will be lost in favour of competitors. It is therefore important for the cooperative to establish a competitive advantage and this will only be possible if the cooperative can survive, innovate and adjust to changes in the industry and the economy (Scarini, 2003:14). The presence of an entrepreneurial spirit is therefore essential if cooperatives want to meet these requirements and stay competitive. Members can therefore not only be participants or recipients, but they must be entrepreneurs always searching for opportunities. The cooperative is actually dependant on the characteristics and involvement of the

entrepreneur. The entrepreneur and the performance of the cooperative are therefore closely linked.

To describe the entrepreneurship in a cooperative, the term collective entrepreneurs (Morris & Kuratko, 2002:165), where individual skills are integrated into a group and the team's collective capacity to innovate becomes greater than the sum of its parts, is actually very appropriate. Group members learn about each others' abilities. They learn how they can help one another to perform better and how they can best take advantage of one another's experience. The presence of collective entrepreneurship can offer the cooperative the opportunity to capitalize on individual talents together with wisdom and collective energy. All of this will contribute to a competitive advantage and a successful cooperative.

### **THE DEVELOPMENT OF SMALL BAKERIES : AN EXAMPLE OF JOB CREATION THROUGH COOPERATION BETWEEN THE FORMAL AND INFORMAL SECTOR IN SOUTH AFRICA**

The Yebo cooperative in South Africa has been established by the Deutscher Genossenschafts und Raffeisenverband with the purpose to promote cooperative development in the country and support and service member-based self-help organizations (Biyela, 2004).

Yebo cooperative has developed a business model whereby unemployed people who want to get involved in business can partner with existing small businesses who are

willing to give them training and business mentorship, enabling them to become formal business owners. When these entrepreneurs reach the stage where they have adequate business skills and sufficient funds they will become part of the mainstream economy.

The project started with 17 informal entrepreneurs who indicated that they want to get involved in the pilot project. It was decided to start with a bread baking business due to the high demand for basic food and an inadequate supply network. It was also decided to establish the project in a black township where the unemployment rate is high. As the group were unemployed they had limited funds to buy baking equipment and rent a premise. Yebo approached a local small bakery to enter into an empowerment partnership with the group and Yebo agreed to become the facilitator. The local baker accepted the alliance and agreed to make his equipment and premises available to be used by the group during training. During training, the group had to bake for their trainer's business as compensation for his service and the use of his facilities. His requirement was 500 loaves per day. Any production exceeding this quantity was for the account of the trainees. The trainers currently work on a cooperative basis and market their share of the production in the nearby township where they had already decided to open their bakery in future. In this way, training was immediately linked with income generation for the group.

Within two months of the alliance, the group was able to sell about 700 loaves per day to their own market. The profit realized from their sales managed to compensate each of them with an amount of at least R400 per person per month and the potential exists to

increase this income. This model does not only create opportunities for people who want to start their own bakeries, but provide trained people who can enter the labour market if they are not keen to own their own baking operation.

A second initiative taken by Yebo cooperative was to invite other existing small bakeries to join hands and buy their baking ingredients in bulk. Five small bakeries have responded which resulted in a dramatic decrease in their purchasing prices.

The arrangement between the entrepreneur and the trainees is currently an informal cooperative alliance. When the time comes to make a decision the group members can either start individual small bakeries or they can form a formal cooperative and expand their production. Not only has this venture created income and employment, but it transformed formerly unemployed people into competent entrepreneurs which can in turn create jobs and contribute to economic development.

This model and the outcome thereof will be monitored and will serve as a case study for future qualitative research.

## **CONCLUSION AND RECOMMENDATIONS**

Although much has been done in some countries to promote cooperative development, more active steps should be taken in South Africa in this regard. To give more momentum to the process the following recommendations should be considered.

-Cooperative alliances between informal and formal entrepreneurs have huge potential, especially in third world countries and should be exploited.

-The promotion of the cooperative type of business form should be promoted amongst existing small businesses, as well as individuals in the informal economy.

-Cooperative training and education should be a priority, not only at tertiary level, but also at secondary level. Government should play a more active role in providing resources, especially in countries where they have not accepted responsibility in this regard.

-Cooperative research institutes within the university sector is needed to ensure research-based education and management development programs. Cooperative centers, which prove to be effective in other countries, should also be considered in a country like South Africa. Government should accept the responsibility to assist these institutions.

# SMALL BUSINESS GROWTH THROUGH FRANCHISING: A QUALITATIVE INVESTIGATION

## ABSTRACT

Although franchising has long been recognised as an attractive means of growing a business, the impact of franchising for small businesses is an area which is relatively under researched and understood. Whilst resource scarcity and agency theory suggest many potential benefits to franchised firms, small businesses wishing to franchise are likely to encounter a number of challenges in translating their business concept into a successful franchise operation. This paper, though a series of case studies of both ‘failed’<sup>1</sup> and successful franchises seeks to provide a rich description and insight into the experiences of six businesses which have tried to expand using franchising, and considers the implications of franchising for small business growth. It appears that many of the ‘failed’ companies were not prepared for the differing nature of the franchisor-franchisee relationship. In addition, the findings suggest that for businesses to franchise successfully, recruitment of suitable franchisees is vital. However, in the early days of system development, the ability to recruit may be impeded by the system’s lack of perceived legitimacy. This is likely to be exacerbated in periods of relative economic prosperity, when all franchise systems appear to find it more difficult to recruit.

## BACKGROUND

The use of franchising has principally been explained through resource scarcity and agency theory. Resource scarcity suggests that franchising enables companies to raise finance through the fees charged to franchisees, and by substantially delegating the costs associated with establishing each additional outlet to the franchisees. For small businesses, for whom raising finance is often difficult (Hall, 1989), franchising may thus provide an attractive solution to financial constraints. However, franchising in itself does not provide a low cost solution to growth because of the costs associated with establishing a franchise system. Indeed, some authors (see, for example, Stanworth et al 2001) have suggested that it may place a substantial financial strain on young systems.

Agency theory contends that franchising, through the incentives it provides to reduce opportunistic behaviour (Mathewson and Winter, 1985) should reduce agency costs. It has been suggested (Barringer and Greening, 1988) that small businesses can find it difficult to establish the controls necessary to attenuate opportunistic behaviour as they expand. By making franchisees residual claimants, franchising should reduce the need for such controls, although as

researchers such as Hunt (1977) have commented, ensuring uniformity across the system can provide a challenge to franchise systems.

It can be seen that franchising may offer partial solutions to resource and agency considerations, but it by no means provides a panacea to the difficulties of expansion, and indeed, may introduce new challenges. This paper explores these issues further, through an examination of the experiences of six companies that have attempted to grow through franchising.

## **METHODOLOGY**

In order to provide a richer description and insight into the key challenges for small businesses in using franchising as a growth strategy it was decided that a qualitative in-depth case approach was appropriate. Thus, the focus of the research is six organisations that had tried to expand using franchising. They were selected using a combination of both purposive and convenience sampling. Three of the companies had successfully grown through franchising, and are now established national chains, and three had all attempted to expand through franchising, but had subsequently withdrawn from it though they remain in operation. Interviews were held with the principals of each of the participating companies, after an initial briefing about the aims of the research. The interviews were semi-structured and lasted between one and a half and two hours each.

## **SUMMARY OF FINDINGS**

Whilst the literature has suggested two principal benefits of franchising, namely relative cost of expansion and the reduction in agency costs, the findings suggest that franchising brings with it additional challenges. One of the key issues appeared to be the differing nature of the franchisor-franchisee relationship to the traditional employer-employee one. It appeared that many of the 'failed' companies were not prepared for this, and struggled to know how to manage the relationship successfully. Certainly, for the 'failed' franchises, it was the stress of the relationship that was one of the key reasons for withdrawing from franchising. In part, this may have stemmed from having recruited unsuitable franchisees; a particular challenge to systems in the early days when the principals have limited experience, and the system is still struggling to establish its perceived legitimacy. Recruitment difficulties are likely to be exacerbated in periods of relative economic prosperity, when all franchise systems appear to find it more difficult to recruit.

Further research is needed to better understand the effect of recruitment on franchise development. In particular the relationship between the economic cycle and the ability to recruit needs to be investigated in order to establish whether, indeed, there is a significant link. It is likely that if such a relationship exists, its effects may be magnified for younger systems, for whom it is more difficult to signal their quality. An examination of franchise systems at different stages of their development would facilitate this.

## ENDNOTES

<sup>1</sup>The companies are termed 'failed' in the sense that they have attempted to franchise but have subsequently withdrawn. Thus, whilst they can be deemed to be 'failed' franchises, in the full business sense they are by no means failures and continue to operate. Failure is thus referred to in inverted commas

## ABSTRACT

The primary objectives of this paper were to examine (using a large, longitudinal database) differences in the *range* and *intensity* of network affiliations for male- and female-controlled SMEs; and to model the association between network access and firm survival. Although the results suggest that approximately 50% of male and female SME owners access more than four networks during the year, the male owners were more likely to access *formal* networks (such as: *banks, business consultants, industry associations, and solicitors*) while the female owners were more likely to consult with *family and friends* (*informal* network). However, despite the extensive use SME owners make of both *formal* and *informal* networks, the models predicting firm survival based on network access (and a number of demographic control variables) suggest that the majority of these networks do not appear to impact significantly on firm survival. The results suggest that (given limited time for networking) SME owners should ensure they at least maintain regular contact with an *external accountant*; this was the only network source significantly related to firm survival, for both the male- and female-owned SMEs. This might be particularly important for female SME owners with family commitments and limited time available for networking. Further, and contrary to suggestions in the literature, the results show that female-owned SMEs are not failing to make appropriate use of networks. Indeed for both firm survival and growth, the model relating firm performance to network use was strongest for the female-owned SMEs.

## INTRODUCTION

Although human resources 'have long been viewed as ... essential to a venture's ability to survive and grow' (Florin, Lubatkin and Schulze 2003, p.374), recently researchers have begun

to 'focus on the significance of the owner-manager's personal contact network as an aid to business development' (Cromie and Birley 1992, p.237). Social capital theory is founded on the premise that a network provides value to its members by allowing them access to the social resources embedded within the network (Florin et al. 2003, p.376). Networking is a means by which 'entrepreneurs can tap resources that are "external" to them' (Jarillo 1989, p.133).

Research suggests there might be significant differences between males and females in terms of the *range* and the *intensity* of their network access. For example, Singh, Reynolds, and Muhammad (2001) suggested that female-owned enterprises are frequently hindered by a lack of access to networks. Cromie and Birley (1992) argued that networks were the product of personal drive and historical experiences and that the social structure and domestic duties of many women might result in female entrepreneurs having fewer networks than men. However, the research to date on gender differences in networking, and the association between networking activities and firm survival, is limited. Therefore, this study has two primary objectives: firstly, to determine whether there are any major systematic differences in the *range* and *intensity* of network access between male and female SME owners; and, secondly, to determine if there is an association between network access and firm survival.

## **LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT**

In looking at the different types of networks firms access, Cooper et al. (1989) found that larger ventures were more likely to access *formal* networks (such as professional advisors), while smaller ventures were more likely to access *informal* sources (such as family and friends). Given that female-owned ventures tend (on average) to be smaller than male-owned businesses (Carter and Allen 1997; Cliff 1998), it would be reasonable to expect that female-owned firms would

make greater use of *informal* networks and less use of *formal* networks. Also, Orhan (2001) noted that past research has found that the first source of advice for male entrepreneurs was usually professional experts (such as accountants and lawyers) and the second was their spouses; whereas the first source of advice for female entrepreneurs was their spouse, second was their friends, and third was professional advisors. This suggests that male SME owners are more likely to make use of *formal* networks; while female SME owners are more likely to turn to family and friends (*informal* network). Further, due to family responsibilities (Lerner, Brush and Hisrich 1997), women might have less time available for networking and might also find it difficult to access certain networks (such as industry associations, which generally meet after hours). These views are supported by the comments of Aldrich (1989) who noted that past research suggests that female entrepreneurs might be embedded in different types of networks than their male counterparts.

In summary, it would seem past research suggests that men are likely to have a broader *range* of networks, which they pursue more *intensely* than women. However, it is conceivable that although women might access fewer networks in total than men, they might make greater use of *informal* networks (particularly family and friends). This gives rise to the first four hypotheses to be examined in this study.

Hypothesis 1: Male SME owners access a greater *range* of networks than female SME owners.

Hypothesis 2: Male SME owners make more *intense* use of networks than female SME owners.

Hypothesis 3: Male SME owners make more *intense* use of *formal* networks than female SME owners.

Hypothesis 4: Female SME owners make more *intense* use of *informal* networks than male SME owners.

Brüderl and Preisendörfer (1998) argued that entrepreneurs who have access to a diverse set of networks, which they access regularly, should be more successful than those who make limited use of networks. Given this argument, it is reasonable to expect a relationship between network access and firm survival, for both male- and female-owned SMEs; even though female SME owners might access networks differently to (not as frequently as) their male counterparts. This gives rise to the final two hypotheses to be examined in this study.

Hypothesis 5: Network access is positively associated with firm survival for male-owned SMEs.

Hypothesis 6: Network access is positively associated with firm survival for female-owned SMEs.

### **DESCRIPTION OF DATA**

A major strength of this study is its use of a large longitudinal data set (funded by the Australian federal government) on the growth and performance of Australian employing businesses. The Australian Bureau of Statistics (ABS) Business Register was used as the population frame for the surveys. All employing businesses in the Australian economy were included in the scope of the survey except for businesses in the nature of: government enterprises; libraries; museums; parks and gardens; private households employing staff; agriculture, forestry and fishing; electricity, gas and water supply; communication services; government administration and defense; education; and health and community services. Data collection was through self-administered questionnaires distributed by the ABS for the periods 1994-95, 1995-96, 1996-97, and 1997-98.<sup>1</sup> Because the ABS can legally enforce compliance with its data requests (under the *Census and Statistics Act 1905*) response rates were very high (typically in excess of 90%). A non-response normally meant the ABS was unable to locate the business proprietor (or the business) and this was, therefore, treated as a business closure. For confidentiality reasons, information on all large

businesses (those employing more than 200 people) was excluded from the data set made available to researchers outside the ABS.

The second (1995-96) ABS survey contained a question relating to the frequency with which SME owners accessed a variety of networks during the year. Specifically, the question asked respondents to indicate how frequently (never; between one and three times; or more than three times) they accessed advice during the year from each of ten different sources: *banks; business consultants; external accountants; family and friends; industry associations; local businesses; others in the industry; the Small Business Development Corporation (SBDC); solicitors; and the Australian tax office*. The question did not ask respondents how often they accessed each listed source for other networking purposes and, therefore, the data provided might not be representative of the full extent of networking by SME owners. However, as seeking advice (and information) is one of the major purposes of networking (Hoang and Antoncic 2003), the data should provide a reasonable indication of how widely networks are used, and allow a comparison between male- and female-owned businesses. As this question was not repeated in the surveys for the remaining two years of the longitudinal study it is assumed that the SME owners did not change their behavior patterns significantly over those subsequent years. This is acknowledged as a potential limitation of the study.

There were 5,027 responses to the 1995-96 survey. However, on examining the data, it was found that 13 businesses had no income (sales or other income). Therefore, these businesses were excluded from the analysis on the assumption they were not active businesses. As this study is interested in the differences between male and female SME owners, a further 1,914 firms had to be excluded because, either they did not have a single major decision maker, or the sex of

that person was not reported.<sup>2</sup> This left 3,100 firms (2,919 male-owned and 181 female-owned) that could be examined over a three-year period.

## RESULTS

The results presented in Table 1 indicate there were no significant differences between the male and female owners in terms of the *range* of networks they accessed during the year 1995-96. The results show that about 85% (88% for males and 85% for females) of SME owners accessed at least one network during the year and in approximately 50% of cases (52% for males and 46% for females) the SME owners accessed more than four different networks. Although contrary to hypothesis 1 (male SME owners access a greater *range* of networks than female SME owners), this finding is consistent with Cooper et al. (1989) and Robson and Bennett (2000) who reported that entrepreneurs sought information from a number of different sources and with Cromie and Birley (1992) who found that the personal contact networks of women were just as diverse as those of men.

### INSERT TABLE 1 ABOUT HERE

Table 2 provides a summary of the *intensity* with which both the male and female SME owners made contact with a variety of *formal* and *informal* networks during the period 1995-96. Table 2 shows that the networking group most frequently contacted by both the male and female SME owners was *external accountants*: 47% of males and 44% of females contacted an *external accountant* on more than three occasions during the year. This finding is consistent with Robson and Bennett (2000) who reported that, from the private sector, accountants were the most widely used source of advice. Interestingly, there was no significant difference between the male and female owners use of this *formal* network. Similarly, *others in the industry* were also frequently

accessed by both the male and female SME owners; 27% of both males and females accessed this *informal* network on more than three occasions during the year. Unlike Birley (1985), who found that entrepreneurs relied heavily on *informal* networks (but seldom tapped into *formal* networks), the results presented in Table 2 suggest that Australian SME owners (male and female) make extensive use of both *formal* and *informal* networks. As there was no statistically significant difference between the male and female owners in terms of the average *intensity* with which they accessed all network sources (both *formal* and *informal*), hypothesis 2 (male SME owners make more *intense* use of networks than female SME owners) is not supported. This result is consistent with Cromie and Birley (1992) who found that females were just as active in their networking relationships as men.

INSERT TABLE 2 ABOUT HERE

There is some support provided in Table 2 for hypothesis 3 (male SME owners make more *intense* use of *formal* networks than female SME owners). The average *intensity* with which the male owners accessed *formal* networks was significantly higher than for females. In particular, the males were much more likely to regularly network with: *banks; business consultants; industry associations; and solicitors*. In terms of accessing *informal* networks, the results reported in Table 2 do not support hypothesis 4 (female SME owners make more *intense* use of *informal* networks than male SME owners). The overall *intensity* with which the female SME owners accessed *informal* networks was not significantly different to that for men; although the females were significantly more likely to seek advice from *family and friends*. This result is contrary to Cromie and Birley's (1992) finding that women were no more likely to consult with *family and friends* than men.

While Table 2 indicates some notable differences between the male and female SME owners' use of specific networks, overall the *intensity* with which males and females accessed networks was remarkably similar. The results indicate that many female SME owners make extensive use of a variety of both *informal* and *formal* networks and, therefore, it is questionable that female-owned SMEs should experience poorer performance as a result of limited access to networks. Social feminist theory (Fischer, Reuber and Dyke 1993) suggests that men and women are inherently different due to differences in their early and ongoing socialization and, as a result of these differences, we might expect males and females to behave and access networks differently. However, 'These differences do not imply that women will be less effective in business than men, but only that they may adopt different approaches' (Watson and Robinson 2003, p.775).

Given that many SME owners (both male and female) access a variety of networks for advice and support, and the findings of Larson (1991) suggesting that a firm's ability to identify, cultivate, and manage network partnerships is critical to survival, the next step is to determine the association between network access and SME survival rates. Before proceeding, however, it is necessary to consider key demographic variables that might potentially confound the analysis. Table 3 provides a comparison of the survival rates for the male- and female-owned SMEs in this study (Panel A), together with demographic variables relating to the owner (education and years of experience - Panel B) and the firm (industry, age and size - Panel C). These demographic variables are regularly reported in the literature as impacting SME performance (Robinson and Sexton 1994; Robson and Bennett 2000) and have also been found to vary significantly by gender (Fischer et al. 1993; Fischer and Reuber 2003; Watson and Robinson 2003).

INSERT TABLE 3 ABOUT HERE

Table 3 (Panel A) reports the number (and percentage) of male- and female-owned firms that survived over the three-year period of this study. While comparing the survival rates for male- and female-owned SMEs was not an objective of this study, it should be noted that the lower reported survival rates for female-owned SMEs would most likely disappear after controlling for age and industry (Watson 2003). With respect to the owner demographic variables (Panel B), a significantly higher percentage of male SME owners had a business degree or trade qualification; with a significantly higher percentage of female SME owners having a non-business degree or school qualification. In terms of firm demographic variables (Panel C), the male-owned SMEs were over-represented in manufacturing and construction, while the female-owned SMEs were over-represented in: retail trade; accommodation, cafes and restaurants; and personal and other services. The male-owned businesses also tended to be both older and larger than the female-owned SMEs. Given the existence of significant demographic differences between the male and female owners and their firms, it is reasonable to expect there might be notable differences in terms of the models derived to predict firm survival for these two groups of business owners.

Binary logistic regression was used to examine the extent to which the probability of firm survival was associated with the various networks accessed by SME owners (and to the two owner and three firm demographic variables reported in Table 3). For the purposes of this analysis, surviving firms were coded “1”, while discontinued firms were coded “0”. Each of the ten potential networks was entered as a categorical variable: if a particular network had not been accessed during the year it was coded “1”; where a network had been accessed between one and three times it was coded “2”; and where a network had been accessed on more than three occasions it was coded “3”. Similarly, education, industry and age were entered as categorical variables with four categories for education, eleven for industry and five for age, as shown in

Table 3. Years of experience and size of the business (measured in terms of the number of employees) were entered as continuous variables.

For the male-owned SMEs in this study, Table 4 provides the results of running a forward conditional binary logistic regression to model firm survival. In conducting this (and the remaining) analysis, the SPSS default cut-offs of 5% for variables entering the model and 10% for removal were used. To check the robustness of the results, the logistic regression was also run backwards, with no significant differences found. Before examining the results provided in Table 4, it should be noted that SPSS converts the categorical variables into a set of ‘dummy’ variables with the last category (the reference group) excluded. For example, Table 4 reports separately both the overall significance of age (on the likelihood of firm survival) and also the impact of each of the first four age categories relative to the last (reference) category. The final column of Table 4 (Exp(B)) reports the ‘odds ratio’ for each individual category of age (relative to the last category). The ‘odds ratio’ is a measure of the impact of a one-unit change in the independent variable (in this case, being in a certain age category relative to being in the last age category) on the dependent variable (in this case firm survival). An odds value of 2 would mean that a firm in this particular age category is twice (.67/.33) as likely (or 100% more likely) to survive, relative to a firm 20 or more years old. An odds value close to 1 would mean that a firm in this particular age category has an equal (.5/.5) chance of survival relative to a firm 20 or more years old. An odds ratio of .67 would indicate that the firm is two-thirds (.40/.60) as likely (or 33% less likely) to survive, relative to a firm 20 or more years old.

INSERT TABLE 4 ABOUT HERE

As can be seen from Table 4, age of firm and accessing *external accountants*, *industry associations* (*formal networks*) and *others in the industry* (*informal network*) appear to be significantly associated with the survival of male-owned SMEs. For example, compared to firms that were twenty or more years old, firms less than two years old and firms that were between two and five years old were 95% (1-0.05) and 34% (1-.66) *less* likely to have survived, respectively. There is no difference in the survival rates for businesses between five and ten or between ten and twenty years old relative to those that were twenty or more years old. Similarly, compared to SMEs that accessed *external accountants* on more than three occasions during the year, those that did not access an *external accountant* were 76% (1-0.24) *less* likely to have survived. There is no difference in the survival prospects of firms that accessed accountants more than three times during the year and those that accessed accountants between one and three times during the year. The same picture is apparent for accessing *industry associations*, namely, the only significant difference in survival prospects is between those firms that never accessed *industry associations* and those that accessed *industry associations* more than three times during the year. In terms of networking with *others in the industry*, however, it seems that investing too many resources (time and effort) in this network activity could be counter-productive and might not result in 'asset parsimony'. For example, compared to accessing *others in the industry* on more than three occasions during the year, male SME owners that accessed *others in the industry* on between one and three occasions only (category 2) were over 1.5 times *more* likely to have survived. There is no difference in the survival prospects for firms that either did not network with *others in the industry* or those firms that accessed this source on more than three occasions during the year. In other words, it seems that not networking with *others in the industry* is equally as detrimental as spending too much time networking with *others in the industry*. This result might help to explain the finding by Bates (1994, p.671) that the heavy use of social

support networks typified ‘the less profitable, more failure-prone businesses’. That is, it might be important for SME owners to regularly assess the *range* and *intensity* of their network access to ensure they are accessing appropriate networks without devoting too many resources to this activity relative to the benefits they receive. ‘Through a process of expanding and culling the network, the entrepreneur identifies a set of relationships that merits continued development and future investment for the firm.’ (Larson and Starr 1993, p.6)

In summary, the final model for predicting the survival of male-owned SMEs incorporates (along with the age of the business) both *formal* (*external accountants* and *industry associations*) and *informal* networks (*others in the industry*). The final model had a Nagelkerke R Square of 0.36 and an overall predictive accuracy of 83.7%; with a predictive accuracy for surviving firms of 86.2% and a predictive accuracy for discontinuing firms of 68.4%. Accessing other networks (such as: the *Australian tax office*; *banks*; *business consultants*; *family and friends*; *local businesses*; the *SBDC*; and *solicitors*) did not add significantly to the explanatory power of the model and, therefore, these networks were not included in the final model presented in Table 4. It is worth noting that, with the exception of *industry associations*, the *formal* networks that were accessed significantly more often by the male SME owners compared to the female SME owners (*banks*; *business consultants*; and *solicitors* – see Table 2) had no apparent impact on the probability of survival for the male-owned SMEs.

Table 5 provides the results of undertaking a similar analysis for female-owned SMEs. As with the male-owned SMEs, age of the business is the only demographic variable that is significantly related to the prospects of survival for the female-owned SMEs. However, for the female-owned SMEs, it is only the youngest firms (those less than two years old) that were significantly (99%)

less likely to have survived. In terms of networking, it would appear that for female SME owners, networking with both *external accountants* (*formal* network) and with *family and friends* (*informal* network) improves the probability of firm survival. Female-owned SMEs that never accessed an *external accountant* were 91% (1-0.09) *less* likely to have survived than those that accessed an *external accountant* on more than three occasions during the year; there is no significant difference where *external accountants* were accessed between one and three times and more than three times during the year. It is interesting to note the similarity between the female-owners networking with *family and friends* and the male-owners networking with *others in the industry*. In both cases, too many resources devoted to these *informal* networks seems to be detrimental to the prospects of firm survival. Female owners who accessed *family and friends* on between one and three occasions during the year, rather than more often, were almost five times more like to have survived in business.

The final model for predicting the survival of female-owned SMEs had a Nagelkerke R Square of 0.62 and an overall predictive accuracy of 86.7%; with a predictive accuracy for surviving firms of 86.2% and a predictive accuracy for failed firms of 88.9%. It is worth noting that the model for predicting the survival prospects of female-owned SMEs appears considerably better than that for male-owned SMEs.

INSERT TABLE 5 ABOUT HERE

The results presented in Tables 4-5 provide some support for hypotheses 5 and 6 (network access is associated with increased firm survival for both male- and female-owned SMEs). The use of *external accountants* (*formal* network) was significantly associated with survival for both the male- and female-owned SMEs. Networking with *industry associations* (*formal* network) and

with *others in the industry* (*informal* network) was associated with the survival of male-owned SMEs. Networking with *family and friends* (*informal* network) was significantly associated with the survival of female-owned SMEs. While these results indicate that a variety of both *formal* and *informal* networks are associated with SME survival, they also indicate that SME owners need to monitor the resources they devote to networking to ensure that the benefits they receive from networking activities exceed the costs.

## CONCLUSIONS

‘The primary purpose of this study was to examine differences in the way male and female SME owners access both *formal* and *informal* networks, and to determine what impact this might have on SME survival. A significant advantage of this study (over many previous studies) is its use of a relatively large longitudinal database developed from surveys conducted on behalf of the Australian Federal Government and specifically aimed at providing a better understanding of the performances of Australian SMEs. As a result, the data was highly representative (with response rates typically over 90%) and allowed a number of potentially confounding demographic variables (owner education and experience; and the industry, age, and size of the firm) to be included in the analysis.

The results show that both male- and female-owned SMEs make extensive use of *formal* and *informal* networks. There is some evidence to suggest that females consult more frequently with *family and friends* while males are more likely to access *banks, business consultants, industry associations* and *solicitors*. However, although the types of networks accessed might vary, the number of different networks male- and female-owners consult is very similar. For example, there was no significant difference in the overall number of networks (both formal and informal)

accessed by the male and female SME owners; approximately half the SMEs in this study (52% of male-owned and 46% of female-owned) accessed more than four different networks during the year.

The results also indicate a significant association between accessing particular networks and firm survival for both the male- and female-owned SMEs. This finding is in contrast to Aldrich and Reese (1993) who were unable to find any evidence linking an entrepreneur's use of networks to business survival or performance. Also, contrary to the suggestions by Aldrich (1989) and Singh et al. (2001), there is no evidence that female SME owners are disadvantaged by any differences that might exist in their network access compared to their male counterparts. This result is consistent with a social feminist theory perspective (Fischer et al. 1993) in that, although men and women might access networks differently, they seem to be equally as effective. Indeed, the model for predicting firm survival was substantially stronger (in terms of the Nagelkerke R Square) for the female-owned SMEs than for the male-owned SMEs. This suggests that the relationship between networking and firm performance is clearer for females than males. One possible explanation for this might be that females, because of the time constraints they face balancing work and family commitments, are more strategic in the way they go about developing networking relationships.

In terms of *formal* networks, the results indicate that accessing *external accountants* was the only source of support significantly related to firm survival, for both the male- and female-owned SMEs. While this finding is consistent with Potts (1977, p.93) who found that 'successful companies rely more heavily on accountants' information and advice than do unsuccessful companies', it is in contrast to the results of Robson and Bennett (2000) and Cooper, Gimeno-

Gascon and Woo (1994). Robson and Bennett (2000) found no statistically significant relationship between accessing advice from accountants and any of their measures of firm performance. Similarly, Cooper et al. (1994) also found that the use of professional advisors (*formal* networks) had no significant effect on firm performance. The only other *formal* network to show up in the models was accessing *industry associations*, which was significantly associated with survival, but only for the male-owned SMEs.

In terms of *informal* networks, the results indicate that, for the male-owned SMEs, accessing *others in the industry* significantly improves the chances of survival. However, the results also indicate that too much time spent networking with *others in the industry* could be counter-productive. For the female SME owners, networking with *family and friends* significantly improves the chances of survival. Again, however, the results indicate that too many resources devoted to this networking activity could also be counter-productive.

Zhao and Aram (1995) noted that broad ranging networks cost more (financially, and in terms of the owner's time and effort) to develop and maintain. Starr and MacMillan (1990, p.80) argued that individuals 'invest their time and energy in social transactions based on their expectations of future profits and rewards' and Uzzi (1996) suggested that 'An organization's network position, network structure, and distribution of embedded exchange relationships shape performance such that performance reaches a threshold as embeddedness in a network increases.' Consistent with the comments above and the notion of 'asset parsimony', the results in this study suggest that too many resources devoted to networking might not be helpful to SME performance. For example, many networks appeared to be unrelated to firm survival (*banks; business consultants; local businesses; the Small Business Development Corporation (SBDC); solicitors; and the Australian*

*tax office*) and in some cases accessing a network on more than three occasions during the year appeared to be negatively associated with firm survival. This applied to males accessing *others in the industry*.

It seems that, despite the extensive use made of both *formal* and *informal* networks by SME owners (male and female), the majority of these networks (with the exception of *external accountants, industry associations, others in the industry, and family and friends*) do not appear to impact significantly on firm survival. This finding calls into question the conclusion by Davidsson and Honig (2003, p.303) that SME owners 'would be well advised to develop and promote networks of all sorts'. Indeed, given the cost of participating in networks, the results could be seen as providing support for Lerner et al. (1997) who found that participation in multiple networks was negatively related to firm performance. These results suggest that, given limited time for networking, SME owners should ensure that they at least maintain regular contact with an *external accountant*. This might be particularly important for female SME owners with family commitments and limited time available for networking. Further (and contrary to prior research), the results suggest that female-owned SMEs are not failing to make appropriate use of networks. Indeed, the model relating firm survival to network access was strongest (in terms of overall predictive accuracy and explanatory power – Nagelkerke R Square) for the female-owned SMEs.

Finally, the reader should be cautioned against interpreting the results as suggesting that networking with those groups not featured in the various models has no benefit. SME owners might get other benefits from networking, beyond the purely economic benefits that were the focus of this study. For example, by consulting with multiple sources, owners might draw more

comfort (reassurance) in their future plans, particularly if these multiple sources are essentially providing similar feedback. Also, the benefits from some network sources might be firm and/or situation specific and might, therefore, not show up in a large sample looking at average outcomes. For example, use of management consultants might be of substantial benefit in a limited number of very specific situations. An analysis of a large data set might mask, or make it difficult to detect, the benefits in such cases.

### **ENDNOTES**

- <sup>1</sup> Copies of the questionnaires can be obtained from the ABS.
- <sup>2</sup> Note that some of the firms could have had multiple owners (both male and female), however, if the major decision maker was male (female) the firm was classified as a male (female) owned firm for the purposes of this study.

“Smart training for the older entrepreneur”

Dr Beverley Webster & Dr Beth Walker

Edith Cowan University

International Council for Small Business

World Conference June 15 – 18, 2005

ABSTRACT

The ageing of the Australian population is guaranteed and more significantly the number of years of employment and the economic consequences related to the risk of long term unemployment and premature retirement. Approximately one third of Australians between the ages of 50 and 64 rely on some form of social security payment and nearly one half of these do not have paid employment. As stated by the Federal Treasurer Peter Costello in February 2004 few older Australians have access to sufficient retirement funds placing a substantial burden on the economy. Considering the significant proportion of people in this group, the lack of participation in the labour force from this sector, either voluntary or forced, presents the Australian economy with significant financial and social challenges. Increasing the participation rate of older persons in the labour force makes clear economic sense and one strategic option is to encourage self-employment or small business ownership. Small business account for 96 percent of the Australian private sector, non-agricultural businesses and they employ 47 percent of people in this sector and hence small business is significant to the Australian economy. It is known from previous studies that older people are more likely to succeed in small business than other sectors of the business population however the eventual sustainment and possible growth is dependent on certain variables. This paper presents a conceptual framework for the participation of older persons in the labour force which includes those factors and interrelationships that influence the outcomes for self-employment through small business ownership.

## INTRODUCTION

The ageing of the Australian population is guaranteed. Currently the proportion of the population over 65 is 12 per cent, by 2021 it will be 18 percent and by 2051 it will be 30 percent (Australian Bureau of Statistics, 2002). It is not just the ageing of the population that poses serious challenges to OECD countries (Curran & Blackburn, 2001; Morris & Mallier, 2003; Singh & Verma, 2001; Stanworth & Stanworth, 1995; Sterns & Miklos, 1995; Taylor & Walker, 1998; Walker, 2001), but the economic consequences related to the risk of long term unemployment and premature retirement (Department of Premier and Cabinet, 2002; Encel, 1999; Sheen, 1999). Around 33 percent of Australians between the ages of 50 to 64 rely on some form of social security payment and 46 percent do not have paid employment (Access Economics, 2001; Australian Bureau of Statistics, 2002; Sheen, 1999). Labour force participation rates for Australian 50 to 64 year olds is less than 50 percent, lower than the OECD average (OECD, 2002). Considering that there are over 30 percent of people in this group, the lack of participation in the labour force from this sector, either voluntary or forced, presents the Australian economy with significant financial and social challenges (Australian Bureau of Statistics, 2002; Blanchflower, 1998; Forum of Labour Market Ministers, 2002; Morris & Mallier, 2003; Platman, 2003; Singh & DeNoble, 2003). This research investigates the factors that will influence or deter participation in mainstream employment for longer and a significant outcome will be the development of a framework by which Australia can build sustainability through the option of self-employment and small business ownership for older people.

## BACKGROUND

Very few Australians over 50 years of age have significant personal savings that will allow them to have sufficient income available at early retirement (Australian Bureau of Statistics, 2002). In addition to the burden on the economy, one of the most significant implications of early retirement is its effect of a lower amount of disposable income subsequently available to individuals. As secure, full-time jobs that last until the statutory retirement age have dwindled, flexible forms of work have developed, such as job sharing, and are increasingly promoted as promising solutions to the problem of economic inactivity in later life (Platman, 2003).

Increasing the participation rate of older persons in the labour force makes clear economic sense and one option is to encourage self-employment or small business ownership (Baucus & Human, 1994; Blanchflower, 1998; Bruce, Holtz-Eakin, & Quinn, 2000; Curran & Blackburn, 2001; European Foundation for the Improvement of Living and Working Conditions, 2001; Greene & Storey, 2002; Singh & DeNoble, 2003; Weber & Schaper, 2003). Australia is in its infancy in relation to the issue of sustainable employment for older workers and there is no framework for encouraging and supporting continued participation in the workforce via options such as small business ownership for this sector of the population. The small business sector is vital for the economy in Australia, not only does it account for 96 percent of the Australian private sector, non-agricultural businesses but 47 percent of the private sector, non-agricultural workforce is employed in small business (Australian Bureau of Statistics, 2002). Small business has been said to be the 'engine room' of the Australian economy (Peter Reith, Minister for Employment, Workplace Relations and Small Business, 1997) and that the role of government is to create the right environment for business to grow and employ (Geoff Prosser, Minister for Small Business and Consumer Affairs, 1997). In addition the current opposition Labor party recognises that small business plays a central role in the Australian economy and that "through individual effort, small business owners provide employment for themselves and many thousands of employees" (Australian Labor Party Federal Platform 2000: Ch 6, Para 108). Even though both major political parties are in agreement in relation to the importance of small business and frequently acknowledge the aging population, neither party have developed a strategy to investigate the possibility of assisting or encouraging older workers lengthening their working lives by taking up the option of self employment.

## SELF EMPLOYMENT

Self-employment and small business ownership already exists amongst older people in most OECD countries (Curran & Blackburn, 2001; de Bruin & Firkin, 2001; Greene & Storey, 2002; Weber & Schaper, 2003). The proportion of people over 50 years of age who start a small business is increasing and it is known that older people are more likely to succeed in small business than their younger counterparts (Greene & Storey, 2002; Kennedy & Drennan, 2001; Morris & Mallier, 2003) but what is not known is what assistance is needed to encourage and support those who may not have considered self-employment as an employment alternative and further, what strategies would promote sustainability and

possible growth of businesses operated by older people. The key question being "is self-employment and small business ownership a viable employment alternative to early retirement for Australians?" If the answer to this question is yes (Greene & Storey, 2002; Kennedy & Drennan, 2001; Mallon, 1998; Platman, 2003; Quinn & Kozy, 1996; Singh & DeNoble, 2003; Singh & Verma, 2001; Stanworth & Stanworth, 1995; Weber & Schaper, 2003), then the further questions to be addressed regarding the early retiree and self-employment are:

- what type of potential early retiree is small business a viable employment option for?
- what are the inhibitors and facilitators of self-employment for this age sector?
- what are the indicators of business sustainability and growth for this age sector?
- what are the interrelationships of the provision of business assistance and advice, training, the background characteristics and experiences of people and the indicators of business success for this sector?
- how can we encourage and support business ownership as an employment option and an alternative to early retirement?

The theory of self-employment or small business ownership is well developed (Bygrave & Hofer, 1991; Casson, 1982; Chen, Greene, & Crick, 1998; De Noble, Jung, & Ehrlich, 1999) but there is little that refers to older people starting a small business as an employment alternative to early retirement in Australia. The theory behind this framework is innovative in developing new knowledge of the older entrepreneur, and building a framework of the distinctive interrelationships between the antecedents of self-employment, the skills and experience brought to the business, the assistance and information required to sustain the business and ultimately ensure the success of the venture. It is known that the economic impact of delaying retirement, for example, by 5 years, would mean that the superannuation savings available would last until the age of 95 as apposed to the age of 72 had retirement not been delayed and had been taken at the age of 58 (Access Economics, 2001).

## ANTICENTS TO SMALL BUSINESS OWNERSHIP

Much research has been conducted on the processes, paths and antecedents of starting a small business with a simplistic dichotomy being that the potential entrepreneur is either 'pulled' or 'pushed' into self-employment (Brockhous, 1987; Brodie & Stanworth, 1998; Buttner & Moore, 1997; Cooper & Dunkleberg, 1987; Gray, 1994; Hamilton, 1987). A 'pull' stimulus is associated with the individual having a reasonably strong positive internal desire to start a business venture. Internal 'pull' reasons for starting a small business centre around the potential new business owner wanting to take control and to change their current 'employee' work status. These reasons can be broadly segmented into personal and financial, which are not mutually exclusive categories. The most common personal reason cited in the literature is independence or wanting to be ones own boss (Birley & Westhead, 1994; Burke, FitzRoy, & Nolan, 2002; Mason & Pinch, 1991). The 'push' set of motivations are predominantly focused around aspects such as job frustration; perceived lack of opportunity for advancement; avoiding low-paid occupations; escaping supervision and constraints of subservient roles, and were traditionally cited by women who started their own businesses (Moore & Buttner, 1997; Roffey & Stanger, 1996). Few business operators cited forced self-employment, however today there is forced job loss through the contracting of the workforce via downsizing and also the change from standard employment towards part-time, casual or contract employment (Feldman & Bolino, 2000; Jurik, 1998; Preston, 2001).

All the available literature and the current state of the economy provides evidence that the group most at risk of these employment changes are older workers. Therefore as a cohort these older workers who become self-employed may well have more push motivations than pull. However enterprises which are started as an alternative to unemployment have a high failure rate (Smallbone, 1990; Smallbone, Baldock, & Bridge, 1998). A key hypothesis for this theoretical framework and future research is that failure may well be high amongst this sector and confirmation or contradiction of the likelihood and the characteristics of this is essential to provide targeted assistance and advice to business start ups for older people.

## TRAINING AND ASSISTANCE

One outcome of future proposed research in relation to the developed theoretical model will be the development of a framework for the support of targeted training and ongoing

professional development and business assistance for older self-employed people which will be specific to their unique circumstances and needs. Older people may not necessarily have the skill set required to become self-employed as they are known to be less able to cope with workplace changes (Hartmann, 1997) and this has clear implications for the training needs of this age group. The OECD has identified a number of principles for population ageing reforms including the need to ensure that training opportunities are available for older workers and included in the National Strategy for an Ageing Australia (1999) it is stated that "The Commonwealth Government's main priority in relation to lifelong learning is to ensure that Australians have the skills and flexibility needed to meet the challenges of continuing technological and structural change and to compete effectively in a globalised economic environment (Council on the Ageing & Committee for Economic Development of Australia, 2000; Department of Premier and Cabinet, 2002). For older workers, life long learning makes a key contribution to the capacity to remain active and independent and measures to support training of older workers are clearly needed in order to ensure that this sector has the required set of skills necessary to prepare them for continued employment opportunities whether in mainstream employment or self-employment (Kotlikoff, Smetterd, & Walliser, 2001). Presented below is the hypothesised theoretical framework of employment options for older workers developed from the available literature. The model does not include early retirement as an option as those who select that option are assumed to have sufficient funds to sustain them into their old age without employment income.

## THEORETICAL FRAMEWORK

The theoretical framework is based on current knowledge regarding the generalised antecedents of entrepreneurship, the facilitators and inhibitors to success and growth of small businesses, and the business advice and assistance and training needs of new entrepreneurs. In this model it is hypothesised that the relationships and interdependencies are unique for older people who select self-employment and small business ownership over early retirement and that older people have different business and assistant needs and different training needs, based on previous work and life experiences. Whereas that would be applicable for all age cohorts, older people may not initially see self employment as a viable option because of the perceived financial risk involved versus the perceived value.

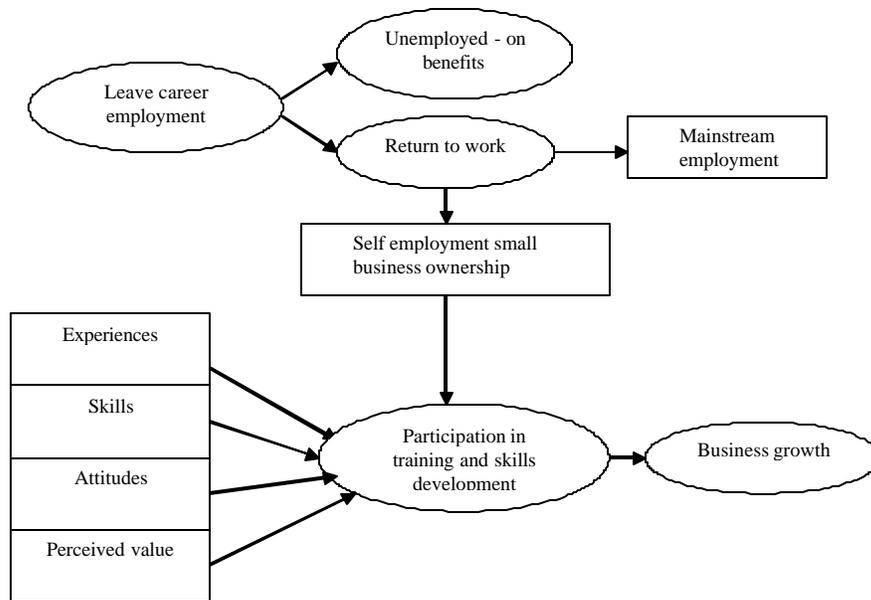

Figure 1: Theoretical framework of employment options for older workers

## SIGNIFICANCE OF THE FRAMEWORK

There are both economic and social benefits to encouraging older workers to consider self employment or business ownership as an alternative to unemployment or early retirement.

- *Firstly* for policy makers, self-employment extends a persons career and so reduces welfare benefit spending and increases both national and personal revenue and small businesses provide significant contributions to the economy of Australia.

The job-market status of older workers is becoming an increasingly important issue in our society. The older population continues to grow in both number and proportion; in part, because of a longer average life span and lower birth rates. The leading edge of the baby boomer cohorts are now in later years and in less than a decade will reach their 60's and Australia will begin a fundamental shift in the age distribution of its population and its workforce. As the proportion of the retired population increases relative to the labour force, pressures will continue to mount on the resources of the social security systems of the country. All OECD countries need people to extend their paid working lives and self-employment in small business is a viable option.

- *Secondly* for older individuals, self-employment promises to inject choice, control and independence into their working lives.

People who lose their jobs when aged in their 50's and 60's find it increasingly difficult to re-establish themselves in a career. Economic inactivity among this age group has grown, whether resulting from people taking early retirement or from people losing their jobs and getting discouraged in the search for a new one. It was identified in the UK that for older people who experience flexible working arrangements in the latter part of their paid employment years, these people found that self-employment offered job quality most comparable to that enjoyed by permanent full-time employees (Morris & Mallier, 2003; Singh & DeNoble, 2003; Weber & Schaper, 2003).

- *Thirdly* for organisations, where managers are forced to downsize older workers, the knowledge and experience of these retrenched workers could be retained in part if these workers become self-employed and subcontract themselves back to their original organisations.

If self-employment is promoted as a viable option for older workers then there could be less pressure placed on human resource managers in organisations who have the unenviable task of retrenching workers. It gives organisations more flexibility in staffing issues and allows workers to have portfolio careers, that is taking short term contracts, which utilise their considerable talents and experience gained over the years but does not bind them to one organisation (Weber & Schaper, 2003).

- *Fourthly* for society as a whole, self-employment promotes the idea of social 'inclusion' for marginal groups of older people in the labour market and retains social capital in the economy.

Self-employment offers choice, opportunity and control for individuals in the latter stages of a career. Self-employment also allows older people to bypass barriers to employment and negotiate their own transition into retirement but as yet very little research has examined the viability of self-employment later in life. In many organisations, older workers experience

discrimination and face voluntary or compulsory redundancy on the basis of age or costs (Encel, 2003; Greene & Storey, 2002). Previous research has described pervasive age discriminatory practices in recruitment, retention, promotion and training (Arrowsmith & McGoldrick, 1996; Burchell et al., 1999; Itzin & Phillipson, 1993; Taylor & Walker, 1998). One way of reducing welfare dependence and discrimination against older people in the workplace would then be for more of them to enter self-employment or small business ownership.

## CONCLUSION

This topic of older workers and the potential for them to become self employed as an alternative to unemployment or early retirement is a relatively new area of research. This paper presents a theoretical model of some of the antecedents that are necessary for the successful transition from mainstream employment to self employment. It should be said that self employment is not suitable for everyone and it is not the intention of the authors to infer that it is a viable option for all older workers who are at a career crossroads. However for some it may well be an extremely attractive and viable option, based on both the social and economic rewards. What is required is empirical research relating to this area to investigate the questions posed in the paper. This would then assist policy makers at all levels to develop appropriate training and assistance packages that are targeted at this age cohort, rather than making the assumption that older people have the same needs as other age cohorts. The ageing of the population is an issue that is only going to escalate and with it will come a plethora of economic and social challenges for the government, communities and individuals. Strategies that provide opportunities to address the labour force issues discussed in this paper are essential and self employment or small business ownership is one potential way to proactively address this particular challenge.

Mary Kay Inc.

## **ABSTRACT**

This case is the story of one entrepreneur, Mary Kay Ash, and how she took her company, Mary Kay Cosmetics, international. Her basic guideposts on the human spirit and her belief in the abilities of women, in particular, have made her company's successes worldwide almost revolutionary. The case encompasses the history of the company, the strategy behind their expansion around the globe, and the beliefs, norms, values, and culture that has made Mary Kay, Inc. one of the strongest direct selling companies in history.

## INTRODUCTION

Mary Kay Inc. had achieved prominence as a U.S. cosmetics company and direct seller, but the company had not even reached its 10<sup>th</sup> year when international opportunities knocked on its Dallas door. The year was 1971 when a couple of Australian entrepreneurs – so impressed by what they had seen and read of the company – persisted to get Mary Kay’s first international outpost in this faraway land ‘down under.’ That’s how it came to be that Mary Kay was in Australia before it was anywhere else outside the U.S. The company now has a presence in more than 30 international markets on five continents and the focus for expansion is clearly on those places where the opportunity will be most appealing to entrepreneurial women.

What has transpired throughout the world is the creation of an interpersonal business model that seems to translate into a language women understand. Mary Kay’s history illustrates how an American company can expertly tailor its marketing plan to emphasize specific market strengths. In regions where women are even more under-employed than they were in the U.S. of the mid-60s, Mary Kay can be the great equalizer, the quintessential micro-entrepreneurial opportunity that has the potential to bring an entire family up from poverty or dire straits. Even in countries where infrastructures are far inferior to those of the United States, the company has experienced the great loyalty of women who – once they are exposed to the company philosophy and possibilities – will go to great lengths to make it work for their lives – in their market. According to Tom

Whatley, Mary Kay's President of Sales and Marketing, it is the culture that makes the most difference to Mary Kay's successful global development plan. When the culture is understood and acted upon, Mary Kay has seen success. Where it is not understood or embraced, the company has experienced difficulty.

The same year that Australia opened was coincidentally also the year that the company took another measure that would have far-reaching effects on the culture and the company's success. In 1971, it named the first two Mary Kay Independent National Sales Directors – establishing an extremely prophetic leadership role that would come to be viewed as one of the smartest succession plans in the business world. It has come to be viewed as a strategic move – instigated by Mary Kay Ash herself -- that has fostered female entrepreneurs like few others. It has been generally accepted that no one would ever replace the dynamic and charismatic company Founder, but the Founder had embarked –in establishing this position— upon a program where she could encourage leaders to create new leaders. The prospect of achieving this pinnacle has greatly enhanced the appeal of the organization worldwide to entrepreneurial women aspiring to leadership.

Texas entrepreneur Mary Kay Ash had founded her company on a shoestring in a small Dallas office center after vowing to create a company where women were provided opportunities long denied them in the workplace. She always said that she never imagined her cosmetics company would make it much outside Dallas city limits, let alone to nearly every time zone in the world. What the illustrious company Founder did realize

was that – just like in the America of the 1960s – the carving out of opportunity reverberates extremely well throughout every culture and language. “We discovered that all women want the same thing,” Mary Kay Ash once said. “They want a better life for themselves, their families and their countries. And they are willing to work for that.”

Perhaps it is that common thread – paired with Mary Kay’s 1963 founding belief that she wanted to create opportunities for women – that has contributed most to the company’s fame as well as its growth as a company whose mission is to “enrich women’s lives.” Corporate employees of Mary Kay Inc. attest that seeing this mission to fruition in the U.S. is exhilarating. However, it is in the witnessing of this phenomenon outside the U.S. that they come to understand the strength, stability and long term possibilities of the Company’s mission. After a 41-year run, the potential for Mary Kay remains huge.

## **The Americas**

By 1976, when the Company’s stock was first listed on the New York Stock Exchange, it had significantly enhanced its product line and already opened three U.S. distribution centers in the South and on the East and West coasts when a major opportunity arose. That was Canada, where in 1978; Mary Kay Ash answered repeated requests from its neighbor to the north. Canadians love to relate the cosmetic icon’s first visit to their country. It was in the midst of a deadly winter storm that the petite dynamo came, sans boots, to meet and rally the Canadian independent sales force. Despite radio safety warnings to stay at home because of difficulty traveling, Canadian women came out to

meet and greet Mary Kay in a hotel ballroom. It was said to be so cold there was ice forming inside the ballroom windows, yet Mary Kay's magnetism warmed the crowd. They definitely warmed to her message. That began a lifelong mutual admiration between the Texan and her Canadian operation. One employee who traveled with Mary Kay Ash on several subsequent visits said, "She was the consummate hands-on leader and that made a real impression with the women of Canada." Mary Kay never hesitated to get out from behind her desk and go up close and personal to disseminate her caring leadership style.

A *Reader's Digest* article, "Mary Kay's Sweet Smell of Success," appeared in late 1978, and just one year later the Company and its Founder were profiled on television's "60 Minutes." This latter 1970s media attention would – coincidentally – set the stage for a continued bright future for the company, both domestically and globally.

Mary Kay expanded to Argentina in 1980. In 1986 – shortly after the company was returned to private ownership – the first European operation, Mary Kay Germany was established. Expansion to Asia didn't begin in earnest until the 1990s.

Argentina and Mexico offer two great examples in the Americas region that validate and provide insight into how closely the Company's global success is aligned to its culture. Both countries have weathered economic crises that – rather than rocking them -- only solidified Mary Kay's position in those markets. Argentina came on board in 1980 but it wasn't until 2001 that its staying power was proved. There was an economic crisis that year that saw a blistering 300 percent devaluation as well as a financial collapse.

According to Mary Kay Latin America President Jose Smeke, even amidst these dire straits, “Our sales force count nearly doubled from 12,000 Independent Beauty Consultants to 20,000. There was a 28 percent sales increase in local currency.” Why? How? Smeke says Mary Kay Argentina knew what to do in 2001 during this economic crisis because one of its most successful sister subsidiaries, Mary Kay Mexico – founded in 1988 – had survived and thrived through a similar economic crisis in 1994. In Mexico that year, there was a currency devaluation of more than 150 percent in one day, a 20 percent unemployment rate, political uncertainty, and price increases of up to 60 percent.

“We faced daunting obstacles, but we had a commitment to our independent sales force and their families, and so we took some risks for them,” says Smeke, who believes the appreciation and support of Mary Kay Inc. to Mary Kay Mexico at that time (and to Argentina seven years later) provided the trust and confidence that would see sales increase by 80 percent by the end of 1995, as well as a 35 percent increase in Consultant count. “We had,” Smeke recalls, “a sales force in very high spirits. Their accomplishments proved that during a crisis a direct selling company can be a very good option for women who need to help support their families.” In Mexico and elsewhere in the Mary Kay world, one key most certainly makes a huge difference. “We always said to these small business owners, ‘you are in business *for* yourself, but not *alone*,’” explains one corporate veteran.

The Company’s fortunes are closely tied to the performance of its independent sales force. Mary Kay Mexico had opened in 1988 when the U.S. parent company was 25

years old. By 2004, Mexico had grown to be Mary Kay's second largest subsidiary in numbers, with an independent sales force of more than 120,000. Among those legions are dramatic and life-changing stories of triumph over illiteracy, poverty and even war. Who are the women of this sales force? Throughout the world, their backgrounds and lifestyles are as varied as they are in the U.S. Their stories portray the Mary Kay mission to enrich women's lives extremely poignantly. When Mary Kay Mexico published a call for stories to celebrate its 15th anniversary in 2003, hundreds of stories poured in. The best of those stories would be published in *Reader's Digest Mexico*. Among them were numerous stories like that of the fruit store merchant who had worked long hours with little to show. Without a car, but with the mentoring of her Independent National Sales Director, she decided to devote as much time to her Mary Kay business as she had to her fruit stand. She is now a successful Mary Kay Independent Sales Director in Mexico, planting many more fruitful seeds for growth than her produce stand ever would or could have provided. Even husbands of sales force members, on occasion, will testify to the life-changing potential they have seen this opportunity offers their wives and their families. One of the things they always express appreciation for is the Mary Kay emphasis on family and balance, which resonates particularly well in these cultures.

Mary Kay Ash saw the huge potential of changing women's lives in Mexico very early on. Not only did she enroll in Spanish classes, she often spoke to Spanish-speaking leaders in their native language. Even though in Mexico she was known to have ordered "a grandfather" once in a restaurant when she wanted a glass of milk, Mary Kay's love for the language and the culture was always a source of great pride to her Spanish-

speaking “daughters” as she called them. The first Independent National Sales Director in the U.S. of Spanish descent was an immigrant who had been airlifted from Cuba to the U.S. with parental consent in 1961 to prevent her indoctrination into communism. By 1975, she was enamored with the thought that she could earn the use of a pink Cadillac like the one she had seen in Mary Kay literature. By 1977, she had her first of many pink Cadillacs, and in 1991 was named a Mary Kay Independent National Sales Director.

The seeds of entrepreneurship exist today in Brazil, where an American woman of Brazilian descent decided to take her knowledge and skills as a Mary Kay Independent Sales Director and start over in the land of her forebears. With 18 years of Mary Kay business experience in the U.S., she knew the huge potential Brazil would have for this company and its mission to enrich women’s lives. She took a giant leap of faith, returning to Brazil to begin a new Mary Kay chapter in her life. It paid off. Only four years after starting over, this woman became Brazil’s first Independent National Sales Director in August 2003 – just five years following Mary Kay’s opening in Brazil.

Mary Kay’s General Manager in Brazil says that this woman’s successful journey represents a true milestone. “Other women have started to see everything that’s possible. She is, they reasoned, ‘just like me’ and so they came to understand how they could do the same.”

## **Mary Kay Europe**

The company had celebrated its 30<sup>th</sup> anniversary and had crossed the threshold as a billion dollar business at retail by the time Mary Kay Russia opened in 1993. Russia has become a pillar of strength and it is clearly among the best places on the globe to see the power of success potential that results from entrepreneurs with a penchant for hard work. Looking at Russia and the surrounding nations, it's apparent that the principles, career path and the products of this Dallas Company have made the transition into an international opportunity that transcends generations, language and culture. Mary Kay Russia also symbolizes that it is possible to transcend weather and wartime.

The story of one Independent National Sales Director from a region in the Far East of Russia illustrates how enterprising women can overcome economic woes and a severe climate. For this woman, building her business often necessitated month-long waits for products to arrive when inclement weather would prohibit air travel to and from the area. She built it anyway. So intent was another woman to get her products to her market that she would routinely fly in the cargo hold of an airplane in order to make the nine hour trek to the distribution center.

Another Independent National Sales Director hails from Chechnya, a region torn by wars since the time of the czars through the Soviet period and even today. This former music teacher left Chechnya for Moscow to discover the only work she could find was cleaning floors. Her Mary Kay business brought a radical lifestyle change -- affording her the luxury of owning her first car in the mid-1990s and the financial ability to unite her family, long separated by poverty and unrest at home.

Mary Kay has also been an important phenomenon during the second phase of “perestroika” – the end of the USSR and the start of privatization and reform.

The president of Mary Kay’s Europe Region, Tara Eustace, resides in Russia where she says she has seen Mary Kay contribute to a better way of life, a change of thinking and many positive influences. She recalls how Mary Kay Ash was overjoyed and proud to bring the Mary Kay opportunity to the former Eastern Bloc countries. Many in the Mary Kay world fondly recall the Founder’s visit to Germany shortly after the fall of the Berlin Wall. Germany had come on board in 1986 but shortly after reunification of East and West Germany, a newly free East German Independent Beauty Consultant just couldn’t contain her enthusiasm when she walked across the stage to shake the hand of Mary Kay Ash. She grabbed the microphone and proclaimed, “First we get freedom, and then we get Mary Kay!”

Eustace says Europe has followed the Mary Kay model very closely. Russia in particular has adapted to the lack of infrastructure (post, delivery, poor phone lines, emerging bank infrastructure, lack of personal check or credit card systems) by developing a Customer Service operation center where placement and payment for orders as well as education can take place. Some of the largest recognition meetings for Mary Kay Russia have been held at the Kremlin, which at one time was one of the few venues large enough.

Eustace believes that oftentimes the most effective way to deal with a less than positive impression of the direct selling model is by careful attention to teaching and focusing first on quality rather than quantity. “A great Mary Kay staff,” she concludes, “helps the new

market attract and teach those very first vital Independent Beauty Consultants. Together they will build the opportunity in their country.”

Eustace recalls hearing the poignant story of a woman from Odessa who is an Independent National Sales Director in the Ukraine. The home she lived in had no plumbing and no water. Today the woman recounts how one hot summer day she and her young son were dust-covered from hitchhiking along the motorway. “I was angry at myself and my miserable life,” she writes, “when suddenly in the row of dusty cars, I see a white, clean Mercedes. That Mercedes became my dream.” Today the woman drives a pink Mercedes courtesy of Mary Kay. She and her family vacation at the best international seaside resorts and her son studies at the most prestigious school and attends the finest sports club. “And owing to Mary Kay, I managed to make my dreams real,” she says.

The entire region is filled with stories of dreams come true and lives changed. Not only did Mary Kay Russia survive the economic crisis of 1998, but the company’s Independent Beauty Consultant count had almost doubled by the end of 2002 and nearly doubled again at the end of 2003. Currently there are some 100,000 Independent Beauty Consultants – third largest of the international markets behind Mexico and China.

Another place where numbers were significant was in sales force leadership. By 2005, Eustace estimates that some 70 women in Russia alone will be Independent National Sales Directors.

## Asia

If the prospect of a recognition and rally meeting of a U.S.-based capitalist company taking place at the Kremlin isn't enough of a contrast, imagine then that kind of a rally taking place in China. It is in this ancient land that Mary Kay has seen wonderful success. China, today the eighth largest consumer of cosmetics, is Mary Kay's most profitable subsidiary. It is also recognized by the business community. *Fortune China* named Mary Kay one of the top ten companies to work for in China. Not only is the marketing plan successful, Mary Kay manufactures its products at its facility in Hangzhou, and was the first cosmetics company that China granted a quality control and guarantee system certificate in 1998, just three short years after Mary Kay opened for business in China. Perhaps even more significant is the impact that the venerable culture of this American company has had on the historic land and its people. K.K. Chua, president of Mary Kay Asia, says he knew from the beginning that Mary Kay principles would transfer well into Chinese culture. "Confucius taught if you want others to treat you well, you must first treat others the same." As we examine the various components of what constitutes the Mary Kay culture, it is closely aligned with the Asian culture.

The region has not been an easy one to excel in. Mary Kay China faced daunting obstacles including a government ban on direct selling shortly after it opened. During the six months of the ban, more than 4,000 Mary Kay Independent Sales Force says Chua, "refused to go away." By the time Mary Kay was back in business, these faithful sales force members were ready to carry China to its current status as the company's largest

subsidiary. Mary Kay looks forward to expanding well beyond its 18 branch offices, as well as set operations in 29 additional cities. A new manufacturing plant is planned for 2006.

In addition to many inspiring stories, Chua points out that Mary Kay has made its way in China by following yet another of the founding principles. The belief in giving back to the communities has taken root in re-investing part of its profits into the lives of the country's women. There is a micro credit fund for female workers, schools in mountain regions where female children have been too poor to attend school, scholarships for female students at two prominent universities, and youth projects emphasizing skills training. The most telling of the impact of Mary Kay Ash on a culture so far removed from her own is the small rose garden outside a maternity hospital in Shanghai. It commemorates Mary Kay's life and philosophy and this Mary Kay garden honors the fact that this American woman's legacy is firmly established in China.

Equally heartwarming is a painting that hangs in the Mary Kay Museum at the world headquarters in Dallas. The Chinese street scene was painted by a renowned Chinese artist as a thank you to Mary Kay Ash. The artist paid tribute to this American businesswoman who had provided her a first chance at developing her personality. In the tribute letter, she poured out the heartwarming story of never having spoken until her teens. Although recognized as an artist she was extremely uncomfortable around people until her own Mary Kay network gave her the confidence among people that had eluded her for her entire adult life.

Another strong testament comes from the woman who ranks first among Independent National Sales Directors in international operations. In China, she was one of the 15 pioneers in the Mary Kay Independent Sales Force – one whose fierce determination to excel at her Mary Kay business could not be dampened. By her late 20s, she had attained the prestigious Independent National Sales Director position and in her mid-30s, ascended to first place among international Independent National Sales Directors. A medical doctor and National Sales Director told of never having worn makeup before she was 30 years old. Her mother believed only bad girls wore cosmetics. She came to know the company through its products and eventually left the medical profession to pursue a Mary Kay business. She says today, “In my mind, Mary Kay is a footstone. On this base, women’s dreams could come true: beautiful appearance, harmonious family, bright life.”

Another National Sales Director in China today has difficulty believing how her life has changed since she first began her Mary Kay business. She fondly recalls how she would regale her skin care class participants by telling them about the Texas-based legend and those infamous pink cars of the Mary Kay world. She went on to qualify, in 2000, for the first pink car in China. Having gone from being a jobless, homeless and poverty stricken divorced mother to becoming an international success story is indeed a powerful journey. It is a journey that breathes belief into other women aspiring for their own brand of Mary Kay success. It is a confidence-inspiring journey that Mary Kay’s history has proven others will emulate.

## **Conclusion**

It is the culture of Mary Kay that seems to shape the heart of the Company, no matter its location worldwide. Mary Kay is intent upon transforming itself to achieve an internal corporate challenge by the Company's 50<sup>th</sup> anniversary in 2013- that the international independent sales force will exceed that of the United States. By 2004, the international business sales projection was expected to exceed what the entire U.S. did in the year 2001.

The number one corporate strategy is to "amplify the soul" of the company. Mary Kay has not only "let the culture be," the Company has gone to extra lengths to make the heart of the Company the focus of international education and development. While the lucrative nature of the Mary Kay marketing plan would seemingly be sufficient, that's not enough. It's not enough, Whatley says, that a woman can earn potentially at 100 times the average per capita income of her country. This success works so much better and lasts longer when it is applied according to Mary Kay's founding principles. In 1963 when Mary Kay Ash stressed her Golden Rule style of doing business, it was a foreign concept to even a U.S.-based company. Today, that style is so celebrated that a recent newsletter took the time to spell out how the Golden Rule translates into all the major cultures and faiths of the world. There is always the emphasis on what Mary Kay saw as, "belief in the beautiful potential of women" that also drives Mary Kay's global success. Once the sales force understands the Mary Kay culture, adapting business systems to the customs and mores of each new country becomes a much simpler process. But it is never simple.

Mary Kay's International staff will talk of a starter kit designed for the tastes of Western women who drive their cars everywhere and how its size wreaked havoc on women in Asia who typically walk and take bicycles or buses everywhere. They will allude to how much more 'global' the color palette and formulas of Mary Kay brands are today as they routinely conduct product focus groups on a multitude of skin tones and in nine languages. Even a recent new Independent Sales Director education session in Dallas featured fully one tenth of the attendees needing translation into languages such as Polish, French, Cantonese and Spanish. But more important than the language is the common and shared experience all women relate to. That will, in summary, make the difference for this American company. When accepting the posthumous award given Mary Kay Ash as "Greatest Female Entrepreneur in American History," her grandson Ryan Rogers said, "Mary Kay tapped into one of the greatest under-used natural resources this nation had to offer – the hearts and minds of its women." It is much the same today throughout the more than 30 markets where Mary Kay has a presence, and in those parts of the world that women have even fewer opportunities.

Direct selling is one of the only forms of retailing that can adapt to virtually any conditions or circumstances and Mary Kay Cosmetics is a great example of this. Entrepreneurs and capitalists alike have come to see that when direct selling operates by the highest of standards, it can make amazing strides in contributing toward solid world economies. Mary Kay, Inc. follows the ethical standards set by the Direct Selling Association (DSA), and was instrumental in seeing the document to fruition in the 1970s

and strengthening it in the 1990s when one of its corporate officers was serving as DSA Chair. The DSA is the industry trade organization comprised of 150 direct selling member companies worldwide and has been an advocate of ethical business practices and consumer services. The DSA Code of Ethics has served the industry well, an industry now comprised of 49,937,719 sales people as of February, 2004 (R. Diamond, personal correspondence, March 10, 2005).

The culture of Mary Kay, Inc. reflects today the caring attitude its founder, Mary Kay Ash, established at the outset. David Holl, President and Chief Operating Officer believes that, "A fiscally sound company can also be a nurturing and caring company. We have a larger goal than selling a product. I have seen firsthand the stories of self esteem and personal growth that abound throughout the Mary Kay world. I know nothing would please our Founder more." Holl continues, "We have experienced in more than four decades that the businesses that succeed the most in Mary Kay are those built and based on the number of lives touched. Having someone in your market break a belief barrier is extremely important. Having them succeed by following Mary Kay principles is even more important."

Mary Kay Ash was a role model that truly believed in the human potential, encouraging others through positive reinforcement, such as praise, recognition, and respect. To instill her point, she insisted her own board of directors table have round seating with no head. These principles have greatly enhanced the appeal of the organization to aspiring entrepreneurial women. Today, there are more than 400 Mary Kay Independent National Sales Directors on five continents that serve as inspirational leaders for more than 1.3 million women in the Mary Kay independent sales force.

## **ABSTRACT**

Investors in startup ventures face the problem of information asymmetry when assessing the potential for return from their investments. In general, investors have imperfect information and as a rule, the less information an investor secures, the more uncertain the outcome from a particular investment. Investors attempt to reduce the risk of funding the wrong businesses by seeking information regarding the founder, new venture teams (NVT) and the new venture concept and strategic plan. This paper argues that investors have become more organized (e.g., affiliation in an organization) in an effort to reduce risk. The result has been greater reliance on formal communication, more complex due diligence processes with more stringent criteria and higher expected returns on investments. This tendency toward increased organization has been a result of market and political uncertainty and instability, increased access to data and expanding global markets. One result of this trend among investors has been more stakeholders with a vested interest in the outcome of the average investment. In this paper, the authors suggest that this increase in stakeholders and the resulting orientation toward a lower risk tolerance may contribute to the trend toward less funding at the seed stage and increased funding in expansion and later stage companies by equity investors who have traditionally provided capital for startups. Questions regarding the impact of these trends on investment returns and new firm startups are posed. A market failures model is used to explain these trends and a model and hypotheses for future research are presented.

## **Introduction**

Investors in startup ventures face the problem of information asymmetry when assessing the potential for return from their investments (Binks et al., 1996, 1997). This is due in part to the fact that new businesses, and often the firm founders, do not have a prior track record that investors can use in their decision-making process (Berger and Udell, 1998). In general, the less information an investor secures, the more uncertain the outcome from a particular investment. Investors attempt to reduce the risk of funding the wrong businesses – either by investing in unsuccessful firms or failing to invest in high potential and profitable ones (Parker, 2002) - by

seeking information regarding the founder, new venture teams (NVTs) and the new venture concept and strategic plan.

The authors argue that investment trends over the past 10 years reflect an increased amount of formal organization among the investors that are the focus of this paper, namely banks, venture capitalists and angels. Moreover, we suggest that the criteria used by each of these groups and the amount and type of information necessary prior to making an investment decision is moderated by the stakeholders that come about as a result of the increased formal organization. Furthermore, we argue that the communication needs and criteria required for investment in new ventures by each of these three categories of investors can be modeled on Williamson's (1975) Market Failures Framework. In other words, investors organize to the extent they need to reduce uncertainty and increase information processing capabilities. Of the three groups, banks tend to be the most organized and constrained by stakeholders and angels the least constrained.

This research examines the proposed trend and offers a model for understanding the changes that have occurred and poses the following question. Has equity investing become more formalized over the past 10 years?

### **Williamson's Market Failures Theory**

The emergence of the organization as we know it today has been explained by numerous theorists (Eisenstadt (1958), Stinchcombe (1965), Parsons (1966), and others – see Scott, 2003 for a comprehensive overview of this literature. However, one well known approach to understanding this phenomenon focuses on the need to reduce transaction costs associated with reaching and policing agreements about the exchange of goods and services. This approach was developed most fully by Williamson (1975). He argued that in a market system, buyers and sellers transact exchanges based on contracts and negotiated agreements. This model assumes that all parties make decisions in these exchanges based upon self interest. According to this model, simple market transactions work well in conditions where all obligations can be fulfilled in the short term or on the "spot" as with *spot contracts* (Scott, 2003). However, when a good or service is not delivered until some later date a "*contingent contract*" is required. In this case, the longer the time frame and the more uncertain the circumstances surrounding the delivery of the contracted good or service, the more difficult it becomes for market systems to provide the necessary structure for an effective and efficient transaction to occur.

According to Arrow (1974: 33), "...organizations are a means of achieving the benefit of collective action in situations in which the price system fails." Both Arrow and Williamson concluded that organizations are superior to markets because they reduce transaction costs in uncertain economic transactions. Williamson's organizational solution to the failure of markets is illustrated in Figure 1. In his model, Williamson suggests that in complex and uncertain environments where there are limited exchange partners, organizations can provide a means to overcome the problems associated with limitations on human cognitive abilities and the human tendency to act in opportunistic ways. The attributes of organizations that help overcome these problems include increased support for decision-making, incomplete contracts, increased auditing and control systems, and the ability to provide agents within the organization with

incentives for contributions to the welfare of the organization and cooperation with the goals of the organization.

[Insert Figure 1 about here]

The conditions surrounding exchanges of money for equity in new ventures pose an excellent example of the circumstances described by Williamson. Individual investors are making decisions – either for themselves or their stakeholders – and are constrained by the limits of bounded rationality. Bounded rationality and cognitive limitations of individuals, emphasized by Simon (1997), simply refer to “the limitations of individuals as information processors” (Scott, 2003: 157).

According to Williamson (1975), the issues associated with bounded rationality become even more pronounced as complexity and uncertainty increase. It is widely understood that market and political environments today are increasingly becoming more and more complex and uncertain. Enhanced and changing technology delivers more and more data, but the sheer amount of data available today makes it even more difficult to sift through and find relevant and meaningful information. Emerging and growing global markets have added to the level of complexity as global expansion is a possibility for even the smallest of new ventures and most large organizations exploit international labor. Moreover, political instability and worldwide terrorism has added a new dimension of uncertainty to the marketplace. In sum, it could be argued that the need to create or associate with existing organizations, as a way to reduce uncertainty and complexity, has never been greater.

In his model, Williamson (1975) acknowledges what might be known as a dark side of human behavior. He evokes the possibility that people may operate dishonestly – especially when they have the luxury of being in high demand. In other words, when there are only a few partners for exchange and especially when the stakes are high, individuals may place self interest over honesty. This also suggests a power difference among exchange partners with the most powerful exchange partner being in a position to manipulate the weaker party.

In exchanges of money for equity, the partners for exchange are often limited. Investors are looking for the few new venture proposals that are likely to succeed while entrepreneurs and NVTs are highly dependent upon funding to pursue the opportunities they have identified. This dynamic provides an excellent example of the conditions cited by Williamson in his market failures model.

According to Williamson (1975), when these circumstances exist, the outcome is the emergence of organizations in an effort to reduce the costs associated with the transaction and improve the likelihood that the desired good or service will be provided. Institutional equity investors – investment banks and venture capitalists - have existed for some time. However, we suggest that more and more individual investors are banding together or investing through institutional investors and fewer wealthy investors are independently entering into equity investment exchanges.

## Dominant Coalition Theory

If "...organizations are a means of achieving the benefit of collective action" (Arrow, 1974: 33), issues associated with goals, power and control gain relevance. Questions about who determines goals and strategy lead to issues of power and control.

Simon (1964, 1997) distinguishes between individual goals, or *motives*, that govern the choices and behavior of the individual within an organization and organizational goals and strategy that serve to guide decision-making and measure the outcomes of organizational actions. One of the most commonly accepted definitions of the latter is "the determination of long term goals and objectives of an enterprise, and the adoption of courses of action and the allocation of resources necessary for carrying out these goals" (Chandler, 1962: 13). Only in a few organizations, which may be referred to as *purposive organizations*, do individual motives and organizational goals coincide. More often, individual motives differ from organizational goals and strategy. Consequently, it makes no sense to aggregate the goals of the individuals to obtain a description of the organizations goals (Scott, 2003) and instead, researchers have more typically attempted to understand who is responsible for establishing organizational goals.

Goal-setting in organizations may be conceptualized on a spectrum ranging from a classic economics theory on one end - where it is expected that the goals of the organization are determined by the owner or organizational founder - to the other end of the spectrum, where one might explain goal setting as a consensual process whereby all parties share equally in the process. Cyert and March (1963) provide an alternative explanation by suggesting that goals are set by members of the *dominant coalition*. In this conceptualization, organizations are viewed as entities comprised of groups of individuals who are seeking similar goals. Each group has some influence on the outcome, but no one group can fully determine the goals for the organization.

Scott (2003) adds that the dominant coalition as an explanation of shared goal-setting, must include all *stakeholders* of the organization. Stakeholders may be defined as "...any group or individual who can affect or is affected by the achievement of an organization's objective" (Freeman, 1984: 25). An individual who has a "stake" in an organization has the capacity to affect an organization's "behavior, direction, process or outcomes." (Mitchell, Agle and Wood, 1997: 858).

### *The role of power in equity investments*

Power, both inside and outside of organizations, resides in capital ownership and control. Capital is typically categorized in three groups: *financial capital*, *human capital* and *social capital* (Scott, 2003). In an equity exchange, investors and the organizations they represent tend to hold most of the power associated with the financial capital piece of the equation. An entrepreneur may be able to garner some financial power if he has an excellent credit history and holds collateral.

Human capital typically refers to attributes, skills, education and experience possessed by people. Entrepreneurs may hold significant human capital and may develop strong NVTs in order to gain leverage in equity investment exchanges. On the other hand, when investors

organize they increase their own human capital by hiring talented employees to assist with the due diligence and negotiation processes.

Social capital refers to power obtained through “networks, norms and trust that facilitate coordination and cooperation for mutual benefit” (Putnam, 1993: 36). Organizations can build increased opportunities for social capital and thus again provide a power advantage for organized equity investors.

### *Challenges of the organization in equity exchange*

Taken together, it can be argued that as uncertainty and complexity have increased and investors have moved toward more formal organizational investing, there have been increasing numbers of stakeholders in any equity investment exchange. Furthermore, those investors have had the opportunity to gain more power in the exchange process. Thus, given the benefits of an organization over the individual, the outcome of this trend should be toward improved investments and better return for shareholders.

One might conversely argue that using organizations to address issues of uncertainty and complexity introduce problems associated with conflicting goals and power struggles among the dominant coalition. Specifically, in new venture funding, the stakeholders must include the investor and the entrepreneur. In this type of exchange, the investor and the entrepreneur typically form a team and work together to encourage the growth of the new entity until one or more of the parties cash out their equity. However, as investing becomes more organized, the partnership is likely to be made up of an “agent” for the other stakeholders on one “side” and the entrepreneur and NVT on the other.. In this case, the agent has more power based in the organization she/he represents, and the new venture leadership less. This may lead to less optimal decision-making since NVTs are likely to hold more information regarding the prospects for the new entity (Amit, Glosten & Muller, 1990; Prasad, Bruton & Vozikis, 2000).

Thus, while the trend towards increased organization among equity investors may enhance the power held by investors by improving communication flows and enhancing decision-making regarding equity exchanges, it may also increase the number of stakeholders for an investment, lead to the potential for power struggles and compromised goals based on the need to seek consensus among the dominant coalition. It may also ultimately serve to slow down the investment process and lead to less investment in seed and early stage companies. These resulting effects may undermine the ability of entrepreneurs and NVTs to create value for the marketplace.

### **Model**

An increase in organized investing has a number of dimensions. Specially, we suggest that as investors become more organized, *the number of stakeholders increases, investors rely on more formal communication, the due diligence process involves more complex criteria and investors require higher expected ROIs.* These changes can be modeled as shown in Figure 2.

[Insert Figure 2 about here]

Via Williamson's model of market failures (1975), the authors suggest a trend towards more formalization in exchanges of equity for investment money that result from increased tendency toward organization, across the spectrum of investors – namely investment bankers, venture capitalist and angel investors. Institutional investors are even more organized and formalized and private investors are creating networks and obtaining the benefits of organization over pure market exchanges. Furthermore, this paper suggests the presence of an equity exchange organization can be measured by examining stakeholders in an equity exchange, formalization of communication used to acquire information for due diligence, criteria used in the due diligence process and the expected returns from investors.

## **Hypotheses**

Information can be defined as “any element in a system that provides understanding of an observed relationship” (Busenitz, et.al., 2004). While technology has increased our ability to obtain data, its effect on information, which requires organization and interpretation, has often been to render it more obtuse and hidden by “noise” in the communication process.

Investors obtain information in two broad ways. First, the founders of a new venture send information about themselves and the new venture via formal and informal methods. Second, investors seek out additional information in both formal and informal ways.

Formal communication from the founders to the investor typically includes a business plan, investor presentations and both brief and lengthy interviews and discussions about the new venture concept. In addition, new venture teams also send more informal “signals” regarding their commitment and their assessment of the value of the new venture through their own level of personal investment in the new venture (Busenitz, Fiet and Moesel, 2005).

Likewise, once investors are interested in the new venture prospect, they will seek out supporting information through industry, market and technology research. Informal information is also frequently sought through casual conversations with friends, colleagues, neighbors and even family members who are in a decision-makers network.

Therefore, in order to gain access to information, investors may wish to engage in more expanded informal networks or they may organize in order to create better flows of information. Similarly, as investors become more organized and have to respond to increasing numbers of stakeholders, they will establish more stringent investment criteria and set higher return expectations in order to meet the goals of the dominant coalition. Thus, we propose the following hypotheses.

**Hypothesis 1:** From 1995 to 2005 the number of stakeholders has increased in new venture investments.

**Hypothesis 2:** From 1995 to 2005 there has been an increase in formalized communication processes in new venture investments.

**Hypothesis 3:** From 1995 to 2005 there has been an increase in the complexity of due diligence criteria in new venture investments.

**Hypothesis 4:** From 1995 to 2005 investors have expected higher returns on investment in new venture investments.

### **Proposed Research**

We propose a two-stage study of angel investors, venture capitalists (VCs) and banks in a Midwestern city where the investment in seed stage ventures has shown a decline from 1995-2005 that is typical of the trend seen across the United States. Data for the Midwest region of the U.S. compiled by PricewaterhouseCoopers, Thomson Venture Economics and the National Venture Capital Association (Table 1) indicate a decrease in the number of seed stage deals from 1995 (437) to 2004 (171). A representation of the data in Graph 1 illustrates that equity investments in seed stage companies was lower in 2004 than in 1995, while investments in later stage and expansion companies was higher in 2004 than in 1995.

[Insert Table 1 about here]

[Insert Graph 1 about here)

Stage 1: We will conduct exploratory research including focus group research and content analysis of due diligence processes to refine our model.

Stage 2: We propose a survey of angel investors in one Midwestern city who have invested in new ventures from 1995 – 2005 to determine the number of stakeholders, reliance on formal communication, due diligence criteria, and expected returns in investments. We will conduct in-depth interviews with 20 angels in the community where at least 10 of those angel investors are affiliated with a well-organized network that has been in existence for more than 5 years.

### **Implications**

Research has shown that entrepreneurship plays an important role in contributing to economic growth (Baumol, 1993; Birch, 1979). Specifically, economists have suggested that the economic performance of an economy is driven by investment in physical capital (Solow, 1956), the accumulation of knowledge capital (Romer, 1986, 1990) and the presence of social capital (Putnam, 1993; Coleman, 1988). More recently, Andretsch and Keilbach (2004) have examined entrepreneurship capital and found evidence that it is positively linked to regional economic performance. They define entrepreneurship capital as “those factors influencing and shaping an economy’s milieu of agents in such a way as to be conducive to economic growth “(Andretsch and Keilbach, 2004: 419).

On the other hand, entrepreneurship only exists when there are entrepreneurs. Economists have directly linked wealth creation to entrepreneurs and entrepreneurial processes (Schumpeter, 1934, 1950), viewing the entrepreneur as the creator of new enterprises (Low and McMillian, 1988; Rumelt, 1987; Schumpeter, 1934).

It can be argued that a trend towards more formalization and organization in equity investment exchanges has and will increase the amount of dollars available for entrepreneurs, minimize investment in organizations that will not succeed and increase investment dollars flowing to the most successful new and growing ventures. Investors and all stakeholders in the exchange will benefit from the trend.

However, an alternative argument is that increased organization in a regional investment community may lead to more focus on the goals of the investor and less on the needs and goals of the entrepreneur. The investor typically does not have the same passion and willingness to overcome any obstacle that is present in someone with an entrepreneurial mindset. For example, in urban and rural Kentucky, where venture capital firms are rejecting nearly every entrepreneurial proposal to come their way (Sekula, 2005) angel investors are providing dollars and giving a “second wind to ideas that otherwise would not see the light of day” (Sekula, 2005).

However, as angels become more organized and create networks, will their investing become more like VCs? Are VCs gravitating toward “bank-like” decision-making? If so, will this gravitation toward more organization in equity investing affect the entrepreneurial capital in communities and the United States?

Specifically, if our research indicates a trend toward more organized equity exchange, we pose the following questions for future research:

- What impact has the trend toward more organized investing had on the quality of investments? In other words, has it led to better returns for investors? Has it improved the likelihood that investors will be able to reduce the chance of investing in unsuccessful firms or failing to invest in high potential and profitable ones?
- What impact has the trend toward more organized investing had on the development of entrepreneurship capital? In other words, has this has any effect on the number of successful start-ups and the growth in entrepreneurial firms and the resulting economic development of the regions in which these firms locate?

# DEMAND OF MENTORING AMONG NEW STARTERS

Wikholm Jimmy, ALMI Business Partner, Orebro Sweden  
e-mail: [jimmy.wikholm@almi.se](mailto:jimmy.wikholm@almi.se)

Henningson Thomas, ALMI Business Partner, Orebro Swed

Hultman Claes M., Orebro University, Orebro Sweden

## Abstract

Mentoring is considered of crucial importance to the survival and growth of small and medium sized companies (SME's), and that provision of new firm support can yield positive and worthwhile returns to the public sector investment. From a Swedish perspective there is a need for further action to become as competitive within business start-ups as the rest of the EU as well as the USA. The purpose of this paper is to get an indication of the extent to which new starters are interested in taking part as an adept in mentoring and their attitudes towards mentoring. The results are based on a questionnaire going out to 1 022 new starters in different branches located all over Sweden, with a reply frequency of 48,53%. Our research is a contribution within the field of supply and demand of mentors for new starters. Furthermore this could give new directions for governmental and other supporting agencies and indicate new directions for cost-effective business development programmes within EU to SME's and entrepreneurial firms.

Keywords: *mentor, mentoring, mentoring program, adept, start-up, new starter*

## **Introduction**

Mentoring is proved to be beneficial to the survival and growth for new businesses. But sadly in Sweden and many other countries we can not offer any extensive mentoring program to our new starters. We should work to be able to offer a mentor to any new starter that would like to have a mentor. From that perspective we need to know how many new starters that would like to have a mentor if they could decide. If we know this information and the amount of mentors that we can offer to new starters it will be possible to see the potential with mentoring programs.

## **Problem and purpose**

In a previous study we focused on entrepreneurs who retired and the possibility to keep this population for a longer time in the job market. We examined senior management from a survey with 406 answering respondents. This led to the paper "*Mentoring New Entrepreneurs - a Course of Action to Retain Knowledge and Experience in Society*", which was presented at the ICSB World Conference in Johannesburg 2004. The question researched was senior management's interest to act as mentors when they become pensioners, due to emotional bonds to their profession, identity and the satisfaction to pass on accumulated knowledge and experiences, which they have built up during a lifetime. For the above mentioned survey constructed a questionnaire, consisting 61 questions, going out to 1269 respondents, with a response rate of 32%. According to this survey there was an unambiguous result. 97% of the respondents were willing to act as mentors after retirement. These results indicate a promising alternative by keeping senior management active in the market for a longer period of time and thereby helping new entrepreneurs succeed by decreasing the risk of failure. [Henningson, Hultman & Wikholm, 2004]

Starting a new business is demanding and there are many complexities that may serve as barriers to entry for new ventures. We have identified through research and practice, an example being the SCORE (Service Corps of Retired Executives) program in USA, a positive correlation between the mentorship of new starters and the success of these very same ventures. It is therefore of great importance to investigate further. Only small shares of the total amount of new starters have access to mentoring programs. Our earlier study revealed a potentially high number of mentors, which would go far towards filling the supply gap for our new start-ups, granted sufficient demand exists for such services, hence:

*The purpose of this paper is to get an indication of the extent to which new starters are interested in taking part as an adept in mentoring and their attitudes towards mentoring.*

## **The Swedish issue**

In Sweden the total amount of SME's are 99,8%, that is those enterprises with less than 250 employees according to the definition by EU. The privately owned companies occupy 2,6 millions Swedes. [Företagarna & SIFO, 2003]

From a Swedish perspective there is a need for further action to become as competitive within business start-ups as the rest of the EU as well as the USA. This issue has been much discussed in the media and is constantly researched.

It is a demanding mission to start a new business. This is a matter, which many times work as a barrier for new ventures. The total entrepreneurial activity, i.e. share of the population who

either are actively engaged in the start-up process or managing a business, in 2002, was low in the European Union (EU) with only 6% and even lower in Sweden with 4% [GEM, 2002].

This should be compared to the United States of America (USA) with almost 11% [GEM, 2002]. The interest in the EU to be self-employed instead for an employee has decreased to 45% and in Sweden to 32% but the interest in the USA has increased to 67% [EOS GALLUP EUROPE, 2002].

According to table 1 below, Swedish people do not, in general, consider starting a business; more do however in the rest of the EU and in the USA. The same survey also reveals what scares potentially new entrepreneurs the most and that is the possibility of going bankrupt, uncertain income and a risk of losing ones property. What is positive is that more than half (55%) of the EU respondents are willing to take classes on how to set up and manage a business. [EOS GALLUP EUROPE, 2002]

|                | Never came to his/her mind | Is thinking about it | Gave up | Currently taking steps to start |
|----------------|----------------------------|----------------------|---------|---------------------------------|
| European Union | 59                         | 11                   | 9       | 2                               |
| United States  | 41                         | 20                   | 4       | 10                              |
| Sweden         | 73                         | 9                    | 3       | 2                               |

Table 1. Individuals taking steps to start a business, 2002, in% [EOS GALLUP EUROPE, 2002]

Potentially new entrepreneurs have good reason to be afraid, as business insolvencies in Europe have increased with 10.7% in 2002, compared to the previous year. The situation in Sweden as well with an increase of 5.2% the same period, but in the USA the bankruptcies fell and had a decline of 3,9% [CERU, 2003]. Bankruptcies do not only strike SME's, also large companies as the retail chain K-Mart, Philipp Holzmann in the construction sector and the Frankfurt bank Gontard & Metallbank amongst a lot of other companies went bankrupt in 2002. Only 55% of the new enterprises who set off their business in Sweden 1998 survived and were still running three years after start [SCB/ITPS, 2003a]. However there are people who conquer the barriers and start their own business and in Sweden there was an increase of 5.4%, in 2002, in the establishment of new enterprises. This is the secondly highest increase for 10 years. Then again the newly registered companies, excluding existing enterprises that expand, have decreased 15% in Sweden 2002. [SCB/ITPS, 2003b]. The same survey reveals that only 20% of the newly started companies have received support when they started their business.

When you put these figures together it could be said that Sweden is not in the optimal situation but it is improving. More needs to be done and mentoring programs are one measure toward becoming more equal with the rest of EU and the USA.

## Methodology

Our targets are new starters in different branches located all over Sweden. The definition we use for a new starter is a business that is within the period of 0 to 3 years since the start up.

We decided to use an online questionnaire, which is very effective; however it has two major weaknesses. Firstly it demands that respondents have access to and computer/Internet use knowledge. We assumed the target population was likely to have access and knowledge as

a result and condition of their profession and the fact that they have an e-mail address. Secondly Internet correspondence, in contrast to ordinary tangible mail correspondence for answering the questionnaire, is less likely to be answered. Reason for that being is that there is no envelope lying on the desk to remind the respondent to fill in the questionnaire every time she sees it; instead an e-mail is easily lost among all new e-mails that arrive to her mail box. For that reason it is of great importance to send out reminding e-mails more frequently and totally compared to tangible correspondence. It is however much cheaper, faster and more effective than tangible correspondence. We received the respondents from the Statistic Central Office of Sweden which is the most respectable provider of statistics in Sweden. The target population is a new started business that has been registered as a start-up year 2001 or later. When filtered this gave us a population of 1 022 respondents of which 496 answered, giving us a response frequency of 48,53%. To be able to receive a high participation rate from the respondents we followed up with three e-mails that reminded our respondents to answer the questionnaire. The reason for this being is that we assume that a survey e-mail is not of instantly importances in a business and as a result without difficulty get lost due to all new e-mails that arrive.

Table 2 shows some background variables of the respondents, almost a third of these being females. The age is structured in accordance with which decade the respondents were born, for example the interval 26–35 was born in the 1970:s et cetera. The mean age is within the interval of 36-45 years of, which are persons born in the 60's. Education can be of importance when you start business due to better knowledge if you start a business within your expertise. Among the respondents more than half, 51%, have obtained a university exam and 7% have only finished compulsory school. Before the respondents started their business they have at the moment, most of them, 62%, were an employee in a company, 21% managed a different company and 6% studied. The main product for the companies studied is for 26% goods and for 74% services in a wide spread of branches. The size of the respondents companies differ were 64% are micro- (0-9 employees), 30% small- (10-49 employees), 5% medium- (50-249 employees) and 1% from large ( $\geq 250$  employees) companies.

### Background of the respondents

| <i>Gender:</i>    | <i>Share:</i> | <i>Branch:</i>                         | <i>Share:</i> |
|-------------------|---------------|--|---------------|
| Female            | 29%           | Manufacturing sector                   | 21%           |
| Male              | 71%           | Energy sector                          | 3%            |
| <i>Age:</i>       |               | Construction sector                    | 13%           |

Table 2. Background of the respondents

## **Definitions used in this paper**

The following are abbreviated definitions or frequently used terms in this paper:

*Mentors* are retired or active senior management with a background as self-employed or top management position and are willing to provide mentoring to start-ups free of charge.

*Adepts* also referred as *new starters*, *start-ups* and *protégés*. These are defined as any small or medium sized business owner that has not been in business for more than three years.

*Mentoring* is a relationship process between an adept and a mentor, independent from age and gender, where the mentor motivate and guide the adept forwards an contracted given goal based on the mentors accumulated knowledge and experiences. Although in this paper we se mentors as retired senior management with the background as self-employed or top management position.

*Mentoring programs* in this paper refers to formal mentoring programs for new starters, where a third part engages in pairing mentors and adepts.

*New starters* also written as *Start-ups* is a business that is within the period of 0 to 3 years since the start up.

## **Mentoring**

Mentoring is understood as a journey that describes a unique relationship between mentor and student teacher [Awaya *et al*, 2003]. "Mentors function as teachers and coaches to create learning opportunities and to challenge their protégés to develop to full potential [Vincent & Seymour, 1995]." There are many other definitions regarding mentoring: "The process in which an experienced veteran helps to shape or guide a newcomer...true mentoring is an extended, confidential relationship between two people who have a mutual personal growth and corporate success as common goal...a protected relationship in which learning and experimentation can occur, potential skills can be developed, and in which results can be measured in terms of competencies gained" [Sullivan, 2000]. We would like in general to define mentoring as a relationship process between an adept and a mentor, independent from age and gender, where the mentor motivate and guide the adept forwards a given goal based on the mentors accumulated knowledge and experiences. Although in this paper we se mentors as retired senior management with the background as self-employed or top management position.

## **History**

These definitions are just a small amount of those existing and there seems hard to declare a definition that is suitable for each and every one within mentoring for start-ups. The history of mentoring starts in the old Greece and mythology. When the king Odysseus of the island of Ithaka is forced to go out in war against Troy, he have to leave his beloved wife Penelope and son Telemachos back home. To insure himself that they will be safe and everything will workout at home without him he wanted a guardian. For the assignment he selected his childhood friend Mentor to run the household and the bringing up of Telemachos, and that is

the origin of mentoring. Similarly actions have been present in to our time and will probably always exist. To take care of knowledge and experiences and pass them on were practiced in earlier days in the fields of trade, handicraft- and art profession et cetera. Mentoring was distinguished as a master and apprentice system, of which the master is familiar these days as a mentor and the apprentice as an adept.

The industrial revolution put an end to the master and apprentice system to the favour of an employer and employee relation. What was beneficial for the master were no longer beneficial for the apprentice, instead profitability was in centre of attention. Mentor has from this background developed to be a person for adepts to model themselves on, with the purpose to make the adept competent in her profession.

### **Comprehensive areas**

In business mentoring there is two comprehensive areas. These are (1) mentoring for career development [See Roche, 1979; Whitely & Coetsier, 1993; Aryee *et al*, 1996] and (2) mentoring for self-employed [See Deakins *et al*, 2002; Waters *et al*, 2002; Smailes, 2002]. The first-mentioned is the area most written about. On the basis of these areas new ones have developed and these are (a) mentoring for women [ See Berry, 1983] and (b) mentoring through Internet [See Bierema & Merriam, 2002; Perren, 2003] that have grown big. There have also arisen combinations of female and Internet mentoring [See Headlam-Wells, 2004].

### **Meaning of mentoring**

Regarding the meaning of mentoring two perspectives is most common. Firstly, (1) it is the adept that should develop, not he mentor [Murray & Owen, 1992; Annerstedt, 1998; Steinberg, 2004]. Secondly (2) it is a dialog and the exchange of knowledge and experiences that occurs between the mentor and the adept take place on an equal footing were the mentor and adept learn from each other [Franzén & Jonsson, 1994; Franzén *et al*, 1999]. Although the most common is, the first mentioned, that mentoring is a deliberate merger of two persons was one of them have less knowledge and experience and opposite. The common goal is that the person with less knowledge and experience should learn and develop certain skills [Murray & Owen, 1992; Annerstedt, 1998; Steinberg, 2004].

### **Informal and formal**

Mentoring can be arranged in two different forms as informal and formal mentoring. Informal mentoring is when the mentor and the adept find each other without arrangement from a third part in the background. Formal mentoring take place when third parts arrange a match and meeting between a mentor and an adept. [Clutterbuck, 2004]

It is argued that a large share of the mentoring relationships develop informally within an organisation because of the physical nearness and regular interaction that occurs between mentors and adepts [Kram, 1985]. However, in the small business environment the mentor is external to the adepts business and there is limited physical nearness and interaction. Consequently, being a mentor to a person who is starting up a business is more likely to occur through a formalised program rather than an informal connection [Hofman, 1998].

## **Purpose for mentors**

There are two fundamental types of purposes for mentors. First, they provide career development behaviours, which involve coaching, sponsoring advancement, providing challenging assignments, protecting protégés from adverse forces, and fostering positive visibility. Second, they provide psychosocial roles, which include such functions as personal support, friendship, acceptance, counselling, and role modelling. [Ragins, 1997]

## **The mentor role**

Finding or becoming a mentor may seem like a huge responsibility, but it is actually rather easy [Call, 2003]. The mentor plays five key roles (1) coach, (2) co-ordinator, (3) supporter, (4) monitor and (5) organiser, where the roles are changing dependent on the needs of the protégé [Clutterbuck, 1991]. Assigned relationships through formal programmes have, however, been found to be problematical [Kram, 1986].

## **Developing adepts**

To be able to develop an effective adept the mentor should remember five standing points. First, the mentor should not assume that the relationships she has developed successfully will work for the adept. Second, the mentor should ensure that the adept is not confused by the mentor's influence. Third, the mentor should not try to hard to shield the adept from mistakes that are bound to happen. Fourth, the mentor should not burden the adept with to great a burden of gratitude. Finally fifth, the mentor should avoid confining the adepts growing potential to her own limitations. [Bensahel, 1977]

## **The adept's selection of mentors**

Before an adept get involved in a mentoring relationship the adept should ask them self questions when looking for a mentor, such as is this someone I admire, am I comfortable with this persons values, is the person in a position to offer me opportunities, does this person have strengths and skills that I want to acquire and finally is this person someone who can increase my visibility, that is, do people respect this person [McCune, 2000]?

## **Mentoring efficacy**

There are theoretical arguments suggesting that support for new ventures should be provided on a mentoring basis, where mentorship should have an impact on the management ability and confidence of such new start-up [Deakins *et al*, 1998]. It is also considered that mentoring is of crucial importance to the survival and growth of SME's [Sullivan, 2000], and that provision of new firm support can yield positive and worthwhile returns to the public sector investment [Deakins *et al*, 1998].

## **Mentoring programs**

National, regional and local economic development agencies use entrepreneurial mentoring as one ingredient in a wide assortment of assistance programs to entrepreneurs and small business owners. In Scandinavia, mentoring programs, where the involved offer their services free of charge to new and young entrepreneurs, are to be found in Sweden with the "Mentoring - Experience agency for new self-employees" at ALMI Business Partner; in

Finland at Yrityskummit ry and in Denmark with the “Sparring med erfaring” project. Other countries in Europe that offer similar services are the Professional Business Advisor (PBA) program in the U.K., ECTI and EGEE in France, SES in Germany and the “Saturno” project in Italy. In the USA there is the SCORE program.

### **Match mentor and adept**

It is recognized, that assigned mentoring relationships are not usually as beneficial as those that develop informally [Armstrong *et al*, 2002]. There appears, therefore, to be a need to match partners in some way. It has been suggested that a better understanding of psychological factors is necessary if this is to be achieved [ibid] and try to match the mentors to clients based on the mentors sector experience [Deakins *et al*, 1997] et cetera. On the other hand a study shows that perceived attitudinal similarity was a better predictor of adept's satisfaction with and support received from their mentors than was demographic similarity [Ensher et al, 2002].

### **Female or male mentor**

A study reveals that gender composition found to have a significant impact on the mentoring process [Armstrong *et al*, 2002]. Combinations with female mentors and male protégés were found to be the least favourable combination [ibid]. But regarding the issue of whether to have a man or woman as a mentor another study reveals that gender was not considered much of importance. But in the end mentoring can offer no guarantee of success. The mentors themselves can often be a bad influence for some people, men and women alike. Individuals must choose their mentors carefully and make sure the chemistry of the relationship "fits" both personalities and situations involved. [Simonetti & Aris, 1999]

### **Mentor supply**

In a research regarding senior management's interest to act as mentors when they become pensioners, interesting results came forward. Senior management want to become mentors due to emotional bonds to their profession, identity and the satisfaction to pass on accumulated knowledge and experiences, which they have built up during a lifetime. According to this survey there was an unambiguous result. 97% of the respondents were willing to act as mentors after retirement. These results indicate a promising alternative by keeping senior management active in the market for a longer period of time and thereby helping new entrepreneurs succeed by decreasing the risk of failure. The same survey also stated that more than 90% were interested to become mentors even before retirement, but for fewer hours. [Henningson, Hultman & Wikholm, 2004]

## Empirical data and discussion

### Have a mentor

According to a study made in New Zealand about small business uncover that 20% of the male respondent have a mentor and that another 33% wished for having a mentor [McGregor & Tweed, 2002]. This should be compared to the female respondents in the same study were 26% having a mentor and another 41% wanting a mentor. So you could say that females experience that they are in a more extensive need of a mentor than males to be successful. This should be compared to our study in Sweden were less persons have a mentor have a mentor than in New Zealand. About 13% of the start-up owners have a mentor. There is a small difference between the genders for having a mentor were 14% of the males having a mentor and 11% of the females having a mentor.

The reasons for the difference between the results in New Zealand compared to Sweden could be due to different atmospheres and attitudes towards mentoring between the two countries. But still the difference is not to extensive for making to drastic conclusions. According to our study it is start-ups that been in business for 2-3 years that have the largest share of mentors with 27%, for start-ups that been in business for 1-2 years it is 23% and the smallest is 12% and that is start-ups that been in business for less than one year.

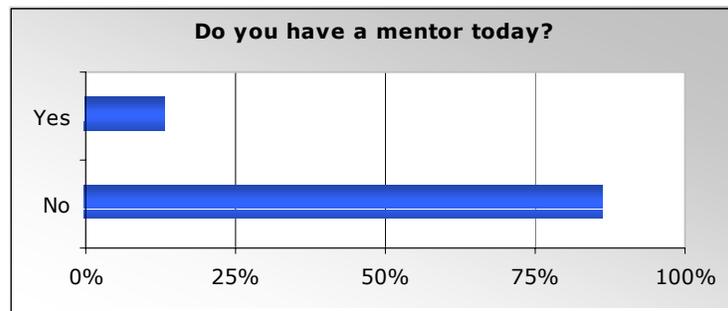

Figure 1. Start-ups that have a mentor

### Have had a mentor

Regarding those who do not have a mentor today there is 16% of the respondents who have had a mentor before. These figures are changing between the genders were 26% of the females and 13% of the males have had a mentor. The difference is too widespread to be ignored. So it seems that females seems to need a mentor more than males and according to the study made in New Zealand more females than males wished for having a mentor.

### Tried to get a mentor

If you not have or had a mentor it is of interest to find out how many there is who have tried to get a mentor but not succeeded, and according to our results that is 7%. As before there is a larger share females, 9%, who have tried to get a mentor compared to the males with 6%. It is first when you been in the business for 1-2 to years when you try to get a mentor. In this group 12% claims that they have tried to get a mentor compared to 6% for those who have been in business for less than one year and 2% for those that been in business for more than two years.

## Reflection towards mentoring

In general start-ups have a positive reflection towards mentoring, and as before there are more female respondents in favour for mentoring. According to our study 41% of the females are very positive compared to 28% of the male respondents. Further on it is the start-ups that been in business for less than two years that are most positive to mentoring for new starters were 78% are positive or more.

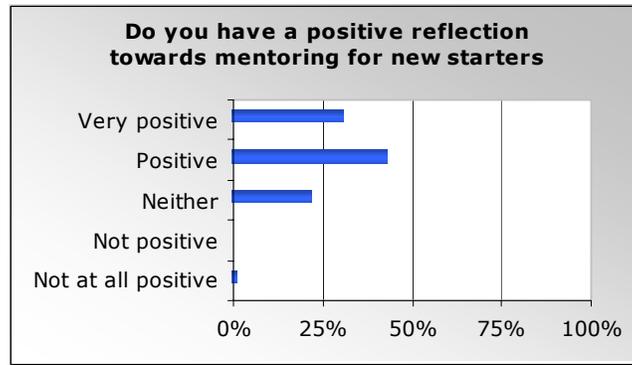

Figure 2. Start-ups reflection towards mentoring

## To have or not to have a mentor

If you could choose between having a mentor or not 85% of the female respondents and 75% of the male respondents would want to have a mentor compared to an average of 78%. And again it is those who have been in business for less than one year that would like to have a mentor. In this group 87% would like to have a mentor compared to 82% for 1-2 years and 78% for 2-3 years in the business.

## Take contact with a mentoring program

On the question if the respondents can imagine themselves taking contact with a mentoring program in their region if there was such a program, the results show that most of them, 63%, would. As we seen before there has been a difference between the genders towards different issues regarding mentoring. But not regarding taking contact with a mentoring program were the answers are fairly equal with 65% of the females and 62% of the male respondents. Respondents in the age of 25 or younger differ from the rest with 38% that can imagine themselves taking contact with a mentoring program.

Start-ups that have been in business for less than one year are most interested in taking contact with a mentoring program. In this group 78% are in favour for such behaviour and start-ups that have been in business for 1-2 years have 71% and 2-3 years have 56% that are interested.

## **E-mentoring**

Mentoring does not necessarily have to be arranged so that a mentor and an adept meet face to face. Mentoring can also, due to computer technology, be arranged over Internet and e-mails. Near half, or 49%, could see it as possible to have a mentoring relationship over internet. Females are considerable more in favour for internet than the male respondents, almost half as much. In figures that corresponds to 62% of the females and 45% of the males. The age factor does not seem to have too much of an impact, but it is the respondents in the age of 65 and more that are most positive, with 60%. Whether how long you have been in business there are the respondents who's been in business for less than one year that is least in favour for mentoring over internet, with 46%. Among those who could consider mentoring over Internet 25% finds mentoring over Internet as a better alternative than actually meeting a mentor. Those most in favour for this is respondents older than 65 years of age were 67% find mentoring over Internet as a better alternative than actually meeting a mentor. Finally when asking all the start-ups if they could consider not meeting a mentor and only has contact through e-mail and telephone 11% of the respondents were in favour.

## **Mentoring contributions**

In our population that we studied there were those who have and have had a mentor and their opinion of the contribution with having a mentor altered as one of the respondents proclaim:

*"A mentor can substantiate the 'truth' "*

But most of them, that is 96%, agrees totally or more that the most important contribution is a mentors support and tip-offs. Further the sharing of knowledge and experiences were 95% agrees totally or more. Receiving feedback from mentors (87%), develop the adepts knowledge (88%) and help to avoid mistakes (89%) of the respondents seeing as a contribution. Network is repeatedly mentioned within the field of mentoring and 84% of the respondents agree almost totally or more that a mentor helps the adepts networks to increase. The respondents experiences is that 76% of them agree almost totally or more that a mentor can help the adept's self-confidence and the motivation for 77% of the respondents. Further on 74% of the respondents believed that mentors can help put ideas into effect and 76% believed that a mentor can help adepts with how you lead a company. Finally 56% of the respondents agree totally or more that a mentor can help them to set up at international markets for their business.

These figures should be compared with those of the respondents that do not have or have had a mentor. Also these answers differed and as two of the respondents who have not had mentor proclaim:

*"A mentor can help me to get a structure and order in the different phases of my business."*

*"A mentor could be a good support when it comes periods of less good times."*

The majority, 89%, believe that sharing of knowledge and experiences are contributions from mentors. They are also united regarding that mentors can help avoid mistaken and give support and tip-offs, according to 88% of the respondents. When it comes to personal

development 83% believe that a mentor can help them to develop their own knowledge. 78% believed that mentors can help them put ideas to effect. 79% believed that a mentor can help them how to lead a company and 78% that a mentor can bring them a larger network. According 78% of the respondents they believe that feedback is a contribution from a mentor and 68% believed that a mentor can increase the adept's self-confidence and for 67% the motivation. Finally 66% of the respondents agree totally or more that a mentor can help them to set up at international markets for their business.

The figures are quite interesting between the two groups. The first group who have or have had a mentor express them selves from experience. The other group who have not had a mentor express them selves from what they expect and believe. Common for almost every answer is that group one, which expresses them selves from experience, have a higher opinion about the contribution of a mentor than group two who have no experience with a mentor. This tells us that mentoring have a higher impact on start-ups efficacy than what start-ups without mentoring experience expects. This gives implications that those start-ups who joins a mentoring program, for the most part, will experience immense satisfaction due to exceed of expectation.

### **Reasons for wanting a mentor**

Reasons for wanting to have a mentor for the group that have not had a mentor are many but there are a few that stands out. As a couple of the respondents say:

*"I want to choose the persons in my surroundings as I already respects."*

*"My business is to narrow."*

The main reason for not having a mentor, for those who answered that they did not want to have a mentor, is that they would like to succeed on their own without help according to 70%. Another reason is that do not believe that mentoring would help there company and 60% are sceptical and 67% believe that do not have time over to get engaged in such a commitment. Other reasons are for 57% that they believe that the difference is to big between the size of the adepts business and the business that the mentor used to have. 38% do not know what a mentor can contribute with. 32% feel that they do not want to "open up" for unknown person. 30% do not have any knowledge about mentoring. 39% do not want to share info about their business with a person they do not know. 43% do not want to get involved in new projects. 37% believe that it would cost too much. Finally 11% are afraid that the mentor could become a competitive to the adepts business.

Contrary to those who did not want to have a mentor we have the respondents who would like to have a mentor. The reasons for this are several and two of the respondents express them selves as follows:

*"My needs of a mentor are totally dependent of my competence and my weaknesses."*

*"To be told from a mentor if I am going to the right direction."*

To be able to have someone to exchange ideas with is the main reason for 98% of the respondents for having a mentor. Supplementary knowledge from another person is a reason for 95% of the respondents. 92% wants mentor for the reason that they believe it is worth a

try. Concerning network 85% believe that mentoring could expand their contacts. 79% believes that mentoring can teach them more about running a business. 81% believe that mentoring can help them with strategies and concrete solutions. Finally, 62% believes that mentoring can help them with issues regarding the change of lifestyle when you start a business.

### **Mentoring program fees**

Start-ups do not in general have extensive funds and mentoring programs require large funds to finance. The advantage of charging start-ups for involvement in a mentoring program and not offer the service free of charge are two. Firstly, you will only receive participators that are serious with their business. These start-ups see a future in their business and honestly want to succeed. By only receiving seriously start-ups you will not invest capital in start-ups that do not believe in their business up to 100%. Secondly, a fee would bring some money into the mentoring program that can be used to finance the expenses voluntarily mentors receive when they meet their adepts.

According to our study 48% can imagine them self to pay for a mentoring program. These figures would increase or decrease depending on the size of the fee and their knowledge about the efficacy impact mentoring can have on a start-up. There are more females, 54%, that could imagine them selves to pay a fee for joining a mentoring program compared to 45% of the male respondents. What is more interesting is that the willingness to pay a fee for participate a mentoring program increase with the age of the respondent. This result in that 33% of the respondents age 25 or younger and 61% of the respondents older than 55 years of age could imagine them selves to pay a fee for joining a mentoring program.

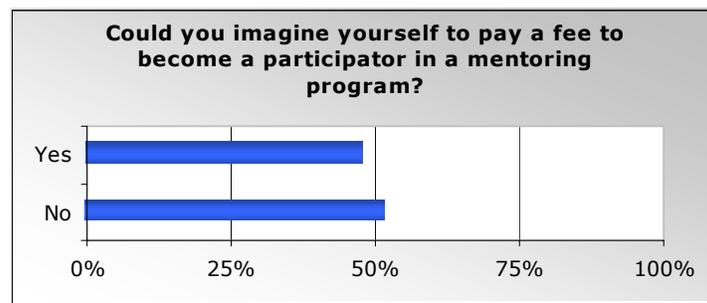

Figure 3. Start-ups reflection towards paying a fee to become part of a mentoring program

### **Meeting the mentor**

Our respondents state that they would like to meet their mentor approximately once a month according to 49%. Another 34% would like to meet their mentor less than once a month, 12% would like to meet their mentor every two weeks and 4% would like to meet their mentor every week.

### **Practical issues within mentoring**

Some practical issues regarding mentoring for start-ups are that they want the mentor to have extensive experience from being self-employed, 85%, and extensive experience from a top management position, 69%. Among the respondents 71% find it as important that a

mentor have experience from the same branch as them. The mentor should be able to meet the adept in the local community according to 57% of the respondents and this should be on regularly basis according 72%. Of the respondents 68% would like to also meet other mentors than their own for ideas and feedback. More than a third, 36%, of the respondents would like to have a central meeting point were mentors and adept can meet up. It is of importance for 45% of the start-ups that there is a working plan to follow in a mentoring relationship and courses to follow about the subject according to 34%.

### **Demand and supply of mentoring**

There is a remarkable possibility within mentoring in Sweden. Today only one of five start-ups has a mentor. It seems like start-ups do not know about the efficacy and benefits of taking part of a mentoring program. We know from research that mentoring have positive on impact new starters. Therefore there is of great importance that mentoring effects will be informed to start-ups and that there is mentoring programs available to join without costing to much.

Mentoring programs in Sweden are in general very small and have approximately 20 mentors or less available in every assembly, which are not many. We know from this research have input that makes it possible to see in which extent mentoring programs could be build up so that the mentoring programs could reach out and be accessible to all start-ups that would like to have their own mentor.

In our research we found that eight out of ten start-ups would like to have a mentor. Among start-ups in business for the first year almost nine out of ten would like to have a mentor. In Sweden we get 49 500 new businesses each year. The consequences would be that 31 680 start-ups would like to have a mentor during the first three years and could consider contacting a mentoring program. The figure 31 680 times three years will be 95 040 start-ups that demand a mentor if they could decide. That is a lot of start-ups that potentially needs a mentor and would require about 60 000 mentors.

A realistic perspective is that there will never be that many start-ups, but still. Not all of them could consider pay a fee for entering a program. After taking the fee in to consideration this would give 68 310 start-ups wanting mentor, start-ups that will contact and pay a fee to participate. This is a figure that will correspond to approximately 45 000 mentors that will be needed in Sweden.

If these figures would be put in to context of a region like Orebro, located in the middle of Sweden between Stockholm and Oslo, that would correspond to how many start-ups and mentors an average mentoring program would require. Orebro gets about 850 new starters each year. But only 46% are willing to pay a fee for mentoring giving us 391 start-ups left for possible mentoring. This figure times three gives us the total amount of new starters, which is 1 173, that needs to be matched against a mentor. The total amount of mentors that will be needed if all would contact a mentoring program would be about 780 mentors.

The truth often is that not that many start-ups or mentors will contact a mentoring program even if they say they would. Real figures would probably be a third of our calculations, which are 391 start-ups and 260 mentors.

We do have the start-ups and we do have mentors according to our studies, the only thing that is needed to be done is to bring them all together.

## Conclusion

We do know that mentorship have a positive impact on society. There is for that reason of great importance that mentorship is being implemented in wider scale in our society than ever before. This could be done in if can arrange an arena for both mentors and adepts to get together. For this to be promising interests need to act on a regional and local level within the nation. It would also be favourable if this could also be arranged over the nation borders if necessary, but have in mind that the mentors have a need in meeting the adepts on regularly basis.

Mentoring have great possibilities if handled correct and wisely. But it is not only positive. Mentoring can also fail due to the fact that it is not a guarantee for success. Many things can go wrong. The big issue is how to match the mentor with the adept, and the efficacy of doing so. Mentors can even have a bad influence on the adepts. So there is not only a problem with matching the mentor with an adept it also has to be a correct one. We discussed earlier that assigned mentoring relationships are less beneficial than those who develops informally. This gives us further complications regarding how to match informally. Further on the adept have to ask them self if this person have the skill and values that are acquired.

Even if the mentors are willing to offer their services free of charge and the demand from new starters extensive, there are plenty of barriers to triumph. The mentors want to share their knowledge and experiences. The mentors want to meet new and interesting people. The mentors want a new challenge in life. But sadly are not all of the mentors likely to be appropriate to become mentors. Not all qualify for such pedagogic assignment.

Most important is that we know the potentially supply of mentors and the potentially demand of mentors from the new starters. This gives an indication how extensive third party managed mentoring programs can be arranged to receive best possible efficacy and survival of start-ups.

DETERMINANTS OF SUCCESS:  
SMALL AND MEDIUM SIZED ENTERPRISES SELLING GOODS AND SERVICES  
TO THE FEDERAL GOVERNMENT

Aleta Wilson  
National-Louis University  
8000 Westpark Drive, Suite 125  
McLean, VA 22102

**ABSTRACT**

The purpose of the study is to discover the characteristics of successful small and medium sized enterprises (SME's) that sell goods and services to the federal government in order to develop a list of determinants of success (DoS). These factors can be used for a variety of purposes including as a self-check for aspiring business owners, a checklist for government or private sector purchasers, a way for determining assistance needs, and even for financiers. This, the first of a 4-part study, covers the rationale, prior research, and survey methodology. Parts two through four cover survey results of three populations—small and disadvantaged business utilization specialists, large government contractors, and successful small government contractors. This is the first study to solicit input from customers of small businesses to obtain their view of success to overlay what researchers view as significant success factors.

**INTRODUCTION**

Small businesses are one of the major engines that fuel the United States economy, and the government encourages small business ventures by maintaining low barriers to entry. According to the U.S. Small Business Administration, Office of Advocacy, there were 22.9M businesses in the United States in 2002. Because of the importance of small business to the U.S. economy, numerous scholars have parsed the entrepreneur in various ways in hopes of determining the theoretical entrepreneurial success formula. The underlying question is whether entrepreneurs have a common set of characteristics that can be used to determine who has the highest probability of success. This study tackles that question, but approaches it from a different direction. In addition to examining successful entrepreneurs to expose possible similarities that can be projected onto nascent entrepreneurs, this study starts from the customer perspective. Use of this approach helps obviate the self-serving attribution bias when entrepreneurs are asked to explain their success (Rogoff, Lee et al. 2004). It also creates an opportunity to overlay customer perspective upon researcher findings about success characteristics.

The purpose of this study is to discover the characteristics of successful small and medium sized enterprises (SME's) that sell goods and services to the federal government in order to develop determinants of success (DOS). These determinants can then be used for a variety of practical purposes including as a self-check for aspiring business owners, a checklist for government or private sector purchasers, a way for determining assistance needs, and as part of the decision-making matrix for venture capitalists or bankers. Another critical outcome of this study is to provide a tool that could help in reducing the

number of business failures, which are frequent and damaging to the efficient operation of a market economy (Storey, Keasey et al. 1987).

## **BACKGROUND**

Small businesses have been hailed and proclaimed as economic engines that make significant contributions to job creation, and the general health and welfare of the U.S. economy. They represent more than 99.7 percent of all employers, pay 44.5 percent of total U.S. private payroll, and generate 60 to 80 percent of net new jobs. A study by Birch was the first to shed a bright light on this magnificent engine (Birch 1979). Since Birch's results contrasted sharply with previous economic research, there was and continues to be debate among mainstream macro-economic researchers about the validity of his research findings. But statistical data from the U. S. Department of Commerce strongly supports his findings, and policy interest in the small business sector arises out of this proven capacity to generate and increase employment.

### **Small Business Advocacy**

Small business—this powerful economic and employment generating engine is shepherded by the U. S. Small Business Administration (SBA) whose mission is to “maintain and strengthen the nation’s economy by aiding, counseling, assisting and protecting the interests of small businesses and by helping families and businesses recover from national disasters (USSBA 2005). The SBA assists small businesses through grants, consulting, counseling, training, developmental programs, business information centers, financial assistance, outreach, women’s business centers, and other activities, which are available to all businesses regardless of size, ability, industry, or other factors.

The culture of the United States is built upon the belief that everyone regardless of background should have an opportunity to succeed, and entrepreneurial development systems are designed based upon that premise—service to all. It is almost heresy, and certainly politically incorrect, to suggest that resources be expended on those ‘most likely to succeed’, but business failure rates (53% over a 4 year period) and loan default rates of 2.5% for all businesses and a higher rate for small businesses provide data that cannot be ignored (Berger and Mester 1999; Boden 2000). Based upon the knowledge that new business creation is highly associated with economic growth around the world (Reynolds, Carter et al. 2002), coupled with rapid movement to a global economy absolutely requires that the United States become more diligent in optimizing its resources, stabilizing its economy, and therefore maintaining economic success.

SBA assistance to small business is threatened by shrinking dollars. The SBA’s 2006 budget request included \$115.8M<sup>1</sup> for assistance to small businesses, which represents a 37% reduction from fiscal year 2000, when they received \$185.6M.<sup>2</sup> If there were a means to identify the factors that drive small businesses to success, then the SBA and its agents could target and nurture those factors. Thus, making the best use of declining public sector funds.

In addition to providing general business assistance, the SBA is mandated to ensure that small businesses get their fair share of government contracts. The SBA negotiates annual procurement preference goals with each Federal agency and reviews each agency's results to ensure that the statutory government-wide goals are met "in the aggregate." Section 15g of the Small Business Act sets statutory goals for contract awards, called *goaling*. Goaling is one area where small businesses operating in the Federal marketplace differ from other businesses. Due to these 'contract goals', small businesses may be selected based upon agency goals or price, and not necessarily because they are the best business. There is another area where small businesses operating in the federal marketplace differ from the non-governmental sector, and that is associated with contract turnover. When a contract ends, federal acquisition regulations (FAR) require that the contract be re-competed.<sup>3</sup> During the re-compete process, another small business may be selected to perform the contract. The new firm often hires the employees and buys the equipment of the previous small business. Consequently, the selection is not necessarily based upon the best company, but is based upon employees.

### **Small Business Research**

Researchers have been investigating small business development and entrepreneurship since Cantillon coined the term entrepreneur (1755). For decades, researchers have been attempting to uncover the secret formula for entrepreneurial success. They have studied the entrepreneur by using different indicators, in different industries, by gender, by country, and most of them have come to the same conclusion—success in business highly correlates to certain personality traits, work experience, and education. Beyond this, there have been minute, incremental steps in our understanding of entrepreneurship.

Birch's seminal, and controversial work on small business job creation, sent researchers on a quest to confirm (or deny) his findings. In fact, some researchers now believe that most new jobs actually come from relatively few small businesses (Stanworth and Curran 1976; Burns and Dewhurst 1996; Glancey 1998). If that is true, then the U.S. Small Business Administration (SBA) and other small business advocates may be expending limited resources on firms with little chance of success. According to the SBA 2005 budget request, approximately 2.1 million entrepreneurs received business counseling and technical assistance through one or more of the Agency's advisory and training programs(SBA). This study asks whether those dollars would be better spent by targeting and nurturing entrepreneurs with the highest probability of success.

With all of the resources and training expended on entrepreneurs, this study suggests that it is now time to study entrepreneurship from a different perspective. Instead of microscopically examining the entrepreneur, maybe we should use a common industry technique, and ask the customer to define and identify successful small businesses. This will allow us to overlay what we believe about entrepreneurial success with the customer's perspective.

Obtaining the customer view of success allows us to confirm, expand, or reject research findings about success. This could be a daunting task due to the plethora of businesses, customers, products, services, geographic locations, etc, but there is one marketplace that

is relatively closed with a vast pool of data—the federal government, where over \$200B are expended each year (USGSA 2003). The federal government market is a perfect laboratory for discovery and testing of entrepreneurial activities, because it is a relatively closed system. All small businesses, must register in the Central Contractor Registration system and contract awards are recorded and tracked in the Federal Procurement Data System.<sup>4 5</sup> Consequently, information on entrepreneurs is available from birth (registration) through contract award to death (no more government contracts).

### **Federal Procurement**

An advantage of focusing on the federal marketplace is that all government agencies are required to have an Office of Small and Disadvantaged Utilization Specialists (OSDBU) (pronounced az-d-bu) whose role is to insure that their respective agencies promote the utilization of small, small disadvantaged, veteran-owned, hubzone, and women-owned business concerns in compliance with Federal laws, regulations, and policies. The OSDBU also assists such firms in obtaining contracts and subcontracts with large businesses.

Large businesses that sell goods and services to the federal government have a counterpart to the federal government OSDBU with a similar charge. The large business representative and the federal OSDBU represent an opportunity to gain direct access to their perceived ‘successful’ small businesses or to the buyers within their organizations who have first-hand knowledge of their small business vendors.

Information from the customer and the names of their successful small businesses is invaluable information for this study. Conversely, the output from this study can be used by those offices to help them assess small businesses desiring to do business with them.

There is one major area where the government is falling short of adopting a business model and that relates to an outcome orientation. Even with all the work being done in support of small businesses in the federal market, and the millions of dollars being expended, there is no way to measure and no definition of success. It is acknowledged that the definition varies depending on the definer, but it is wasteful to expend resources on an activity with no measurable outcomes other than the number of nascent entrepreneurs receiving counseling.

### **OBJECTIVE OF STUDY**

The objective of this study is to uncover the determinants of success (DOS) for small businesses selling goods and services to federal government agencies. A successful outcome of this study would provide: a practical roadmap for policymakers to allocate scarce and declining funds for small business development; the foundation for trainers and educators to develop training and curriculum that targets specific small business needs; a of success probability to be used by investors and financiers; and, most importantly, it would assist the nascent entrepreneur in assessing her own abilities. Finally, this study will be the first to consider customer input on small business success characteristics.

## THEORY

The focus of this study builds upon research pertaining to small business success. It is not necessary to rehash and re-review past research in order to create a bibliography, because others have done an excellent job of that. (See Timmons and Peacock for reviews and bibliographies of studies related to characteristics of small businesses (Timmons and Spinelli 2003; Peacock 2004)). Therefore, this study only provides an overview of pertinent studies.

This study concerns what Van Praag calls the “personspecific” determinants as opposed to the “businessspecific” determinants, because small business success and entrepreneurial success are intertwined (vanPraag 2003). The culture and characteristics of the small firm generally reflect that of the owner(s). Consequently, research on small business success often focuses on the owner characteristics.

Researchers have parsed the entrepreneur by considering a variety of factors. Reynolds and Newbert studied the characteristics of the nascent or gestational entrepreneur (Reynolds, Carter et al. 2002; Newbert 2005). Boden studied small businesses by industry and race (Boden 2000). D’Amboise and Muldowney looked at management and organizational structure (D’Amboise and Muldowney 1988). These studies and others focus on the small business in the earliest stages of development—one to five years. Whichever framework is adopted, researchers tend to focus on what Morrison and Breen has categorized as pro-growth factors, which include intention, ability, and opportunity (Morrison, Breen et al. 2003).

Due to the desire for quantification, several factors are excluded from the success equation—the unobservables or intangible assets such as corporate culture, access to scarce resources, management skill, corporate reputation, luck and social networks, which can be postulated to be principal determinants of business success (Aldrich and Zimmer 1986; Hall 1992; Freeman 1996). Freeman supports the inclusion of social networks as a factor by offering that an invaluable input of venture capitalists is access to their networks.

The underlying objective of entrepreneurial success studies is to develop a predictive model, but accurate models are not widely available (Lussier and Pfeider 2001; Reynolds, Carter et al. 2002). Even if a model existed, it would not be a replacement for existing decision-making techniques, but an adjunct. This study takes a qualitative approach to answer Birch’s question about why “gazelles” grow (a gazelle is a business establishment with at least 20% sales growth, starting with a base of at least \$100,000.) (Birch, Haggerty et al. 1993), and takes D’Amboise’s challenge to identify factors critical to above average growth by using customer input to sharpen vague generalizations about entrepreneurial success characteristics (D’Amboise and Muldowney 1988). The overall conclusion is that there is no one factor that is the lynchpin of success, but a combination of factors.

## **STUDY METHODOLOGY**

The study is conducted in four parts designed to capture determinants of success from those with firsthand knowledge of successful firms in the federal government contracting community—the customer and the small business. This first part of the study involves an explanation of the background, hypothesis, methodology, and establishes the framework for the overall study. The second through fourth parts of the study involve surveying small business customers and selected small businesses.

### **Definitions**

Three terms need to be defined for this study—small business, entrepreneur, and success.

#### **Small business**

Most researchers use the U.S. SBA definition of a small business “an independent business having fewer than 500 employees. <sup>6</sup> SBA further delineates small businesses by size standards—500 employees for most manufacturing and mining industries and \$6 million in average annual receipts for most non-manufacturing industries. This study is based upon these definitions.

#### **Entrepreneur**

The definition of an entrepreneur begins with the originator of the term and idea, Richard Cantillon, an economist who spoke of the entrepreneur as someone who organizes and assumes the risk of a business in return for the profits (Cantillon 1755). The term disappeared until J.B. Say’s *Treatise on Political Economy* (Say 1863). Say believed that the entrepreneur used their industry/labor to organize and direct the factors of production so as to achieve the satisfaction of human wants. These ideas were built upon by other economists and refined by Schumpeter who viewed the entrepreneur as one who engaged in ‘creative destruction’ as innovations caused old inventories, ideas, technologies, skills, and equipment to become obsolete (Schumpeter 1912/1934). A more recent definition comes from work done at Harvard Business School and is now generally accepted by authors: “Entrepreneurship is a way of thinking, reasoning, and acting that is opportunity obsessed, holistic in approach, and leadership balance” (Timmons and Spinelli 2003).”

This study rejects Schumpeter’s idea of innovation, because today’s entrepreneur is often more capitalist, imitator, or opportunist than innovator and may simply shift factors of production (i.e., business, employees, customers) from one venture to another. A combination of these previously formulated ideas forms the definition for this study an “entrepreneur is one who assumes the risk of business by creating or seizing an opportunity with no guarantee of profit”.

#### **Success**

Prior research has tended to focus on industry average profits, share of the market, return on investment, age of business, and other quantifiable elements to determine success. These are often difficult to calculate for small, non-public, businesses due to record keeping, organizational structure, owner/manager expenses, and other elements, but as Adaman and Devine state “...whatever the subjective motivation of the owners may be,

the ultimate criterion of survival and success is profitability” (Adaman and Devine 2002). Therefore, profit cannot be ignored and is included here in the success definition.

For the purpose of this study, success is refined to reflect the realities of the federal government contracting market. It has been found that having more than one contract is critical to survival of contractors with 10 or more employees (Fullenbaum and McNeill 1992) and that the average number of contracts awarded to minority-owned businesses in 1999 was 2.5 while the average number for non-minority-owned businesses was 1.7 (Wilson 2001). It was also found that the average dollars received per firm in 1999 was \$1M.<sup>7</sup> This leads to the following definition “a successful small government contractor has ten (10) or more employees, average annual revenues greater than \$1M, increasing or stable profits, and more than two contracts.”

### **Thesis and Hypotheses**

The thesis of this study is that successful, small government contractors have similar characteristics. Morrison and Breen’s pro-growth factors of intention, ability, and opportunity are used to test this thesis (Morrison, Breen et al. 2003). Not only do their factors encapsulate and categorize elements most often studied in the area of success and entrepreneurship, they dovetail with this study’s definition of the entrepreneur.

Most of the unobservable success factors (corporate culture, access to scarce resources, management skill, corporate reputation, luck and social networks) are covered in Morrison and Breen’s list with the exception of corporate reputation and luck so they have been added. Corporate reputation can be ascertained from customer interviews, and luck can be added as a survey question for small businesses. This lists of factors form the core of the surveys to be conducted in parts 2 thru 4 of this study.

The framework of this first part of the 4-part study consists of four elements: background, objective, thesis/hypothesis and study methodology. These elements represent the foundation upon which the surveys in parts 2 through 4 are based.

The second part of the study involves surveying the Office of Small and Disadvantaged Business (OSDBU, pronounced az-d-bu) officials who are the first-responders for small businesses selling or desiring to sell products and services to the federal agencies. According to the Small Business Act, all government agencies with contracting authority are required to have an OSDBU whose role is to insure that their respective agencies promote the utilization of small, small disadvantaged, and women-owned, Hub Zone and veteran-owned business concerns in compliance with Federal laws, regulations, and policies.

Part three of the study involves surveying federal government prime contractors who subcontract work to small businesses. The prime contractor counterpart to the federal agency SADBUs is asked for their input about their small business vendors and for a list of internal managers with direct relationships with small businesses. They are also asked to provide a list of their success small businesses to be surveyed in part 4 of this study. The conduct of surveys will be via email or in-person.

The fourth and final part of the study surveys small businesses identified by government agencies and prime contractors as successful. Survey conduct is by email and/or in-person. The survey questions are structured to utilize the pro-growth categories defined by Morrison and Breen, and the final analysis will incorporate the findings of all parts of the study.

## **Conclusion**

In order for the U.S. economy to capitalize on its gazelles, it is imperative that a system be developed to identify and nurture them at the early stages of their development. The rapidly increasing move to a global economy makes it incumbent on the research community to move rapidly in the development of success determinants. Researchers can take a lesson from the technology community and move toward standardization. It has been proven that standards speed development, because each individual firm does not have to spend time developing and maintaining their own standards.

Researchers should settle on the SBA definition of a small business, and this study suggests a standard definition of the entrepreneur as “one who assumes the risk of business by creating or seizing an opportunity with no guarantee of profit”. Whether this definition is accepted or not is not important. It is important that the community settle on a definition that everyone understands and agrees upon.

It is past time to include customer input in the determination of a successful small business. Researchers seem to be mired in a continuous loop review of the same personal entrepreneurial characteristics. In fact, some success criteria once thought to be significant are now being considered insignificant. Very little new knowledge is being developed in the area of success characteristics. The customer perspective is a way to validate research findings.

The fundamental question being asked by this research is whether small businesses operating in the federal government market and considered successful by their customers possess the characteristics that researchers have found to be significant. The federal market was chosen because it is a relatively closed system with vast stores of data. This first of a 4-part study is the framework to be implemented in study parts two through four.

## **ABSTRACT**

Entrepreneurial and small- and medium-sized (SME) firm performance is a complex; multi-faceted construct that researchers (e.g., Dvir, Segev & Shenhar, 1993) argue should be examined with an eye toward its complexity. Our research study seeks to accomplish this examination by proposing a conceptual model of SME performance with two distinct outcome dimensions—growth as one dimension and profitability as the second. We propose hypotheses for relationships between the four factors above and an SME's likelihood to pursue either product improvement or process improvement as their primary strategic orientation. Further we propose that an SME product improvement orientation likely has greater influence on growth and profit performance than will a process improvement orientation. The findings of the study suggest that internationalization and innovator position have a positive impact on new product and process improvements, while environmental uncertainty, internationalization, and product improvement have positive influences on growth as a performance dimension. In addition and as hypothesized, the product improvement orientation is positively associated with growth and in turn profitability whereas the process improvement orientation showed no statistical relationship to growth and ultimately profitability.

## **INTRODUCTION**

An important subset of the small- and medium-sized enterprise (SME) and entrepreneurship literature is that which examines venture related performance and the various antecedent factors proposed to affect performance (for example Chandler & Hanks, 1994; Covin & Covin, 1990; Qian & Li, 2003 Zahra & George, 1999). High firm performance can facilitate growth and subsequent profit performance, which in turn can yield employment and economic growth. Conversely, low-performance may lead to firm stagnation or failure and the negative economic ramifications of these outcomes. Given the resource constraints of small firms (Acs, 1999) and their susceptibility to distress, hardship, and outright failure with respect to environment change and uncertainty, a better understanding of the contributing factors and mechanisms for high growth is desirable. Therefore the goal of this research is to examine a set of conditions, factors and actions that we propose are of consequence to high SME performance.

This empirical research paper examines two characteristics of entrepreneurial SMEs (their innovator position and the propensity to internationalize) in conjunction with two contextual variables (environmental uncertainty and firm size). We propose hypotheses for relationships between the four factors above and an SME's likelihood to pursue either product improvement or process improvement as their primary strategic orientation. Further we propose that an SME product improvement orientation likely has greater influence on growth and profit performance than will a process improvement orientation. The hypothesized relationships are developed from much of the significant research conducted in entrepreneurship, small business management, and strategic management over the recent past. Our postulates are explained and illustrated using a structural equation model.

## **HYPOTHESIS DEVELOPMENT**

### **Environmental Uncertainty**

Uncertain, unstable, or hostile business environments generally result in difficulties of varying types for all business firms with the margin for error particularly thin for SMEs. Organizational

flexibility and entrepreneurial posture (i.e., innovation, proactiveness and risk taking) can mitigate the effects of hostile environments for SMEs (Covin & Slevin, 1989; Lau, Man & Chow, 2004). Small firms may also be aggressive in difficult environments (Covin & Covin, 1990).

*H1: Environmental uncertainty is positively related to product improvement.*

Second, innovation and proactiveness as a response to environmental uncertainty may lead to process improvements to lower costs and thereby preserve financial flexibility.

*H2: Environmental uncertainty is positively related to process improvement.*

In a recent study of market orientation, product innovation and small firm performance Verhees and Meulenber (2004) linked market orientation and market intelligence to performance. Information gathering, market understanding, environment understanding, and sense making are necessary for SME performance. Such a market orientation is likely to elicit development of the internal resources and capabilities commensurate with adequately meeting the market's needs with appropriate products. Chandler and Hanks found that "[f]irms with higher levels and broader varieties of resource-based capabilities grew faster and had higher levels of business volume" (1994: 343). With fewer degrees of freedom for survival, small firms will seek to derive the benefits attributable to size to more effectively fend off the undesirable consequences of environmental conditions.

*H3: Environmental uncertainty is positively related to growth.*

### **Internationalization**

Following Johansen and Vahlne's (1977) stage theory propositions, small firms develop their business activity in domestic home country markets. Success in domestic markets provides the capability to move into foreign markets at first primarily through export activity. From this limited exposure to foreign markets through exporting, firms can learn about customer's product needs, pricing needs, country distribution systems, culture, etc. Ultimately, such learning yields greater commitment to international markets and potentially enhanced performance for the firm. Logically, SMEs have two general strategic orientations from which they may pursue international activities—product improvement or process improvement.

*H4: Internationalization is positively related to product improvement;*

and

*H5: Internationalization is positively related to process improvement.*

Internationalization is a major strategic action for an SME. Under the stage theory premise, an SME operates from an established base of business activity. Research has reported internal conditions that impact SME internationalization to include special competitive advantages (Jaffe, Pasternak & Nebenzahl, 1988), the possession of a unique product, profit advantage, and technological competence (Koh, 1989), and underutilized production capacity (Kaynak, Ghauri, & OlofssonBredenlow, 1987).

*H6: Internationalization is positively related to growth.*

### **Innovation**

Typically SMEs are characterized as resource constrained when comparison is made to large-sized firms. What SMEs lack in resource endowments may be compensated for by flexibility, agility and innovation (Acs & Yeung, 1999; Buckley & Mirza, 1997; Qian & Li, 2003). SME innovation is generally manifested in the form of product modifications (Verhees & Meulenber,

2004). Romano (1990) revealed that the internal drivers for SME growth from innovation were technology, R&D and the ability to generate a competitive edge in the firm's product market. The ability to innovate and adapt new technology to make product modifications is likely due to the greater creativity and innovativeness of small-firm employees (Acs & Yeung, 1999).

*H7: Innovation is positively related to product improvement.*

Similar to the product improvement arguments presented above, firms may also pursue innovations in their organizational and manufacturing processes to become more productive and improve quality, reliability and efficiency.

*H8: Innovation is positively related to process improvement.*

### **Firm Size**

In discussion above we stated that small firms are typically characterized as resource constrained. Larger firms likely possess a greater array of resources to cope with corporate life-cycle changes (Miller & Friesen, 1984). Zahra and George (1999) report significant differences in the manufacturing strategies between corporate ventures (CV) and independent venture (IV) biotech firms. Many of these differences are directly attributed to the different resource endowments available to the ventures—CVs have the wherewithal to draw upon their corporate parent resources while IVs do not. McDougall, Deane, and D'Souza (1992) reported similar outcomes for computer and telecommunications equipment manufacturing ventures.

*H9: Firm size is positively related to product improvement;*

and

*H10: Firm size is positively related to process improvement.*

### **Product improvement and SME growth**

Growth is related to R&D, product innovation and the ability to gain competitive advantage in the product market (Romano, 1990). Product improvements and new products provide firms the momentum for market leadership and growth (Iansiti, 1995). Product innovation opens firms to market share growth and hence sales growth by increasing the customer base in current markets or attracting new customers by opening new markets to the firm (Zahra & Nielsen, 2002).

*H11: Product Improvement is positively related to growth.*

### **Process improvement and SME growth**

Covin (1991) contrasted the characteristics of what he termed entrepreneurial strategic posture versus conservative strategic posture firms. Several important differences emerged in Covin's (1991) analysis that distinguishes entrepreneurial from conservative firms. However, an interesting outcome of Covin's research is the lack of difference in emphasis on operating efficiency between the entrepreneurial and conservative SMEs. Possibly resource constrained firms must get maximum productivity from the resources they possess. We postulate that resources improvements and subsequent operational efficiencies positively impact SME growth.

*H12: Process Improvement is positively related to growth.*

### **Growth and profitability**

SME managers/owners may find it useful, necessary, or unavoidable to pursue strategies that sacrifice (short-term) profitability for growth. Such risky strategies may be due to environmental conditions (Covin and Slevin 1989; Lau, Man, & Chow 2004) or to a particular time in the firm's development (Oviatt & McDougall, 1994). Absent the ability to reach a "critical mass" in

revenue at some point in the early development of a firm, the issue of profitability in the traditional sense is moot. In similar fashion major organizational transformation stages (Miller & Friesen, 1984) in established firms may necessarily require the (albeit temporary) abdication of profit in favor of sales growth.

As performance dimensions growth and profitability are sometimes treated as contemporaneous constructs (e.g., Qian & Li, 2003). However, particularly with respect to small firms, there is a greater likelihood that growth may be antecedent to profitability. Therefore we put forth our final hypothesis:

*H13: Growth is positively related to profitability*

## **METHODOLOGY**

The research design employed the survey method for data gathering. A representative random sample of 855 small- and medium-sized manufacturing firms was identified. A cover letter and survey were addressed to the president or owner from each firm soliciting a response to the questionnaire. A total of 192 key-informants responded, with 182 providing complete information for an overall response rate of 21%. The means, standard deviations and intercorrelations for our data are presented in Table 1.

-----  
Table 1 about here  
-----

Following the method of Anderson and Gerbing (1988) we employed a multistage process to verify construct validity. Both discriminant validity and convergent validity were determined satisfactory through a process of principle components and confirmatory factor analysis. Structural equation modeling was employed using the AMOS software package in SPSS to test all proposed hypotheses simultaneously. Again following the method of Anderson and Gerbing (1988) outcomes from the analysis show an adequate model based on fit indices provided (see Table 2).

-----

## **RESULTS**

The results from the statistical analysis support most (but not all) of the major premises of the hypotheses developed (see Table 2). Briefly, we find support for the hypothesized positive relationships between innovator position and product improvement ( $p < .001$ ); innovator position and process improvement ( $p < .001$ ); internationalization and product improvement ( $p < .001$ ); internationalization and process improvement ( $p < .01$ ); internationalization and growth ( $p < .001$ ); environmental uncertainty and growth ( $p < .001$ ); product improvement and growth ( $p < .001$ ); and growth and profitability ( $p < .001$ ). Of note is the lack of a significant positive relationship between process improvement and growth which indicates that a process improvement orientation may not yield growth and, in turn, profitability. Conversely a product improvement orientation (as noted above) does yield higher growth, and in turn, higher profitability. Finally, the findings had no support for the hypotheses examining firm size on either product or process improvements.

## DISCUSSION AND CONCLUSION

The primary contribution this paper makes to the literature on small firm performance, namely SME growth is the distinction between product improvement and process improvement as an orientation for growth. Acs (1999: p12-13) stated:

*“The importance of the relationship between innovation and firm growth is also clear. The successful entrants that grow the most are those that develop some type of innovative activity either with new products, new technology or human resources.”*

The results of our research support this premise in part. Innovations (and internationalization) that works through new product and product improvement efforts appear to be successful drivers of growth. However, if new technology is interpreted to mean new processes and process improvements, our data does not support this element of the premise.

These findings reveal that among small businesses environmental uncertainty only has a direct affect on growth (H3), while the hypothesized indirect affects through either product (H1) or process improvements (H2) never materialized. In fact, contrary to the theory developed above, the negative relationships between environmental uncertainty and both product and process improvements were not at all what we expected. It could be that small businesses perceive the uncertainty in the environment more harshly than first thought (Covin & Slevin, 1989).

However, the findings reveal that internationalization has both a direct as well as indirect—through product improvement (H4)—affect on growth (H6). Although, internationalization had a significant influence on process improvement (H5), the relationship between process improvement and growth was not significant (H12). The results suggest that the internationalization construct is significant in explaining all of the above hypothesized relationships (H4, H5 and H6). It would seem that small business internationalization is important for product and process improvement orientations as well as growth of the businesses, it may represent some form of learning or capability development that enables leaping of the stages of internationalization by small firms (Johansen & Vahlne, 1977; Verhees & Meulenber, 2004).

The results of the study also suggest that innovation significantly impacts both product (H7) and process improvements (H8) for small businesses. The findings are not surprising, it seems that product and process improvements are likely due to the greater creativity and innovativeness of small businesses (Acs & Yeung, 1999). According to Romano's (1990) research a central driver of growth is from the innovation of small businesses. However, based on our findings we suggest that innovation impact growth but only product improvement mediates such a relationship (H11). Unexpectedly, firm size had no apparent effect on either product (H9) or process improvement (H10) for this sample of small businesses. Although other researchers have found significant relationships between the size of a firm and manufacturing approaches, clearly this study found no relationships (Zahra & George, 1999).

Finally, we found that product improvements (H11) lead to greater growth of the firm, process improvement (H12) did not, and growth is significantly related to profitability (H13). These findings support the research of Acs and Yeung's (1999) work, which suggested that the ability to innovate and adapt to make product improvements is likely due to the greater innovativeness of small businesses. In addition though, we suggest that profitability will also improve as a result of growth achieved by new product development.

Intuitively the relationship between innovation and growth may seem to be clear. The results from our research indicate that the causal effects from innovation are more complex than such a general statement might indicate.

| NNFI = 0.93                                   |                          |                    |                |
| CFI = 0.97                                    |                          |                    |                |

Note: All parameters are significant except for the impact of firm size, macro environment on product improvement and process improvement on returns; the R<sup>2</sup> for Returns is non-significant. R<sup>2</sup> indicates the proportion of variance accounted for each of the four endogenous constructs (product improvement, process improvement, growth and returns)

# **THE IMPACT OF ENTREPRENEURSHIP UPON TOWNSHIP, VILLAGE ENTERPRISES OF THE PEOPLE'S REPUBLIC OF CHINA**

Max S. Wortman Jr. and Jing Feng  
Iowa State University

## **ABSTRACT**

The purposes of this paper are: (1) to show the development of Township, Village Enterprises (TVEs) in China; and (2) to discuss the possible impact of entrepreneurship on TVEs. The paper has several sections which discuss: (1) a brief introduction of the TVEs' history, development and position in the national economy; (2) the rationale behind TVEs' rapid growth despite the ambiguous ownership structure and seemingly insufficient incentives; (3) the ambiguous ownership structure and the involvement of community governance as the appropriate responses to an unfavorable economic environment during the transition from a command economy to a market economy; (4) the cultivation of entrepreneurship in an unfavorable environment; (5) the emergence and development of entrepreneurs in China; and (6) the impacts of entrepreneurship upon TVEs.

## **INTRODUCTION**

Many people are amazed by the dramatic change in Communist China during the past 25 years. Yet not many understand the locomotive of the national economy: Township, Village Enterprises (TVEs). From the early 1980s to mid 1990s, the rapid development of TVEs in rural China has caught the attention of the entire world. In less than two decades, TVEs have grown from a stepchild of the national economy into a giant adult which contributes more than one third of the total national industrial output. By 1998, there were more than 20 million TVEs nationwide, with a total employment population of 125 million, compared with 12 million TVEs and a total employment of 75 million in 1985 (see Table 1). Their contribution was tremendous, especially

---

during a period while most State-Owned Enterprises (SOEs) stagnated and the population was dislocated by reform.

The rapid growth of TVEs is fascinating; yet it can hardly be explained by existent economic theories. Unlike SOEs and private enterprises, TVEs have ambiguous ownership. Therefore, they may seem to lack a strong stimulant towards entrepreneurship. However, the ambiguous ownership and the involvement of community governance are appropriate responses to an imperfect economic and political environment in China. Given the unique political and cultural contexts, the incentives are strong enough to cultivate entrepreneurship, but the culture may also cast a negative impact on entrepreneurship. In general, two types of managers are more likely to transform into modern entrepreneurs: cadres who have service records at various levels of government and have been appointed to managerial positions, and people with experience of long-time apprenticeship in the commune-brigade enterprises in Mao Tse-tung's era. As reforms

deepen, entrepreneurs face great challenges in terms of human capital and enterprise management knowledge and skills. Hence, appropriate training and development become most important.

Despite the growth of TVEs during the early 1980s and mid 1990s, their development has slowed down after the mid 1990s. This can be attributed to the general economic slowdown, unfavorable external environment (Southeastern Asian Financial Crisis) and sluggish exports at the same time. With the development of a market-oriented economy, the costs of ambiguous ownership and community governance have gradually offset the benefits, and the advantages of TVEs over other types of organization have diminished. TVEs face two choices: either privatization or stock-ownership by employees. In either choice, TVEs are non-national enterprises. Will TVEs become *standardized* (more like Western enterprises) or *characterized* (maintain Chinese characteristics)?

### **TRENDS IN THE GROWTH OF TOWNSHIP, VILLAGE ENTERPRISES**

After the mid 1990s, TVE development has slowed down, with deteriorating enterprise performance and diminishing contribution to national economy. According to Fewsmith (2001), the annual growth rate of TVEs has dropped from an average of 42 per cent during the Eighth Five-Year Plan period (1991-1995) to about 17 per cent in the latter part of the Ninth Five-Year Plan period (1997, 1998, and 1999). These decreases have occurred primarily due to the negative effects of ambiguous ownership structure and community governance which began to offset the benefits as the deepening reforms and the strengthening of the market economy occurred.

Given the fact that the uniqueness of TVEs (ambiguous ownership and community governance) is an appropriate response to an imperfect economic environment, it is reasonable to regard TVEs as expedient during transitional period, rather than a perfect organizational type. As the Communist Party becomes more positive about the market economy, the effects of cultural factors diminish and the ideal-typical versions of enterprises become more appropriate in China. The management styles of TVEs must be changed, or TVEs will become history. In fact, several changes concerning TVEs have emerged since the mid 1990s: privatization and joint-stock co-operatives, both of which are based on well-defined property rights.

#### **Privatizing TVEs**

The rapid privatization occurred during the mid 1990s, with variance in different regions. TVEs are sold to individuals and become private firms. TVE managers, who have rich experience and broad networks, are more likely to take over the new private enterprises. Academics have different explanations for the striking trend of privatization in rural China. One holds that the trend is due to poor performance of TVEs and a shift in government policy. Peng (1998) argued that there was nothing fundamentally wrong with the rural industrial sector and the recent slump in performance might be mostly as a result of the economy-wide recession. Looking back to the development of rural enterprises, TVEs are rather flexible in an imperfect economic and political context and have a tendency to adapt to newly emerging changes in the economic environment.

Privatization occurs when agent costs outweigh the benefits from ambiguous ownership and community governance. The recent wave of privatization is just an extension of the evolutionary process that has seen continual improvement in the property rights bestowed on the manager since the early reform. As privatization becomes more widespread and adjustment costs are sunk, there is no reason to believe that this new private sector cannot lead rural China in another drive to rapid growth (Li & Rozelle, 1998).

First, the central government gradually recognized the contribution of private firms, and thus granted more favorable policies and regulations. The government realized that private firms had become a dynamic enterprise type and an indispensable part of market economy. Due to well-defined ownership and straight-forward incentive system, private firms are more flexible, nimble, and always set on the pulse of the market. Moreover, private firms create a huge number of jobs for urban laid-off workers as well as for rural saturated laborers. Second, a changing attitude of banks accompanied by favorable government policies also accelerated the privatization of TVEs. In 1994, nearly all bank managers favored lending to collective firms. By 1997, only 14 percent favored collective firms while 58 percent favored private firms (Park & Shen, 2002). It is partly due to fierce competition and diminishing profit margin of TVEs. Park (2000) argued that poor TVE performance had led to a collapse in confidence in the ability of whole townships and villages to remain solvent. Third, Gabriel (1999) discussed a trend among the TVEs towards the “individualization of ownership”: ownership shares are increasingly being distributed from the local governments to firm management due to a keen interest in expanding their authority over TVEs by managers. From managers’ perspectives, privatization would provide stronger incentives to focus on creating share owner value and improve business performance. Fourth, with increasing exposure to the outside world, especially after the entry into WTO, the costs of community governance have become increasingly significant. On one hand, foreign companies are attracted by the TVEs’ low labor and land costs and eager to establish cooperative relationships. On the other hand, foreign companies hesitate when taking ambiguous ownership and community governance into consideration. In other words, they do not want to work with companies that have much interference and distraction from outside.

Although massive privatization of TVEs has become a striking trend in recent years, it also has brought negative effects. Undoubtedly, unambiguous ownership should improve managerial incentives, and should come with increasing productivity and profitability. However, such ownership reform does not happen in a vacuum. Effective private sector development requires supporting financial, legal, and government institutions. If appropriate reforms in these supporting institutions are not implemented, private firms may struggle (Park, 2000).

### **Joint-Stock Cooperatives**

Meanwhile, there is another trend of TVEs in rural China. According to Sun, Gu and McIntyre (1999), many of the existing TVEs themselves have changed their legal form during the 1990s, becoming joint-stock co-operatives. Under this form, shares of TVEs are sold or distributed to TVE employees and managers or community residents in the form of both “collective shares” (one-person-one-vote) and conventional individual shares (one-share-one-vote) (Che & Qian, 1998). In this way, ownership becomes straight-forward. Owners can influence the enterprise operation by stock transaction. Once the property rights and control are well-defined, owners usually become more responsive to incentives. Che and Qian (1998) also discussed the partial

privatization of TVEs, mainly in the form of sales of control rights to managers and employees or to foreign investors. The two main features of this change from community collective ownership to joint stock ownership are: quantifying employees and community's equity stakes; and reallocating control rights to the board of directors from the local government (Chang, McCall, & Wang, 2000). Although community government still plays a role after partial privatization of TVEs, its role primarily focuses on investment in infrastructure and public works. Under joint-stock cooperatives form, there is a mixture of local government ownership and employee share ownership. It is a type in between TVEs' community governance and complete privatization, revealing the fact that main Chinese institutional innovation is much like a multi-member partnership. If privatization of TVEs is an adaptation for the increasingly market-oriented economy, joint-stock cooperatives are more like a Chinese characteristic experiment to set up a socialist enterprise type, rather than a pure capitalist one.

### **DEVELOPMENT OF TOWNSHIP-VILLAGE ENTERPRISES IN CHINA**

Despite the fact that TVEs have become privatized or joint-stocked, they were contributive to national economy, especially to rural economy. In rural China, farmers had been depending upon agriculture for thousands of years. It was not uncommon to end up with nothing at the end of the crop year because of bad weather. To avoid merely relying on agriculture and to diversify risks, many farmers set up small-scale family businesses, which formed traditional industry in rural China. In the early 1950s, the central government put the management of rural industrial firms on its agenda, and tried to guide rural development. During the *Great Leap Forward* era in 1958, the communes established many small industrial enterprises. None of them lasted very long, but they turned out to be valuable in terms of experience involving community governance in enterprise management.

During the national agricultural mechanization drive of the early 1970s, rural small-scale industrial enterprises rapidly started to re-emerge (Modderman, Gorter, Dalhuisen, and Nijkamp, 2001). Due to the low wage rates and land costs, many SOEs gradually subcontracted or outsourced operations to small industrial enterprises in nearby rural areas. Such community enterprises were then known as so-called commune and brigade enterprises (CBEs), the predecessors of TVEs and eventually changed their names to TVEs with the termination of the commune system in 1984. The central government adopted a few favorable policies and regulations towards TVEs so that they could improve in terms of economic scale, management, specialization, and cooperation. In many provinces (similar to states in the U.S.), TVEs contributed to one-third, or even one-half of their industrial output.

A TVE is neither a state-owned, cooperative, nor a private enterprise. A TVE is small-medium-sized enterprise owned by all the residents living in a rural community. Theoretically, only the rural residents can claim ownership. Thus, they make the final major decisions, such as appointing managers and allocating revenues and profits. Such collective ownership is so vague that it is inefficient in the real business world. If everyone has ownership, no one can really claim it. Therefore, various levels of local government, township and village government in particular, execute the control of the enterprise on behalf of rural residents.

At the township (formerly the Commune) level, community government not only takes charge of routine administrative duties, but also supervises the running of TVEs. The township government is not necessarily in charge of daily operations. The government appoints a manager to manage the enterprise. Similarly, the village (formerly the Brigade) enterprise is controlled by the village government, but run by the manager. Hence, a TVE is more like an economic co-operative in which rural residents, community governments, and managers are involved. Although community government does not have the real ownership of a TVE, it takes an active part by offering not only the necessary infrastructure, but also its financial support, given its close relationship with rural banks.

The period between the early 1980s and the mid 1990s was a golden era. TVEs enjoyed a rapid growth and gradually replaced the dominant position of SOEs in certain industries. In terms of the total number, TVEs achieved their apogee in 1993, with a total of 34.53 million enterprises. Although the number decreased thereafter, the population of employees, the revenues and profits, as well as assets have increased steadily, indicating that the development of TVEs were becoming more quality-oriented. TVEs are still the dominant component of the rural industrial sector (Yep Kin-man, 2001).

The reasons for the rapid growth of TVEs vary. First, the growth occurred during the second stage of reform, and thus benefited from the fruits of first-stage reform. The Chinese reform is significant, yet it is rather a step-by-step transformation, so that the later reforms can borrow both successful and failure experience from the previous ones. Understanding that agriculture is the foundation of national economy, the central government decided to start the reform within that sector. By the time TVEs began to develop, the agricultural sector was able to provide sufficient resources, including foods, materials, and surplus labor. In fact, TVEs did not start from scratch. Second, TVEs had competitive advantages over other types of enterprises, given their unique economic and political environment. Thanks to community governance, it was easier for TVEs to get loans from local banks or governments. Compared with TVEs, private firms did not have such access because they had neither collateral nor close relationship/network (guanxi) with banks. Therefore, an absence of funding has never become a serious bottleneck to TVEs as to most private firms. Third, limited access to financial services pushed TVEs to maintain a closer look at their financial situation and adopt harder budget constraints. Unlike SOEs, TVEs' access to financial services was limited due to the relatively weak influence of community governments on banking systems. Hence, TVEs were more cautious in enterprise management to make sure that they stay solvent and continue to get funding from banks. Last, Stern (2001) pointed out that TVEs seek social support from state enterprises. Many families received income or other forms of social benefits from SOEs, which provided a sense of security and encouraged risk-taking activities.

Throughout the 1980s and the early 1990s, the employment gap between country and urban areas was partially offset by the growth of TVEs. This not only increased rural incomes, but also absorbed over 100 million workers who were transferred out of agricultural labor (Fewsmith, 2001). However, the growth of TVEs apparently slowed down after the mid-1990s: the number of TVEs decreased, their performance deteriorated, and the ability to absorb surplus labor was reduced. The explanations for such a trend vary. Fewsmith (2001) noted that the TVE sector has entered a new phase of development; where intensive growth has begun to replace extensive

growth. Such a trend may partly be due to the general unfavorable economic environment. Woo (2001) argued that the slowdown of TVE growth perhaps is the result of a general economic slowdown since 1994. At the mid-1990s, the growth rate has slowed down with the concomitant slowdown of the national economy. Since then, the economy has been experiencing deflation. Moreover, the external environment deteriorated with the explosion of the Southeastern Asian Financial Crisis. Since most TVEs have been export-oriented, the crisis inevitably cast negative impacts on their production and sales. Another explanation is that massive privatization of TVE sector occurred at the same time, which significantly decreased the number of TVEs as well as employment. As private entrepreneurs have taken over, they have no doubt felt freer to lay off excessive or unproductive workers and not to take on new staff (Park, 2000). As the Chinese market matured with economic reforms, the disadvantages of community governance became more obvious. TVEs may be replaced by different types of organization.

### **RATIONALE BEHIND TOWNSHIP-VILLAGE ENTERPRISES' RAPID GROWTH**

This section discusses the rationale behind the rapid TVE development during the reform era. The rapid growth of TVEs is most fascinating, yet it can hardly be explained by existent Western economic theories. Theoretically, well-defined property rights are absolutely essential to the well-functioning of enterprise in that it is directly related to incentives. According to Weitzman and Xu (1994), the Chinese model, with a central role being played by TVEs as the major form of non-State enterprises, is much more successful than any actual applications of the standard property rights model, where the existence of well-defined private property rights seems an absolutely essential precondition to the proper functioning of a market economy. There are two interesting paradoxes in rapid TVE development: ambiguous ownership versus rapid growth, and community governance vs. management.

#### **Ownership Structure**

What makes vaguely defined TVEs outperform such well-defined counterparts as SOEs and private firms? It is partly due to a unique ownership structure. It is mentioned above that the ownership of TVEs lies in local residents, but in fact, the township, village governments represent the nominal owners to control the enterprises. Moreover, with explicit rules specified by the center regarding profit distribution, residual benefits of the TVEs are shared between the local citizens and the township, village governments (Chang & Wang, 1994).

The ambiguity in ownership reveals a balance between maintaining the present political system and providing economic incentives. The reform that China has been undertaking is gradual, with many debates and suspicions of the central government and academics about the application of market economy to the country. Therefore, the dominant position of public-owned enterprises could not be changed radically during the transitional era. TVEs happened to act as a successful model of public-owned enterprise type, especially when SOEs suffered from stagnation. TVE is not quasi-governmental, yet it is not private. In general, TVE is still a collectively-owned enterprise type, with a group of local residents as property owners. In addition, part of TVE profits go to infrastructure and benefits local residents, indicating a superiority to private firms.

Yet, assigning the control rights to local residents is inefficient. It is more difficult for individuals to get government support or bank loans, which are of critical importance to TVE operations. Due to the fact that township, village governments are more accessible to bank loans, getting them involved in operation and allocating part of residual benefits provide strong incentives to exert positive influence on TVEs. Of course, the number of TVE owners in a given TVE is much smaller than the number of owners in SOEs so that TVE owners can be directly involved in operations. Hence, a sense of commitment provides them with strong incentives to make sure TVE is running well.

Although township, village governments have more resources to operate TVEs, control rights cannot be assigned to them. First, it is against the public-owned philosophy of the government. If township, village governments own TVEs, their roles move to business from governance. In this case, economic incentives are so strong that township, village governments may retain more profits and ignore their commitment to the central government: tax revenue demands. Local residents lose their ownership and rights to claim for residual benefits, and thereby lose incentives to safeguard the well-being of TVEs.

In a perfect market environment, well-defined ownership is the foundation of a well-functioning enterprise. Li (1996) claims that the immature market environment in China makes ambiguous property rights often more efficient than unambiguously defined private property rights. Compared with private firms, TVEs are more accessible to credit from banks and capital markets. In the meantime, TVEs are relatively immune to excessive and irregular charges placed by local governments. Given the dual roles of community government in governance and business, it is efficient to get township, village government involved in TVE operations.

### **Community Governance**

Involving community government in enterprise operations is certainly shown as Chinese Characteristics in transitional economies. It is the rationale behind balancing the costs and benefits of community governance under unique cultural and economic contexts. Given the imperfect market environment during transitional era, community governance is rational in terms of joint liability lending. Until recently bank loans to TVEs exhibited the key features of joint liability leading, which facilitated the provision of formal credit to finance the rapid expansion of TVEs (Park & Shen, 2002).

In rural China, local residents are not sufficiently well off to collateralize loans and it is very difficult to get funding from outside organizations. Under a joint liability lending system, all people involved hold responsibility of repaying bank loans. Since township, village governments control the enterprise and share residual benefits; they could use their own assets as collateral or equity to seek funding from local banks. In addition, community governments provide loan guarantees and assume final responsibility of repaying loans. Meanwhile, banks give more credit to community governments because governments have more resources and lower default risks.

Joint liability lending relies on local information and the monitoring and sanctioning abilities of borrowers to overcome problems of adverse selection, moral hazards, and strategic defaults that

frequently plague bank lending when collateral is absent (Park & Shen, 2002). Given the fact that Chinese culture emphasized collective interests, financial institutions have more solid trusts in community governments than individual rural residents. Additionally, township, village governments have control over many TVEs within its territory. Even if one TVE fails to repay bank loans, it is always possible for community governments to arrange for other TVEs to pay back money. In this way, community governments are able to maintain a clean record and a good reputation. Moreover, the relationship between government officials and bank managers are somehow intertwined. It is possible for local leaders to exert political influence on bankers. The effect of “one good turn deserves another” is not uncommon in Chinese society. By offering bank loans to TVEs, government officials owe bank managers big favors (renqing), and try to pay these favors back in other ways. That explains why the total rural lending by state financial institutions to TVEs increased steadily during the rapid growth of TVEs even though the nominal owners lacked collateral and credits.

Township, village governments that share residual benefits and take charge of allocating profits have vested interests in TVEs. Under such circumstances, community government is not likely to bother TVEs with excessive and irregular charges, which are common and harmful to individuals and private firms in rural China. Over interference and imposition are more likely to incur when interests of government and individuals diversify or clash. Again, it has partly resulted from government’s dual roles in business and governance, which is one of the Chinese characteristics during transitional era. Through community governance, the interests of rural residents and those of community governments are somehow aligned, avoiding direct interest conflicts. In this sense, community governance can be interpreted as a rational adjustment to an imperfect economic and political environment.

Another benefit of community governance is hard budget constraints due to limited influence of township, village governments on local banks. Limited access to bank loans provide financial support to TVE operations which restrains TVEs from unnecessary spending and bad business decisions. If the access to funding is all good for enterprise management, it is hard to explain the stagnating performance of SOEs. Compared with SOEs, TVEs have harder budget constraints, which lead to better business performance.

Both TVEs and SOEs are government-controlled; the difference is that the former are controlled by community governments, whereas the latter are controlled by the central government. SOEs suffer from a soft budget constraint problem (Kornai, 1980). Banks are not independent entities making decisions on lending to SOEs because both banks and SOEs are controlled by the central government. If the government considers it necessary to refinance SOEs, banks can do nothing but make loans, regardless of profitability. In most cases, the central government makes decisions in refinancing SOEs not only from an economic perspective, but also from political and social perspectives. Perotti, Sun, and Zou (1999) pointed out that SOEs may not have performed so badly if their broad social contributions other than reported profits are also taken into account. Unlike their counterparts in foreign countries, SOEs in China have too many political hues. Once SOEs go bankrupt, laid-off employees lose their “iron rice bowls” (tiefanwan), and thereafter lose their sense of security and trust in socialism. Because the society cannot create sufficient jobs to absorb unemployed and the social security system is not developed, a large population dislocated by reform may put social and political stability in

jeopardy. Even if the SOEs are losing money, the central government continues pouring money into the SOES, for fear of a large population of unemployed and social instability.

Soft budget constraints do not happen to TVE because community governments have no controls over local banks. This separation of control over enterprises and banks may allow banks to refuse refinancing when the benefits of refinancing are small (Dewatripont & Maskin, 1995). Although community government does have some influence over bank managers, such influence is so limited that it does not ensure unconditional financial support. In other words, refinancing by local banks is virtually based on the ability to repay loans, rather than the liability to provide financial services. Without assurance of continual funding, TVEs tend to be more cautious in business decisions and enterprise management.

In summary, the major benefits of community governance come from two aspects: fund raising and hard budget constraints. Che and Qian (1998) pointed out that the community government's basic features help TVEs reduce State predation, raise capital in an imperfect capital market, and cause harder budget constraints for TVEs than for SOEs.

## **ENTREPRENEURSHIP IN TRANSITIONAL CHINA**

Township, village governments control TVEs on behalf of rural residents, yet they are not necessarily involved in daily operations. Instead, community governments execute control by appointing (renming) managers to TVEs and letting them run the enterprises through contracts.

### **TVE Managers as Entrepreneurs**

As the agents take charge of enterprise management, TVE managers must be nominated by community governments and approved by the township, village Economic and Trade Commission. Generally, two types of people are more likely to be appointed as TVE managers: those who have service records at various levels of governments, and those who have rich experience of long-time apprenticeships in commune-brigade enterprises in Mao Tse-tung's era. There are several ways of obtaining managerial positions in TVEs, including internal promotion, contract, or administrative transfer. For those who have been serving in community governments for a long time, it is more likely to be a transfer from an administrative position to a managerial position. This kind of appointment is based on mutual contact and solid trust. In contrast, for those who have long-time experience in business, they are more likely to achieve managerial posts by winning contracts or internal promotion. Due to long-time service and thorough understanding of the enterprises, TVE managers arise from an internal contact, usually with the recommendation of outgoing or retiring managers. It is not uncommon that a TVE has several candidate managers available, and the one with the highest vote in an election always secures the position. In addition, achieving managerial posts through contracts is another option: people who are interested bid for the contracts, and those who make the best bid beat the competitors and sign the contracts. In this case, previous service records in business, rich management knowledge, as well as a willingness to take risks are of critical importance in winning the contracts. People who have previous work experience in communes, brigade enterprises, such as purchasing staffs, accountants, sales clerks, have competitive edges in bidding for the contracts because they have accumulated a great deal of experience and

established broad relationship networks. By putting the enterprises in their leadership, TVEs are more likely to flourish.

There is something in common about TVE managers: most of them were not highly educated, but they have acquired management knowledge and skills in a unique economic environment. Due to the fact that TVE managers lack higher education and formal training, their ways of enterprise management are based on business instinct and their experience. In addition, sensitive political sense and thorough understanding of market environments are essential to business management.

### **Distinct Incentives for Entrepreneurs**

Appointed by community governments, TVE managers manage daily operation on behalf of the governments. Their daily routine includes setting manufacturing objectives, allocating resources, hiring labors, boosting morale in workplace, dealing with upstream and downstream suppliers, as well as evaluating business performance. In other words, TVE managers have multiple roles in a rural enterprise: accounting, marketing, engineering, human resources, and decision makers.

However, managing daily operations does not entitle TVE managers to the title of “entrepreneurs”. Entrepreneurs should be more than managers: the latter is like a steward of the business, whereas the former is an innovator, bringing fresh air to the TVEs and transforming entrepreneurial talents into marvelous ideas, critical strategies, and eventually large market shares and handsome profits. As Schumpeter (1943) argued, the function of entrepreneur is to reform or revolutionize the pattern of production by exploiting an invention or, more generally, an untried technological possibility for producing a new commodity or producing an old one in a new way, by opening up a new source of supply of materials or a new outlet for products, by reorganizing an industry and so on. According to Western economic theories, entrepreneurship is closely related to private ownership and strong incentive mechanism. In Western market economies, most entrepreneurs own the entire enterprise or part of the enterprises; and thus, the risks and benefits are very straight-forward. When the owners of the business make bad decisions, their property or assets shrink, or they may even go bankrupt. Even if they are only hired to run the business by the real owners, they lose salaries and stock options by making bad decisions. A loss of the companies indicates that the managers have to leave with a severance package. Such overwhelming benefits and risks seem to be foreign to TVE managers; however, there is a set of distinct motivational mechanism in rural enterprises.

For TVE managers, there is a broader definition of incentive mechanisms given the unique economic and cultural environment in China. Brus and Laski (1989) pointed out that the adoption of various forms of performance-related remuneration methods in collective enterprises in the post-Mao period have strengthened the linkage between personal losses by the manager and business failure. First, like their counterparts in foreign countries, TVE managers’ financial well-being has been closely related to the business performance of the enterprises, which is always made explicit in contracts. Under the contract responsibility system, TVE managers sign contracts (hetong) with community governments, setting business goals and various performance-related remuneration methods. In most cases, TVE managers secure minimum wages. Bottom-line wages are meager compared with handsome bonuses if the enterprise

performance is good. TVE managers receive monthly wages, and by the end of business cycle, they get bonuses according to the enterprise performance as well as the fulfillment of original business goals. TVE managers always strive for the maximum bonus: the minimum wages make them only slightly different from common laborers; but handsome bonuses help them achieve comfortable lives.

In rural China, the implications of managerial failure go beyond the loss of tangible capital (Yep Kin-man, 2001). A sense of loss and humiliation can be as important as financial loss, if not more so. Situations can always be worse in township, village communities where people know one another and have close communication. In Chinese culture, people tend to make judgments primarily based on success. It is revealed by a famous Chinese saying that those who win are somebody (wanghou), while those who lose are nobody (zei). People tend to look down upon a “loser”, regardless of the reasons for losing. Once you lose, you lose forever. If the enterprise performance is not as good as expected, the manager gets fired and becomes a “gossip” topic for the local people. Behind-the-back talks always go beyond the talents and capabilities of TVE managers; they can go as far as to the character and the integrity of the human being.

In China, it is always more comfortable and beneficial to be government officials than business managers in that the latter have a sense of insecurity. It is not uncommon that government officials are appointed to other posts (sometimes even higher up the political ladder) even if they have failed in previous positions. Relationships with higher-ranking officials are more important than administrative positions and service records. This does not apply to rural business world. Poor business performance not only terminates one’s business life, but also closes the door to the political world. Looking back to ancient Chinese culture, there was a tendency to emphasize politics while slighting business. It is still true in modern China in that politicians can exert influence on businessmen, but it does not always work the other way around. Therefore, the ultimate goal of many TVE managers is to pursue political positions at various levels of government. At least, they may obtain honorable positions in local or higher-level congress. In this case, a sense of humiliation and a loss of business and political future can be more detrimental to TVE managers than financial loss.

Similarly, good enterprise performance rewards TVE managers in various ways, including a sense of fulfillment, promotion by community government, a climb up the political ladder, and nominal positions at various levels of Congress

### **The Influence of Chinese Culture on Entrepreneurship**

The Chinese culture (Confucian) plays an important role in the motivational mechanism in organizations. The question whether the Chinese culture is conducive to the cultivation and flourishing of entrepreneurship has long been an interesting topic for both Chinese and Western academics. According to Kirby and Fan (1995), some entrepreneurial attributes---a positive response to change, initiative, and profit-orientation---appeared to be in conflict with Chinese values. For thousands of years, Chinese have been deeply influenced by Confucian values, which emphasize ideology and human relationships despise profit-seeking behaviors. People who have high rankings in government are seldom poor, and those who achieve business success strive for penetration to the political world. It is true that some entrepreneurial attributes are

foreign to Chinese values though; political incentives mentioned above may have a few offsetting effects: it encourages and promotes innovation, creativity, and flexibility. Traditional Chinese culture seems to be only partially conducive to entrepreneurship; however, the newly modified culture is more favorable. With accelerating reform and increased openness to the outside world, Chinese values keep changing. Nowadays, pursuing business interests is no longer shameful as long as it is done in appropriate ways. Successful entrepreneurs are viewed as role models by people of every walk of life, and they are awarded with various political titles. In this way, the barriers to business decrease since entrepreneurs have various sources through which to complain or report. It is expected that Chinese entrepreneurs will make haste in pursuing their goals and make use of their talents in a more favorable economic environment fraught with business opportunities.

### **THE IMPACTS OF ENTREPRENEURSHIP ON TVEs**

TVE managers were not the same as real entrepreneurs since they were involved in the contract system and did not own the businesses, yet they demonstrated some entrepreneurial characteristics. They decided the product line, sought their own sources of funding, bore risks, reacted to price and cost to maximize profits, and reaped the benefits. This flexibility stands in stark contrast to the constrained and unimaginative behavior of SOE managers. TVEs can be seen as the beginnings of modern Chinese Entrepreneurship. (Liao & Sohmen, 2001)

Given the distinct motivational mechanism resulting from a unique cultural environment, entrepreneurship can be cultivated and flourish in China. Chinese entrepreneurs share something in common with their foreign counterparts, yet they have some entrepreneurial characteristics that are labeled “Made in China”. Such entrepreneurial characteristics may cast significant impacts on the development of TVEs.

First, political sense is always critically important to business performance. Due to a long history of human-governance, China lacks legal institutions, especially in rural areas where people have relatively less exposure to outside world. The fact that China is at least partly ruled by a group of elites increases the instability and unpredictability, which is unfavorable to business operations. Though China is transforming to market-oriented economy and a country ruled by law, it takes time to change the current imperfect economic and political environment. Hence, entrepreneurs still need to seek support from and establish harmonious relationships with government officials.

Second, business acumen is another oft-quoted characteristic universal to successful entrepreneurship (Liao & Sohmen, 2001). Despite the fact that most TVE entrepreneurs were not highly educated, they are still enormously successful in operating the enterprises. Their success depends on empirical experience accumulated by long-time service in previous commune-brigade enterprises and thorough understandings of economic and political climate, instead of formal education and trainings. Business acumen has offset the small amount of formal education of TVE managers and contributed tremendously to the development of TVEs. As the market economy becomes mature and Chinese enterprises operate as Western enterprises, lack of education and knowledge of managers will de-accelerate the growth of TVEs.

Third, Chinese entrepreneurs establish broad relationships networks with government officials, bank managers, and technical staffs in higher institutions. TVE managers clearly understand that successful performance relies on policy protection from various levels of government, financial services of local banks, and technical support from academic and research institutions. Therefore, TVE managers make friends with those people to seek support. In this sense, Chinese entrepreneurs have the characteristics of being flexible, sensitive, and respect for knowledge, which contribute to the well-being of TVEs.

Fourth, Liao and Sohmen (2001) have held that most Chinese entrepreneurs tend to emphasize short-term profits and opportunism. Such tendency is revealed by a lack of long-term strategies and clear market positions, and it is not good for the well-being of enterprises in the long run. Being opportunistic is an appropriate response to an unpredictable and imperfect economic environment. Due to community governance, TVE entrepreneurs do not have full control of the enterprises, and thereby are being restricted in large decisions. Planning for long-run strategies when things often go beyond their control is difficult. Clear market positions are hard to set and valuable customers are hard to target, because manufacturing can always be changed. It is not uncommon that TVEs are in A industry today, while switching to B industry tomorrow. To squeeze cash cows is more important than to make strategic plans. In addition, there is always pressure from community government, which expects revenues from TVE. It takes a long time for long-term strategies to take effect, and TVE entrepreneurs may miss the chance to claim the credits. Making short-term profits is directly related to financial rewards and promotions. Being nimble and opportunistic is a unique characteristic of entrepreneurship in China; it is expediency to the unstable political and economic environment. An absence of strategic plan is harmful to the long-term well-being of TVEs.

## CONCLUSION

The rapid growth and economic success of TVEs during the early 1980s and mid-1990s are remarkable, despite the fact that TVEs, as an enterprise type, seem to have disadvantageous structural and behavioral features. It is better to explain TVE success from an institutional perspective, rather than the aspect of economic entity. Ambiguous ownership and community governance have turned out to be appropriate responses to an imperfect economic environment during transitional era. With the acceleration of market economy and deepening of reforms, agent costs gradually outweigh the benefits of community governance, and ambiguous property rights have become a hurdle to TVE development. Hence, community governance is only an expediency to an imperfect market environment, and it does not deny the benefits of well-defined ownership.

The slowing down of TVE development since the mid-1990s makes people re-think ownership issues and consider changes in the legal form of TVEs. One way is privatization, which is close to the Western enterprise type. The other one is joint-stock cooperatives, a mixture of employee and local government ownership, in which employees and rural residents become more involved and the role of community government diminishes. It is more like a Chinese characteristic experiment to test a socialist enterprise type within a market-oriented context. With rapid privatization, China is moving rapidly to an economy that will be dominated by the private sector, with collective ownership representing an important, but clearly transitional phase (Park,

2000). It will be interesting to see whether TVEs will become more Western standardized or continue to carry on a Chinese characteristic during the continuing reform.

# **FUTURE PROSPECTS FOR ENTREPRENEURSHIP IN AZERBAIJAN**

Max S. Wortman, Jr. and Ilham Huseynov  
Iowa State University

## **ABSTRACT**

This study attempts: (1) to show the trends on SMEs and toward entrepreneurship in Azerbaijan; (2) to determine the major challenges and solutions for the development of SMEs and entrepreneurship in the country; and (3) to discuss future prospects for entrepreneurship. The national economy is dominated by the petroleum industry. SMEs that have been developed are generally related to that industry. There are other SMEs in manufacturing, transportation, construction, and retail trade. Since 1992, new laws and regulations have been helpful in developing SMEs. The history and development of the petroleum industry has had a significant impact upon new SMEs. New SMEs are being developed outside of this relationship to the industry. To strengthen these new SMEs, encouraging legislation needs to be passed in efficiency and effectiveness and entrepreneurial ethics, strengthening entrepreneurial public organizations, providing information on the development of entrepreneurs, conceptualizing family businesses, and strengthening SME service centers.

## **INTRODUCTION**

During recent years, Azerbaijan has been implementing economic reforms that have boosted the development of entrepreneurship and that have strengthened the role of businesses in improving living conditions of population. However, entrepreneurship has not yet become a decisive factor in producing quality output in the country, development of competitive production and ensuring employment opportunities for the people.

The purposes of this paper are: (1) to show the entrepreneurship trends in Azerbaijan; (2) to determine the major challenges for entrepreneurship in Azerbaijan; and (3) to discuss the future prospects for entrepreneurship in Azerbaijan. Several sections discuss: (1) a brief introduction of the entrepreneurship history, development and position in the national economy; (2) entrepreneurship in the oil industry; (3) the challenges which entrepreneurs have in Azerbaijan and the possible solutions on the way which to protect the entrepreneurs.

## **SMALL AND MEDIUM ENTERPRISES IN AZERBAIJAN**

A strong market economy is impossible without a dynamic private sector, which is a major force for internal investment, technological change and economic growth. Azerbaijan is no exception. The more that there are internal funds available --- especially the fast-growing earnings from oil and gas exports --- the more the support for the energy sector will be reduced. Promotion of the private sector should strengthen the economy through targeting support for small and medium size enterprises (SMEs) and create new market economy structures.

The definition of SMEs in Azerbaijan depends upon the sector of economy in which this enterprise exists. The form of enterprise is determined by the number of the employees (see

Table 1).

---

Table 1 about here

---

The main measures of promotion for SMEs are the following:

1. SMEs may apply for tax credit through the National Fund for Small Enterprise Support.
2. SMEs are exempt from paying tax in the construction industry, reconstruction and updating of capital assets, utilizing new technology, educating and training human resources.

SMEs are exempt from paying tax during their first two years of operation in the fields of food processing, manufacturing household goods, construction materials, and small innovative enterprises.

The number of operating small enterprises by segments is illustrated by the primary direction of development of the whole economy (see Table 2). This table shows the strong increase of industrial enterprises after 1998.

---

Table 2 about here

---

The major pieces of legislation affecting the development of the SME sector are:

1. Law No. 405 on Entrepreneurial Activities, December 15, 1992.
2. Presidential Decree No. 269 on the National Fund for Support of Entrepreneurship, October 12, 1992.
3. State Policy Concerning the Development of Entrepreneurship and the State Program for the Development of Entrepreneurship in the Azerbaijan Republic for the years 1993-1995, adopted on January 26, 1993.
4. Presidential Decree on Urgent Measures for the Development of Small Businesses, June 20, 1993.
5. Law No. 847 on Enterprises, July 1, 1994.
6. Law No. 858 on Bankruptcy of Enterprises, July 22, 1994.
7. Law No. 931 on Leasing, November 29, 1994 and Law No. 952 on Investment Activities, January 13, 1995.
8. Project on Program of State Support for SMEs in the Azerbaijan Republic for the period 1996-1998.
9. Presidential Decree No. 610 on State Support Program for Small and Medium Entrepreneurship for the Period of 1997-2000, June 24, 1997

Private SMEs are innovative and flexible in the face of changing market requirements. They could help guarantee a balanced economic structure in Azerbaijan. However, the establishment of a broad corporate structure is impeded by high taxes and corruption as well as deficits in the legal system. The government has taken initial steps to improve overall institutional and legal conditions, including the introduction of a new insolvency law. The transformation of the tax legal system and the absence of practical applications render the process difficult. The majority

of the companies have their home in Baku. Frequently smaller commercial enterprises get involved in production.

In many countries, there are significant differences between small business and entrepreneurship. “Entrepreneurship is the creation of new organization that introduces a new product, serves or creates a new market, or utilizes a new technology regardless of whether that new organization is created independent of (entrepreneurship) or within (intrapreneurship) a corporate structure” (Wortman, 2005). In Azerbaijan, it is difficult to find differences between entrepreneurs and small businesses.

Yet, insufficient capitalization and liquidity problems as well as weak financial markets considerably restrict their ability to expand and diversify. For the most part, the banks limit their activities to granting short-term trade finance. Overall, lack of credit is a key constraint to the development of private business in Azerbaijan. The existing credit supply is far too small to provide a suitable environment for the development of even small enterprises in Azerbaijan, let alone medium-sized ones. Many enterprises have no access to affordable credit given collateral requirements and short payment terms. Long term trade and project finance are rare. Outside of donor-backed credit lines, there is essentially no bank credit exceeding 12-18 months. The existing donor-backed finance facilities, while helpful, simply are not large enough to accommodate the needs. The relative volatility of the Caucasus region, combined with the under-capitalization of Azeri banking sector, puts a further squeeze on availability and terms of trade and project finance. Azeri banks offer difficult lending terms, usually 15-25 percent interest in dollar-denominated loans with a maximum two year term. Many Azeri firms simply cannot afford such loans and turn to private sources for finance. Some Azeri banks have begun lending in the nascent private sector, including constructions, telecoms, and food processing and packaging.

## FINANCIAL SECTOR IN THE COUNTRY

Western businesses use a handful of local banks for their local business dealings. The International Bank of Azerbaijan (IBA), the healthiest majority state-owned bank, Unibank, an upstart private commercial bank, the Turkish Kocbank and Azerigasbank are more among the more popular. HSBC, the British Bank of the Middle East, a widely used bank for exports and by the Azeri community was downsized in Summer, 2002 but it closed its doors in Spring, 2003. Of the four state-owned banks, only IBA is a fully functioning commercial bank. The other three are technically bankrupt and currently going through a restructuring program. Consequently they are unable to lend money. The IBA is currently a candidate for privatization. The Azeri government has selected a financial consultant to assess the value of the bank’s assets and to advise them regarding all investments proposals received. EBRD is expected to take 20 percent of the available shares in this bank. Local private banks exist, but they account for about 15 percent of deposits in the commercial banking sector, which is dominated by the state-owned IBA. Several smaller Azeri private banks--- most notably Unibank, Arkobank, and Most Bank---are making good progress toward becoming viable, market oriented financial institutions (Country Commercial Guide Azerbaijan, 2004).

Therefore, building an efficient financial sector is a key to successful transition process. Very

few private banks are attempting to broaden the spectrum of their activities to cover the field of SMEs' finance. Owing to insufficient knowledge about assessment and monitoring small-scale loans, to a lack of funds to build this field of business and to the possible risks involved, the banks have been hesitant to move out of their target group.

To succeed in transforming itself into a stable, market-oriented nation, Azerbaijan, with the support of the international community, is focusing on developing SMEs.

## THE IMPACT OF THE PETROLEUM INDUSTRY

In the early 1990's, there was a collapse of Azerbaijan's economy as the result of political instability and a war with Armenia. Although the gradual return of political stability and a ceasefire with Armenia ended the general economic decline in 1995, the journey towards a strong market economy has been a long one for Azerbaijan. With every year of deadlock, the risk of a resumption of war has been growing, with its implications. As the result of aggression by the Republic of Armenia against the Republic of Azerbaijan, during the period 1988-1994, more than 10,563 sq. miles (approximately 20 percent of the territory) were occupied. Serious material damage has been inflicted, currently estimated at \$22 billion dollars. The number of internally displaced persons (IDP) from the occupied Azerbaijani lands and refugees from Armenia reached about 1 million people. In a country of 8.3 million people, this represents the highest per capita number of IDP in the world. (ATAA, 2005) This unsolved conflict is still the largest challenge not just for the growing SMEs, but also for the whole economy.

Azerbaijan has been linked with oil for centuries, even for millennia. Medieval travelers to the region remarked on its abundant supply of oil, noting that this resource was an integral part of daily life there. By the 19th century, Azerbaijan was by far the frontrunner in the world's oil and gas industry. In 1846---more than a decade before the Americans made their famous discovery of oil in Pennsylvania---Azerbaijan drilled its first oil well in Bibi-Heybat. By the beginning of the 20th century, Azerbaijan was producing more than one-half of the world's supply of oil.

The last century saw sharp rises and falls in Azerbaijan's economy. The oil boom at the start of the century transformed Baku into the `Black Gold Capital` of the world with a thriving market economy and buoyant entrepreneurship. In the 1920's, the Soviet regime introduced an inefficient centrally-planned economy. Oil production peaked at about 500,000 barrels per day (bbl/d) during World War II and then fell significantly after the 1950's as the Soviet Union redirected its resources elsewhere.

Azerbaijan has 1.2 billion barrels of proven oil reserves, as well as enormous possible reserves in undeveloped offshore Caspian fields. Over 80 percent of Azerbaijan's oil production currently comes from offshore, with a significant percentage coming from the shallow-water section of the Gunashli field, located 100 km off the Azeri coast.

## AZERI OIL COMPANIES AND SUBSIDIARIES

The State Oil Company of the Azerbaijan Republic (SOCAR) was established in September, 1992 with the merger of Azerbaijan's two state oil companies, Azerineft and Azneftkimiya.

SOCAR and its many subsidiaries are responsible for the production of oil and natural gas in Azerbaijan, for operation of the country's two refineries, for running the country's pipeline system, and for managing the country's oil and natural gas imports and exports. While government ministries handle exploration and production agreements with foreign companies, SOCAR is a party to all of the international consortia which develop new oil and gas projects in Azerbaijan. The company (not including subsidiaries) employs 70,000 people. In January, 2003, President Aliyev issued a decree calling for the reorganization of SOCAR. Under its new charter, SOCAR now owns the oil it produces. Previously, SOCAR relinquished ownership when the oil had been sent to processing facilities. The restructuring also involved transferring some of the non-oil-producing businesses to the Ministry for Economic Development. In June, 2004, reports indicated that SOCAR might change into a joint-stock company within the next three to four years. The European Bank for Reconstruction and Development (EBRD) and the U.S. Trade and Development Agency will underwrite this transformation.

Development of new fields through joint ventures and Production Sharing Agreements (PSA) in the Caspian Sea likely will boost Azerbaijan's oil production well beyond its earlier peak, with predictions that Azerbaijani oil exports could exceed 1 million bbl/d by 2010, and 2 million bbl/d within 20 years.

These huge oil contracts are all PSAs. The PSA are based on one common concept: they provide for the exploration and development of selected oil fields and allow for the sharing of the proceeds by the participants. Each PSA must be approved separately by the Azerbaijan Parliament. Parties to the PSA are consortia of international oil companies headquartered in many different countries, notably the United States, the United Kingdom, Turkey, Saudi Arabia, Norway, Japan, and Russia. They are always partnered with the Azerbaijan State Oil Company.

Over 21 PSAs have been signed in Azerbaijan alone between the state oil company SOCAR and various major oil companies. The biggest contract is named "Century Contract" and provided by Azerbaijan International Operating Company (AIOC), which is a consortium of 11 major international oil companies and SOCAR. According to this contract, the consortium is developing the Azeri, Chirag and deep-water portion of Gunashli fields in the Azerbaijan sector of the Caspian Sea. Their 30-year PSA was signed on September 20, 1994. The contract area has estimated reserves of more than 4 billion barrels of oil.

Azeri crude oil is refined domestically at two refineries: the Azerineftyag (Baku) refinery, with a capacity of 160,000 bbl/d; and the Azerneftyanajag (New Baku) refinery, which has a capacity of 202,830 bbl/d, with domestic production averaging about 328,000 bbl/d in 2003. With one-half of that exported as crude oil, Azerbaijan's refineries have been running well below capacity. Overall refinery utilization rates are as low as 40 percent. Heating oil accounts for roughly one-half of the output at Azeri refineries, followed by diesel fuel, gasoline, motor oil, kerosene, and other products. The U.S. Trade and Development Agency is financing a \$600,000 feasibility study to be conducted by ABB Lummus for upgrading the two refineries and the specialized oil port of Dubendi.

Currently, Azerbaijan's only export pipelines are the Baku-Novorossiysk pipeline ("northern route"), which sends Azeri (and exclusively SOCAR) oil to the Russian Black Sea, and the Baku-

Supsa pipeline ("western route"), which mainly carries AIOC's "early oil" from ACG to Georgia's Black Sea coast. The Baku-Novorossiysk pipeline closed briefly in late June, 2004 after oil thieves set off an explosion when they attempted to steal oil from the pipeline. Azerbaijan's options for increasing its oil exports depend to a large extent on the construction of new pipelines. Several oil export pipelines from the Caspian Sea region are under consideration, but Azerbaijan has not wavered in its support for the Baku-Tbilisi- Ceyhan (BTC) pipeline currently being constructed. This so-called "Main Export Pipeline" would export Azeri (and possibly Kazakhstan ) oil along a 1,040-mile route from Baku via Georgia to the Turkish Mediterranean port of Ceyhan. Such a pipeline would allow oil to bypass the increasingly crowded Bosphorus Straits. Construction of the 1-million-bbl/d pipeline, which is estimated to cost \$2.9 billion, is scheduled to be completed in early 2005, with oil to begin flowing in the summer of 2005.

Azerbaijan has proven natural gas reserves of roughly 30 trillion cubic feet (Tcf), and a potential for even larger reserves. However, because there is insufficient infrastructure to deliver the country's natural gas from offshore fields, natural gas has been flared off instead of being piped to markets. Azerbaijan's major natural gas production increases in the future are expected to come from the development of the Shah Deniz offshore natural gas and condensate field. Industry analysts estimate that Shah Deniz is one of the world's largest natural gas field discoveries of the last 20 years and contains "potential recoverable resources" of roughly 14 Tcf of natural gas. According to the project's operator, BP. Natural gas from Shah Deniz, as well as associated gas from ACG and the Bakhar-2 project, is expected to make Azerbaijan self-sufficient in natural gas as well as to generate significant export revenues.

#### DEVELOPMENT POTENTIAL OF OIL RESERVES

The State Oil Fund of the Republic of Azerbaijan (SOFAZ) has been established in accordance with the Decree of the President of the Republic of Azerbaijan in 1999. It is a mechanism whereby energy-related windfalls will be accumulated and efficiently managed. In so doing, the government is demonstrating its over-riding desire and determination to avoid the inherent risks for any nation in the midst of an oil and gas boom to spend excessively and create macroeconomic distortions. The State Oil Fund of the Republic of Azerbaijan has as its main objective the professional management of oil and gas related revenue for the benefit of the country and its future generations.

Earning from oil and natural gas exports are basically opening up good perspectives for development for the country of Azerbaijan. However, they are associated with the risk of one-sided focus of the economy, which would jeopardize the development of sectors outside of the oil industry. Azerbaijan is now at a crossroads. It needs to decide whether its quickly rising earnings from oil sale are to be used for broad-scale economic development or whether they will flow into pockets of only a handful of people who control that development. By establishing the oil fund---as recommended by the donor community---the government signaled that it is striving for structural change and the diversification of the economy that such change will bring about.

Business support centers (BSC), incubators and techno-parks all try to provide new SMEs with the resources necessary to improve their chances to success. Different entities emphasize

different mixes of space, training, capital, human and computer networking, and consulting. Several definitions have been proposed, but definitions have to be flexible to fit current usage. To cover all of these various entities, the term “Local Business Assistance Centers” (LBAC) has been suggested. Generally business support centers emphasize soft resources such as training, while techno-parks emphasize physical resources such as space. The best business incubators try to provide most resources for small business’ survival and growth. While techno-parks often focus on space and business support centers on consulting, but incubators identify the bottlenecks and try to overcome them. Depending on the environment, the bottleneck could be space, training, access to capital or markets, and infrastructure such as computer networks and many others (Hubner, 2001).

Business incubators in Azerbaijan are organizations, creating favorable environment for start up companies. Incubators offer space for start-ups and provide the necessary managerial, legislative and accounting backup. The government is trying to develop its own infrastructure policy in order to create a favorable environment. There is also a great need for more liberal legislation concerning taxation and investments policies. The first objective for Azerbaijan is the development of SMEs sector.

The business environment of an incubator consists of two crucial factors: the immediate environment near the incubator and a more general business environment in the region and the country. When selecting a site for the incubator, there are a number of success factors that need to be taken into account. Many local business centers focus on particular economic sectors, often naturally based on the resources and skills available in region concerned. Azerbaijan integration to the European Structures is a very important issue. One of the principal goals of Azerbaijan is to shift investors’ attention toward non oil sector of the economy and to develop franchising and cooperation of SMEs with transnational corporations.

The Enterprise Center in Baku is a very good example of supporting local business in Azerbaijan. This Center is a major new undertaking aimed at helping Azerbaijan-owned based companies develop their business to support oil and gas industry. The Center, opened in May, 2002, helps to build local supply capability, promote international standards and increase opportunities for local business. Specific services offered include: information on industry standards for health, safety and environment, as well as contracting and procurement processes; consultancy and business advice; and business skills training. The Center also maintains a register of local suppliers. Primarily oriented toward local SMEs, the center is intended to bring together national and international companies to increase mutual awareness of capabilities and needs. This facility has been established by foreign oil companies to increase business opportunities for local industry. Offering training, support and advice to small and medium-sized enterprises (SMEs), it reached its 2002 goal of expanding the commercial involvement of local companies in the projects by 25 per cent. Even more ambitious targets have been set for 2003.

## THEMATIC DEVELOPMENT OF OIL RESOURCES

Six themes were identified as critical to the peaceful development of Azerbaijan in the context of the exploitation of its oil reserves according to Killik(1998): (1) supporting the development of local business in order to diversify the economy; (2) meeting the needs of internally displaced

people and refugees; (3) strengthening civil society; (4) establishing democratic reforms and development; (5) stabilizing regional politics; and (6) strengthening oil industry co-operation;

The most progressive theme to date is business diversification. A new multi-sectoral body has been established to manage the evolving program---the Business Development Alliance (BDA) - with the Steering Committee comprised of British Petroleum (BP), Citizen's Democracy Corps, Azerbaijan Entrepreneur's Confederation, the Eurasia Foundation, and the American Chamber of Commerce.

Given the diversity of themes, some probably would progress faster than others. The most progressive is the work on supporting business diversification through the body known as Business Development Alliance (BDA). The rationale for the BDA is that if Azerbaijan is to reap the full social and economic benefits of its oil and gas wealth, it will need to invest heavily in strengthening and broadening its economic base.

The BDA is not a traditional business or trade organization; it is a network of international and local companies and business associations, government, international and local NGOs and international development agencies. The founding principles of the group are that partnership and co-ordination are the most effective means to achieving the goal of local business development. The objectives of BDA are: promote the growth of Azeri private sector; provide a unique multi-sectoral forum for information sharing, consultation and advise on issues related to private sector development in Azerbaijan; enhance co-ordination and coherence amongst different economic development initiatives (government, multilaterals, private companies, international NGOs, donors, IFIs, etc.); identify gaps in and obstacles to economic development in Azerbaijan and develop strategies and recommendations to address them; define and recommend policy and legislative changes that will enhance private sector growth; collectively and through individual members, implement initiatives drawing upon members' core competencies and constituencies; provide a comprehensive information resources for the local and international business on investment opportunities, potential business alliance partners, financing, capacity building services/programs available, etc.

The BDA is an entirely voluntary organization. In order to develop, expand and sustain its work, the BDA will establish a permanent Secretariat and set up an office within a local Enterprise Center supported by BP and its partners. To date, the BDA has established five Working groups focused on issues that are identified as joint priority and that match the expertise and capacity of its current members, namely: supplier database, training, oil industry needs assessment, policy development, credit and finance.

The SMEs in the oil industry in Azerbaijan have some specific characteristics. The registration of SMEs in Azerbaijan still has some bureaucratic challenges. Still, the companies lack access to broad information about the situation in the market and other significant financial data. In other words, information exchange is yet to be developed.

Licensing presents obstacles for some firms in Azerbaijan. However, a September, 2002 Presidential decree, "Activities Requiring Special Permission (Licenses)," reduced the number of activities subject to licensing from 270 to 30 with the term of all licenses increased to five years.

While this step has been welcomed by the business community, as of August,2004,it remains unclear as to what practical, day-to-day effect this decree will have on business.

As this industry needs large investments, the majority of SMEs are doing research or supporting the PSA. The main aim is to help local companies develop their business in support of major oil and gas developments in Azerbaijan. A centralized and simplified official registration system for legal entities would be the most effective way of addressing the problem. A few initial steps have been taken in this direction, including the launching of a state programme for SMEs, which aims to simplify registration and licensing procedures for SMEs and ensure protection of their rights.

## CONCLUSIONS

In addition to reducing bureaucratic roadblocks to the development of SMEs in Azerbaijan, there are a number of potential solutions which could be implemented such as:

1. Carry out control on efficiency of adopted legislations and other normative-legal acts.
2. Conduct explanatory studies relative to business-ethics among entrepreneurs in order to improve entrepreneurs' image.
3. Strengthen public control by attraction of entrepreneurs' public organizations in order to ensure clarity of the processes related to the entrepreneurial development
4. Improve the role of entrepreneurs' public organizations in organizing new SMEs.
5. Provide the entrepreneurs with information in all aspects of business activities--- through all basics of business,
6. Establish timely, complete information on entrepreneurship development in the Republic from entrepreneurs themselves;
7. Encourage the concept of family members in spin-offs;
8. Organize and provide management assistance from local and international small business development centers;

## APPENDIX I

National Confederation of the Entrepreneurs (Employers') Organizations of Azerbaijan Republic (AEC) was established and officially registered according to the legislation of Azerbaijan Republic in Baku on March 5, 1999. AEC being a union of employers in Azerbaijan is non-commercial, non-government, self-managing organization coordinating activities of the juridical and physical persons dealing with the entrepreneurial activity not-dependent on their property and organization-legal form (excluding state-financed organizations) on voluntary basis, protecting their legal and economic rights, having public-effective objectives and considering not to get profit as the basic principle of its activity. The Confederation collaborates with BESO - British Executive Services Overseas (Great Britain), NMCP- Netherlands Management and Cooperation Program, EU TACIS - MTP (Managers Training Program), OACIS ASSN, UNDP, TACIS SME and other international programs. It has concluded cooperation agreements with its partners operating in more than 20 foreign countries. AEC is the member of International Industrialists and Entrepreneurs Congress, Azerbaijan-British Trade Industrial Council. Confederation works closely with the embassies of USA, Great Britain, Germany, France, Iran, Turkey, Egypt and Israel, international organizations, such as UNDP, CDC and participates in their various meetings. The governing and executive bodies of Confederation are as follows: General Assembly, Board of Directors, Presidium, Auditing Committee, the President of Confederation is the Chairman of Board of Directors and Presidium. The executive structure of Confederation is the Directorate. The Secretary General manages the Directorate. The Confederation has its representatives in 20 regions of Azerbaijan Republic. The modern conference-hall, training classes, business meeting rooms and library are always used by the members.

AEC renders the following services to its members:

- to analyze the activity of entrepreneurship enterprises and invite foreign experts through the international programs to assist in fund-raising;
- to assist in search of partners abroad;
- to organize business trips to foreign countries;
- to organize trainings covering various spheres of entrepreneurship, computer and language courses;
- to send the representatives abroad to promote entrepreneurial unions in the framework of the international program;
- to advise regarding the legal matters, legislative and other normative-legal documents;
- to provide review regarding the juridical examination of the documents and their correspondence to the current legislation;
- to assist in composing of statements, appeals, petitions and other juridical documents;
- to examine of the documents and their correspondence to the current legislation;
- to assist in composing of statements, appeals, petitions and other juridical documents;
- to clarify and advise regulation of the relations in Commercial and Labor legislation;
- to offer modern conference-hall, business-meeting rooms in the center of the city for various meetings;
- to render consulting services;

## **Abstract**

While studies of entrepreneurship development in China continue to debate on whether China as a socialism ruled country is compatible with an entrepreneurial environment, the economic prosperity in China's private sector and the Chinese government's serial policies to protect private property and ownership have made the pursuit of an entrepreneurial environment irresistible. Existing studies of entrepreneurship development in China, unfortunately, are inadequate to measure the breadth and scale of entrepreneurial activity and performance in China in an orderly and systematic way that enables benchmarking with other nations.

The purposes of this paper are, therefore, to provide an analytical framework so as to better define and measure entrepreneurship and to apply it in the context of China. The following questions are addressed from both a policy and scholarly perspective: 1) How and why has entrepreneurship developed in China? 2) What is the likely role of the Chinese government in the facilitation of entrepreneurial development? 3) What are the barriers that might impede the steps of China toward a more entrepreneurial society?

## Introduction

Although the investigation of entrepreneurship is not new in China, current studies seem to be trapped in a debate of compatibility between the country's market-oriented innovation strength and legacies from a central-planned economy (Crug, 2000; Crug and Hendrischke, 2001, 2002). On the other hand, gradual deregulation policies in the private sector and continuous economic growth during the past two decades have taken the edge off the debate because facts and data have demonstrated that an entrepreneurial environment has been established and is rapidly evolving (Global Entrepreneurship Monitor, GEM, 2003). Thus, potential conflicts in the study of entrepreneurship do not lie in whether it could be entrepreneurial or not, but in how it can be more entrepreneurial.

The purpose of this paper is to examine the development of entrepreneurship in China and the factors that have had a major impact on this development during the period 1979-2003. Three questions are important. First, how did entrepreneurship develop in China? This entails an examination of entrepreneurship in the past and the development that has led to its status today. Second, what are the factors that have impacted entrepreneurial activity in China? A distinction is made between demand and supply factors in responding to this question. Third, what is the contribution of government policy, institutions and culture to the evolution of entrepreneurship? To answer these questions and to contribute to the understanding of entrepreneurship as an economic action under particular social and cultural conditions, this paper begins with a short review of relevant literature. In part 2, mostly informed by the *Eclectic Theory of Entrepreneurship* (Verheul, Wennekers, Audretsch & Thurik, 2002), we investigate entrepreneurship in China. From a static perspective the state of entrepreneurship in China in 2003 is described and discussed, whereas from a dynamic perspective developments in

entrepreneurship between 1978 and 2003 are examined. Various demand and supply determinants of entrepreneurship in China are analyzed in part 3 while in part 4 and section 5 we examine the influence of government policy and culture on entrepreneurship in China, respectively. An empirically based conclusion is provided after the comparison of the different factors that influence the entrepreneurship development in China

## 1. Relevant Literatures

Approached from different theoretical perspectives, different analytical models have been constructed to describe, explain and predict entrepreneurial behavior (Kilby, 1971). Broadly speaking, studies of entrepreneurship tend to be carried out at one of three analytical levels: 1) societal, focusing on macroeconomic or cultural-institutional conditions; 2) structural, focusing on social relation factors; and 3) individual or organizational, focusing on psychological and behavioral factors.

At the societal level, *the mainstream economic* approach treats entrepreneurship as an outcome rather than a cause of social change, claiming that when commodity, capital and labor markets are developed, individuals, as rational actors, will follow market signals and take advantage of new opportunities. As put vividly by Schultz (1964, p.5), “once there are investment opportunities and efficient incentives, farmers will turn sand into gold”.

Instead of the simple explanation relying on the profit incentive, *institutional economists* trace favorable social and economic conditions for entrepreneurship to the institutional arrangement that provides incentives for entrepreneurial activities (Coase 1988; North 1981). While the provision of physical facilities is necessary to carry out routine market transactions, “an intricate system of rules and regulations would normally be needed” in order to reduce transaction costs and to increase the volume of trade (Coase 1988, p.9). With respect to completing the neoclassic

interpretation, North emphasized that “institutions are a set of rules, compliance procedures, and moral and ethical behavioral norms designed to constrain the behavior of individuals in the interests of maximizing the wealth or utility of principles”

Making significant modifications to mainstream economic analysis, the institutional school has been confronting a debate over the relative importance of formal vs. informal social rules, that is whether there is a linear relationship between the degree of institutionalization and the level of entrepreneurial opportunities. Demonstrated by Li (1997), entrepreneurship incentives, especially in a mixed economy, do not necessarily come solely or even primarily, from the market. The opportunity structure undergoes dramatic changes which pull and push different social groups to engage in entrepreneurial activities during different stages of institutionalization (Róna-Tas, 1994). Certain highly profitable opportunities such as brokering between the state and the market sectors only exist during the transition period, and certain types of entrepreneurs rise only in a mixed economy during transition to capitalize on their social and political resources. Knowing this, when the level of institutionalization is measured in terms of the amount of regulations codified rather than their effective implementation and wide observation, the correlation between institutionalization and entrepreneurial behavior becomes arbitrary and cloudy.

Another approach at the societal level is *the cultural approach*. Scholars in this orientation focus on how certain cultural scripts motivate entrepreneurship. Weber ([1930], 1991) suggested that the Calvinist doctrines about salvation through hard work provided a necessary motivation for industrial activities, which led to the development of early capitalism. His pioneering study has inspired a persistent search for cultural factors, or functional alternatives to Protestantism, in other societies to account for capitalist development. One of them is Berger’s argument that

“there can be no capitalist development without an entrepreneurial class; no entrepreneurial class without a moral charter; no moral charter without religious premises” (Berger 1991, p.12)

The soar of economic growth performance in East Asia during the late 20<sup>th</sup> century has aroused a great enthusiasm in Oriental culture, especially the Confucianism. The Confucian ethic of hard work, deference, and group-orientedness has been identified as a determinant of the dazzling economic success in East Asia, particularly among ethnic Chinese groups (Hamilton, 1991; Basu, 1991; Harrell 1985, 1987; Redding, 1991). Regarding these cultural arguments, their weakness is exposed when people point out that they are ahistorical and unable to account for the fact that the Confucian ideology has existed for thousands of years but did not spur much capitalist activity until the last few decades. As the cultural premise advocates have rightly acknowledged, the effect of culture is never independent of concrete social structures (Berger, 1991, p. 19). Without embedding the cultural effect in a spatially and temporally limited social group and specifying the mediating structure, a cultural explanation of entrepreneurship might sometimes seem inconsistent and *ad hoc* in the sense that the Western and Confucian cultural orientations have fundamentally different emphases, yet both are used to account for entrepreneurial activities. In other words, a mono-causal cultural approach without incorporating social structural and institutional factors is handicapped in predicting entrepreneurial motivations and behavior. After all of the above, we could see that the macro-level approach, economic or cultural, provides some necessary bases for understanding the importance of environment for business activity- why entrepreneurship is more developed in certain areas and among certain social groups. Although this approach has limited explanatory power in accounting for varying degrees of entrepreneurship within relatively homogeneous populations, why some people choose the business avenue while others within the same population or culture do not remains a question?

Our concentration in this paper and its limited space do not permit us to give integrated and comprehensive reviews of entrepreneurship studies at the individual level, which include the familiar and influential theories from Schumpeter (1936), Kirzner (1973) and McClelland's concept of *n* Achievement (need for Achievement) (McClelland, 1971) and other more contemporary orientations.

*An Eclectic Theory of Entrepreneurship: Policies, Institutions and Culture* (Verheul, Wennekers, Audretsch & Thurik, 2002) provided one of the recent outstanding entrepreneurship works which created a combined analytical framework for comparing the level of entrepreneurship across nations. Because there is no generally accepted definition of entrepreneurship (OECD, 1998; Van Praag, 1999; Lumpkin and Dess, 1996), measurement and comparison of the level of entrepreneurship for different time periods and countries is complicated by the absence of a universally agreed upon set of indicators (OECD, 1998). In this **Eclectic Theory** framework, the authors try to incorporate different disciplinary approaches (mainstream economics, institutional economics and cultural studies), levels of analysis (societal, structural and individual), a distinction between the demand (carrying capacity of the market) and supply (labor market perspective) side and a distinction between actual and 'equilibrium' level (a long-term equilibrium rate determined by the state of economic development, i.e., technology, market structure) of entrepreneurship. What is more encouraging, such a frame work has been successfully applied to cross-national research including U.S. and several European countries, which has proved to be substantially fruitful compared to the background of Western Capitalist countries (Audretsch, et al, 2002a).

On the other hand, the fall of the Berlin Wall made clear, the centrally planned eastern economies, built around economic concentration and the exploitation of scale economies, failed and ultimately disappeared. This fact has sent out an urgent call for the renaissance of entrepreneurial spirit and activity in the so-called 'transitional economies' which consequently demands continuous monitoring and study of entrepreneurship development in the former socialist nations.

China, unlike the Eastern European former socialist states which in many cases had adopted a "shock therapy" approach to the market and democratic principles, has been successfully implementing a gradual reform since 1978. The distinctive attribute of the Chinese reform exists in its abandonment of bureaucratic coordination of the economy through a process of gradually "growing out of the plan" and reaching the goal of a full-fledged market economy (Naughton 1995, pp.7-13), yet simultaneously preserving vestiges of the socialist political and ideological system. This unique character is very helpful when people try to understand the asymmetric development between the prosperous, exploding private sector and a lag in similar interest in the study of entrepreneurship in China. Largely due to the fact that it is a communist ideology, which creates tremendous uncertainty for entrepreneurial behavior, and the complexity of defining "private firms", most Chinese scholarship on entrepreneurship remains at the descriptive level. It is easy to conclude that in the absence of an efficient theoretical framework and representative data, descriptions based on limited cases and personal anecdotes are far from accurate.

Supported by some exceptional research on China's entrepreneurial environment (Li, 1997; GEM, 2003) and Chinese government's serial policies to protect private property and ownership, this paper advocates introducing sorely needed knowledge about entrepreneurial dynamics in China and a framework for examining the evolution of the entrepreneurial environment over the

last twenty years. In other words, instead of tangling with the debate on whether gradual reform in China is compatible with an entrepreneurial economy, we accept it as an irresistible trend and lay groundwork for future research.

## **2. Determinants of Entrepreneurship in China**

### **2.1 State and Development of Entrepreneurship in China**

Different indicators can be used to measure the degree of entrepreneurial activity (Wennekers and Thurik, 1999). The number of private businesses and their share in the national economy has been widely taken as equivalent of the entrepreneurial intensity in China because entrepreneurs together with their business, employees and the output are categorized as 'private economy' in Chinese official statistical material (Li, 1997).

More than ten years ago in 1994, industry and commerce (including wholesale, retail and restaurant sectors) respectively constituted 41% and 9% of the nation's GDP and they were the two sectors that had witnessed phenomenal expansion of private-owned businesses. As the fastest growing sector in China, private-owned industry grew at an average annual rate of almost 140% from 1979 to 1994, its share in the national industrial output increasing from zero to 12% (China State Statistical Bureau, CSSB, 1995). Meanwhile in the service sector, particularly in retail and restaurant establishments, Chinese entrepreneurs have already replaced their state owned counterparts that had dominated before 1994 (CSSB, 1992).

Today, comparatively longer time series data may enhance confidence about the current state of entrepreneurship in China (See Figure 1). While the private owned enterprises have proportioned more than 80% in total numbers of establishments since 1991, the contribution of private enterprises in output constantly increased to nearly 20% of total GDP by 1999, indicating the improvement of the private sector's competitiveness in China. Due to the variation of indicators

of the State Statistical Bureau, comparable data after 2000 are not available, but the issue of a series of legislative acts and government policies after 1999, seeking to foster the private economy, confirm about the continuity of this trend.

Figure1 about here

Using the performance of the private sector in the national economy as an indicator of the degree of entrepreneurial activity however does not permit a comparable research from a world wide perspective, especially when the comparison is among transitional countries and OECD countries. Such a deficiency can be partially addressed by another approach, the Total Entrepreneurial Activity (TEA) index. The TEA is a measure that identifies individuals that are active in either the start-up phase or the management of new businesses. It is developed as a prevalence rate, reflecting the number of individuals among all those 18-64 years old in the human population involved in start-ups or new initiatives (Global Entrepreneurship Monitor, GEM, 2003). The results of the 2003 assessment among 31 countries are presented in Figure 2, in which China appeared to be more entrepreneurial than the average (GEM, 2003). Year-to-year correlations are presented in Table 1 for four years of data on the aggregate TEA measure. The three year-by-year correlations: 0.81, 0.74, and 0.93 provide strong evidence for TEA as a relatively stable national characteristic.

Figure2 about here

Table1 about here

While the scholars can be particular about the rationality of TEA index, this paper tends to use it as an evidence, together with the performance of the private economy in China, in order to compare the deviation of China's entrepreneurship development track from that of other

countries. Observed by Carree, et al (2001), the development of entrepreneurship in most OECD countries can be characterized by a U-shape trend, with a decrease in entrepreneurship till the mid-eighties and an increase afterwards. However, entrepreneurship in China has been soaring since the beginning of its economic reform in the late 1970s (Li, 1997) and will likely carry this tendency into the near future. In the following parts, we discuss the logic of such a development and attempt to justify our prediction from a macro-level perspective.

## **2.2 Equilibrium Analysis of Entrepreneurship Determinants**

In this part of the paper, the determinants of entrepreneurship in China are examined, both from a static and a dynamic viewpoint and the current situation as well as development of the different variables influencing entrepreneurship in China are also considered. The explanation and analysis of entrepreneurial activity in China are based on the *Eclectic Theory* (Verheul et, al., 2002) due to its comprehensive theoretical approaches and its feasibility in cross-national comparison, which we have mentioned in part 1.

### **2.2.1 Demand Side Determinants**

Discrimination between demand and supply factors is customary when explaining the level of entrepreneurship (Blanchflower, 2000; Storey, 1994). The demand side stimulates entrepreneurial opportunities through market demand for goods and services. Meanwhile, the supply side provides potential entrepreneurs who can act upon the opportunities. A combination of factors including the stage of economic development, globalization and the stage of technological development may affect the demand for entrepreneurship via influencing the industrial structure and the diversity in market demand, and together ultimately lead to more profit (See Figure 3).

Figure 3 about here

### **2.2.1.1 Technology Development**

Based on the experience of the OECD countries, technological advancement often promoted the demand for entrepreneurship on two dimensions: First, contemporary technology developments, such as the application of information technology, seem to favor small-scale production through cheaper capital goods, a decreasing minimum efficiency scale and possibilities for flexible specialization (Piore and Sabel, 1984; Carlsson, 1989), which benefit small firms with more expectation and attention in the development and spread of innovations (OECD, 1996).

Moreover, the advances in information technology have created better access to information and communication devices that may facilitate small business ventures and thus enhance the competitiveness of established small businesses. As the costs of sending information across geographic space have been dramatically decreased (information can be transferred through email, fax machines, and cyberspace, and the availability of profitable information has also enlarged significantly (Audretsch and Thurik, 2000, 2001).

To obtain an impression of the level of technological development in China, the ‘innovation capacity index’, as developed by Porter and Stern (1999), can be used. In 2001, China was ranked No. 42 of all 75 countries on this index (Porter and Stern, 2000). In the recently released *Global Competitiveness Report 2004-2005* (World Economic Forum, WEF, 2004), China ranked 62<sup>nd</sup> among 104 countries with respect to the ‘Technology Index’.

Such continuing lagged performance in the innovation and technology areas given this horizontal comparison may induce Chinese people to compete more aggressively. Yet this is not an appropriate answer concerning the impact of technology on entrepreneurial activity from a historical perspective. The role of technology in the growth process differs by country, depending on the stage of development. It is widely understood that technological innovation is

relatively more important for growth in countries close to the technological frontier while the adoption of foreign technologies associated with foreign direct investment, or the technology transfer and dissemination in the domestic market will be relatively more important in a country such as China (WEF, 2004). The most striking feature that distinguishes direct investments through multinational companies from other forms of international capital flows – portfolio investment and foreign aid – is the long-lasting interest on the part of investing company in their subsidiaries abroad. This long-term interest provides not only for pure capital transfer but also for the transfer of product and process technology, know-how and marketing and managerial skills. According to the statistical data from the United Nations Conference on Trade and Development (UNCTAD), setting aside the special case of Luxembourg (owing to transshipping), China became the world's largest FDI recipient in 2003, overtaking the United States, traditionally the largest recipient, with inflows of \$53.5 billion and it has been in the leading position among all of the developing countries through the last decade (UNCTAD, 2004). The continuous huge inflow of Multinational companies (MNCs) not only created uncountable subcontracts for potential Chinese entrepreneurs in the supply chain, but also fostered a competitive market which forces domestic companies to learn from foreign companies about new product and process technology, marketing and organizational frameworks, as well as channels to new foreign markets. Such a healthy market environment is definitely crucial to entrepreneurship development in China.

What is more, the existence of an energetic external and internal technology market is also expected to expedite the diffusion of technology and produce more opportunities for ambitious entrepreneurs (see Figure 4 and Figure 5).

Figure 4 about here

Figure 5 about here

With a more and more active technology market and the uncertainty contained in the variation of profitable products, one could expect that more small business and new business will be set up by entrepreneurs in China so as to adapt to expanding market demand. Regarding this, entrepreneurship activities benefit from technological development both in China and in the OECD countries, although at different levels.

Additionally, due to the concern of constructing a powerful national innovation system and sustainable competitiveness in international markets, the Chinese government has fostered an ambitious high-technology business incubation program since 1987. By the year 2002, 436 technology business incubators (TBIs) had been established under this program. These incubators were created to provide physical support (room, office facilities, loans and innovation fund) and information networking for any technology specialist with a potentially profitable and manageable idea who was willing to start their business. Knowing the large numbers of TBIs in China that ranks second among all countries and the substantial 23,379 tenants being incubated there, it is reasonable to hold a comparatively optimistic view about China's technology driven entrepreneurial development in the future (Stough and Yu, 2004, forthcoming).

#### **2.2.1.2 Economic Development**

China's achievement in economic growth since the late 1970s used to be a common concern of economists and does not require more attention here. Our question is about the correlation between economic development and the improvement of entrepreneurial performance in China. The answer depends on the stage of economic development and on the intermediate factors through which economic growth exerts influence on entrepreneurship.

Several arguments have been offered supporting a conclusion that economic growth has a negative impact on the level of self-employment (Carree, et. al, 2001). Economic development is accompanied by an increase in wage levels and often by an improved social support system. Rising real wages raise the opportunity costs of self-employment and thus make wage employment more attractive (EIM/ENSR, 1996).

Figure 6 about here

Figure 7 about here

In contrast, as we have shown in Part 1 and Figure 6 and Figure 7, entrepreneurship development appears to be significantly positively related to economic growth in China (Li, 1997; Audretsch and Keilbach, 2003). There are several explanations for this. First, as the primary means of resource reallocation turns from the government's plan to market forces, the private sector and self-employed managers exhibit their entrepreneurial endowments and gain more profit from new market demand. Meanwhile, employees in the state owned enterprises experience a comparatively slow income increase, making self-employment a more preferable choice (Kornai 1992). Second, the surplus created by economic growth is considered to be very limited when it was distributed across China's huge population. The income per capita of China is only \$1,100, ranked No. 137 in the world and it is still a low income country (World Bank, 2004). Favorable living conditions and social security are not easy to acquire for those with average wage employment, especially for the large proportion of peasants in rural and also suburban areas with respect to the enlarging income disparity problems in China. Therefore self-employment activities may produce very limited opportunity cost but a relatively high expectation for profit. Moreover, a higher level of prosperity will tend to higher personal needs, as argued by Maslow. The higher need of self-realization is likely to be better fulfilled through self employment than

through routine organizations (Verheul et al., 2002). A market oriented economy evidently provides more options for people's career development than a bureaucratic centrally planned economy. Economic development accompanied by income increase per capita obviously decrease the barrier for potential entrepreneurs in China for obtaining their initial capital, thus making personal ambitions more reachable (Wang & Yao, 2002). The popularity of *Xia Hai*, a Chinese word indicating the phenomenon that more and more people choose to leave the bureaucratic system and start up one's own business strongly support this explanation (Li, 1997). Last but not the least, increasing prosperity gives people the means to buy more and greater differentiated goods. The increasing wealth and the demand of people for new goods then create incentives for business to fill these market niches. The demand for more varieties of products and services increases and small firms are well equipped to supply these new and specialized goods (Carlsson, 1989). Consequently, new firms in manufacturing and service sector in China are characterized by small firm size, thus creating opportunities for entrepreneurship (Li, 1997).

### **2.2.1.3 Globalization**

Globalization's impact on the level of entrepreneurship can not be addressed simply. Positively, globalization involves the integration of the world market and resources, which activates different countries' comparative advantage and promotes their productivity through the flows of capital, knowledge and human resources. For entrepreneurs, globalization offers more opportunities for exploiting scale as well as reducing trade barriers for the entrance of foreign producers. As a consequence, increasing competition in international markets may have a negative impact on the survival rates of business (Verheul et al., 2002).

The volume of international trade is a direct indicator of a country's degree of globalization. In 1978, one year before the implementation of China's 'Reform and Opening' Policy, total value

of imports and exports was 20.64 billion US dollars with the value of exports making up 9.75 billion US dollars of the total. Such figures have soared respectively to 620.8 and 325.6 in the year 2002. This sustained trend more clearly presented in Figure 8.

Figure 8 about here

Supported by Carree (1997) and Haltiwanger (1998), the risk of volatility caused by increased international market competition can be better absorbed by small firms. As we have mentioned, small businesses in China's private sector adapted more quickly to the emerging market demand created by international trade. Compared with large scale and state owned enterprises, less path-dependent problems exist in private small business making it easier for to absorb new technologies and management skills. Moreover, the potential comparative advantage of China in international trade—lower labor costs, is fully exerted by the small businesses served in manufacturing and service industries, which are believed to provide most of the new opportunities in a transitional economy (Li, 1997). All of the arguments and data above reveal why globalization has favored entrepreneurship development in China instead of suppressing it. Additionally, the increase in international competition and the increase in cross-cultural influences, through which globalization expresses itself, has made Chinese entrepreneurs and latent entrepreneurs aware of the existence of other cultures and their characteristics through the nature and type of products and services offered. This has resulted in a diversified and refreshed culture and cognition, which are more influential and important than the diversification of products or customer demand (Acs, Audretsch and Evans, 1994).

#### **2.2.1.4 Industrial Structure**

At present, countries in the Western world are experiencing an increase in the number of firms in the service sector. Most services are characterized by relatively small average firm size, creating

opportunities for self-employment (EIM/ENSR, 1997). This phenomenon is interpreted as a result of evolution through different economic development stages: In the first stage, economies specialize in the production of agricultural products, characterized by high levels of self-employment; then it evolves towards a manufacturing oriented economy, followed by increasing firm size; in the third stage, the economy shifts from manufacturing toward services, offering new opportunities for small-scale production (Acs, Audretsch and Evans, 1994; Rostow, 1971). As we have noted in Part 2.1, the reconstruction of China's entrepreneurship environment has been accompanied and continuously motivated by the revitalization of the service sector (tertiary industry) during the last two decades (See Figure 9).

Figure 9 about here

Described by Kornai (1992), in a central planned economy, the government's decision over resource allocation was guided by a set of rules giving priorities to industry over agriculture, heavy industry over light industry, production goods over consumer goods, and large installations over small ones. Consequently, the service sector was officially suppressed as well as consumers' requirements. Towards the goal of building a market oriented economy, the Chinese government gradually eliminated the regulations mentioned above. Therefore, the reallocation of resources quickly filled the vacancy in emerging market demand and led to the prosperity of the service sector. So, the significant growth of China's service sector should be mostly regarded as the result of an optimal adjustment in the market economy instead of as advancing to a more advanced development stage.

How the development of the services will influence entrepreneurial activity in China within the coming 10 years is not clear. In other words, the coefficient of this determinant has to rely on the policy of the Chinese government and the availability of stable economic growth. When more

and more economists insist on speeding China's evolution to a service economy so as to favor the development of entrepreneurship, it is important to take time to consider potential but possibly looming, such as the flood of unemployment, the huge income gaps among different groups (low, middle and upper classes; rural vs. urban; and coastal vs. interior locations) and the disfunction and vulnerability of financial institutions, which may cause severe crises or a great depression.

### **2.2.2 Supply Side Determinants**

Viewed by macroeconomic theory, the level of entrepreneurship in a particular country can be explained by the equilibrium between the supply side (labor market perspective) and the demand side (economic development, technology development and industrial structure). The supply side of entrepreneurship is dominated by population characteristics, i.e., demographic composition. Furthermore, because people's individual attitude towards entrepreneurship, i.e. preferences and culture and institutional factors also influence the supply side of entrepreneurship, this paper will address them briefly after the analysis to supply side determinants in the sense of population.

#### **2.2.2.1 Population Density and Urbanization Rate**

Evidence is mixed when we consider the impact of population density or the urbanization rate, on the level of entrepreneurship (Verheul et al., 2002). On the one hand, population density and urbanization can lead to the pursuit of economies of scale which reduce 'space' or opportunities for small firms and self-employment. Moreover, some research in western countries has found that thinly populated areas with many dispersed small villages often have many small retail stores, indicating that population density can have a negative effect on the level of business ownership (Bais, Van der Hoeven and Verhoeven, 1995). On the other hand, more researchers support a conclusion that proximity to market and business infrastructure benefits entrepreneurial

activity. In addition, because most research centers and universities are often situated within urban areas, there is a more qualified work force and better knowledge access for entrepreneurs. Furthermore, the establishment of enterprises in certain areas is likely to attract other ventures because of the opportunities for cooperation, spillover effects and the ‘signaling effect’ (Audretsch and Fritsch, 2000; OECD, 1998)

The general situation of population density in 1998 in China is presented in Figure 10.

Figure 10 about here

Historically, most of the population of China has been concentrated in the middle and eastern parts of China, especially along the coastal areas. Since the economic reform, urbanization in such high population concentrated areas has accelerated dramatically (See Table 3).

Table 3 about here

According to the principles of the Chinese government when implementing economic reform, deregulation policies or the so-called ‘privileges’ were initially activated in cities then are expected to be universally legalized, first in open coastal areas as has occurred then pushed forward to internal regions which is now occurring (China Council for the Promotion of International Trade, CCPIT, 2004). Under this political-economic logic, increasing population density in eastern China, which are regarded as the effect of entrepreneurs’ rational responses to unbalanced economic development and administrative deregulation, could lead to a higher business success rate there (See Figure 11).

Figure 11 about here

Meanwhile, judging from the positive relationship between the urbanization rate and entrepreneurship intensity shown in Figure 12, clearly more benefits have been spilled over to entrepreneurs after the rate of urbanization increased.

Figure 12 about here

### **2.2.2.2 Unemployment and Income Disparity**

There are conflicting hypotheses that explain the influence of the unemployment rate on the rate of self-employment. At the macro level a high rate of unemployment can negatively impact the level of entrepreneurship through suppression effects on new ventures, i.e., a decrease in the availability of business opportunities induced by a depressed economy (EIM/ENSR, 1996). Such an assumption, based on the observation of OECD countries, will fail to explain the pattern in China where the nation experienced an increase in both the national GDP and the unemployment rate (See Figure 13).

Figure 13 about here

The transition from a centrally planned economy to a more market oriented economy announced vast and significant restrictions on the use of administrative protection of state owned enterprises (there were a few exceptions in sectors considered to be crucial, e.g., energy and transport) and equalitarianism as an inefficient income distribution principle. State owned enterprises (SOEs) have been forced to improve their productivity and competitiveness; otherwise they are to be removed from the market and replaced by competitive private owned enterprises. Even the very few remaining giant SOEs that are still to some degree supported by the government also attempted to import modern management systems. They were obliged to construct reward-punishment mechanisms as an incentive to create higher productivity and “profit”. Millions of employees from the SOEs have been laid off due to enterprise bankruptcy or because of labors’ poor performance (Howe, Kueh and Ash, 2003).

Moreover, the return of ownership of land to Chinese peasants who compose nearly 80% of the total population of China not only rebuilt the incentive for more output and higher productivity

but also introduced the problem of how to manage the labor force surplus that has been liberated from the agriculture sector. While the existing household registration system limits legal permanent migration from rural to urban sectors and across regions, a large proportion of this labor force surplus chose to establish businesses or join in such enterprises as employees.

Therefore, China has witnessed a boom of so-called Township and Village Enterprises (TVEs) since the 1980s (Nolan and Dong, 1990; Byrd and Lin 1990; Naughton, 1992).

Based on the experience of China, (the risk of) unemployment is likely to have a positive effect on the level of entrepreneurship through reduction of the opportunity cost of self-employment.

When there is little chance of finding paid employment, unemployed people have no other productive or legal option than to become self-employed. This is especially true in China where there is a serious lack of social security benefits to unemployed people and an expanding gap between the rich and poor (UNDP, 2004). This in turn is driving people at the lower end of the income distribution to take the risk associated with self-employment and thus to establish businesses.

### **2.2.2.3 Other Supply Side Determinants**

Some other demographic factors have also been mentioned as supply side determinants for entrepreneurial activities, such as population growth (Bais, Van der Hoeven and Verhoeven, 1995), age structure of the population (Cressy, 1996; Acs, Audretsch and Evans, 1994), immigration (Borooah and Hart, 1999; Bates, 1997) and women participation in the labor market (Buttner and Moore, 1997; Brush, 1992). All these determinants have proved to be influential to entrepreneurship development in OECD countries based on empirical studies. But since China has a huge population which is more than the sum of OECD countries and its special background in demographic and economic transition, the determinants listed above do not appear to be

significant, at least, in the short term. Thus, a detailed analysis of these determinants is not made in this paper.

As a complement to our equilibrium analysis of entrepreneurship development in section 2.2, two more exogenous variables: government intervention and culture together with their influence on entrepreneurial activities in China are discussed below.

### **2.3 Government Intervention**

The government can fulfill different roles in the economic environment. First, it creates a legal framework in which the property rights of all market parties are defined, guaranteed and protected (Verheul et al., 2002). In neoclassical economics (Samuelson, 1970) and institutional economics (North 1981), the general role of the government is supplemented with an ‘adjusting’ role in case of market failure. Combining the Austrian Economists’ theory of entrepreneurship and all the related elaborations just mentioned, recent studies have evolved a new concept of entrepreneurship, that sheds more light on the role of government. As a system necessary for economic growth, entrepreneurship consists of three components: entrepreneurs that desire to achieve their goal of economic survival and advancement; the social constitution that grants the right for forming and operating “free enterprises” is; and government that has the ability to motivate entrepreneurial behavior toward social development and growth and to adjust the constitutional system that works at its best to protect each individual entrepreneur (Audretsch, et al, 2002; Lowrey, 2003).

Compared with the OECD countries where small government and a mature market economy used to exist, the Chinese government’s intervention in fostering an entrepreneurial environment is far more crucial and decisive than any other determinant. Without the premise of reforming the socialism system in China, the emergence of entrepreneurship would not be possible nor would

the existence of a private economy. Socialism is rooted in the claim that state ownership is the only viable form of property right and that bureaucratic coordination of the economy is superior to market coordination (Kornai, 1992). Traditional socialist systems pushed the bureaucracy further than any other systems to the extent that it became a system with “strong thumbs, no fingers” (Lindblom 1977, p. 239), leading to problems of information overload, mis-prioritization, inefficient factor allocation, inadequate technology, conflict of incentives, and failure of national planning (Ellman, 1989), and with devastating consequences such as chronic shortages, suppressed consumption, lack of worker incentives, gross inefficiency, and, ultimately, to economic stagnation and political crises (Kornai, 1992).

The reaction to such crises by the Chinese Communist Party and the Chinese government has been a tentative and inconsistent process of deregulation and decentralization. These series of deregulating and decentralizing measures, which include the return of fiscal power to local governments, the expiration of government price and government price guides, the protection of fair competition, the establishment of an efficiency based income distribution principle and so on were engaged to rebuild and strengthen the market mechanism yet spontaneously required. In turn they have induced a private sector and entrepreneurship renaissance following the sequence of launching deregulation policy, from central cities to peripheries, from coastal regions to interior regions.

Why did the “big bang” marketization and privatization strategies in Eastern European socialist economies generate dramatically more social, economic, and political costs than gradual reform of China? Why was the social transition less painful in Romania, Czech or Poland than that in Russia? There are many historic, economic and institutional explanations to these questions while the Austrian economists remind us about the importance of the relationship between

entrepreneurship and market dynamics (Schumpeter, 1936; Kirzer, 1973). When we trace the state of entrepreneurship in these transitional economies, Russia suffered more from the lack of entrepreneurship than its peers due to the longer domination of a central planned economy while China benefited more from the revitalization of an entrepreneurial society that significantly absorbed and digested the turbulence and fluctuation in a transitional economy.

But the realization of sustainable economic growth in China requires more than a spontaneously formed entrepreneurship environment, in other words, the unconscious intervention of the Chinese government in fostering entrepreneurship will not be sufficient for continued economic growth in the future. Lowrey (2004) argues that although Romer's explanation of long term economic development due to human capital-accumulation of knowledge and skill, scientific knowledge and technical skills is central to economic growth in the 21<sup>st</sup>. century, these factors merely determine potentialities. The realization of ideas, such as business formation or economic advancement crucially depends on the cost and the risk factors related to the quality of the labor force. Entrepreneurship is the crucial mediator that transforms 'knowledge' to the labor force with the profit motivation and therefore it turns out to be the key determinant of sustainable economic growth.

While it has already been shown above that non-economic conditions such as value systems and institutions that are not hostile to entrepreneurial activity and a government that is able to maintain law, power and policy consistency are necessary for the development of entrepreneurship (Papanek, 1962; Baumol, 1990), the Chinese government seems to still be struggling with the paradox created by its communism ideology and the demand for encouraging entrepreneurship. Such a hesitation in the construction of an entrepreneurial society has greatly delayed the study of entrepreneurship in China and weakened its voice. Moreover, the

ambiguous attitude of the Chinese government to entrepreneurship development increased the uncertainty about entrepreneurial activity and may thus ultimately suppress the growth of its entrepreneurial niche (Li, 1997). Knowing these, the future effect of Chinese government's intervention in entrepreneurship development becomes more unpredictable and is tightly linked to the direction its political reform takes.

## **2.4 Culture**

There are intensive literatures on the importance of culture for economic structure and performance. The role of culture has been analyzed at the macro level (Fukuyama, 1996; Landes, 1998; Lynn, 1991; North, 1990 and 1994; Olson, 1982 and 1996) and the firm level (Casson, 1991; Hofstede, 1991; Whitley, 1992). The most famous approach to measure the cultural influence across nations was made by Hofstede (1980) who analyzed the empirical data of an exceptionally large survey of IBM subsidiaries in 40 countries in 1968 and 1972. Hofstede produced four dimensions of national culture: individualism, power distance, masculinity and uncertainty avoidance.

It would be interesting to spend more effort on the analysis of culture's effects on entrepreneurship development. However, the diversified and controversial assessment of the relationship between entrepreneurship and culture, at least in the case of Chinese entrepreneurship, oblige us to give it up in this paper. When we try to display the complex role of culture in the rise and fall of business-ownership, more extensive and international comparable data regarding cultural dimensions at the country level are needed to create or test the beliefs about the influence of culture on entrepreneurship and the relevant social and economic processes involved. Although we acknowledge the importance of culture in cross-national

entrepreneurship study, the effect of culture is not evident without the premise of concrete social structural transition, which makes culture less significant in a macro level determinants analysis.

## **Conclusion:**

Industrial restructuring and the requirement for promoting international competitiveness in Western societies, economic revitalization in developing countries, and market transition processes in former socialist states all interpret the growing interest in the role of entrepreneurship in economic and social change. While the level of entrepreneurship differs considerably across countries and periods, this paper tries to provide a profile of the entrepreneurship development in China during the last two decades and in the process devise a framework to analyze its determinants.

First of all, both the private sector's climbing share in the national economy and China's high rank by the TEA index are introduced to demonstrate the existence of an entrepreneurial niche and its growth in China. Unlike the U-shaped entrepreneurship development curve shown by the OECD countries, China's self employment activities exhibited a persistently ascending trend not only in quantities but also in competitiveness. Such a fact may appeal to scholars to extend the existing entrepreneurship theories to better fit the development experience of entrepreneurship in developing and transitional economies.

Second, **the Eclectic Theory** of entrepreneurship development (Verheul et al., 2002) combined with orthodox entrepreneurship economics, has been adapted to analyze the macro-level determinants of entrepreneurial activities in China. Equilibrium analysis based on demand side factors (i.e. technology development, economic growth, industrial structure and globalization) and supply side factors (i.e. demographic variance, unemployment rate and income disparity) shows that continuous social and economic transitions have activated the latent entrepreneurial

spirit in China which once motivated will increasingly tend to become a seemingly irresistible tide. Moreover, it is easy to tell from many empirical studies that the development of entrepreneurship is supposed to strengthen these determinants thus ultimately leading to a self-reinforcement process. Hence, we may expect the emergence of an even more entrepreneurial Chinese society in the future.

Third, the Chinese government, that not only implemented a successful top to bottom economic reform but also preserved much of its socialist political system, is taken as the most influential determinants of entrepreneurship development. On the one hand, the renaissance of entrepreneurship in China was laid on the pedestal of Chinese government's decentralization and deregulation measures. On the other hand, while more and more Chinese economists (Zhang, 1995; Hua, 2004) begin to advocate entrepreneurship's importance to technology innovation and sustainable economic growth, when and how will or can the Chinese government restore the reputation of entrepreneurship that might conflict with its ideological principles, becomes an interesting and crucial problem.

## Abstract

Existing studies of government's role in supporting business incubator development are scattered everywhere in the so-called 'incubator-incubation research' (Hackett and Dilts, 2004). The absence of a systematic summary and analysis on this topic not only deduced unnecessary repetitions in discussion, but also committed confusing and paradoxical evaluations of the government's influence in different countries. Therefore, the purpose of this paper is to review and refine the existing literatures' explanation about the government's role in incubator-incubation development by integrating institutional theory with entrepreneurship economics to move toward a more explicit illustration.

## **Introduction**

Temali and Campbell (1984) initiate the academic attempt to study business incubators by describing their operation in United States. Twenty years later, the subsequent literatures in this field have boomed simultaneously with the world's increasing concern on entrepreneurship and small business. Most of the current works are categorized into five primary research orientations: incubator development studies, incubator configuration studies, incubatee development studies, incubator-incubation impact studies, and studies that theorize about incubators-incubation.

(Hackett and Dilts, 2004)

While the statements of government and their functions such as the preacher of incubation concept, the sponsor of early incubators, the organizer of supportive network and the arbitrator of incubators performance have almost been mention in each orientation, a systematic review and explicit explanation with powerful theories remains conspicuously absent.

North (1981), the vigorous theorist of institutional economics, founded a clear and persuasive framework to analyze the government's motivation in creating economic institutions and organizations. Combining his contributions in the property right and the transaction cost theories, this paper will build a new path leading to an institutional interpretation of the government's role in incubator-incubation development.

Moreover, this paper also concerns about the absence of precise entrepreneurship economic explanation to incubator-incubation construction in term of the governments' unique function. Although business incubators were used to be regarded as a component of the government's policy in fostering entrepreneurship, the necessity and importance of the governments' involvement haven't been manifested and clarified by entrepreneurship theories up to now. With regard to the various approaches to entrepreneurship study, the oncoming parts choose a socio-

economic perspective which is not only supposed to support the active participation of governments in incubator-incubation development but also provide instructive policy implications for the comment of our case studies.

At last but not the least, a comparative case study among U.S., several nations of E.U., Middle East countries and China will be formed when we combine the theory framework with incubator-incubation history of different nations. Distinctive government's roles with the respect to undertaking business incubating activities in above regions are depicted and the logics behind such diversifications are analyzed adopting the methodologies that have been mentioned. Policy implication with a short but essential conclusion which summarizes the different modes of government's interference in incubator-incubation development will be found at the end of this paper.

### **1. Questions and Relative Methodology**

There is a ubiquitous recognition of the government's propulsive effect to business incubator construction (Pace, 2001). But extant literatures have mostly been obsessed to repeat the identical content of policies across different countries instead of notifying some significant distinctions in property right distribution which have already existed and define the scope of government behavior. For example, U.S. government and E.U. nations' government are used to share the cost of building and financing incubators with the local community and private sectors, while the government independently invested for business incubators in the early 1990s. On the other hand, we could see that the governments in Central Asia and Middle East tended to completely rely on international organizations' investment when they build incubators. We are going to prove that an overlook of such important facts directly resulted in academic incapability of appropriately modeling the government role in different nations.

Only three years before Temali and Campbell's ground-breaking work in incubator-incubation research was published, North (1981) established his well-known theory which delicately interpreted the changes and evolutions in economic history via a model locating the state's role to devise and set up organizations and institutions.

The basic service of state has two objectives: One, to specify the fundamental rules of competition and cooperation which will provide a structure of property rights for maximizing the rents accruing to the ruler.

Two, within the framework of the first objective, to reduce the transaction cost in order to foster maximum output of the society and, therefore, increase tax revenues accruing to the states. (North, 1981, p.24)

North testified his theory with the example of 'state', a synthesized political and economic organization which had existed in human being's civilized history all along. Moreover, the emergence and evolution of some subordinate organizations such as markets, companies, churches and parties were also involved so as to reveal the government's influence within this framework.

Can we apply North's theory to examining the role of government in incubator-incubation development? Our reply is: we can and we have to. This is not only because institutional economics has been widely regarded as a triumph in explaining varied and diversified government behaviors in different economic organizations, but also attributed to the logical consistency between the fascinating phenomenon and the extant theoretical tool: As have been mentioned, the already existed divergence among the property right mechanisms in different countries' incubator-incubation career calls for concerns and persuasive interpretation. North appropriately educated people how a government would devise the property right mechanism of a certain organization according to its profit motivation and highlighted the crucial influence of this mechanism with respect to the organization's long term economic performance. Meanwhile, since the extant studies give much light to socio-economics and transaction cost theory (Cormie,

2003) when they attempt to describe the incubator's synergistic effects to regional economy, North's second criteria, which defines that whether a government will adopt the policy to reduce transaction cost of the whole society or not depend on its cost-benefit analysis of the monitoring expenditure and potential tax revenue, enlightens us to give more comprehensive understand of different governments' attitude to incubation network.

More details of North's theory are going to be introduced in the coming sections when we try to exhibit and analyze the characteristics of incubator-incubation activity in different countries, which will be simultaneously combined with the popular entrepreneurship economic theory.

### **Entrepreneurship Economics**

In the advent of globalization and a knowledge economy era, a constant restructuring and readjustment of regional economies which responses to the changing consumer preferences and production technologies has become mandatory (Rietveld & Shefer, 1999). Therefore, entrepreneurship economics' market dynamics theory rather than the neoclassic economics' static 'general equilibrium theory' appears to be increasingly instructive and flexible for regional development strategy.

From a classical entrepreneurship economic approach, Schumpeter (1936) and Kirzner (1973) both relate entrepreneurial activity to the process through which the market economy adjusts in response to factors which create disequilibrium. This is why business incubators have been overmuch elaborated as 'the nest for entrepreneurs' (Hackett and Dilts, 2004). This approach mainly focuses on entrepreneurs' personal traits such as an innovator, a risk taker and a self disciplined manager. As a result, many literatures interpret business incubators' function to be an inexhaustible miner for the storage of entrepreneurs as special human resources. In these literatures, however, the role of government is universally overlooked or even excluded due to

the repulsion to government interference in traditional entrepreneurship economic theories, e.g. Hayek (1972).

A gradually fledged entrepreneurship economics tends to relocate the position of government in its conceptual frame work (Lowrey, 2003). The most prominent character of these theoretical progresses is that they represent more comprehensive attempts at identifying the economic importance of entrepreneurship than the theories we considered above.

Etzioni's (1987, 1988) approach which incorporates socio-economic study in entrepreneurship economics has been regarded as an outstanding contribution among relative literatures. Etzioni pointed out the tendency which blurs the distinction between the entrepreneurs as an economic agent and entrepreneurship as a system that consists of entrepreneurs, a legal and institutional arrangement and an environmental structure. His socio-economic analytical framework is not a theory of individual entrepreneurs or a theory which places much emphasis on the possibility of entrepreneurship at individual level. While Etzioni suggests that some individual entrepreneurial activity may occur on an *ad hoc* basis, the most endemic form of entrepreneurship occurs in a collective institutional form in which decisionmaking is made routine and thus entrepreneurship is made routine (Etzioni, 1987). In this respect, Etzioni argues that collectivism is the basic form of human organization, social and economic, and that collective beliefs and values determine the preferences for, and constraints upon, decisionmaking and therefore upon activities such as entrepreneurship. In this sense, government with its power in hands, turns out to be particularly influential during the legitimization of entrepreneurship no matter in a national or local level. When people try to identify, explain as well as evaluate the governments' impact in business incubators development, such as the government's motivations and their differentiated policies,

entrepreneurship economics, especially its modern socio-economic approach will soon be proved to be compatible and foresighted in our case studies.

## **2. Case Studies.**

### **2.1. United States**

The United States is among the earliest countries to implement business incubation promote small business development. The first incubator in the United States appeared in the late 1950s, but the massive attention and resources devoted to incubation programs did not show up until the late 1980s. It was estimated that more half of currently existing incubation projects were established during that period (Adkins, 1996).

Business incubators have been serving as a crucial vehicle for new business creation and thus an integral part of economic development in the United States. Successful incubation programs intend to cultivate entrepreneurship, create and accelerate new, and often small, business, and produce financially viable “graduated” firms. In so doing, these programs directly create considerable new jobs, enlarge local wealth base, and generate economic momentum and dynamics to local economy. In addition, business incubators are often employed to empower economically disadvantaged population and to revitalize economically depressed regions in the United States.

It is highly desirable for the federal, state and local governments to participate, if not directly manage, incubator programs in the United States in light of their significant positive effects. However, due to the strong “free market” ideology in the United States, the governments only play a limited role, that is, complement that of private market in the creation and operation of business incubators. Specifically, the federal government, upon request, is mainly responsible for providing necessary start-up grants and loans to new incubator programs. A number of

federal agencies may have various funds for incubation programs, including the U.S. Department of Commerce, the U.S. Department of Housing and Urban Development, the U.S. Department of Health and Human Services, the U.S. Department of Agriculture, and others. These federal funds, however, typically cover only the programs' construction costs (Rice & Mathews, 1995).

Similar to the role of the federal government in existing incubation programs in the United States, state governments try to focus on areas where market mechanism does not fully function. A manifest example for this complementary role of state governments is that they generally mobilized various local resources and provide, if not exclusively, favorable financial support to "risky" small business owners, who are often hard to find private financial sources (OECD, 1999). State governments also enhance small business development through legislative processes. For example, the State of Michigan passed its "*Michigan Business Incubator Act*" in 1984. The Act explicitly stated that the Michigan state government shall encourage and assist the establishment and expansion of business incubator centers within the state in hopes of improving state and local economy.

Since there are piles of literatures to introduce and analyze the United States' practice in incubator-incubation development and many of them have occasionally mentioned the government role from different perspective, the U. S. case in this paper will be simply displayed and clearly concluded based on our methodology: knowing the existence of a strong 'free market' ideology, the U.S. government chose to encourage a joint or inclusive property right mechanism which on the one hand allows the government to cultivate entrepreneurship and innovation spirits into the local milieu, and on the other hand reduces the friction among different interest groups via the negotiation within a certain incubator's committee. In this regard, the government may obtain its benefits by reactivating backward regions or increasing the

national technology competitiveness, but also minimize the transaction cost which might derive from the resistance from local communities. Therefore, the inclusive property right mechanism of U. S. business incubators could be regarded as an efficient institution system following the North's rationale.

While the networking situation among business incubators and other local organizations in U. S. is very much similar to that in European countries, which we will exhibit more specifically later, the legitimization of entrepreneurship promotion activities in a local context, e.g. the "*Michigan Business Incubator Act*", turns out to be a uniqueness of the U.S. government role in strengthening spatial interactions and mutual support. This character could be regarded as a viable option with respect to embedding incubators into local networks.

## 2.2. European Countries

The concept of business incubator was firstly imported to western European countries while they were facing serious unemployment problem due to the failure of adaptation to knowledge economy in the early 1980's (Acs, 1998). As a reaction to the successful experience of U.S.A in regional economic transition, European countries such as Britain, Germany, France and Italy formed the consensus that entrepreneurship and its favorable environment are necessary for the revitalization of traditional industry clusters. Therefore, the construction of business incubator and its network with local economy has been implemented at a marvelous scale and speed during the past two decades. Following the collapse of Communism in central and east Europe and the later reconstruction of market system in such area, the significance of entrepreneurship as well as business incubator activity were soon adopted by these countries (Lalkaka and Abetti, 1999; Bateman, 2000).

Comment [yjb1]: Citation

Table1 here

Just like the case in U.S, our institution economic methodology could identify that maximization of the European government's profit in business incubator construction is based on the incubators' embeddability in local economy and their catalytic action to small business prosperity. On one hand, European countries' governments have to invest certain amount of capital in setting up incubators due to the lack of entrepreneurship in these nations and the possible market failure considering incubators' significant externality effect (OECD, 1999), no matter that the money are from territorial governments or commonwealth and federal governments. On the other hand, the governments will tend to share the property right with local communities; otherwise an exclusive control of the government must lead to isolation between the incubation supply and the regional economic demand. Such isolation equals the failure of an incubator's intention to promote local entrepreneurship, which is totally against our socio-economic approach.

Comment [yjb2]: Citation

### **2.2.1 The Property Right Mechanism**

The most supportive case for an inclusive model in European Countries is the German case. Germany began setting-up incubators noticeably later than the other G7 nations. This was because regional development was first organized on a truly regional basis in Germany in the 1980s (OECD, 1999). In 1983, the first incubator was set up as an initiative from the parties responsible for technology transfer at the Technical University in Berlin together with support from the Berlin Parliament. Even in the start-up stage, federal and state level authorities had only very limited influence there.

Between 1984 and 1986 the number of German incubators doubled each year due to the widespread concerns on technology innovation. The next push which came after German unification in 1990 was catalyzed by numerous areas in East Germany seeking to achieve

economic restructuring and transition with incubator-incubation activities. The double demand from a national level with respect to Germany's technology competitiveness and a regional level related to the renaissance of economic backward areas provided sufficient encouragement for the government participation in business incubator development. Additionally, the unique background of the formation of German government's profit motivation naturally forced it to fit the local communities' strong preferences.

Today, the majority of incubator projects are implemented as initiatives from regional economic development offices together with chambers of commerce. The relationships between these two bodies were not always without disagreement and attempts to co-operate often remained as intentions only in the past. It is the creation of incubators that builds a concrete basis for this cooperation. In more than 30% of German incubators the two bodies are both partners. In addition, there are numerous cases in which a town gets part shares in an incubator and the chamber of commerce is active in management. Many incubators have also managed to involve the financial sector in their projects development. In 45% of incubators, financial institutions are listed among the partners. Although these institutions are mainly public savings banks and still very few private banks tend to invest, with regard to the accusation that banks in Germany were used to disregard new innovation- oriented firms, such a progress is very positive. Another optimistic phenomenon is the recent progress in eastern Germany, where various universities and private companies (mainly the so-called research and development Gmbhs- or limited companies –previously belonging to the R&D departments of large industrial firms) have become actively involved in the creation of incubators.

While an agreement to transform from traditional industrial economy to knowledge economy exists between the German government and its local communities, the maximization of

government's profit could be easily achieved via the cooperation among different interest groups and the reduction of social transaction cost. Therefore, the German government selects to play an intermediary role and modestly attempt to facilitate the plan of making local communities more entrepreneurship, e.g., business incubator construction. As a result, the government's favorable operations with respect to the supply of institutional products have become an element of entrepreneurship, and successfully embedded business incubators in Germany into their local context.

### **2.2.2 The Government's Role in Networking and Benchmarking**

When more and more communities start to develop their business incubator programs, the enthusiasm on the part of federal, state, and local funding agencies and legislative bodies has been uneven (Sherman and Chappell, 1998). The case coming up in Italy will give us an illustration about the government's role in balancing the uneven enthusiasm and reducing the transaction cost which generated in the process of sharing information.

Local alliances for business incubator's development in Italy are composed of political, commercial and trade union leaders because the government hopes to integrate its policies with the local interest groups' concerns all along. The Calabria regional government put this forward by becoming a shareholder in the new Business Incubator Center under construction there, which is also a good example for securing the local authorities' oral commitment of support into practices. A key factor in building such alliances is that the governing system could be made neutral by designing a board or committee. The majority of these boards are comprised of business, community and government representatives in Italy while all the representatives are required to be aware of two principles: firstly, they have to submerge their differences and commit themselves to work together to achieve common goals; and second, each leader has to

have a broader vision of and for their community than their own role in it (OECD, 1999). SPI— *Promozione e Sviluppo Imprenditoriale S.P.A.*— which is dedicated to entrepreneurship and development is one of the principal agencies responsible for inspecting the formation of an incubator's board.

Meanwhile, in an age of decreasing financial public support of government programs, there is increasing pressure on economic development programs to clearly justify their benefits (Sherman and Chappell, 1998). Both the policy makers and stockholders demand to identify and establish good practice as well as develop 'benchmarks' to measure performance and impact. As a reaction, benchmarking projects in Europe have been ubiquitously supported by governments not only at the national level but also at an international level. For example, in 2002 UK business incubation (UKBI) initiated a project sponsored by Welsh Development Agency to develop an incubation benchmarking framework, with a view to establishing a set of 'benchmarks' for the incubation industry in UK. Organizations which are doing the same research funded by national governments can be found as ADT - Association of German Technology and Business Incubation Centers in Germany, SPI in Italy. What is more, the European Commission's Enterprise Directorate-General has created Business Incubators Database which objects to provide an overview of the business incubators in the 15 EU Member States, the EEA countries (Norway, Iceland, Liechtenstein), Switzerland and the 13 candidate countries. It also engages in establishing network and implementing benchmarking among all the incubators in European countries.

Without the inclusive property right mechanism, incubator construction in European countries will not be able to contain so many interest groups' (e.g. the government, local entrepreneurs, financial institutions, and research institutes) incentives and continuously attract their

participation and investment. Followed by the case of China, this part particularly exhibited the importance of institutionally converging the government's interest and the local communities' interest with the respect to cultivating entrepreneurship and fostering incubation programs. Hereby, the government role as a supplier of appropriate institution and a coordinator in incubators' networking as well as continent wide benchmarking should be acknowledged and emphasized based on the European case.

### **2.3. China**

The research of incubator-incubation development in China is not novel to people (Harwit, 2002; Lalkaka, 2003). Since the first technology business incubator was established in 1987, the total number of business incubator has soared to 435 which ranked the second across all nations (China Torch Program, CTP, 2004). While most of the current literatures are paying much attention to the impressive output of Chinese incubators in production, patent and job creation, few of them is successfully to explain the government's role and make it comparable to the other countries. Even there are some experts who questioned Chinese government's mighty, bureaucratic control of business incubator (Harwit, 2002), the absence of a solid and coordinated theoretical frame work obviously limited their influences.

The following noticeable facts which are related to the property right mechanism of Chinese business incubators have inspired our hypothesis that: the government's role in incubator-incubation development followed a completely different model in China. According to the statistic of the Society of China Incubator Central Commission (SCICC, 2004), state owned business incubators which stands for a purely ownership of the government, dominate in this field with a proportion over 75%. Moreover, before the late 1990s, all the incubators in China were state owned and belonged to Torch Program, which is a national high-tech industrialization

initiative (Yu and Stough, forthcoming). Regarding to these facts, property right mechanism of incubator-incubation development could be categorized as a government monopolized exclusive model in China.

What is the rationale behind such a unique model? How the rationale had affected Chinese government's attitude and behavior to reduce transaction cost generated from incubators' networking process? How to evaluate this model's current and future influences to business incubator development in China? Adopting the methodology of institutional economics and entrepreneurship economics, we will try to find corresponding answers in turn.

Unlike U.S. and European countries who built up incubators directly to underpin their formulated strategies for promoting revitalizing regional economics and promote entrepreneurial activities (NBIA, 2003), the startup of Chinese incubators served for the central government's Science and Technology (S&T) mechanism reform (Yu and Stough, forthcoming). In the late 1980s, rural economic reform and the following market oriented industry reform in urban area led to a remarkable prosperity in China. At the same time, while China is gaining more and more profit from the Opening policy and her participation in the international trade, the nation's comparative disadvantage, such as the scarceness of capital and backwardness in the development and deployment of modern technology, forced Chinese central government to launch another trial in order to revise the traditional (S&T) mechanism--Since too much time, fund and too many talents had been consumed in military related high-tech zones, China is too far behind developed countries in commercial and civil products related techniques; Meanwhile an obvious vacancy impeded the transition from S&T research achievement to applicable products favored by domestic consumers. Such embarrassment should be charged to the

indifference and dullness to market demand of the government directed R&D institutes, such as the National Science Academy and most of the universities (CCPCC<sup>①</sup>, 1985).

In 1985, the concept of business incubator was introduced by United Nations to China (Mi, 2001). Professor Song Jian, then head of the China State Science and Technology Commission, sang high praise for incubator's inspiration to adjust Chinese S&T mechanism to a market-driven one. Soon after that, the first business incubator was established in Wu Han city named Dong Hu Business Startup Center in 1987. But the real scaled production of business incubators of China did not begin until the year 1988 when the declaration of the Torch Program came (CNSC, 1994).

Comment [spp3]: More document

While most of the extant literatures describe Chinese government's objective of incubator-incubation development as organizing the network system in Figure1, they were failed to recognize this network as a substitute to traditional S&T mechanism

Figure1here

in China. Regarding this, this paper attempts to conclude the Chinese government's profit motivation in supporting incubator construction as the establishment of a networking system which can effectively join the research institutes and the technology market so as to form a competitive, market oriented S&T mechanism. Therefore, incubator programs were initially devised to restructure the academic and technological resources of Chinese central government, rather than promote regional economic performance and foster entrepreneurship.

After all above, it is clear why Chinese government choose to carry out incubator programs independently. Firstly, evolved from a central planned economy, Chinese government occupied substantial power and resources which allowed it to set up, operate and sustain huge incubator programs without negotiating with local communities. Moreover, after a more than 30 years' experience of highly central-planned economy, local communities or even local governments had

just started to recovery from the deprivation of economic decision-making power in 1980s. They were strong and matured enough to participate in financing or operating incubators. What's more, since the private or even joint-stock enterprise did not gain complete and trustworthy legitimacy in the middle of 1980s, Chinese government could not count on other strengths as a partner to implement S&T mechanism reform. In conclusion, the exclusive model could be institutionally explained as the best option for Chinese government considering expeditiousness and viability. While the superficial organization reform of S&T mechanism had been swiftly finished, the negative impacts of the exclusive model were soon exposed. Conducted by the Torch Program, the transaction costs derived from negotiation or coordination among different interest groups as what happened in western countries have been transformed into the monitoring costs in a principle-agent bureaucratic system (Harwitt, 2001; Stough and Yu, forthcoming). Such a routine system is doomed to be incompatible with the sensitivity and flexibility required by innovative entrepreneurs. This could be told from the low proportion of incubatees which finally graduated from Torch Program's incubators and became competitive companies (Mi, 2001). Since the incubators had not been organically embedded into the network shown in Figure 2, there were hardly any spontaneous cooperation between the incubator and local community unless the cooperation was forced by administrative command. The ignorance of Torch Program incubators to entrepreneurship cultivation through local socio-economic network gradually broke down their connection to territorial markets, human resources, financial supports and the research institutes.

From the late 1990s, the uniformed concern of sustainable regional economic development stimulated Chinese local governments' enthusiasm and input to incubator-incubation development, and the total numbers of technology business incubator soared from year 2000's

131 to year 2002's 436 (CTP, 2004). We could expect that the explosion of local interests in incubator-incubation development may break through the unsustainable exclusive model and realize the combination of entrepreneurship promotion with S&T mechanism reform, which announces the adjustment of the government role. But we should also be aware of the isolation of most Chinese incubators to their local network.

#### **2.4. Middle East and Central Asia**

In recognition of the contribution to the economy that smaller firms make, a number of federal, state, and local government-sponsored intervention programs have been introduced to facilitate the creation and growth of small start-up business (Sherman and Chappell, 1998). Since we have introduced and characterized the role of government in operating business incubators in some counties, we do not include identical practices in Japan, Australia/ New Zealand and Latin and South America, although many interesting developments are occurring in those countries as well. In the following part, more light will be given to the unique incubator-incubation activities in Middle East and Central Asia countries.

Compared with the inclusive model in U.S.A and the exclusive model in China, the government's role in business incubation and development activities in Central Asian and the Middle East countries locates in attracting foreign investment. While there may be some foreign corporate investment activities involved with strengthening technology-based start-ups, most business incubation activities appear to be linked with US and international development programs (Johnsrud, Theis & Bezerra, 2003).

Central Asia countries such like Armenia, Tajikistan, Turkmenistan, etc. are mostly former Soviet states. Historically, these countries were poorly industrialized or simply relied on unitary industry. For their transitional economies, the import of business incubator had been placed on

the task to shift away from deeply entrenched ideas, values, legal and financial structures, and other elements of previously state-controlled economies toward an economy based to varying degrees on free market capitalism. Consequently, it is necessary to encourage growth and development of an entrepreneurial spirit, provide training and awareness about basic business organization forms, operations and competition, and restructure the legal, regulatory, banking and other elements. Hereby, the government's profit motivation in incubator-incubation development exists in a successful, overall restructure of the national economic institution. With regard to Middle East countries like Jordan and United Arab Emirate, their so-called developing and emerging economies, have slightly different demand based on free market capitalism. In these situations, the task more often than not is to strengthen an existing informal capitalist economy and to nurture its growth and expansion. While most of outputs in Middle East countries are produced by large scale oil industries, the benefits brought by small business in market and technology innovation, a comprehensive improvement in national economic competitiveness derived from widespread entrepreneurship, become more and more remote to them. Too much reliance on unitary industry and limited numbers of state own giant factories, which is going to increase the risk of depression in face of various crises, urges the governments to refocus on small business. So, profit motivation for the governments in business development and business incubation systems which have been recently established serve to provide access to technology, improve production processes, expand markets, and provide a range of other assistance to entrepreneurs and small and medium-sized enterprises (SMEs). Rather than re-orient the populace toward entrepreneurship, the emphasis is more often on strengthening the existing base of entrepreneurs and helping them to achieve business growth.

Both Central Asia and Middle East countries were challenged by the weakness of their governments and local community when they intended to set up an appropriate property mechanism for the incubator- incubation development, which made it impossible for them to copy the conceptual model of European countries or China. In Central Asia, most of the governments have just been organized after 1991 and it will be a long journey for them to establish a powerful and effective institutional system so that they could afford the costs of supporting incubator construction like Chinese government. We will get the same conclusion in Middle East area, although the specific situation is more likely to be that the strong religious society there has in some degree diminished the governments' influences to local communities, especially when the governments attempt to build network for incubators. Moreover, the inclusive model in U.S. and European countries will not be viable here since the formation of local community's economic function has just started in transitional economies or even been interfered by religious power in Middle East countries.

The import of business incubators as foreign investments pulled out the governments of above countries from the dilemma we have mentioned. With the assistance from outside international and foreign sources (See Figure 2), including the World Bank, the US Agency for International Development (USAID), United Nations Industrial Development Organization (UNIDO), United Nations Educational, Scientific and Cultural Organization (UNESCO), United Nations Development Program (UNDP), United Nations Development Fund for Women (UNIFEM), and the Eurasia Foundation, those governments with transitional and developing market economies successfully obtained incubator-incubation services from abroad at the price of property right. While the majority of tenants in these international or foreign invested incubators are local

enterprises, they will be expected to gradually promote entrepreneurship at regional level and meet the maximization of the governments' profit in this business.

Table2 here

Despite the triumph in settling property right mechanism, government's role in organizing socio-economic network for incubator-incubation development which aims at expediting information communication and creating local innovative milieu have not been highlighted so far in Central Asia and Middle East. Besides improving the cooperation with international investors, how to provoke the governments' interests as well as their unconsolidated local communities' motivation in such activities will remain as a challenge for these countries, particularly where neither the government nor the local community possess a share of the business incubator.

### **3. Policy Implication**

With respect to the inclusive model which is popular in the United States and European countries, it serves well to the government's intention of promoting technology competitiveness and entrepreneurial activity in national level. Meanwhile, it also functions comparatively better regarding to its efficiency and sustainability which should be ascribed to the inclusive model's property right mechanism and the incubator's embeddedness in socio-economic network. The weakness of this diversified property system could be the conflicts among different interest group, which consumes time or even opportunities to coordinate them. Moreover, the diverse legal status, and consequently the different aims, can have a profound influence on the incubator managerial policy, particularly in the selection of the projects and in the assistance in raising capital and preparing for the market. Such complex situation would certainly requires the

government to support and undertake national wide or even international wide benchmarking work so as to scientifically evaluate and improve the incubators' performance.

As we have shown, the amount of government fund available for incubator-incubation development and the level of government participation varied significantly across countries. But learned from the socio-economic explanation of entrepreneurship and the case of United States, European countries, it is more sensible for the government to play a 'catalytic' role rather than direct management role in incubator development. The case of China displays how a powerful central government could quickly accomplish huge incubator construction plan with a pure exclusive model. But it simultaneously reminds us that the dynamics of entrepreneurship and innovation depends on a tight interdependence among different actors within the regional system, it must be territorially based on the network rather than on the hierarchy, on the spatial interconnection rather than on the isolation, on the mutual learning and reciprocal exchange of technologies rather than on the interdependent managerial enterprise model.

The experience of incubator-incubation development in Middle East and Central Asia shows the role of government in technology and entrepreneurship promotion where neither a powerful government nor a conformed, resourceful local community exists. The problem that might derive from those governments' dependence to international incubator programs is whether these exogenous resources could synergize with the local context. According to our socio-economic rationale, the government in Middle East and Central Asia countries must learn how to play a role of 'guide' or 'coordinator' so as to facilitate the communication between those international incubators and local communities.

#### **4. Conclusion**

Although there is now a convergence of different governments' attitudes to incubator-incubation programs, an overlook to these governments' diversified understanding of business incubator as well as their specific strategies to carry it out has existed in extant literatures. Therefore, this paper attempts to extract and categorize the government role via case studies to representative countries incorporating the methodology of North's (1981) institutional economic theory and the socio-economic approach of entrepreneurship economics (Etzioni, 1987, 1988).

Through the case study to United State, European countries, China, Middle East and Central Asia countries, three models can be generalized based on the paper's methodology. First, 'the inclusive model' with the premise that the maximization of the government's utility exists in technology innovation and sustainable regional economic development. United State and most of the European countries' government adopt this model since they own comparatively full developed local communities and entrepreneurship enlightened governments. A completely opposite exclusive model has been driving the incubator program in China while the central government administratively nailed incubators into local community to reform its S&T research mechanism. With the explosion of local communities' strength, this model seems to be on the edge of restructuring now. The last model which is widely accepted in Middle East and Central Asia countries depends on the investment and aids from international organizations. These governments tend to utilize international support to accelerate their economic transition or steps toward entrepreneurship before their local communities accumulated sufficient socio-economic capital.

Policy implications based on corresponding theoretical and empirical analysis have been provided at the end of case studies. However, since many countries face the wide socio-economic gaps existing between core and peripheral regions, between advanced and backward

regions, and these gaps often exacerbate spatial, social and political unrest, this part sheds more light on the importance of the government's acknowledgement to socio-economic network.

### **ABSTRACT**

This study provides insight into how entrepreneurship promotion fits within state and local economic development strategies. This is achieved by tracing the evolution of entrepreneurship policies and programs and how they supplement or complement other developmental tools within the state and local government's economic development arsenal. The study discusses the importance of entrepreneurship for economic development and provides the background for why it must be a central component of any economic development strategy. An overview of entrepreneurship policy is presented with emphasis on micro-level entrepreneurship policies and policies targeted at developing the entrepreneurial climate, which are the primary tools of entrepreneurship promotion used by state and local economic development practitioners and policymakers. The four waves of economic development strategies are introduced and entrepreneurship promotion as an approach to economic development in the context of these waves is discussed in-depth.

### **INTRODUCTION**

This study reviews the use of entrepreneurship support and promotion as an economic development approach against the backdrop of the shifts in state and local economic development strategies. The goal is to provide insight into how entrepreneurship promotion fits within the context of state and local economic development strategies. This is achieved by tracing the evolution of entrepreneurship policies and programs. Four waves of economic development are introduced and entrepreneurship promotion as an approach to economic development in the context of these waves is then discussed in-depth.

For this study, the focus is on economic development at lower levels of government such as at the state and local levels. The analysis is limited only to developmental efforts within the U.S. and does not cover economic development activities of the national or federal government. Economic development is defined as the efforts on behalf of state, municipal, and local governments to "encourage private investment in a particular jurisdiction for the purposes of generating or retaining jobs, expanding the tax base, and increasing the general level of economic well-being" (Eisinger, 2002, p. 20). Such definition of economic development, therefore, includes all efforts by the states, regions, and cities to develop an entrepreneurial base and encourage entrepreneurship.

## **ENTREPRENEURSHIP AND THE ECONOMY**

Why is entrepreneurship important for economic development? Why should developing an entrepreneurial base and promoting entrepreneurial activity be a central component of any economic development strategy?

Entrepreneurship and entrepreneurial firms have been important drivers of economic growth in the U.S. Nearly 70% of the U.S. economic growth can be attributed to entrepreneurial activity (Reynolds, Hay & Camp, 2000). Since the 1980s, the majority of new jobs generated in the American economy can be attributed to entrepreneurial firms (Slaughter, 1996). Entrepreneurial firms have contributed close to two-thirds of the net new jobs in the 1990s (NCOE, 2002).

Entrepreneurial firms have also been found to be responsible for more than half of the innovations changing our economic and social landscape. 67% of all inventions (Zacharakis, Reynolds & Bygrave, 2001) and 95% of all radical innovations created since World War II (Timmons, 1999) can be attributed to entrepreneurial firms. Some examples of innovation produced by entrepreneurial firms include microcomputers, cardiac pacemakers, overnight package delivery, auto airbags, air conditioning, artificial skin, frozen foods, heat sensor, hydraulic brake, safety razor and soft contact lenses (Slaughter, 1996; Timmons, 1999).

### **POLICIES TO ENCOURAGE AND PROMOTE ENTREPRENEURSHIP**

Policies to promote entrepreneurship can be broadly classified as macro policies aimed at the macroeconomic environment, micro policies supporting entrepreneurs and entrepreneurial firms, and policies aimed at improving or supporting the entrepreneurial climate (Glancey & McQuaid, 2000). The goal of macro policies is to provide a conducive economic environment within which entrepreneurship can occur. Since these economic conditions are not specific to entrepreneurship, but are instead necessary for all transactions within the economy, these macro policies affect all economic activity, not only entrepreneurial activity. Micro level policies, often adopted by state and local governments, on the other hand, are aimed at assisting individual firms and entrepreneurs (Malecki, 1994). These policies seek to encourage collaboration among firms and entrepreneurs, support and/or enhance the flow of resources such as information and financing, and to provide a flexible response to entrepreneurship factors specific to a region or locale. Policies aimed at the entrepreneurial climate and culture are based on the assumption that a supportive entrepreneurial culture will lead to greater entrepreneurship. The Commission of the European Communities (1998), for example, has found that the development of an entrepreneurial culture is critical if a region hopes to increase its entrepreneurship levels.

States, regions and cities have increasingly begun to understand the unique role entrepreneurs play in the U.S. economy. They have increasingly become involved in developing policies and programs targeted at facilitating and encouraging entrepreneurship and have introduced them into their cache of economic development tools. At the state and local levels, most policies and programs targeted at entrepreneurship can be categorized as micro-level policies. Policies targeted at improving and supporting an entrepreneurial climate have also been used by states and local governments to encourage entrepreneurship. These micro-level policies and

entrepreneurial climate- or culture-related policies will be the primary focus of this exploration of entrepreneurship promotion in the context of state and local economic development.

## **ENTREPRENEURSHIP PROMOTION AND ECONOMIC DEVELOPMENT**

The previous sections have provided both an understanding of why entrepreneurship promotion is an important element of any economic development strategy and an introduction to the types of policies and programs underpinning entrepreneurship support and promotion. This section will provide an in-depth review of the four waves of economic development and will discuss how the promotion of entrepreneurship and entrepreneurial activity fit into each wave.

### **First Wave: Focusing on Big Business through Industrial Recruitment**

The first wave of economic development strategies, which began in the 1930s and continued in popularity until the 1970s, has traditionally been referred to as industrial attraction and recruitment or smokestack chasing. During this first wave, economic development “meant organizing an industrial sales force in the state’s economic development agency, arming it with a menu of subsidies to lure footloose plants and back office operations across state lines” (Ross & Friedman, 1990, p. 3). Success was measured by the number of firms captured and the number of jobs created, with little regard to the types of jobs and industries being developed (Waits, 2000). First wave programs were primarily designed as locational incentives to lure manufacturing facilities and back office operations from outside the state or region by lowering the costs of production. The typical economic development policy tools for the first wave were subsidized or low-interest loans, land write-downs, investment credits, direct payments to firms for relocation expenses, tax abatements and reductions, and labor-training grants (Bradshaw & Blakely, 1999; Eisinger, 1995).

This first wave was based on luring businesses from outside a region by lowering the costs of production. The emphasis was on large, established manufacturing corporations with branch plants or facilities. Policy tools used during this period were specifically tailored to the needs of these big businesses. The heyday of the first wave, the 1950s and 1960s, was the era of big business. Small firms were seen as less efficient and less productive compared to big business (Audretsch, 2003). Entrepreneurial firms were not at all the focus of economic development efforts, primarily because economic development practitioners and policymakers saw much more potential for job creations coming from the large manufacturing plants. In its search for new branch plants and other major facilities, first wave economic development strategies often ignored the role of small- and medium-sized businesses and entrepreneurial companies. The practice of economic development often ignored the needs of these firms, instead, tailoring economic development programs and tools to meet the lower production cost needs of big businesses.

### **Second Wave: Growing Locally, Emphasizing Small- and Medium-Sized Businesses**

The second wave of economic development came about in the late 1970s and in the wake of the recession of the early 1980s. In addition to the goal of job creation, the second wave was also oriented towards economic diversification. The second wave saw a shift in focus from attracting

out-of-state firms to building, retaining and expanding indigenous businesses. While the second wave came about primarily as a result of the widely accepted belief in the undependability of smokestack chasing, several other factors also contributed to the rise of the second wave, including increased global competition, rapid changes in technology, new studies linking small firms and their contributions toward economic growth, and the retreat by federal government from economic development (Eisinger, 1988; Ross & Friedman, 1990; Kossy, 1996, Blair, 1999; Waits, 2000).

Birch's (1987) groundbreaking book *Job Creation in America* had a significant impact on the second wave approach taken to grow and develop local economies. Thanks to new knowledge about the role of small businesses in job creation, economic development practitioners and policymakers realized that they could no longer ignore small- and medium-sized businesses. The large manufacturing branch plants – the holy grail of first wave economic development strategies – had become more elusive targets as they began to look abroad for even lower production costs. With advancements in production technologies, manufacturing processes became more capital intensive, and the large manufacturing corporations became less attractive as sources of job and wealth creation for states and local economies.

To maintain a strong and vibrant economy, economic development practitioners and policymakers could no longer rely on big business. Instead, they had to adopt new strategies that were aimed at increasing the number and size of homegrown businesses. As the backbone of the economy and the primary creator of jobs, these homegrown businesses needed to be incorporated into the economic development agenda.

Economic development efforts of the second wave were focused on offering services that made it easier for homegrown small- and medium-sized firms to do business. This was primarily achieved by lowering the costs of doing business. When these businesses had trouble obtaining financing, capital access programs such as revolving loan funds, below-market loans or tax increment financing were created. When businesses required affordable real estate space, the first generation of business incubators were developed and put into practice. When the small and mid-size businesses had specific training needs for continued growth, inexpensive training programs and training subsidies were provided. Specific technical or informational needs were addressed using counseling from small business development center, technology assistance and commercialization programs, and centers for entrepreneurship. Combined, these initiatives created a business support infrastructure in the community or state.

Entrepreneurship promotion of the second wave took the form of micro-level policies aimed at providing specific assistance to individual firms and business owners. This assistance ranged from financial assistance, information and training, technology and technical assistance, and business and management assistance. The basic philosophy behind the second wave was to meet every business need or fill every service gap faced by homegrown businesses. New organizations, programs, and/or services were created to meet every new need, resulting in programmatic sprawl with a plethora of new programs providing a multitude of economic development activities (Pages et al., 2003). In addition, state and local governments also had to be entrepreneurial in providing economic development support, as “the public sector is called on

to play entrepreneurial roles such as market developer, broker, financial partner, and risk bearer” (Robinson-Barnes & Waugh 2000, p. 1588).

As this discussion illustrates, the second wave of economic development strategies was more entrepreneurially-oriented than the first wave. The goal was to support not only the growth and expansion of small and medium businesses, but also the start-up and creation of these businesses. The model behind this second wave is what Mokry (1988) calls an “entrepreneurial model,” which is based on the assumption that entrepreneurs and their new firms have a large and untapped potential to improve the health and condition of local economies. However, Pages et al. (2003) argue that economic development practitioners have, for many years, paid lip service to the importance of entrepreneurship to local economies, yet doing little to encourage and support entrepreneurship. I believe that despite the good intentions of second wave economic development practitioners, encouraging and supporting entrepreneurship was not the primary emphasis of their programs and services. These programs and services provided mostly business support, and not entrepreneurial support. Business support addresses the basic needs of all types of firms, whereas entrepreneurial support addresses the unique needs of entrepreneurs and their firms.

### **Third Wave: Economic and Institutional Capacity Building**

Third wave economic development strategies hit the economic development arena in the late 1980s and early 1990s. Eisinger (1995) suggests that the third wave of economic development strategies was essentially in response to the lack of scale and accountability of the entrepreneurial development programs of the second wave. The third wave was also based on the new realization that while government is responsible for assuring the accessibility of necessary economic development resources, it does not have to be the sole supplier of such resources (Ross & Friedman, 1990). Third wave strategies, therefore, expanded the economic development paradigm by shifting the focus of economic development efforts to “creating the context for economic growth through public-private partnerships, networks that leverage capital and human resources to increase the global competitiveness of a group of strategically linked firms” (Bradshaw & Blakely, 1999, p. 230) or what Eisinger (1995) called capacity building. Many of the best examples of collaborative partnerships for third-wave programs were aimed at building institutional capacity such as through the promotion of technology and technology transfer, business development, and job retention.

The third wave involved a shift in both the content and delivery of economic development policy (Pages et al., 2003). The former involved a shift away from a provider-driven model of business assistance to a customer-driven model. While the focus remained on small- and medium-sized businesses, the approach taken to support these businesses had changed. This change in content involved moving beyond simply emphasizing reducing business costs to having a wider application that include specific business assistance related to process and manufacturing modernization, technology investment, and strategic planning.

Compared to the first and second waves, the third wave of economic development strategies was also more holistic. Policymakers and practitioners had come to the realization that policies related to education and other infrastructure also “determine the configuration and the quality of

the “playing field” on which all economic activity occurs” (Kayne, 1999, p. 1). This realization pushed many economic development practitioners and policymakers towards incorporating educational, infrastructure, and other aspects of development into the economic development mix.

From a delivery mechanism perspective, the third wave’s new approach shifted the delivery of economic development programs away from the public sector as nonprofit and private sector organizations became more involved. These organizations were assumed to have a better grasp of business needs and better able to more effectively deliver the services. Economic development organizations were no longer lone rangers in the crusade. Instead, a range of government agencies, and their nonprofit and private sector partners, acted together to build local, regional, and state competitiveness.

While third wave programs, for the most part, continued in the path of micro-level entrepreneurship policies achieved through supporting new small- and medium- sized businesses, there were also broader programs targeted at the entrepreneurial culture. Entrepreneurship policies of the third wave sought to influence or shape the region’s entrepreneurial climate. A fundamental philosophy behind the third wave was that a clear set of well-articulated economic development policies targeted at entrepreneurship, combined with an effective business-community organizational structure, will create a climate and infrastructure that facilitate new firm establishment as well as the retention and expansion of existing firms.

Third wave economic development strategies did not offer much guidance or assistance to the growing service sector or to the growing numbers of self-employed individuals and start-up firms that might offer hope to the more distressed communities that lack major home-grown industries. While the emphasis had been on small- and medium-sized businesses, the majority of economic development programs tended to enhance the competitiveness of existing firms, while neglecting to build entrepreneurial capacity for future growth (Pages et al., 2003).

#### **Fourth Wave: Entrepreneurial Development**

The late 1990s and early 2000s marked the beginning of the entrepreneurial age in the U.S. This entrepreneurial age also coincided with the onset of the “new economy” and its associated emphasis on entrepreneurship and technological advancement. Entrepreneurs and their companies, especially those in technology-related industries, played a pivotal role in transforming the economic landscape. The pivotal role of “gazelles” or high-growth small entrepreneurial firms in all industries also helped set the stage for entrepreneurial development of the fourth wave.

Thanks to these technology firms and gazelles, many economic development practitioners and policymakers have come to realize that entrepreneurs are essential change agents in the new economy and are major contributors to economic growth. The transition to the new economy, in the late 1990s, prompted the states to reexamine their economic development policies. For example, several states have adopted development strategies to improve their economic competitiveness in industries such as advanced manufacturing, biotechnology, information

technology, and telecommunications. Entrepreneurs and entrepreneurial firms are critical elements of these new strategies.

There has been some confusion over the fourth wave, which began gaining a foothold in the late 1990s. Pages et al. (2003) introduce the fourth wave as entrepreneurial development. Waits (2000) discusses the emergence of a fourth wave that is based on cluster-based economic analysis and strategy development. I believe that entrepreneurial development is at the heart of the fourth wave of economic development strategies, achieved through a combination of technology-based development and cluster-based development. The goal of this entrepreneurially-driven fourth wave is business creation and growth, rather than number of firms attracted or jobs created and retained.

While second and third wave programs targeted small- and medium-sized businesses, most fourth wave programs and services favor entrepreneurial and technology companies. The transition to the new economy, in the mid to late 1990s, prompted economic development practitioners and policymakers to adopt strategies to improve their economic competitiveness in select industries such as advanced manufacturing, biotechnology and life sciences, information technology and telecommunications. Entrepreneurial development plays a prominent role in building these industries. States have invested heavily in research and development efforts and have created programs to stimulate commercial and entrepreneurial activity around technology innovations. These programs are often targeted towards specific high tech industry clusters.

As a developmental approach, clustering allows firms to develop a high degree of specialization, creates specific industry niches, eases entry and new business start-ups because of low vertical integration, facilitates greater access to capital, and creates spillover effects. Enhanced entrepreneurial activity is a direct outcome of clustering and its creation of critical mass.

“While most state policies for small business benefit entrepreneurs, there are important aspects of entrepreneurship that can be nurtured by effective state policies targeted to their specific needs” (Rubel & Palladino, 2000, p. 7). This is where the fourth wave of economic development strategies came into play. Second and third wave strategies were oriented more towards the needs of small and medium businesses, with the needs of entrepreneurs and their organizations being subsumed under these broader business needs.

In addition, entrepreneurial development programs had previously been scattered throughout state and local government and did not fall completely within the purview of economic development. During the fourth wave, the trend has moved away from single-standing programs or organizations toward housing entrepreneurial development activities within larger and more traditional economic development organizations. Traditional economic development, especially the second wave, has often been plagued by what Pages et al. (2003) call “program-itis.” When a new business need was identified, economic development practitioners and policymakers responded by creating a new program to address this need, and then creating an organization to provide the program. Encouraging and promoting entrepreneurship, through the fourth wave’s entrepreneurial development, however, requires a more holistic approach. Numerous government agencies, private sector leaders, and non-profit organizations must come together to build an

infrastructure that provides education, linkages, learning opportunities, and other services for entrepreneurs.

These shifts indicate two important aspects of entrepreneurship promotion during the fourth wave. First, is the mainstreaming of entrepreneurial development as the entrepreneurship mission becomes more central to economic development. Second, is the increasingly central role of entrepreneurship promotion as a core economic development program. During the fourth wave, entrepreneurial and business assistance programs of the third wave were increasingly becoming integral parts of the economic development landscape.

Technology-based development is also a major component of fourth wave economic development strategies. Initially, this development was tightly clustered in specific cities or regions, such as Seattle, San Francisco/Silicon Valley, and other “techpoles” or “innovative milieus.” In these communities, economic development is founded on supporting technology-based entrepreneurial firms. The goal of economic development is to create agglomeration forces through promoting the availability of venture capital, increasing the strength of research universities, maintaining high quality of life, and ensuring the presence of a strong labor pool with the requisite technology skills. Technology-based development overlaps with entrepreneurial development to create regions – such as Boston’s Route 128, San Francisco’s Silicon Valley and Austin, Texas – and states – such as Massachusetts, Washington and California – that lead the country in terms of economic growth and prosperity.

In other areas of the country – particularly the small- and mid-sized cities – a different kind of technology-based development is taking place. This approach to economic development is oriented around meeting the technology needs of local companies, regardless of their technology orientation. While these technology needs may be related to information technology and telecommunications, they could also be manufacturing- or process-related, retail- or inventory-oriented, or simply be related to general business services (Sommers & Heg, 2003).

Most fourth wave entrepreneurial development programs and services favor technology companies. States have invested heavily in research and development efforts and have created programs to stimulate commercial activity around technology innovations. States are highly focused on ways to create investment capital though access to such capital may or may not be useful to all entrepreneurs (Rubel & Palladino, 2000). Where states have specifically created programs for entrepreneurs and their organizations, they are targeted towards specific industry sectors. The most common industry sectors have been biotechnology, telecommunications, software, computing, advanced manufacturing, etc.

Economic development of the second and third waves have primarily utilized micro-level entrepreneurship policies. The fourth wave approach to economic development, on the other hand, is much more reliant on entrepreneurship policies that seek to develop or enhance the entrepreneurial culture or climate. The entrepreneurial development model is based on several philosophies (Pages et al., 2003), which include (1) focusing on an entrepreneurial eco-system; (2) promoting cultural change; (3) serving individuals, not firms; and (4) focusing on high growth.

## CONCLUSION

As shown by the later economic development waves, supporting entrepreneurial firms and encouraging entrepreneurship have become important to practitioners and policymakers as they contemplate enhancing and diversifying their region's economic base. "As states and local governments move beyond industrial recruitment approaches and seek to develop locally based business and foster clusters of related small firms, questions of how entrepreneurial activity can be amplified become important to state policy" (Goetz & Freshwater, 2001, p. 59).

The state's role in facilitating access to financial capital has a long and varied history, and over time states have implemented a variety of measures to increase capital availability for entrepreneurs such as through state venture capital funds, guaranteed loans, and angel networks. As education became more integrated into the economic development arena, the number of university-based entrepreneurship centers and entrepreneurship curriculums exploded. States have invested in creating entrepreneurial centers of excellence, in addition to funding and supporting the development and implementation of entrepreneurship curriculum within the primary, secondary and post-secondary educational systems, and a variety of other educational programs. Provision of direct entrepreneurial support, such as through small business development centers and incubators, has also undergone transformations, both in content and service delivery. All these changes are evident if we analyze the evolution of modern economic development to begin to understand how entrepreneurship promotion rose from obscurity to become the core of today's economic development practices.

This study identified the different waves of economic development within the American landscape of the past seventy years, and traced along the progression of approaches taken by state and local governments to encourage and support entrepreneurship and entrepreneurial activity. It provides an understanding of when and why various entrepreneurial programs came into existence and how they evolved from the early focus on small- and medium-sized businesses to the current focus on technology entrepreneurship and gazelles.

## ABSTRACT

The globalization of the German economy requires new marketing strategies for SMEs since their traditional marketing management is not sufficient in achieving success. This paper is focused on 'Musicon Valley', a regional SME cluster based on musical instrument industry ties, geographical closeness, and networking. This cluster in the Saxonia Vogtland is continuously facing growing competition, particularly from Asian competitors. It is becoming a difficult task for an individual company to be successful, therefore the cluster becomes the way to protect and strengthen competitiveness of individual firms.

Following a description of the cluster, in this paper a basic framework for competence analysis is explained. Since this instrument has been developed for application to a different situational context, the necessities of and starting points to adapting it to the analysis of competencies within the cluster Musicon Valley are discussed.

## INTRODUCTION

In this paper the conceptual basis of an instrument for the analysis of the competencies within a regional SME cluster is outlined. Such a competence analysis is a part of a recently started research project funded by the German Federal Ministry of Education and Research (BMBF). The overall goal of this project is to strengthen the competitiveness of individual firms as well as the whole cluster by inducing a learning process within the network aiming at the optimization of the marketing activities. The diagnosis and building of competencies are therefore considered as fundamental prerequisites for this process.

The paper is structured as follows. In the next section the SME cluster 'Musicon Valley' and its market and competitive situation are described. Then the basic ideas of an analytical framework

for competence analysis are presented. The following section of the paper discusses the adaptations necessary in order to apply this framework to the analysis of the cluster Musicon Valley. Finally, starting points for this task are suggested.

### **THE SME CLUSTER MUSICON VALLEY**

The cluster Musicon Valley consists of musical instrument manufacturing companies in the Saxonia Vogtland, a region in East Germany where this industry has an internationally unique tradition and concentration.

A few facts may suffice to underline this appraisal:

- In the year 1677 the first German craft guild of violin makers was founded;
- Already at the beginning of the 19th century a wide range of musical instruments and accessories were manufactured;
- From 1870 overseas trade and export began (especially to the USA; even setting up of sales branches);
- To date approximately 140 firms exist;
- Around the geographic center of the cluster, the city of Markneukirchen, the musical instrument industry represents between 60 and 65 percent of the economic infrastructure.

Despite this impressive tradition and economic significance for the region, the development of the Vogtland musical manufacturing industry in the 20th century was neither linear nor unbroken. The First World War, the world economic crisis, the Third Reich and the Second World War, the subsequent integration into the Eastern Bloc economy with its nationalizations of businesses and finally the breakdown of the Eastern Bloc and the German reunification each led to specific structural discontinuities and crises.

After the recent economic setback following the German reunification in 1990 a consolidation of the regional industry was reached. Nevertheless, a substantial drop in employment had to be accepted resulting beyond numerous insolvencies from the change from the predominating concentration on mass production during the GDR back to a production based mainly on craftsmanship. The available employment figures (1964: 6416 employees, 1995: 1033, 2000: 1213, 2005: 1120) indicate that after a dramatic loss of jobs a slight relaxation took place until the year 2000. Meanwhile, the growing competitive pressure resulted again in a loss of jobs. The following table 1 shows the percentages of the firms and of the employees which are engaged in manufacturing the different kinds of products.

---

Table 1 about here

---

Approximately three quarters of the cluster members are firms concentrating on tailor-made production of single high-quality musical instruments, especially in the fields of string instruments, bow making and plucked instruments. One half of the firms (ca. 70) are very small, employing altogether 225 people (ca. 20 percent of all employees). In contrast, roughly 30 firms are small and medium-sized businesses with up to 250 people employed. The latter specialize in

standardized large scale production of brass instruments, hand and mouth harmonicas, music electronics and electric basses and guitars.

With a share of approximately 50 percent of the total sales the export plays an important role for Musicon Valley. The most important export markets are the USA, Japan, Korea, and the European countries, whereby the tradition and quality of the instruments are regarded as being salient choice criteria for the customers. For the international sales it is crucial to visit trade fairs and get into direct contact with potential customers, some firms also attempt to sell via the internet but this medium does not yet contribute significantly to the figures of total sales. In the field of high-quality instruments the relationship between manufacturer and customer plays a prominent role for the sales success because the buyers wish to be treated like a partner who is involved in the production process.

Due to the ongoing economic globalization (Sheth & Parvatiyar, 2001, Yip, 2003) the Vogtland firms are facing a constantly growing competitive pressure. Especially the increasing threat by Asian (China, India, Korea, Vietnam) and East European (Hungary, Czech Republic, Romania) competitors makes it necessary to restructure their business activities, a task which proves to be very difficult for individual businesses by themselves. The low-price segment already seems to be hopelessly lost to the competitors, while at the same time there are growing problems even in the higher priced segments due to tremendous quality improvements of the foreign manufacturers.

In the year 2000 more than 120 firms have joined the network Musicon Valley that is taking part in the BMBF initiative InnoRegio, a program intending to enhance the innovativeness of East German regions. Other members apart from the musical instrument manufacturers are research and educational institutions, business associations, public administrations, etc. Conceptually, Musicon Valley can be regarded as a regional cluster in Porter's (1998a, 1998b) sense, whose respective criteria are, e.g., the geographical closeness or the close ties within an industrial branch, but also as a network (Sydow & Winand, 1998, Hinterhuber & Stahl, 1996). Here the broader cluster concept is preferred.

A central cluster player is the registered society Musicon Valley e.V. which within the context of the InnoRegio initiative has the function of organizing and moderating the network and also performs free services for the members (international image building activities, collection of information, acquisition of public funds, project management, controlling of the network activities). After the end of the InnoRegio initiative in 2006 Musicon Valley e.V. will only be able to sustain if it succeeds in finding new sources of income, e.g., revenues from paid services and membership fees. Another important network player is MIGMA e.G., a registered cooperative society, which has been performing sales functions for the craft businesses since the 1940s. Additionally, chambers and craft guilds play a role for the network and even single 'grassroots activities' can be named. The latter are efforts of cooperative marketing and sales activities.

Nevertheless, it has to be stated that the cluster players did not yet succeed in making full use of the potentials the network and its umbrella brand 'Musicon Valley' are offering for the international marketing activities. This appraisal marks the starting point for the competence analysis.

## **AN ANALYTICAL FRAMEWORK FOR COMPETENCE MEASUREMENT**

The basis of the competence analysis forms a framework developed by Zanger and Deckow (2003, Deckow & Zanger, 2002, Deckow, forthcoming) which at first distinguishes between the two dimensions of competencies related to single persons and those specific for the firm as a whole. Because the analytical unit of interest is the firm, only the latter will be dealt with in this paper.

The firm-specific competence dimension consists of collective capabilities, skills and knowledge which - in the sense of a (sub) system specific potential - allow fulfillment of a distinct category of tasks or requirements in a reliable and sustainable way (Dosi et al., 1992, Cohendet et al., 1999). In sum, they are the basis of core competencies (Prahalad & Hamel, 1990) the existence of which is crucial for building and securing a company's success. Resources are regarded as firm-specific assets which, due to the existing implicit knowledge and transaction costs, are far from being imitated easily by competitors (Teece, Pisano & Shuen, 1997). The core competence approach is adopted here because of its ability to connect the conflicting perspectives of the market-oriented and the resource-based view of strategic management.

In order to gain a rough structure of the firm-specific competence concept, the subdivision suggested by Turner and Crawford (1994) that differentiates between company, management and technology competencies is applied.

First, company competencies are those potentials mirroring a firm's current market position and public image, e.g., the financial and innovative strength, the scope and price-performance ratio of its products and services, and its marketing and order processing capabilities.

Second, the term management competencies addresses those potentials which allow to control a company's processes necessary for planning, organization, leadership, supervision, and coordination.

Third, technology competencies comprise those potentials enabling a firm to continuously create product and process innovations as well as to master the processes of production, logistics, services, and technology oriented cooperation.

Indicators for the factors of the described rough differentiation were derived by means of an interdisciplinary literature review and a following dimensional analysis (Faix & Krupp, 2002). In the next step the appropriateness of these indicators was examined during expert interviews (Deckow, forthcoming). The resulting list of basic indicators for measuring firm-specific competence is shown in the appendix.

## **ADAPTATION NECESSITIES TO THE ANALYSIS OF MUSICON VALLEY**

Due to the fact that developing competencies has to be understood within the specific situational context (Van de Ven, 2004), each competence analysis requires the evaluation of the appropriateness and a following adaptation of the general framework to the objects of interest and research questions, respectively. For the cluster Musicon Valley four aspects are regarded as being of crucial importance.

1) The analytical framework described above has been developed for the requirements of the marketing of the so called 'contract goods' (Kaas, 1992). Therefore, it is not only based on approaches from management research but also on ideas from the economics of institutions and economics of information. The latter stress the vital role that credence qualities play for the marketing of complex plants and systems (Schade & Schott, 1993) and, therefore, the necessity of a 'signaling' (Spence, 1973, 1976) through competence marketing (Deckow, forthcoming). In contrast, for the marketing of the products of the Vogtland manufacturers of musical instruments,

search and experience qualities are more prominent compared to credence qualities (Nelson, 1970, Darby & Karni, 1973).

Accordingly, it is argued here that the specific international market situation of the cluster Musicon Valley and its members requires specific signaling activities. Since the numerous political changes during the 20th century altered the situational context several times in an unfavorable way, after the German reunification in 1990 the Vogtland musical instrument manufacturers could not start from such a prominent market position they were holding until the end of the 1920s.

This implies that the international reputation of the cluster is not as good as it could be without the discontinuities it had to suffer - considering the unique combination of regional concentration, historic tradition and craftsmanship. Here, it is argued that signaling capabilities in the sense of management and marketing competencies have to be built up which allow the single firm as well as the whole cluster to transmit this combination to potential customers. After all, many companies offer high end products which are not adequately valued by the market. Hence, particularly the smaller firms could benefit from a strong network brand in order to stand out from the mass of international competitors. Further, it is assumed that the signaling impact of the cluster (through regional tradition) could by far exceed what is possible for a single firm.

2) In general, most of the small enterprises are only capable to fulfilling the prerequisites and tasks of a successful international marketing in cooperative efforts. This implies that besides the single firm perspective it is necessary to analyze the competencies of network structures.

3) An additional difference between the competence analysis of the cluster Musicon Valley and the previous analyses by Zanger and Deckow (2003, Deckow, forthcoming) results from their focus on the single business transaction in the marketing of contract goods - even if it has to be acknowledged that usually there are intense interactions following the sales transaction. In contrast, developing a relationship management and marketing (Parvatiyar & Sheth, 2001; Sheth & Parvatiyar, 1995) is a crucial step for advancing towards the goal of continuously rising or stabilizing the sales of musical instruments.

4) The Musicon Valley cluster consists of SMEs. This kind of businesses differs from large companies not only with regard to the resources available, also its management is much more oriented towards the entrepreneur himself. Hence, approaches of an 'entrepreneurial management' (McCarty, 2003, McGrath & MacMillan, 2000) seem to hold valuable potentials - especially for understanding the cooperative efforts of the single firms within the network.

## **STARTING POINTS TO THE ADAPTATION OF THE ANALYTICAL FRAMEWORK**

As central aspects of the core competence approach are already integrated in the basic framework by Zanger and Deckow (2003; Deckow, forthcoming), with regard to a managerial foundation of the competence analysis in the special case of Musicon Valley especially the cooperative, network and relationship aspects are to be considered.

Highly stimulating for this task proves Vanhaverbeke's (2001, 97) study who develops a framework for the analysis of the 'construction and home furnishings' business cluster in South West Flanders (Belgium) by "combining the ... 'value constellation' concept [Normann & Ramirez, 1993] and the literature about industrial districts". Vanhaverbeke (2001, 97) points out that the "advantages related to geographical concentration of economic activities are insufficient in the competition with companies that are linked to each other within a value constellation". He further argues that it is not very likely that such a customer-oriented network evolves by chance

because SMEs are locked in their traditional ways of doing business. Moreover, a customer-oriented network has to be built intentionally. With regard to participation in a network O'Driscoll et al. (2000, 193, 194) even address the danger of a "network myopia" where "continued participation in a particular network [e.g., a cooperative sales system in the cluster], with its shared information resources, mindset and expectations, can blinker the firm to opportunity and advantage elsewhere".

Central network actors like business associations or local institutions which are capable to act as disseminators can play a crucial role in overcoming those mental blocks even if they are also underlying a tendency "to being locked into traditional and unproductive patterns of interaction" (Vanhaverbeke, 2001, 113).

The analyses performed so far within the cluster Musicon Valley confirm all assumptions. Neither are most of the firms unwilling to give up their autonomy in production and marketing in favor of a network nor are the active network actors enjoying enough trust to convey major marketing tasks to them. But interestingly, there are 'grassroots' activities like the cooperation of four string instruments manufacturing companies which have been entering a cooperative marketing by joint activities like internet sales and exhibition stands at trade fairs. This example indicates that potential for cooperation exists which could be extended further.

Due to the assumption that an intensified cooperation in the field of production is currently facing insuperable resistance, it was decided for the competence analysis to concentrate on marketing and sales because the chances for cooperation are estimated to be better in these fields. Beyond the 'hard' factors of cooperation (e.g., synergies from joint sales systems) weak factors are important as well (e.g., the better conditions for signaling image aspects like tradition.

## APPENDIX

The basic indicators for measuring firm-specific competence (Zanger & Deckow, 2003)

|  |
|--|
| <b>Company competence</b>                        |
| Size (number of employees)                       |
| Public awareness                                 |
| Market share                                     |
| Financial strength                               |
| Geographical closeness to customers              |
| Know-how of workforce                            |
| Scope of product program                         |
| Price-performance ratio of products and services |
| Marketing capabilities                           |
| Market image                                     |
| <b>Management competence</b>                     |
| Order-related planning                           |

|  |
|--|
| Order-related organization                             |
| Resource-efficient order processing                    |
| Schedule effectiveness                                 |
| Flexibility of delivery                                |
| Capabilities to manage customer relations              |
| Communication capabilities related to order processing |
| Scope of services                                      |
| Quality of services                                    |
| Customer-oriented organization                         |

|  |
|--|
| <b>Technology competence</b>                           |
| Product and process know-how                           |
| Innovative capability                                  |
| Knowledge concerning market trends                     |
| Customer-oriented product developing and manufacturing |
| Adaptability (technological flexibility)               |
| Quality management                                     |
| Time management concerning product developing and      |
| Capability to adopt innovative technologies            |
| Capability of technology-oriented cooperation          |
| Technological services                                 |

## **Abstract**

There has been very limited research in the area of small business decision making. Many issues remain unexamined and one important issue is the communication processes underlying the inter-organizational decision making in small businesses. In the trend of globalization, small businesses build network or alliance with other businesses to tap into external resources. Considering this web of relationships, decisions of small business are often made as an inter-organizational communication and negotiation process. To examine how technology can support such communication process, a case study is conducted and problems in the communication process are identified, including information ambiguity and conflicting understanding, trust issue, domination of bigger companies, and communication workload problem. For each problem, preliminary technological solutions are proposed.

## **Introduction**

Small businesses are an important and integral part of every nation's economy (Hambrick and Crozier, 1985). In the United States, small businesses account for almost one-half of the gross national product, create two-thirds of new jobs and invent more than one-half of the technological innovations (U. S. Small Business Administration, 2001). From many perspectives, small businesses are unique. They are likely to be limited in financial, management, human, and information resources (Aspelun & Moen 2003), with different managerial processes and structures that are less rigid, sophisticated, and complex than those in larger firms.

In the last past decade, with the increase of evidence in the awareness and investment from small businesses to information technologies, there has been significant convergence of IS research and small business research. The major stream of small business IS research has been focusing on the technology adoption decision and implementation practices in small business. However, small business research has been criticized as adapting theories exclusively developed for large corporations (Southen & Tilley 1999) and a number of important areas are under-researched (Premkumar 2003).

One area of small business IS research warrants more exploration from the academicians are decision support. Sporadic studies have been conducted which examined how analytic models

can be used to complement the intuitive decision styles and bring more scientific operational management into small businesses (e.g. Hayen 1982; Houben, lenie and Vanhoof 1999). These researches were conducted in a context where a single or a small number of small business managers made decisions independently. Nonetheless, in the new business environment of increasingly globalization and more-than-ever intensive competition, decisions in small businesses are often made in a new fashion. Small businesses, typically with limited resources, build a network and alliance with other businesses to expand its operation into a larger market with the help of external resources. Decision in one small business is influenced by other businesses in this network. To carry out its plan, one small business often relies on the commitment of other businesses and the impact of one small businesses' decision will ripple through the network. The new decision-making environment demands collaboration and communication between different businesses. Therefore, though traditional model-based DSS still hold its place in small businesses, it is also important to develop an understanding how the communication-intensive decision-making in small business can be facilitated by decision support systems. To that end, this paper first reviews existing literature from several fields; based on the literature review results, the research question is refined; a case study in a small business with a network of business partners is presented; typical communication-intensive decision making scenarios are accounted; problems and issues are identified and preliminary analyses are done in terms of how information technologies work or fail to solve these problems. The paper concludes with a discussion of the contribution and limitation of this paper and suggestion for future research.

## **Literature Review**

### **Small Business and Decision Support**

The definition of small business is controversial. A variety of different standards including industry type, sales volume, the number of employees and etc. have been used. This paper adopts one of the most popular definitions from U.S. Small Business Administration: Small Businesses are independently owned and operated and not dominant in its field of operation (Small Business Administration 2003). Past organizational science research has found the importance of the role of owner manager in small businesses. There are often only one or two managers in small businesses and the businesses are very dependent on the decisions of the owner manager ( Feltham, Feltham & Barnett 2005). In view of three levels of management activities: strategic, managerial and operational, small business lacks of long-term planning as long-term planning is considered time-wasting or resource-costly (Miller & Toulouse 1986; Temtime, Chinoka & Shunta 2003). Other researchers explained from another perspective that small businesses' strategic planning is constraint by the competition level it is faced with and small businesses tend to adopt the strategy of market leaders instead of inventing strategies of their own (Dodge, Fullerton & Robbins 1994). Small business managers, however, are very involved in operational management but they resist the use of quantitative methods, more comfortable with intuitive decision making (Chaudhry, Salchenberger & Beheshtian 1996; Dianich & Gupta 1983).

Small business decision support research has focused on introducing operational management principles and theories into small businesses. Model-based decision support systems were found improved the efficiency and quality of decision making in financial planning (Hayen 1982),

inventory management (Chaudhry, Salchenberger & Beheshtian 1996), and other management activities. Some researchers attempted to find ways to use rational decision making method to complement the intuitive way of decision making (Dianich & Gupta 1983). In addition, several studies have been done on the adoption and implementation of DSS in small business (Lai 1992; Raymond & Bergeron 1992). At the same time, industry practitioners have called for the use of more powerful software and applications in small businesses (Heathfield 1997). However, from a technology determinism perspective, they along with the adoption research stream have assumed the benefits inherent in the use of technology, failing to examine the complexity of small businesses.

### **Small Business and Communication**

Small businesses are considered characterized by a flat organizational hierarchy and close proximity to coworkers, which is believed to contribute to effective communication practices, often comprised of informal channels (Vinten 1999), and typically carried out face-to-face as the need arises rather than through formal communication channels such as scheduled meetings. Nonetheless, it is found that as small business grows, especially into a global market, traditional face-to-face is not sufficient any more.

Small enterprises are increasingly active in international markets (Erramilli and D'Souza 1993; Haahti, Hall, and Donckels 1998). In addition, a growing body of research has found the trend of building business-oriented relationships outside organizational boundaries in small businesses (Street & Cameron 2004). The web of external alliances provides a wide variety of tangible and intangible benefits. Small businesses use external relationships to tap into these resources to extend their reach. Such practices help small businesses to overcome resource constraints of time, capital, and expertise by looking outside the company for colleagues and collaborators (Gomes-Casseres 1997; Lipparini and Sobrero 1994). More and more, companies have to see their business processes in a wider context where many companies contribute complementarily to achievement of business goals. In this light, the companies have to integrate business partners into effective information and communication. Moreover, as decisions will impact a small business' partners in the network and many decisions need to be carried out collectively by the businesses in the network, external communication becomes an integral part of decision making. In the communication process, information is exchanged, understanding is established and commitment is promised. Such process crosses organizational boundaries and geographical distances and has to be facilitated by information and communication technologies.

Considering the potential significance of networking strategy toward the wellbeing of a small enterprise (Feindt, Jeffcoate, and Chappell 2002; Alvarez and Barney 2001; Hite and Hesterly 2001), it is imperative to examine the external communication process small business managers engage in when making decisions with partner businesses and how information technologies can be developed or used to support the process. The literature review in the last section shows that, from this perspective, the small business decision support research has not been adequate. They are more objective model oriented and little has been actually known about the communication processes underneath decision making.

### **Social Communication**

The inter-organizational communication involved in small business decision makings is rife with risks: Business partners in the network may not have common goals in every decision making scenario and understand the problem from the perspective developed from their own individual experience. Information may be withheld from others and even wrong information may be intentionally conveyed. Inter-organizational trust may not be at a level to make one business to commit to the decision from another one. Due to the small scale of operation and resource constraint, facing with conflicts and differences, a small business cannot use dominant buying or selling power to force compromise from other parties, like big corporations would be able to do. Instead, a typical inter-organizational decision-making communication process in small business is expected to be a process of establishing mutual understanding, negotiating differences and fostering trust. Smoliar and Sprague (2002) view such a process as social communication in interactive decision making, which has three dimensions: meaning, authority and trust. "Meaning" simply means what things mean. Smoliar and Sprague (2002) explains the volatility of business world makes difference in understanding what things mean a norm. They emphasize that the right format and material through which information is presented is essential to solving difference in "meaning" understanding. By "authority", they mean the authority from the organizational position or functional expertise. They think conflicts are inevitable, but conflicts should be solved through negotiation not authoritarian mandate. Authority determines more on the responsibility of what a person brings to the communication. Technology can be used to facilitate communication to move away from authority. However, awareness of who has the expertise should be fostered. Trust is needed for members to accept interpretations of meaning. To build trust in communication, technology should be used to improve awareness of prevailing opinions through collecting, visualizing and filtering opinions.

The proposals of Smoliar and Sprague provide insights into the social interaction process in interactive decision making and give an organized way to look at the situation. They emphasize conveying the "meaning" and create shared understanding of "meaning". While they inspire this paper on the shared understanding issue in the small business issue, they do not consider many other important issues such as information sharing, motive conflicts and etc.

In summary of the literature review section, there has been very limited research done in the small business decision support field. The existing literature yields little knowledge on the inter-organizational decision making process in small businesses. The communication processes underlying such decision making is subject to various risks. Nonetheless, theoretical research by Smoliar and Sprague, though not addressing the unique situation of small business, gives some initial thoughts.

After thorough review and drawing on different perspectives, the research question raised at the beginning of the paper is refined as: what problems actually exist in the inter-organizational communication processes underlying interactive decision-making in small businesses and how such problems can be overcome from a technological perspective.

## **Research Method**

As the first attempt in this research field, this paper is not to get deep theories. It aims to do a descriptive study of this new issue and give preliminary analysis. As Benbasat et al. (1987) suggest, when an area is new and few prior studies have been done, the researchers can begin with recording the trial-and-error process of the practitioners and formalize knowledge from accumulated understanding. They suggest case method is appropriate for a research question where no established theories exist and the research question is of an exploratory nature. Small business IS researchers have criticized using quantitative method and modeling based on theories which are exclusively developed for large corporations (e. g. Southen & Tilley 1999; Swartz & Boaden 1997). These researchers also recommended qualitative research method.

In this study, case study is conducted to identify the actual problems in the decision process this paper targets.

### **Case Study Site Selection**

The study site should be a small business with typical resources constraints and dependence on owner manager. Also the study site company should have a network of external partners and collaboration in the network is extensive. The decision processes should often involve interaction with other businesses, so the manager can give a good account of decision making experience the study is looking for. To select such a company, the author talked to several small business managers and choose Company A (the name is changed for privacy purpose). This company meets all the standards. Also the author has strong connection with the managers of this company so the managers trust the author and gave rich information.

### **Overview of the Study Site**

Company A is an E-commerce retailer. It sells brand-name gifts and its customer base consists of customers from all over the world. It has five employees and one owner manager. The owner manager along with another manager conducts all managerial activities in the company and is also into the daily operations of the company. The annual sales of the company are under \$1 million and the company is actively seeking new business partners to expand its business. The order fulfilling process of the company is carried out in close collaboration with its suppliers. The company does not carry any inventory. When an order arrives, the company processes the order then send shipping request to the suppliers. The suppliers ship the product from their warehouse. Very high level of collaboration is required to fulfill each order. Decisions about the company's product and service offering, and pricing and marketing strategy are largely influenced by the information provided by and the ability to cooperate of the suppliers and also need the supplier to work together to make the decisions a reality.

### **Data Collection Method and Analysis**

Case study should use multiple data collection methods and results collected through different channels can be used to triangulate in order to improve the objectivity and validity of analysis and conclusions (Benbasat et al. 1987). In this case study, three data collection methods were used. First, the managers were interviewed in-depth about detailed processes of inter-organizational decision-making, communication practices involved, communication technologies

used, and issues and problems associated with the communication. Second, the managers were also observed making such decisions. Third, communication record including IM transcripts and emails were collected. The information collected from the latter two methods corroborates the description of the manager and complement it with a higher level of details. No conflicting results were identified. It is believed that the data collected from the three methods give a cohesive and objective picture of the inter-organizational decision making processes in Company A.

Patterns about problems which occurred during the communications are induced and reasons are explored. In the following section, the results about the problems and the reasons behind the problems are presented and illustrated by typical scenarios. It was found Company A uses phone calls, and text message exchange in email and instant messaging to communicate with its suppliers. These basic communication tools cannot provide effective solutions to the problems. Therefore, for each problem, how other technologies can help is analyzed.

### **Problems, Reasons and Solutions**

First, information ambiguity and understanding conflicts

The message conveyed is ambiguous and the decision makers from different parties may interpret the message in more than one way. There is no shared understanding of what the message means. The owner manager gave an example about this problem: Company A needed to decide on the price on some new laptop models. The supplier of the laptops emailed the spread sheet containing the prices upon the request of Company A. There were three types of prices in the spread sheet: market price, retail price and wholesale price. The manager of Company A determined that the “market price” is the price other retailers in the market use and the “retail price” is the cost Company A needs to pay the supplier. It turned out that “retail price” was actually the dominant price on the market and “wholesale price” is the cost Company A needs to pay. The problem occurred mainly because of information asymmetry and the poor way information is presented. The supplier is in a country where the retailers usually list an “official” market price but actually sell the product at a discounted price. Since this becomes the standard practice of the retailers, the actual market price is the “discounted” retail price. However, Company A is not aware of such a phenomenon. Also the prices are presented as mere numbers and there lacks the additional cues through which the managers of Company A would’ve gained better understanding.

This problem is a common issue, as the businesses are in different market positions and knowledge of different companies is developed in different business environments and social cultures. The consequence of this problem can be highly costly if critical business decisions are made with wrong interpretation. It also slows down the decision making process. It takes time for the managers to find out about the problem and revise the decision. To solve the problem, technology should facilitate the awareness of the context where information is created. No GDSS or CSCW studies have been found addressing this problem. Some communication theories have touched on the issue, though.

McGrath and Hollingshead (1993) proposed a relationship between medium and task types based on information richness. Task types include idea-generation, negotiation, and intellectual tasks. Negotiation tasks are further categorized into cognitive conflict and mixed-motive tasks. Cognitive conflict tasks are those in which group members have conflicts of viewpoint and mixed-motive tasks are those in which group members have conflicts of interest. Both task types exhibit equivocality and uncertainty phenomena. They argue that to reduce equivocality, richer communication means should be used. Then it can be inferred that to solve information ambiguity problem, increase the bandwidth of communication technologies in terms of the capability to convey multiple cues will help. For instance, automatic hyperlinks can be added into the spreadsheet so documents, videos, or audio files which provide additional background information on an item in the spreadsheet will be retrieved. However, this preliminary solution only provides a starting point. How such rich communication media should be actually integrated in the whole decision processes is still a question.

Visualization tools can be used to present the information in a visualized way managers can intuitively understand the information with little cognitive efforts. Many DSS tools come with a set of visualization functions. Also it will be useful if the visualized results from one company's DSS can be read by commonly available application which the manager of another company may use and can be used directly as input to the DSS of the other company.

Recent development in semantic integration also sheds light on the solution of the information ambiguity problem. When ambiguity arises because of difference in the contexts of information receiver and sender, shared ontology can be developed to representing, processing, and reconciling heterogeneous data semantics. However, to date ontology sharing technology only address differences in object context variables such as currency, weight measurements and etc. In the small business inter-organizational decision making process, communication barriers exist, in many cases in the sharing of subjective data such as managers' judgments and evaluation.

## Second, trust problem

Trust problem occurs when there are conflicts of interests. Conflicts arise often because each business acts in an individually rational way for its own good or seeking to maximize its own utility. The manager of Company A depicts such an example: Company A needed to decide on which new models of a brand-name watch will be added to their E-commerce website. They asked their supplier what options the supplier could provide. The supplier wanted to make as much profit as possible. Even though they could not guarantee the stable supply of some models, they withheld this information from Company A. Instead they told Company A to market all the new models. Later on, Company A had to remove some models from their website after several experiences where the supplier did not have the product in stock. Reputation and credibility of Company A was damaged in these incidents.

To solve this problem, Smoliar & Sprague (2002) propose that technology can be used to collect and visualize the prevalent opinions which are hold by most parties in the negotiation. DeSanctis & Gallupe (1987) suggest a similar solution where the opinions of team members are aggregated and presented in a way everyone in the team can see. Besides that, the author believes increasing external transparency will help. Street & Meister (2003) explains that external transparency is the outcome of communication behaviors directed outside the organization. From the supply chain

management perspective, information exchange between supply chain partners (e.g., Lamming et al. 2001) is described as a type of transparency. One type of information that can be made transparent is cost. With such transparency, one company will believe the truthfulness of the information provided by other companies and will be able to collect information the other companies unintentionally omits to transmit. The positive role of IS in increasing transparency has been highlighted (Min et al. 2002). However, detailed solutions on increasing transparency have not been studied. The author proposes some additional features of DSS may increase external transparency. For instance, a list of businesses which will be impacted by the decisions is recorded in the DSS; when a decision is being made, the DSS also models the impact on the other businesses. A report is automatically generated including, for example, cost consideration, action plan and etc, and sent to the other businesses.

### Third, domination of larger partners

Larger partners possess dominant power over smaller ones in the supply chain and are often unwilling to reconcile in case of interest conflicts or to cooperate with other businesses when collective efforts are needed. The managers of Company A complained about some of their bigger partners and here is an example: High-quality service is one of the primary strategies Company A deploys. They provide services such as sending a free greeting card along with the gift and these services have distinguished Company A from its competitors. The actual fulfillment of these services often falls onto the shoulder of the company's suppliers. However, when deciding on what service the company can provide with the pearl jewelry products, the manager found it hard to negotiate with the pearl jewelry supplier, the largest pearl jeweler in the country, even when Company A is willing to pay for premium costs for the services.

This issue is similar to the "authority" issue Smoliar & Sprague posit, in that bigger companies generally have more authority in negotiation. Traditional GDSS addresses this issue by implementing anonymity feature in hope that participants will not be judged by their organizational position or expertise and social barriers to participation will be removed. However, this approach will not work in the context of small business problem as the domination of bigger players cannot be overlooked or circumvented. To address this problem, technological support must be designed in the context of the relationship of bigger companies and smaller companies. Some artificial intelligence research has been trying to find ways to reduce the influence of domination. For example work practices may be mediated by conversational agents as a move away from authority figures (Smoliar & Sprague 2002). The capabilities of such artificial agents have been investigated by Elizabeth Churchill et al. (2000).

### Fourth, communication workload

Most of the decision making, due to the negotiation nature, is communication intensive. Also because of the volatile business environment, decisions have to be reevaluated frequently and new rounds of negotiation begin. This creates large volume of communication workload and results in communication fatigue. As the manager of Company A explains: For each new product or service, he has to negotiate with his suppliers and negotiation lasts intermittently over a few days before a final consensus can be reached. Sometimes, he simply gets tired of communication and makes a hasty decision.

To deal with this problem, technologies should be used in a way that facilitates efficient communication. First of all, communication media need to be carefully chosen. For example, communication media with features such as presence awareness, real-time exchange of messages, like instant messaging, results in higher response rate than telephone calls (Herbsleb et al. 2002) and can be used to initiate a communication process. Also managers should control the variety of communication tools they use to reduce information complexity (Rennecher & Godwin 2003). In addition, as small business managers need to frequently reevaluate the basis of decisions they made, the DSS models should be designed to be easily understood by the managers. The models should also be easily tried and modified so the managers have less workload in revising decisions.

## **Discussion**

The four types of problems identified in the case studies are interrelated. For example, information ambiguity may be attributed to information withholding or distortion due to lack of trust. They should not be viewed as existing independently.

Traditional DSS technologies fail to address these problems effectively. The communication-based GDSS are more oriented towards groups who work for one organization and do not address the social aspects of communication processes such as trust or shared understanding. Actually social processes in decision-making groups are considered detrimental to the quality of decisions. It is often assumed that removing social influence of the group on its members improves group decisions. GDSSs are increasingly used to remedy the social faults of the decision-making process in groups. In these systems, anonymity is seen as tool to reduce the impact of the group over its members, and therefore as the key to improved group performance. In their meta-analytic review, Postmes and Lea (2000) examines the assumption that anonymity in GDSSs is beneficial for group decision-making on a range of performance indicators. They find that the effects of anonymity on group performance are mixed and argue that performance in decision-making groups partly depends on the social context and relevant social norms. Therefore, to support communication-based inter-organizational decision making in small businesses, GDSS design must facilitate the inter-organizational social communication process and address the special problems in the process.

Some agent-based decision making research have also attempted to facilitate communication processes in the group interactive decision making. One popular agent-based process is multi-attribute negotiation process. According to Jonker and Treur (2001), the multi-attribute negotiation process includes the following five steps: (1) Evaluation of the attributes of the initial solutions made by the participants; (2) These evaluations are aggregated into overall utilities of these initial solutions; (3) Provision of the target utility; (4) Based on the target utility and the distribution of attributes, the values of the target attributes are determined, which lead to a new round of decision making; (5) For each of the target attributes, an attribute value is chosen that has an evaluation value as close as possible to the target evaluation value for the attribute. However, this method assumes 1) the participants will objectively and truthfully evaluate the attributes and set the objective; 2) the participants will trust the input from each other; 3) there is no authority issue. These three assumptions do not hold in the case of small business inter-organizational decision making.

The contribution of paper is that it identifies an important area where researchers can provide wisdom and guidance to the practitioners. Moreover, some preliminary technological solutions are proposed and may inspire the small business practitioners to use technologies to better support their inter-organizational decision making process. As the first study in this field, this paper serves as a starting point for future research.

However, this paper is not without its limitations. This paper only studies the support of the inter-organizational decision making from a technological viewpoint. The author recognizes that technology alone cannot effectively solve the problems. The organizational and managerial factors must be studied in light of how they can significantly improve the process and be combined with the use of technologies.

Also this study uses the method of single case study. A major concern about case study has been about generalizability. Generalizability may be impacted by the subjective lens through which the researchers collect and interpret case study results as well as the small number of research sites. The findings of this study should be tested in more varied types of organizations. Also, in future study, quantitative method, such as questionnaire survey, should be used to get data from a large number of small businesses and rigorous statistical analysis should be conducted to triangulate with the results from the case study. Such “in-between” research methodology will yield more confident inference and more convincing results (Swartz & Boaden 1997).

Technology entrepreneurs or technology development firms are companies that seek to differentiate themselves and develop a strategic competitive advantage through innovation. Their focus is on technology development and commercialization. Though idea rich, technology entrepreneurs are typically resource poor. Government programs like the Small Business Innovation Research (SBIR) program can play a vital role in helping technology entrepreneurs develop and commercialize technology. This conceptual paper examines entrepreneurial orientation, the organizational processes, methods, styles, practices, and decision-making activities employed by entrepreneurs that lead to bringing new products to market. It describes the SBIR program and develops a series of research propositions to describe the interaction between entrepreneurial orientation and the SBIR program.

**INTRODUCTION**

In a seminal book, Michael Porter (1980) identifies three generic strategies for competitive advantage: differentiation, cost leadership, and focus. Differentiation strategies allow companies to build brand loyalty and charge higher prices, as buyers perceive the company's product or service offerings as unique and superior to other products or services offered in the market place. One of the key types of differentiation strategies involves innovation to create new products and services which embody new technologies and offer up-to-date features (Miller, 1986).

Many small business ventures or entrepreneurs develop and commercialize new technologies in order to obtain a sustainable competitive advantage (Kelley & Rice, 2002). Although innovation can be beneficial to many industries or services, innovation is especially important to high-tech industries. Industries such as telecommunications,

biotechnology, artificial intelligence, and the software industry, are built upon innovation (Zahra, 1996a). A coherent technological strategy which harnesses innovation can help lead to superior financial performance (Zahra, 1996b).

Even recognizing the importance of innovation, high-tech start-ups or technology development firms often lack sufficient operating capital to implement a coherent technology strategy. These firms may lack the resources to pursue interesting research ideas, to develop prototypes, and to commercialize products and, investors typically give preference to commercially developed innovations. Given the lack of resources, technology entrepreneurs may need to act entrepreneurially to find the resources to fund R&D and commercialization. One key source of funding for technology entrepreneurs are government programs such as the Small Business Innovation Research (SBIR) program.

This research is motivated by a perceived need for a better understanding of the conditions and drivers that transform technology into value creation and bring it to market. We examine the entrepreneurial orientation of a firm and the relationship between the entrepreneurial orientation and the conceptual role that government technology programs can play in facilitating the entrepreneurial process in high-tech start-ups. Lumpkin and Dess (2001) define entrepreneurial orientation as the “strategy-making processes that firms engage in entrepreneurial activities” (p. 429), and it is conceptualized to have five general domains: autonomy, innovativeness, risk-taking, proactiveness, and competitive aggressiveness (Lumpkin & Dess, 1996). We use the structure posited by Lumpkin and Dess (1996; please see Figure 1) and focus on the interaction between the program and a firm’s entrepreneurial orientation. (The role that government technology programs can play in the environmental and organizational factors is discussed in another paper.)

[Insert Figure 1 here]

Although it is possible to examine the impact of a number of government programs on technological entrepreneurship, it is helpful to focus on a specific program in developing the conceptual framework. As the Small Business Innovation Research (SBIR) program was specifically established to help entrepreneurs and to promote innovation and assist in the commercialization of technology, we have selected the SBIR program as our initial focus. The impact of other government programs, such as those focusing on technology transfer, can be studied in future research projects.

### **SMALL BUSINESS INNOVATION RESEARCH PROGRAM (SBIR)**

Founded in 1982, SBIR was formed to assist in the development and commercialization of technology. The SBIR’s goal is to facilitate the technological development and subsequent commercialization and, at the same time, promote small businesses, create new jobs, and develop alternative sources of supply. Additionally the program is designed to help promote minority and disadvantaged businesses.

The Departments of Agriculture, Commerce, Defense, Education, Energy, Health and Human Services, and Transportation, as well as, the Environmental Protection Agency, the National Aeronautics and Space Administration, and the National Science Foundation each have at least one SBIR office. Some departments, such as the Department of Defense, have multiple SBIR. For example, the Army, Navy, and Air Force each have SBIR offices. Finally, there may be multiple SBIR offices within an organization. As an example the Navy has an SBIR office devoted to sea defenses and another devoted to air defenses.

US for-profit technology companies with 500 or less employees can apply for grants under the SBIR program. A Phase I grant, capped at \$100,000, is typically used for a feasibility study to explore a technology. A Phase II grant, capped at \$1 million, is usually considered the stage where a prototype is developed though, under special circumstances, the funding may be used to further develop a technology. Although no SBIR funds are awarded for Phase III projects, Phase III of the program is considered the commercialization stage when the technology is successful in attracting funding from customers or other government programs, such as the Transition Assistance Program.

SBIR has multiple stakeholders, including small businesses, the government agency or department interested in exploring the technology, and the SBIR program office, itself. The small businesses can be technology development firms that specialize in developing and commercializing new technologies or newly formed entrepreneurial business ventures organized to develop and commercialize a specific technology. On the micro-level, the program manager of the program office that originates the topic call for the new technology is a direct stakeholder. On the macro-level, the public is a major stakeholder and is represented by the Congress which funds and oversees the program.

The level of success of an SBIR project is related to the goals and objectives of each stakeholder. The project manager of the sponsoring agency and SBIR are interested in a project outcome, was the technology developed within a reasonable time-frame at a reasonable cost. The firm can have multiple goals, such as, implementing a component of its technological strategy, technological or production superiority through innovation and profitability, and developing a new technology in order to license, sell or spin-off the technology. Sometimes, the firm's objective can be as basic as survival. SBIR and, depending upon their objectives, the firm also want to commercialize the technology.

The conceptual relationships between the SBIR and technological entrepreneurs and a series of research propositions are developed in this paper.

### **Entrepreneurial Orientation**

Entrepreneurship can be distinguished from entrepreneurial orientation. Entrepreneurship can be thought of as a dynamic process of creating something new and assuming the risks and reward (Schumpeter, 1976). Entrepreneurial orientation involves the organizational processes, methods, styles, practices, and decision-making activities employed by entrepreneurs that lead to new entry (Stevenson & Jarillo, 1990; Lumpkin & Dess, 1996;

Lumpkin & Dess, 2001). We discuss and develop a series of research propositions for each of the five components of entrepreneurial orientation --- autonomy, innovativeness, risk-taking, proactiveness, and competitive aggressiveness --- along with possible relationships with the SBIR program. The proposed conceptual interactions between participation in SBIR and entrepreneurial orientations are shown in Figure 2.

[Insert Figure 2 here]

### **Autonomy**

Autonomy can be thought of as the initiative or independent spirit used to develop ideas and visions and to carry them through to completion. Lumpkin and Dess (2001, p. 431) conceptualize autonomy as “independent action by an individual or team aimed at bringing forth a business concept or vision and carrying it through to completion.” Autonomy can involve a relative freedom from organizational constraints and an empowerment to act. Autonomous organizations often empower a key manager to be the primary decision maker or product champion (Shrinivastava & Grant, 1985; Burgelman, 1983).

Participation in a program such as the SBIR can potentially place limitations on a firm’s independence through program oversight, reporting requirements, and other program specifics. Therefore, entrepreneurial firms that are more autonomous would be less likely to become involved with a government program.

P1: There is an inverse relationship between autonomy and willingness to participate in government programs that support technology development.

### **Innovativeness**

Innovativeness “reflects a firm’s tendency to engage in and support new ideas, novelty, experimentation, and creative processes that may result in new products, services, or technological processes” (Lumpkin & Dess, 1996, p. 142). Activities associated with innovativeness include developing new processes, introducing new products/services, supporting R&D, and focusing on technological leadership (Lumpkin & Dess, 2001, Lumpkin, 2002). Market pioneering is often considered an expression of an entrepreneurial orientation (Covin et al., 1999). Technology strategy involves a firm’s commitment to acquire, develop, and deploy technology which is inherently linked to innovation (Lumpkin & Dess, 1996). As the SBIR program was developed specifically to promote innovation, innovative entrepreneurial organizations may be more likely to take advantage of available resources. Therefore

P2: There is a positive relationship between the innovation component of entrepreneurial orientation and willingness to participate in a government program that supports technology development.

### **Proactiveness**

Proactiveness is a forward-thinking perspective which includes activities such as opportunities identification and assessment and forming teams to develop and exploit the opportunities (Kropp et al., 2004). It involves introducing new products/services and acting in anticipation of future demand, and acting opportunistically. Proactiveness is especially important to firms in the early stages of industry development (Lumpkin & Dess, 2001). Proactive firms may be more willing to seek assistance in turning their visions into reality. Therefore,

P3: There is a positive relationship between the proactiveness component of entrepreneurial orientation and willingness to participate in a government program that supports technology development.

### **Risk-taking**

In the context of entrepreneurial orientation, risk can be conceptualized as the “uncertainty and potential losses associated with the outcomes which may follow from a given set of behaviors” (Forlani & Mullins, 2000, p. 309). Strategic risk may include significant borrowing, committing a relatively large share of assets to a project, and venturing into new and unknown territory (Baird & Thomas, 1985, p. 231-232, cited in Lumpkin & Dess, 1996). Although entrepreneurs generally are willing to take risks in return for potential rewards, arguably, when possible, they would prefer to lower the risk aspect of the risk-return equation. Since the SBIR program provides funds to explore technologies and develop prototypes, it helps lower exposure to financial risks. Therefore,

P4: There is an inverse relationship between the risk component of entrepreneurial orientation and willingness to participate in a government program that supports technology development.

### **Competitive Aggressiveness**

Competitive aggressiveness involves a willingness to gain market share by challenging rivals directly (Lumpkin & Dess, 1996). Competitive aggressiveness is more helpful to firms in later stages of industry development (Lumpkin & Dess, 2001). Earlier-stage ventures technology entrepreneurs may often lack the ability or motivation to be competitively aggressive. However, more mature technology development firms may be willing to participate in programs that support technology development as these programs may provide a competitive advantage. Therefore,

P5A: There is a positive relationship between the competitive aggressiveness component of entrepreneurial orientation for a mature technology entrepreneur and willingness to participate in a government program that supports technology development.

P5B: The relationship between competitive aggressiveness and willingness to participate in a government program will be mediated by the firm's stage of development such that earlier forms will be less motivated than later firms.

## **DIRECTIONS FOR FUTURE RESEARCH**

This paper is conceptual and only examines the interactions between entrepreneurial orientation and SBIR. Linkages between environmental and organizational factors need to be examined. The entire model then needs to be tested empirically. Subsequent research should focus on participants in other SBIR programs, and participants in other technology development programs.

## **Abstract**

While generally accepted that entrepreneurship and small firms play a vital role in economic development and job creation, certain areas, such as franchising, have received much less attention than others. A recent study conducted by PriceWaterhouseCoopers for the International Franchise Association examined the economic impact of franchising in the United States and found that franchised businesses provided 9,797,117 jobs and produced output of \$634.6 billion (Price, 2004). However, the percent of jobs, by state, attributable to franchising ranged from highs of 20.0% and 19.4 % for Nevada and Arizona respectively, to lows of 6.3% and 8.1% for the District of Columbia and New York. What accounts for this wide variation?

In this study, the relationship between state economic freedom and the economic impact of franchising will be investigated. The hurdle rate model, borrowed from the field of finance, generally reflects the minimum rate of return that an investment must provide in order to be acceptable to managers of a firm (Liesch and Knight, 1999). Government barriers such as time and money expended in complying with regulations, as well as taxation, reduces the rate of return of an investment in a new business. Stated differently, reduced economic freedom increases the costs and hence, the hurdle rate for new business formation. In this study, we use a hurdle rate model to hypothesize that individual states' economic freedom will have a mediating effect on the impact of franchised business by state.

## **Introduction**

While it is generally accepted that entrepreneurship and small firms play a vital role in economic development and job creation (Shane, 1996), certain areas pertaining to small businesses have received much more attention than others. One of the major areas of entrepreneurship which has been relatively ignored, given its importance, is franchising. Shane and Hoy (1996, p. 325), describe the shortcoming in franchising research by stating that "the lack of research attention paid to this form of business is problematic, given the relative economic importance of franchising." For example, in 1995, franchising accounted for 33% of U.S. retail sales and 10% of U.S. gross domestic product (Shane and Hoy, 1996). While not to suggest that research on franchising is non-existent, the research has left large areas under-explored.

One such under researched area is franchising's economic impact. A recent study conducted by PriceWaterhouseCoopers for the International Franchise Association looked at the economic impact of franchised businesses in the United States and found that franchised businesses provided 9,797,117 jobs and produced output of \$634.6 billion (Price, 2004). This study once again highlighted franchising's importance to the U.S. economy. What this study does not address, however, are the factors which influence the economic impact of franchised businesses on the state level. For example, the percent of jobs, by state, attributable to franchising ranged from highs of 20.0 % and 19.4 % for Nevada and Arizona respectively, to lows of 6.3 % and 8.1 % for the District of Columbia and New York respectively (Price, 2004). What accounts for this wide variation?

Economic freedom as a measure of the cost of starting or expanding a business is one possible perspective from which to examine franchise expansion subsequent impact. In this study, the relationship between economic freedom by state and franchising's economic impact will be investigated.

## **A CONCEPTUAL EXPLANATION OF FRANCHISE EXPANSION & ECONOMIC FREEDOM**

### **Franchising Expansion & Growth**

As previously noted, small, entrepreneurial firms are widely recognized as the primary drivers of economic growth and job creation (Shane, 1996). As a result, various entities, both public and private are intensely interested in assisting small firm growth. As Fischer and Reuber (2003, p.347) have noted, various entities “focus on high growth firms due to their value as job creators.” A wide range of factors influencing firm growth have been looked at, including patterns of growth, measures of growth, external factors, life experiences of the owner-manager, management style, personal factors (i.e. beliefs and expectations) and public sector assistance (Fischer and Reuber, 2003). Widely differing and often competing findings have resulted. Thus, there is no clear overall understanding of how and why entrepreneurial firms, including franchises, grow.

Scholars have applied various theories to the phenomena of firm growth. Despite these efforts, Wiklund et al., (2003, p.254) correctly assert that “knowledge of small firm growth is still quite incomplete and incoherent.” Not surprisingly, due to the large number of factors affecting business growth, an overriding framework has not been identified. Such a framework would be extremely useful to the wide range of parties interested in firm growth. As Morrison et al., (2003, p.424) point out, “Quite simply, if a means to identify what economic and social factors drive small businesses to become growth oriented can be achieved, then support agencies have the potential to target and nurture these factors.”

According to Shane and Hoy (1996), a major unexplored area of cooperative entrepreneurship is franchising. As previously mentioned, various public and private entities expend a great deal of time, effort and, most importantly, money, in attempting to assist entrepreneurship and small firm growth. Clearly, encouraging and assisting a phenomena such as growth, is not possible without a clear understanding of how and why the phenomena occurs. Much of what impacts entrepreneurial firm growth has either not been studied or is still not clearly understood. Franchising, as previously noted, has a significant impact on the United States economy as a whole and this study will examine one of the factors which may help explain this impact.

Elango and Fried (1997, p.69) define franchising as “an organizational form in which a company grants an individual or another company the right to do business in a prescribed manner over a certain period of time in a specified place in return for royalties or the payment of other fees.” These authors also define a franchising system as the franchisor along with all units whether franchised or company owned. Historically, franchising research has utilized three primary perspectives: 1) limited resources (resource based), 2) administrative efficiency, and 3) risk management (Combs and Castrogiovanni, 1994).

### **Measures of Growth & Impact**

There are many possible measures of franchise firm growth and impact. For example, D’Amboise and Muldowney (1988) use number of employees and annual sales as measures of growth. Erramilli and Rao (1993) similarly use employees, while Lee and Tsang (2001) use

growth of sales and profit. More recently, Delmar et al., (2003) define a business as high growth if it ranks in the top ten percent in any one of six categories: 1. absolute total employee growth 2. absolute organic employee growth 3. absolute sales growth 4. relative (%) total employee growth 5. relative (%) organic employee growth 6. relative sales growth. Such programs are most interested in assisting firm growth in terms of job creation (employee growth) while business owners and managers are typically interested in other goals. In this study, we will look at three output measures: jobs, payroll and output. In addition to direct numbers, we will also look at the percentages of these measures in each state.

### **Barriers**

While there are a myriad of barriers to business growth, most parties interested in firm growth wish to know which are the most significant. In general, lack of resources is a barrier for small firms. Barney (1991) identifies three general types of resources: 1. physical capital (physical assets, location, trade names, etc.) 2. human capital (training, experience, judgment, etc) 3. organizational capital (formal reporting systems, coordinating mechanisms, etc.)

Barriers self-reported by entrepreneurs and small business owners may be different from barriers observed by outside individuals. Owners and managers typically cite external barriers such as access to capital and education of available work force as major barriers to growth (Chrisman et. al.1987; Gundry and Welsch 2001). Other areas such as cultural and regulatory differences have also not been directly integrated into the research on this area (Fladmoe-Lindquist, 1996). Conversely, other scholars find that other individuals, such as lenders, service providers or public sector assistance personnel, report internal factors as barriers to growth. These include management skills, lack of planning, and poor accounting practices. Thus, it is not surprising that Elango and Fried (1997) also found that lack of managerial abilities and legal barriers are major obstacles to the spread of franchising. Therefore, barriers and how to deal with them are an important consideration.

How can the barriers to franchising's economic impact be quantified and measured? Economic freedom provides one possible perspective.

### **Economic Freedom**

"Economic freedom is the right of individuals to pursue their interests through voluntary exchange of private property under rule of law. This freedom forms the foundations of market economies," (Huang, et al., 2004, p.12).According to Easton & Walker, (1997, p.328) "we have to establish a framework for considering the issues of ownership and reliance on the market." Economic freedom provides this framework. "In a nutshell, economic freedom is the right of an individual to keep what he earns, produce what he wants, and compete in product and labor markets of his choosing, subject to the restriction that he cannot use force or fraud to further his interests," (Huang, et al., 2004, p.12).

Economic freedom is a concept which has been increasingly studied. According to Huang et al. (2004), "There has been an explosion of academic research on this theme...". For example, The Heritage Foundation in Washington, D.C. and the Wall Street Journal have jointly published an annual report titled Index of Economic Freedom since 1995. The Fraser Institute in Vancouver and the Cato Institute in Washington, D.C., have similarly co-published another cross-country

annual report since 1996 titled Economic Freedom of the World. The first study on U.S. economic freedom was conducted in 1999 by Byars et al., and a 2004 study by the Pacific Research Institute, *U.S. Economic Freedom Index: 2004 Report*, “is an effort to update, refine, and improve on this seminal work,” (Huang et al., 2004, p.12).

This concept of ownership has important implications for economic activity. For example, "Personal ownership of self is an underlying postulate of economic freedom. Because of self ownership, individuals have a right to choose-to decide how they will use their time and talents," (Gwartney & Lawson, 2003, p.406). This includes deciding when and where to invest in a new venture such as a franchise. In other words, the presence of economic freedom will allow the choices of individuals to decide what and how goods and services are produced (Gwartney & Lawson, 2003). These decisions then impact other economic aspects. Easton & Walker, (1997), for example, argue that more economic freedom is associated with higher levels of income as well as faster rates of income growth, *ceteris paribus*. In fact, these authors found support for this hypothesis, "changes in economic freedom have substantial effects on the steady-state level of income. They are fully comparable to those associated with physical investment, schooling and workforce growth," (Easton & Walker, 1997, p.332). What this study does not address, however, is how or why economic freedom has these effects. We propose that hurdle rate theory may provide an explanation.

### **A HURDLE RATE EXPLANATION**

The hurdle rate model, from the field of finance, “generally reflects the minimum rate of return that an investment must provide in order to be acceptable to managers of a firm,” (Liesch and Knight, 1999, p.387). Government barriers such as time and money expended in complying with regulations, as well as taxation, increases the cost of a venture such as a franchise investment. Thus, for a given expected return, lower levels of economic freedom reduce the rate of return of an investment in a new business. Stated differently, reduced economic freedom increases the hurdle rate for new business formation. Our proposed model is similar to Liesch and Knight’s (1999) application of the hurdle rate model to information internalization and enterprise internationalization. In the context of franchising expansion, the hurdle rate model represents the process from an entrepreneur’s exposure to an entrepreneurial opportunity through information search to the decision to invest in a franchise.

The X-axis in Figure 1 is the market economic freedom. The Y-axis illustrates the aggregate cost (in money, time and effort) of establishing an entrepreneurial venture such as a franchise in a market.

---

Insert Figure 1 about here

---

As a market’s degree of economic freedom decreases, the corresponding costs of new venture investment increase as shown. While the desired return from an entrepreneurial investment will vary with each entrepreneur, an increase in the cost of the investment will raise the relative hurdle rate. Markets with decreasing economic freedom thus represent an increase in the

relevant hurdle rate associated with costs of investment in a new business. This applies to both franchisors and franchisees.

For example, Elango and Fried (1997) found that franchisors need to reach a minimum size in order to cover transaction costs of expansion, although what exactly this minimum size is has not been clearly defined. Huszagh et al. (1992) demonstrated that experience and size are important considerations in franchisors' international expansion decisions. Large franchisors which typically have greater resources and experience, for example, consider overseas market entry as a natural extension of domestic business (McIntyre and Huszagh, 1995). Similarly, Julian and Castrogiovanni (1995), found that domestic U.S. franchisor expansion efforts depend on both market opportunities and firm capabilities.

We therefore propose that an entrepreneur's decision to expand into a certain market via a franchise investment will be affected by the market's economic freedom. Reduced economic freedom will limit franchise expansion that might otherwise have occurred. Therefore, using franchising as a proxy for investment in new ventures, we expect that markets with greater economic freedom will see a greater economic impact from franchising. Specifically, in this study, we use a hurdle rate model to hypothesize that individual states' economic freedom will have a mediating effect on the impact of franchised businesses. Our research model is presented in Figure 2.

---

Insert Figure 2 about here

---

### **Hypotheses**

H1: States with greater levels of economic freedom will exhibit greater numbers of jobs caused by franchising as a percent of state jobs than states with lower levels of economic freedom.

H2: States with greater levels of economic freedom will exhibit higher levels of payroll caused by franchising as a percent of state payroll than states with lower levels of economic freedom.

H3: States with greater levels of economic freedom will exhibit greater levels of franchising output as a percent of total state output than states with lower levels of economic freedom.

### **Methods**

Franchise impact data for all fifty states was reported in the International Franchise Association's *Economic Impact of Franchised Businesses*. Specifically, we used data pertaining to franchising's impact in three areas (jobs, payroll and output) in 2001. Data on economic freedom comes from the Pacific Research Institute's *U.S. Economic Freedom Index 2004 Report*. This report is a composite of data gathered on 143 variables from 1995 to 2003 and reports the economic freedom index value for each state (Huang et al., 2004). Data for control variables is from the U.S. Census Bureau and is also for 1991.

Franchise impact was measured with three dependent variables. These variables are percent of total jobs in the state attributable to franchising, percent of total payroll in the state attributable to franchising, and total output in the state attributable to franchising. Numbers attributable to franchising are a wider measure than numbers directly in franchising. That is, not only are jobs directly in franchising counted, but jobs created as a result (suppliers, consultants, etc.) of

franchising as well (Price, 2004). Percentages are used to account for scale effects due to the wide variation in state size.

Economic freedom, the independent variable, is measured on a scale index of 1 to 50 with 1 being the least free and 50 being the most free. The control variables are total state employment, state unemployment percentage, and educational employment by state (both high school and above and bachelors and above).

## **Results**

We began the analysis by examining the correlation between the independent, control, and dependent variables (Table 1). Ordinary least squares regression was then used to test the hypothesized relationship between economic freedom and franchising impact (Table 2). Model 1 shows the impact of economic freedom and the four control variables (total employment, unemployment percentage and educational attainment) on percent of jobs by state attributable to franchising. Model 1 was significant ( $p < .01$ ) and had an  $R^2$  of .477, indicating that the variables explained a significant portion of the percent of jobs attributable to franchising variance by state. The “Economic freedom” variable was significantly ( $p < .01$ ) related to the percent of jobs. None of the control variables was significantly ( $p < .01$ ) related to percent jobs, although educational attainment (bachelors or higher) was significant ( $p < .01$ ) before the addition of economic freedom.

Model 2, Table 2, shows the impact of economic freedom and the control variables on the percent of payroll attributable to franchising by state. This model was also significant ( $p < .01$ ) and had an  $R^2$  value of .412, also indicating that the variables included in the analyses explained a significant portion of the percent of payroll by state variance. The economic freedom variable was significantly ( $p < .01$ ) related to percent of payroll attributed to franchising by state. Model 3, Table 2, shows the impact of economic freedom on percent of total state output attributable to franchising. Model 3 was also significant ( $p < .01$ ) with an  $R^2$  value of .206, indicating that the included variables once again explained a significant portion of the variance seen in percentage of state output attributable to franchising. Once again, the economic freedom variable was significantly ( $p < .01$ ) related franchising impact on the state level.

The first two regression models provided strong support for hypotheses 1 and 2. As hurdle rate theory would predict, franchising had a proportionately greater impact in the areas of jobs and payroll in states with greater levels of economic freedom. Similarly, the third regression model provided strong support for hypothesis 3: franchising had a proportionately greater impact on output in states with greater economic freedom. Although the relationship between economic freedom and state output is strongly supported, economic freedom appears to have a greater impact on jobs and payroll than on output.

## **DISCUSSION**

Franchising plays an important role both domestic and international business, yet previous franchising research tends to ignore the true impact of franchising and possible determinants (Shane and Hoy, 1996). Furthermore, few, if any studies have examined the role of economic freedom and investment hurdle rates on franchising expansion and economic impact. This study

applies both of these concepts to examine franchising's economic impact. Specifically, we sought to study what explains the wide variation of franchising impact by state.

In general, our findings provided strong support for applying a hurdle rate model to franchising's economic impact using state economic freedom as a proxy for the cost of investment in a franchise business. This indicates that greater levels of economic freedom will make it more likely for entrepreneurs to choose to invest in a new franchise business or expand existing franchise businesses. Economic freedom's positive impact on jobs, payroll and output by state indicates that greater levels of economic freedom do lower the hurdle rate for franchising decisions. The impact of economic freedom was found to persist even after controlling for total state employment, unemployment rate, and educational attainment.

### **Implications and Limitations**

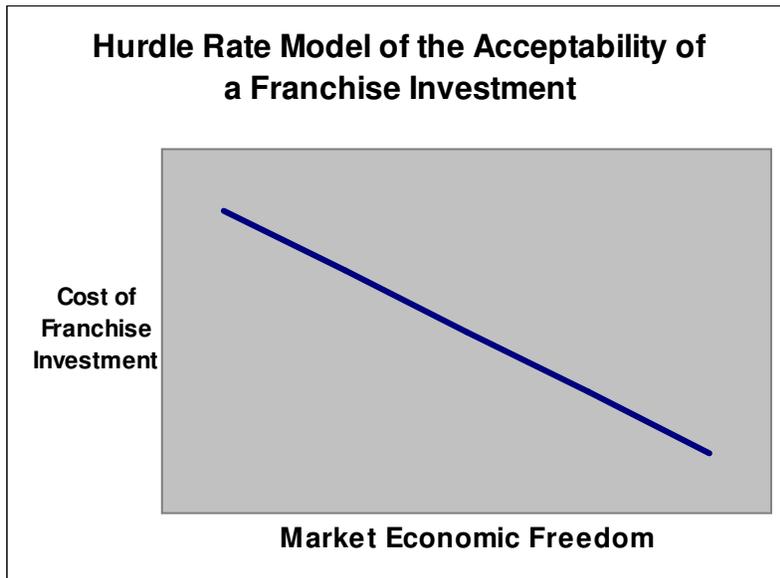

This study has important implications for researchers, entrepreneurs, and policy makers. Intuitively, one might expect franchising's economic impact to have a roughly linear relationship with a state's economic size and performance. However, this was not found to be the case. While we found that economic freedom does affect franchising's impact, future research should look at other categories. For example, we did not differentiate between different types of franchising (business format franchising as opposed to product distribution models). We also did not differentiate between franchisor-owned and franchisee-owned establishments. In addition, our study only looked at United States data. Future research should look at national levels of economic freedom and the resultant impact on franchising. Finally, this study provides a cross-sectional view of economic freedom's impact on franchising. Longitudinal studies should provide additional insight to the relationship between these phenomena.

# Capacity building- Is this a conscious approach to change?

## Role of Support Organisation in Capacity building.

### Shakeel Abro

SPO Strengthening Participatory Organisation

This research paper explores the concept of the “Capacity building”, examining its contours and its potential in enabling organizations (grassroots level voluntary organizations) to meet the challenges of the demanding milieu in which they now operate.

#### *Researcher:*

Researcher Mr. Shakeel Abro is working in SPO Strengthening Participatory Organisation Pakistan as senior coordinator Projects. He did his Masters in Business Administration-MBA with specialization in Marketing and Masters in Economics. He is doing his M. Phil in Development Studies from Sindh Development Studies Center. He has completed a year long training course in Managing People and Organizations from LUMS under LUMS-McGill (Canada) NGO Management Program for Pakistan. Institute of International Education Development-IIED San Francisco under Leadership Development Mechanism (LDM) awarded him a fellowship for undertaking an International development course on Management of Community Based Services from Nairobi-Kenya. He has an extensive field and office experience in Community Development, Administration and Management. He has his internship experience with Pakistan National Shipping Corporation-PNSC Karachi. He is affiliated with International Association for Community Development-IACD U.K. He got appreciation from World Bank Washington for Pakistan Country Assistance Strategy-CAS assessment visits. Commonwealth Foundation-UK granted him sponsorship for

organizing a series of training seminars at Commonwealth Peoples Festival Oct2001, at Brisbane-Australia.

Parallel to this experience he invested his valuable time by participating in various seminars, workshops, training program's and exposure visits like Grameen Bank Bangladesh, BRAC and Proshika. In the IT field he has command over MS-Office includes MS-Word, Excell, PowerPoint and MS-Project2000 package and Epiinfo software. He is using frequently Internet and online computer use. He is good at report writing and has written regular progress reports and Research Papers.

He initiated his career by a joining an NGO working in Primary Health Care, Micro Enterprise, Quality Education, Water and Sanitation, Community Organization with their capacity building. He established NGO's first office in a very sensitive area and successfully led a 34 professional team. He has a special interest in Human Resource Development both at organizational and grass root level. At present he is working with a Multi Donor Supported National Organization engaged in providing technical support in trainings and project designing to NGOs. Priority areas are Health, Education, Agriculture and Environment.

### ***Introduction/Abstract:***

This paper has emerged from the research undertaken by the researcher in the field area of NGO where he works. A partner CBO was selected to study and to better understand how capacity building is implemented in practice, what actually happens, what works and why. The need of this research is realized in wake of the situation that despite 50 years of development assistance and investment, there remains an unacceptable level of poverty and inequality in the world and specifically in Pakistan. It will be argued that local communities, their institutions, networks and governments need to be strengthened so that the people themselves can play an effective role in identifying their own problems and lead development in their own context. Capacity building in this regard, particularly from its holistic perspective, is considered to be the best approach to strengthening capacities at individual, organizational and societal levels and to bringing a balance between micro-and-macro development initiatives. Many development professionals believe "capacity building" is a very useful tool, and the international aid community is placing growing emphasis on it as a key to reducing poverty and hunger.

This paper revolves around the critical assessment of the capacity development efforts undertaken by the Strengthening Participatory Organization (SPO), a national support NGO in Pakistan, and more specifically how SPO's approach can contribute to achieve the rights-based development objectives.

This paper reveals the results of a CBO, which was selected and was assessed at two levels. Before training and after training. Assessment tool in practice was Capacity building Indicators-CBIs through Learning Information System LIS . The background of this research is the term 'capacity-building' which has become almost synonymous with 'development' in many aid circles. Almost all the donors, The World Bank, international NGOs, and some local NGOs are prioritizing capacity building. It is therefore critical to analyze carefully the practice of capacity building to ensure that we learn from others' experience and avoid the danger that the term 'capacity-building' becomes merely a cosmetic

and meaningless addition to all proposals and policies. Capacity building is a conscious approach to change which, if taken seriously, has very radical and far-reaching implications not only for skills and behaviours, but also power dynamics within and between organizations.

This paper seeks to contribute to our understanding of capacity-building by analyzing a number of specific capacity-building interventions, drawing out the issues and insights from practice. It also highlights the consequent implications, particularly for NGOs involved in developing strategies for capacity-building. It is aimed at all development professionals engaged in capacity-building, but has particular relevance to NGOs, and capacity-building providers.

### **Why capacity building?**

Many contributors to the debate now suggest a greater emphasis on people in organizations as ;

*'Companies realize that in order to remain competitive they must utilize their human resources more efficiently'* (Morgan A. 1996:24).

In the introduction to his book *Imaginization* (Morgan 1993), Garreth Morgan reminds us that;

*'an organization has no presence beyond that of the people who bring it to life'*.

This concurs with Egan's (1988:46) view that,

*'people make things happen in companies and institutions'*

while Handy (1994:152) counsels that,

*'we must make people our assets'*.

Fisher & Torbert (1995) and Harvey-Jones (1994) stress that

*unless people in an organization are transformed, the impact of change is limited.*

Therefore it seems that if organizations are to respond successfully to rapidly changing circumstances, this process is dependent on the people in the organization to forge the new path to progress.

It comes from experiences of many development organizations that one way of facilitating this process is to create a learning process where people can learn from their own experiences. Many scholars also suggest that

***'people are continually learning how to learn together'* (Senge 1993:3).**

In fact McKergon (1994:16) reports that

*'learning, both by individuals and in organisations, is proving to be one of the key business topics of the 1990s'*.

One convincing reason for this focus on learning is that it is seen as a means of gaining competitive advantage. As Mayo (1995:14) reports'

*'the pace of change needed in today's world makes flexibility and rapid effective learning key competitive advantages'*,

For creating a learning organization we need to view capacity building from a holistic perspective, rather than addressing human, societal and institutional development issues in parts. Studying different parts and hoping thereby to capture the whole, it is argued that we need to generate a picture of the whole through exploring the relationships between the

various parts, because it is through these relationships that the complexity of the whole emerges.

Capacity building at best promises a process whereby individuals, groups, organizations and societies enhance their abilities to identify and meet development challenges in a sustainable manner. It makes local communities, organizations, and governments of developing countries key actors and places them in the center for their own development.

## **Development Context**

### ***Development in Pakistan***

Pakistan has started the new millennium with more hope. Starting from a position of extreme vulnerability at the end of 1990s- a financial crisis, domestic tensions and external isolation- it has achieved a remarkable turn around. A major factor behind this is strong leadership in the country with internal cohesion and a clear sense of direction. The government is engaged in fundamental political, institutional, economic, social and gender transformation of Pakistan's transition towards a modern Islamic state.

### ***Social Sector Development in Pakistan***

Pakistan inherited an agrarian economy with poor physical and social infrastructure. At the time of independence, only 13.2% of the total adult population was literate (8.6% of the adult female population). There were only 8,413 primary schools, 2,190 middle schools, 408 high schools, two universities and no professional colleges in the country. The health situation was even bleaker, with only 13,769 hospital beds and fewer than 1,500 registered doctors.

Development policy during the first decade was characterised by three features: First, the emphasis was on the establishment of import-substituting industries. Although consumer goods were being substituted by domestic production, all the machinery needed for the capital intensive industrialisation had to be imported. Second, the agriculture sector suffered seriously from official neglect in resource allocation with the result that the overall economic performance was hampered by stagnation in this sector in the 1950s. Finally, miserly allocations for education and health established a pattern of neglect in the provision of social services, particularly for the poor.

The early 1960s were again a period of substantial economic growth. Similar high priority was accorded to industrial development and the infrastructure base was strengthened through investments in transport, water and power which was supplemented by foreign aid. The 1965 war led to the first in a series of disruptions of the aid flow.

Aid resumption in the latter part of the 1960s was accompanied by a further change in focus. Agriculture now became the primary recipient of aid as the impact of the Green Revolution began to be felt. This also gave the wrong signal to the policy makers that there was no need to worry about population growth - Pakistan could feed itself. As a consequence, the government was able to delay hard policy choices.

The most significant economic development was during the late 1970s and 1980's due to the dramatic growth in remittances from the Middle East. These were however accompanied by accumulating structural imbalances in the economy. It was during the 1980s that the natural consequences of the gross neglect of the social infrastructure also began to appear. The quality of existing public education and health facilities deteriorated while the unmet demand for primary education and health set the agenda for increased and more efficient use of resources in the social sectors. To suggest that the government began to accord high priority to the social sectors would be an exaggeration. However, resource allocations towards the end of the decade do represent an increase from the low base that had plagued human development in Pakistan throughout its previous history.

Since 1988, successive governments in Pakistan have been committed to the policy initiatives necessary to implement social sector programmes. The National Finance Commission which met in April 1991 (for the first time in 15 years) was a significant move in clarifying the respective responsibilities of the central and provincial governments in relation to human development. The impetus to social policy change and increased spending has been a result of the government's realisation that poor performance in the social sectors has not only hampered other development objectives but also affected Pakistan's image in the region and the world.

### ***Role of NGOs as Agents of Change***

The role and perspectives of NGOs in Pakistan have grown and evolved over the years. Mainly charitable and philanthropic organisations at the time of independence, NGOs have stepped increasingly into welfare-oriented roles as the state system failed to deliver. In the 1970s, they shifted towards development and community based initiatives. Over the last decade or so, organisations with the specific objective of mobilising and organising targeted communities for development activities have emerged. Most NGOs are supported by community contributions, local donors, and government funds. In recent years, support from international donors has also become available.

Among NGOs working in the area of social, agricultural and rural development, three types are significant. The first are the national level capacity building and/or funding organisations. These include SPO, SAP and the NGO Resource Centre (NGORC). The second are the more regionally focused support organisations such as Sungi and Pattan. They work directly with community based organisations to transform their orientation from being welfare oriented to participatory development and afterwards support their development projects. The third type are the Rural Support Programmes that have followed the Aga Khan Rural Support Project (AKRSP) model of forming village or community organisations and enhancing productive investment activity. Prominent among this is National Rural Support Programme (NRSP).

In a 1991 study, the UNDP and SPO compiled a list of 5,833 NGOs. In 1994, a TVO Study updated this information base and identified 8,547 NGOs. After excluding religious organisations, professional and commercial associations, employee unions, housing societies, clubs, clinics and hospitals, 4,545 organisations remained. Of these, 1,998 did not exist or could not be found. A more recent survey of 200 NGOs from the same sample showed that

more than two-thirds of the NGOs surveyed are involved in the provision of education in one form or another, whereas more than half of them are also providing health and nutritional services. Of the NGOs working in social sectors, the survey showed that twice as many are concentrated in the urban than in the rural areas.

In essence, the NGOs play an important role in the social sector development and their impact is significant. As commented by World Bank CAS 2002 that *NGO implemented program of building social and physical capital and extending micro credit schemes under the PPAF is a very successful scheme.*

### ***SPO's Niche and Distinctiveness***

Since its transformation from a bilateral project to a Pakistani NGO, SPO has carved out a distinctive niche for itself. SPO has become recognised as a leading proponent of participatory development in Pakistan and is heavily engaged in capacity building of Community Based Organisations (CBOs). Among all organisations strengthening the development capacity of rural communities SPO has a unique position and role in development with innovative capacity building strategies. SPO's partner organisations enjoy independence and a strong self-help orientation. When it comes to ownership and sovereignty, even the AZTs and WOSs which SPO has helped to form and capacitate, are never regarded as being owned or managed by SPO. From the outset, they and their communities are encouraged to value and protect their independence and legal entity.

Similarly, SPO's national presence, democratic and horizontal structures help to ensure that whilst there is a common image and pursuance of SPO's Mission, the regional centres operate in a decentralised decision making environment which is responsive to both the local needs and corporate standards. Another distinctive feature relates to the issue of gender. All of SPO's policies, procedures and programmes are regularly checked to ensure an increasing level of gender equity. The principles of gender equity are applied at all tiers of SPO management, from the composition of the general body and elections of the Board of Directors to the hiring and training of programme and administrative staff from SPO in-house practices to capacity building of partner organisations.

Furthermore, the creation of and support to Participatory Development Coalitions (PDCs) are unique to SPO. They are part of SPO's phased approach to ensuring long term support to partner CBOs. They provide a natural exit point for SPO allowing it to reduce its direct support following its contact cycle of capacity building. At the same time, through its PDCs, SPO is able to encourage the development of self-sustaining area-based capacity building organisations which respond directly to their member CBOs.

All of this has helped develop and strengthen SPO's niche as a truly national rural development support organisation which is attracting national and international recognition, in its own right.

## *How SPO builds the capacity /SPO Programming*

### **Contact Cycle for Capacity Building**

The CBO Capacity Building Contact Cycle is the focal point of SPO's approach to social development. A typical cycle normally lasts three years and includes five main elements:

- 1. Area Survey for CBOs Selection:** The Contact Cycle begins with a survey of suitable areas in the country. Areas where SPO already has contacts are given preference. Support and information from other CBOs is requested to study the accessibility and the law and order situation of a particular area. Efforts are also made to find out whether other support agencies are working there and whether there exists any secondary baseline data prepared by other agencies. The role and communication of the area with the Social Welfare Office is another element that is taken into consideration while assessing whether SPO's potential for the area and whether there is good potential for positive replication of SPO capacity building program.
- 2. Identification, Assessment and Selection of CBOs:** The next step is identification of potential partner CBOs which are situated with access to each other. This step relies on extensive field work, personal scouting of the area, meeting with potential CBOs, reviewing existing documentation of local groups and assessing if the selected groups will be receptive to SPO program. A list of CBOs in the area is prepared and invitations to SPO's "orientation meeting" are sent to all organisations on the list. Attendance, interest and response exhibited by the CBOs at these meetings and the mutual information shared helps in assessing the CBO interest in SPO. There are direct one-to-one meetings between SPO and individual CBOs as well as group activity with several CBOs to develop a rapport. At this stage, a Rapid Organisational Appraisal (ROA) is undertaken with each CBO. The ROA includes institutional mapping, socio-economic profile of the area, organisational history of the CBO, historical prospective of the CBO and comparison with other development ventures in the area. This step concludes with the mutual selection of about six to eight CBOs to participate in the Contact Cycle as a cluster.
- 3. Cluster Formation:** CBOs selected to participate in the Contact Cycle are then organised into a cluster. SPO Programme Co-ordinators and CBOs prepare a Partnership Plan (PP) adapting to the needs of each of the selected CBOs through a process called Participatory Organisational Review (POR). The POR process includes checking on the desirable qualities, essential qualities and killer characteristics in order to help CBOs realise their strengths and weaknesses and also help them understand their optimum potential.
- 4. Capacity Building:** The PP sets in motion a cycle of training in Development Planning and Management (DPM), technical assistance and feedback, networking, linkages, funding of selected projects accompanied by continuous monitoring and follow-up. The DPM training modules were developed in 1992 and have since been improved upon in the light of CBOs needs and SPO experiences gained in the field. DPM courses are designed so that CBOs become thoroughly familiar with development concepts and approaches; and develop appropriate skills in organisational management as well as project planning, development, implementation and monitoring. These skills are essential if CBOs are to play an active role in their community's development.

- Environmental Issues -A
- Environmental Issues-B

### Putting learning into practise:

After attending each training CBOs have to transform their knowledge into practice and SPO Staff conducts followup visits in the CBO target areas to further reinforce the knowledge imparted. SPO also provides funds for small projects that have been conceived and developed by the CBO thus putting into practice the skills acquired during DPM. Technical assistance and backstopping is provided by SPO during project implementation to ensure that these CBOs get the most out of these small projects in terms of capacity building.

**5. Reduced Support:** Once a CBO Contact Cycle is completed, SPO begins to pull away to a point where the relationship with the CBO is limited to contact and networking. By this time, the CBO has attained the ability to manage its work independently, to carry out networking, linkages and training, and to share expertise within its own cluster as well as with CBOs in other clusters. The CBOs are also encouraged to develop linkages with donors, government departments and other support agencies/organisations for long term funding and sustainability.

### **Approach of SPO:**

SPO's approach differs from other Pakistani NGOs in the sense that it concentrates on developing **capacity building partnership plans** with clusters (groups of 7-8 CBOs/WOSs) instead of individual community based organisations. Once the CBOs are identified or the WOSs formed, SPO groups these into a geographical cluster for capacity building activities. There are two major advantages in doing so: firstly, this approach minimises SPO's human and financial efforts put into capacity building of individual organisations and is therefore an efficient and cost effective way to impart capacity building. Secondly, the formation, strengthening and sustainability of a cluster encourages mutual co-operation among member organisations and provides an opportunity for member organisations, and in turn their individual members, to understand, develop consensus on and co-operate in the development of their common geographical area.

Linkages are encouraged among member CBOs/WOSs so that a local base of information and support services is established at each cluster level. The focus of SPO is to enable local groups make decisions related to resources themselves i.e. acquire and use local and external resources in a way that ensures greater participation and accountability in the use of development resources. These clusters once capacitated, can then provide a focal point for development activities in the area and are the first step in becoming Local Area NGOs and later PDCs.

### **The Learning Information System**

Central to SPO's desire of developing into a learning organisation is the Learning Information System (LIS). In order to learn from it's experience, SPO has to make it's monitoring and reporting system more efficient and the information produced more accessible and available. To assist in this area, SPO has been developing a computerised system, the LIS. The LIS is a database of performance information which SPO uses in a variety of ways including:

1. Tracking the transformation of Community Based Organisations (CBOs) into development organisations (CBDOs) - The LIS has a 5 point maturity scale, in addition to a range of Capacity Development Indicators (CBIs) that are used to represent the different steps of the transformation. These steps can be examined on screen or printed out for a particular CBO or a cluster of CBOs.
2. Tracking the progress of CBOs through SPOs contact cycle - Each month the LIS receives data from the regions on the steps of the contact cycle completed for each CBO. This data is then compiled into tables which show the progress of the CBOs in each of all clusters.

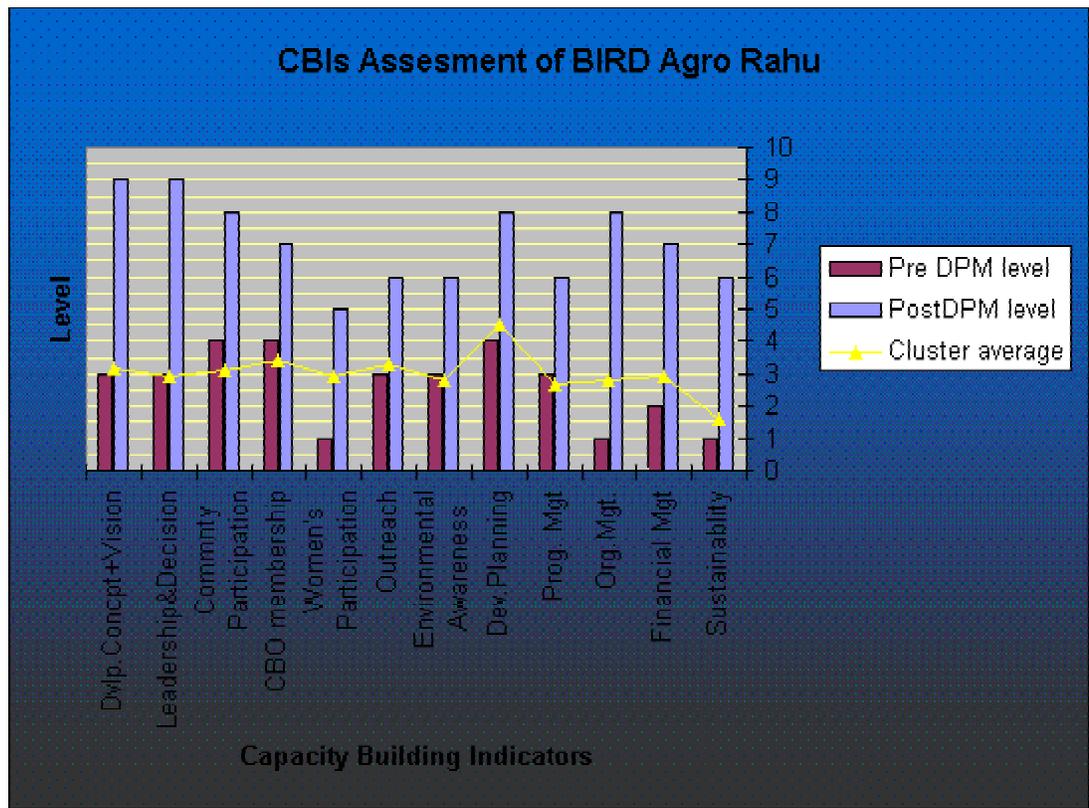

3. Learning about the effectiveness of its capacity building inputs - By measuring the process of transformation over time, including baseline information, SPO can learn about how CBOs respond to different components of the contact cycle, why some CBOs progress faster than others, even in the same cluster, why particular inputs may be more effective than others, and how some inputs may need to be customised for different regions.
4. Producing monthly reports of activities undertaken versus planned - The LIS compiles activity data from all the regions which is printed out in graph or table form
5. Preparing for field and monitoring visits - The LIS is used to print background information on the CBOs to be visited

The LIS has been a useful tool for SPO in the continuous enhancement of its performance through applied learnings. SPO has also shared its experience with other NGOs in Pakistan. SPO is committed to improving and extending this tool to other areas of its operations in a phased and realistic manner.

## Case study of a partner organization :

### Assesment of a Partner Organisation through application of CBIs-Capacity building indicators

**CBO below 35%**  
**Operational CBDO**

## **Stages and Characteristics of CBO**

### **Development concept and Vision(Ideal CBO)**

CBO is totally oriented to developmental approach of self help and empowerment.

CBO's activities contributes to the achievement of Vision and Mission

CBO has developed a strategic plan for next five years.

### **Leadership and Decisionmaking.(Ideal CBO)**

Secondline leadership in place.

Leadership monitors the performance and review the strategy.

Member feel positive about all decisions.They feel that their concerns about these were heard and discussed.

Leadership is participatory.All opportunities are shared with solved as appropriate.

All problems are recognised and solved as appropriate.

### **Community Participation(Operational Development Oriented)**

Every body benefits or is allowed to avail equal benefits from CBOs work.

Community participates in identifying planning,managing & supervising programmes.

Majority of the community is invoved in key decisions.

### **CBO Membership(Operational Development Oriented)**

More than 70% of the poor and middle class householdsa are represented.

65% of households are represented.

75% of members attend every meeting/50% participate.

75% of the members pay membership fee.

### **Women Participation(Development oriented with some gaps)**

Some of the CBOs activities are addressing women issues.

Women issues are discussed through male community.

Women membership initiated.

Women are consulted before making decision.

### **Outreach(Development oriented with some gaps)**

CBO is well known within its community.

CBO is a member of district level networks.

CBO is in contact with line departments but the relation is formal.

The CBO has received funding but has yet to acquire sufficient credibility to be considered by other donors.

### **Environment Awareness(Development oriented with some gaps)**

Members activity seek information on environment.

CBO consciously practice traditional conservation methods.

Members have attended in depth training on impact assesment.

### **Development Planning(Operational development Oriented)**

Management has a comprehensive system for program development and implementation.

This system can provide required information to donor

The budget reflects program plans. the budget is controlled on an ongoing basis.

### **Program Management(Developmenty oriented with some gaps)**

Informal system exists to monitor program activities.

CBO prepares reports on demand of donor but do not share with other stakeholders.

Basic evaluation is carried out on demand of donor.

### **Organisational Managemen(Operational Development Oriented)**

Adminstrative procedures and manuals exist but are not referred to regularly.

Regular meetings are held with preplanned agenda and appropriate action is taken on decisions.

CBO has achieved most its targets planned during last year.

**Financial Management(Operational Development Oriented)**

Financial procedures and reporting systems are in place and function partially. Funds are managed for each project separately.

Independent audits or external financial reviews are performed periodically on donor's request.

Internal audits are being conducted on an ad hoc basis.

CBO occasionally produces accurate and complete financial reports which it makes available to the management and donor.

**Sustainability(Development oriented with some gaps)**

CBO has mobilised significant in kind contributions from within its own community

e.g.(voluntary labour/use of space/technical assistance)

The PO has a shared vision but as yet lacks the understanding and skills to interact with other development partners.

Members have skill to plan manage the projects but they are not confident enough.

**Conclusion:**

Findings of this paper concludes that the “capacity building” is a very useful approach but we need to view capacity building from a holistic perspective, rather than addressing human, societal and institutional development issues in parts. Studying different parts and hoping thereby to capture the whole, it is argued that we need to generate a picture of the whole through exploring the relationships between the various parts, because it is through these relationships that the complexity of the whole emerges.

This paper concludes that the Capacity building should be seen as a process whereby individuals, groups, organizations and societies enhance their abilities to identify and meet development challenges in a sustainable manner. It makes local communities, organizations, and governments of developing countries key actors and places them in the center for their own development.

Paper also concludes that this process should be monitored with some monitoring tool like LIS that provides continuous feedback on set indicators how the CBO is moving towards the path of capacity building.

# **DEVELOPMENT OF WOMAN'S BUSINESS IN UNDEVELOPED ENTREPRENEURIAL SURROUNDING – THE CASE OF SERBIA**

## **Abstract**

The women's business in Serbia belongs to the most dynamic domains of the development of real private sector and strongly marks the process of privatization of economic activities. The space half opened by the institutional possibility to privatize the development in early nineties of last century, stimulated a large number of women in Serbia to take their economic fate in their own hands. Emphasis in the development of woman's business took place, first of all, in the creation of new jobs for that part of population which is the victim of the existing model of restructuring the economy and enterprises. Accordingly, the engagement of women in Serbian business is mainly based on self-employment and foundation of shops and micro enterprises, in classic service activities. However, moreover, the woman's business due to its cumulative influence to the whole privatization of production and employment represents one of the key factors of changes in the socio-economic system of Serbia. The basic limitations for the development of the modern woman's business in Serbia take place in an antientrepreneurially oriented national surrounding. In spite of the political and institutional transformation of Serbia, existing situation continuously shows that the distribution of political power, in a large extent, also influences the distribution of economic results and that, on this basis, the limitation of individual economic freedom is not favorable for the dynamic development of entrepreneurship and small business. An additional difficulty for the position of women in business represents a patriarchal cultural and social heritage. For this reason, for women's entrepreneurs in Serbia, the creation of their own business is not the single challenge but also the foundation of organizations (business associations and networks) having as their basic function – efficient actions in the process of making political decisions in the sphere of economy.

## **Introduction**

Changes imposed by the restoration of capitalism, restructuring of economy and privatization of enterprises cannot be imagined without a substantial access to the problem of the development of women's business. The development of the women's business represents a dynamic, insufficiently known and for the society of Serbia wholly new phenomenon. It is unclear and imprecise whether and how many economic, social and political currents are or are not going in the favor of women's business. The development of this business, in foregoing fifteen years in Serbia took place in the characteristic circle of economic recession and intensive social partitions where the low rate of employment in the production factor generated a low demand and the low demand a low production leading to the further diminution of production. This is the reality of Serbia. The exit from such situation should be found, according to the

principles of functioning of modern market economies, in processes stimulating entrepreneurial spirit and maximization of efforts, otherwise neglected, as: originality, ability to run a business, executive knowledge in creation – all mentioned in order to develop and implement new organizational principles and technologies with high competitive values and high profitability. However, Serbia, although situated directly at the frontier of the second (by its significance) global pole of the socio-economic development is far away from this process. For this reason, the purpose of this work is to indicate everything insufficiently known and visible within the problem of treating the women's business in Serbia as a development component in resolving the problems of an undeveloped entrepreneurial surrounding.

In accordance with this, in the work will be treated the following aspects: (1) Why the actual privatization of the economic life of Serbia did not give a strong impulse to the development of the women's business? (2) What is the (potential) role of the woman's business in restructuring the economy and privatization of enterprises in Serbia, to the criteria of modern market economy, especially in the segment of self-employment and development of micro and small enterprises? and (3) What should be done to stimulate and promote the woman's business in Serbia, within a generally antientrepreneurially structured socio-economic surrounding featuring strong patriarchal traditions?

### **Privatization of economy and economic development and woman's business in Serbia**

The problem of restructuring the economy and privatization of enterprises, in the present research, is treated, first of all, from the standpoint of the privatization of development, id est the establishment and development of new, privately owned enterprises that should move the society and economy of Serbia from its development lethargy which lasts already twenty five years (the last year with a valuable rate of economic growth was 1979). In this context, the actual process of the restructuration of economy and privatization of enterprises owned by the state of Serbia is characterized by the fact that there is the lack i. e. insufficiency of market rules, meaning that social and economic problems are not alleviated and removed – on the contrary, they are deepened.

The space, half-opened by the institutional possibility of the privatization of development, stimulated a large number of women in Serbia to take their economic destiny in their own hands, in the first line by the self-employment and establishment of shops or micro-enterprises, mainly in service activities. The basic data concerning the role of woman's business in Serbia are given in the Table 1.

---

Table 1 about here

---

At the first sight, information on the dimension of small business and entrepreneurship are very impressive. When comparing these data with the number of inhabitants, the result, in Serbia, in 2003, is 69 shops, small and medium size enterprises per 1.000 inhabitants. However, because, in the same year, only 67.000 were active small and medium enterprises (due to very liberal legislation between 1990 and 1994, a very large number of private enterprises was registered, but their major part never carried out a market operation and, due to an undeveloped

economic administration, such enterprises were not erased from the register of enterprises); that way, the above ratio may be corrected to 41,5 shops and small and medium enterprises: this figure is slightly lower than the average ratio of European Union. However, while the shops, small and medium enterprises in EU participate in the creation of its GDP with 40% - 60%, depending on the member country, their participation in Serbia amounts to 20% - 25% (here should be taken into account that the national product per capita, with reference to the internal purchase prices in Serbia, amounts to only 20% of the average of EU). But, let's return to the woman's business. The presented data, fragmentary due to the undeveloped national statistic service, demonstrate that the woman's business in Serbia has very poor dimensions. An average woman's business unit is a shop where its female owner is the single employee running a business or rendering some other classic services. The comparison between the male and female business gives a conclusion that the woman's entrepreneurship in Serbia is a very rare resource. The rate of entrepreneurship in last 15 years, after the liberalization of the right to private property (also including unsuccessful attempts to open shops and enterprises in this period) in Serbia, for women amounts to only 29,6 per 1.000 women aged 18 and more years while, the same rate, for men, amounts to 144,4 per 1.000 or, relatively, 5 times more.

The qualitative and quantitative analysis of the development of the woman's business in Serbia and researches carried out in order to identify the reasons of its failures and missings show that the basic difficulties of the wider penetration of entrepreneurship should be observed within a context that national reformers, in fact do not accept the basic rules of the market economy. Namely, the social and political elite of Serbia undoubtedly understands and performs the privatization as an standard for the external valuation of the success of reforms and not as a means for the establishment of the new (national) entrepreneurially oriented ambient of an economic system. The establishment of the private property instead of the state owned sector (Serbia belongs to countries where in the short period of only fifteen years the attempt of the privatization in all of three known forms was made: after an initial attempt to introduce so called "popular" capitalism in the spirit of Thatcherism, the privatization process was continued with an institutionally unsettled process of the concentration of the property in the hands of a (new) national financial oligarchy and, after the change of the dominant political option, at the end of 2000, was supplemented with the take over of the property of enterprises with the monopoly and oligopoly control of national markets by transnational corporations or investment funds located in exotic states, probably with the dominant influence of our home capital) is treated as an goal per se and not as a factor which should, first of all, contribute to the amelioration of living condition of the mayor part of population via the massive activation of entrepreneurial abilities and individual savings (so, e. g., only the annual inflow on the basis of financial assignments of our workers employed in foreign countries amounts to 11% of the value of GNP) in order to, combined with the higher degree of economic freedom, provide basic conditions for a stable and democratic development.

When considering, in this context, the development of the woman's business in Serbia, we come to particular paradox. The relatively small share of woman's business in the privatization of economy and economic development in Serbia should not be attributed to discrimination between sexes, as the manifestation of a very strong patriarchal culture and its social and political heritage. Poor results, however, first of all, are the reflexion of the distribution of power as the consequence of the simultaneous action of internal political, managerial and organizational structure and external political and economical regulation which generates a socio-economic surrounding for the promotion and progress of unable and

incompetent entrepreneurs, managers and expert teams (relating to the criteria of modern market economy) as shows also the “iceberg top” discovered in the attempt of subsequent taxation of extraprofiters from the last decade of last century and so called “entrepreneurs” as well, characterizing Serbia, still two centuries after becoming the independent state and this can be considered as inadequate, taking care that, in contrast to many other countries, Serbia realized its independence autonomously, through the particular form of peasant revolution with strong antifeudal features and requests for economic freedom (first of all: trade freedom and private property rights).

In this sense, it can be concluded that the development of the woman's business as an instrument for the privatization of economy and economic development, in Serbia, did not reach a point where its problem may be treated from the standpoint of providing the real equality of sexes in the realization of entrepreneurial activities (because, also, males as entrepreneurs, especially in small business, are really discriminated). The explanation of this statements leads us to the next aspect of analysis – the consideration of relation between the problem of restructuring the economy and enterprises and the development of woman' business.

### **Place and role of woman's business in restructuring economy and enterprises in Serbia**

Economy and enterprises restructuring in Serbia, in this research, is defined as their adaption to dominant criteria, standards, mechanisms and rules of the global surrounding, on the principles of an open economy. The measure for the definition, of the succes of structural adaptation is the capability of the whole economic structure of Serbia and each individual enterprise as well – to create and to implement new technologies, products and service having high competitive performances and great profit. Unfortunately, Serbia, as other (post) communist states in Central and South-East Europe, has not succeeded to wholly find proper answers to key questions related to the above defined notion of the restructuring of the economy and enterprises. This statement is not denied even by successes in the transformation of the socio-economic structure in eight ex-communist countries which, on May 1 st. 2004, joined European Union as members. The real range of the development of national entrepreneurial capabilities in these countries is best reflected in the fact, that after 15 years, within them, none at all valuable national company or an authentic (entrepreneurial) project, belonging to the top of global entrepreneurial enterprises, were not formed.

That what directly and the most heavily affects the realization of activities concerning the restructuring of enterprises and economy in Serbia, this is the drastic recession of production (actual GNP in Serbia amounts only to 50% compared with its maximum value realized in the very far 1986, after five years of stagnation - Author's note). Basic reasons for such a situation should be looked - for in the reduction of the exploitation of all disposable production factors - work, soil and capital. Serbia, 15 years after the restoration of capitalism (the period of the domination of political option represented by Slobodan Milošević is rather the prove of the ability of the ancient political elite to accept, without any prejudice, the new (capitalistic) rules of game than and not of the tenacity of communism) came into a situation to have to perform, via exorted improvisations, minimal structural adaption indispensable to prevent the deeper fall of the whole society and collapsing economy. For this reason, it is very important to examin all possibilities to increase the production by using disposable resources under the criteria of individual entrepreneurial and developmental rationalism. This demonstrates, from the standpoint of unused resources, that the causes of difficulties in the operation of the real sector in Serbia

should not be located in such factors as: the lack of own money, expensive credits, obsoleted equipment and apathetic labor and so on but, first of all, in economic, social and political blocades preventing the demonstration of real entrepreneurial initiatives. This hypothesis is based on the following arguments.

Serbia belongs to societies in which, traditionally, as the basic reason of the blockade of efforts for the modernization of its social and economic structure, the shortage of capital is declared. Changes in the macroeconomic sphere, during the last 5 years, characterized by: (1) several times repeated attempts to introduce a hard budgetary policy (mainly, under the pressure of the International Monetary Fund, often implicitly attributed with negative connotation because the political and economic elite does not want to openly declare that the reason of inflationary disturbances is, mainly, the consequence of irregularities in fulfilling financial obligations taken over, the consequences thereof, in a large extent, also bears the small business), (2) the liquidation of banks being the bearers of key dubiousness in the financial sphere, (3) Figures on the potential value of the home capital, collected on the basis of data on the conversion value of the thesaurized savings of Serbian population in the currencies withdrawn after the introduction of EURO and similar, convincingly demonstrate that (definitively) it should be necessary to abandon the dogma that the basic reason of national problems in the modernization of the operation of economy is the lack of capital. In fact, it became evident, with the restoration of capitalism that the main economic problem in Serbia was the lack of good enterprises and reproduction projects. Actually, the national financial system is in such a situation that even the (modest) volume of capital circulating in official financial flows has not sufficient possibilities to be placed in (real) projects which, as their final (economic) result may provide the repayment of invested external financial means (of course, under the real rate of interest) and, on the other hand, provide an appropriate profit to enterprises or entrepreneurial activities. The essence of Serbian economic problems is the undeveloped entrepreneurial surrounding in which, as mentioned above, dominate stimuli for the promotion and progress of unable and incompetent entrepreneurs, managers and expert teams.

Under the light of these ascertains, it should be also necessary to define the role of the woman's business in restructuring the economy and enterprises in Serbia and this is, first of all, concentration to the autonomous creation of new jobs. From a macroeconomic aspect, their business should create incomes for that part of the population which represents the victims of the existing model of restructuring the economy and enterprises. This may be defined as an "art" to create the impossible. However, because the major part of the population is in the net of lost existential equilibrium, an exit should be found out. And, in this way imposed global (on national level) and individual action displaces reasoning towards specific "woman's" values integrated into independent, private and non-profit organizations which should have an important role in overcoming common socio-economic barriers to the more efficient organization of the small business. For this reason, a challenge for female entrepreneurs in Serbia is not only the creation of their own business but also the foundation of organizations (business associations and networks) having as their basic function – efficient actions in the process of making political decisions in the sphere of economy. However, for the efficiency of these institutions, it is necessary to define, exactly, their goals, provide sufficient human and financial resources, develop the efficient strategy and policy of representation and promotion and reasonably resolve their managerial and financial problems.

## **Possibilities for the stimulation and promotion of woman's business in Serbia**

The provision of conditions for entrepreneurship to become the holder of economic development, involves the creation of a stimulation policy as the part of the whole macroeconomic policy. As a curiosum, it is needed to note that the first programme for the stimulation of entrepreneurship in Serbia was made more than 3 decades ago on the basis of the constitutional structure of Ex-Yugoslavia, allowing a limited private initiative in the development of small enterprises. After that, practically in the periods of time of ca 5 years, new political supports to the development of entrepreneurship took place. And, after the elimination of the major part of blockades on private initiatives, in early nineties of the last century, periodic campaigns for the stimulation of entrepreneurship continued. So, during 2001, started a very ambitious project for the development of private entrepreneurship in Serbia favorizing the development of small and medium enterprises. However, poor results in its implementation impose the serious analysis of the efficiency of public infrastructures in the initiation of the development of entrepreneurship in Serbia. The basic feature in these programs is their relative scientific correctness being the consequence of important influences of market ideas on professional economic science. On the other side, small or zero effects of their implementation show that an attempt to implement market ideas in an anti-market system suggests their non-conformity with the real mechanism of the regulation of economy and economy development. From the historical point of view, three essential remarks may be given to their contents. The first one is the underestimation of the undevelopment of market infrastructure; the second one is the overestimation of the efficiency of administration infrastructure and the third one, as the most controversial, is the installation of a subvention system in the stimulation of development. Namely, the basic mechanisms for the stimulation of the development of entrepreneurship, in all mentioned projects, were non-commercial credits (with negative rates of interests and long grace periods). Such orientation is directly transplanted from the dominant system of financing the development of the state sector of economy and its results were similar because they stimulated the distributive instead of entrepreneurial orientation. Of course, because demands for so defined subventions are unlimited, it seems that the problem is in the lack of capital and not in the quality of subventioned entrepreneurial actions. Due to the untransparency of the operation of economic administration, it is not possible to estimate the dimension of the engagement of public funds to this purpose, but as an illustration, it can be mentioned that someones, the appearance of one of the key capitalistic actors on the economic stage of Serbia put into connection with the public support to his project of development of even 50 small enterprises in Kosovo. Probably it is superfluous to note that, until now, details concerning the amount of public financial means invested into the realization of this project, are unknown but one thing is sure - none of these enterprises does not function. For this reasons, the Authors plead for another access to public support to woman's business. Anyhow, priority should be given to measures which bring more regularity and transparency in the conception and realization of the system for the development stimulation of entrepreneurship. In this sense, a start basis for the stimulation and promotion of woman's business should be an initiative that the Government of Serbia i. e. it's Ministry of Economy and Privatization as well as Ministry for Work and Social Policy initiate the elaboration of the project "Strategy and policy of the development of woman's business in the Republic of Serbia". The basic target of this project should be to identify a way how to use woman's potentials in order to speed up reform processes in Serbia.

The contents of the project, according to the Author's point of view, should be as follows:

- Development of an education system for women, in order to develop abilities and skills necessary for the creation of their own business.
- Foundation and development of the local business associations of women being active in business and their linking into a national network.
- Organization and realization of media campaigns for providing the public support for women's entrepreneurship and their organization into local associations and unions on national level.
- Specific problems of women relating to external financial means.

Priority in the public support to women's entrepreneurship should have specialized training programmes in the function of the development of business skills, use of these knowledge's for founding their own shops or micro enterprises and contacts with other women – entrepreneurs. In order to illustrate our view of the contents of a local training programme for women wishing to start their own business, we are presenting here a 6-days workshop:

- Day 1: Small (micro) enterprises and marketing.
- Day 2: Small (micro) enterprises and management.
- Day 3: Small (micro) enterprises and financial engineering.
- Day 4: Basics of business legislation.
- Day 5: Associating and linking women in business.
- Day 6: Case(s) of successful local women's business.

In addition to the training programmes for women who intend to run their own business or who already are in the business and have needs for an additional education, particular training programmes should be organized for young girls (12 to 16 years) in order to stimulate the entrepreneurial spirit of younger population.

The basic function of the local women's business associations should be:

- Spread of free market ideas;
- Promotion of the role of private sector;
- Stimulation of the development of entrepreneurial spirit;
- Promotion of women-business owners;
- Education of women being in business;
- Creation of business networks in the function to support woman's business;
- Creation of woman's lobby and its actions within the framework of local, regional and national political structures and similar.

The business associations should provide: the diminution of the influence of some business barriers, realization of business contacts, increase of self-confidence of business women, encouragement and stimulation of other women to make business and to open enterprises and, indirectly, easier access to financial markets. As mentioned above, the major part of woman's business is small in size and a small number of women in Serbia use modern communications means – and the local business associations united in the national network should have a key role in the easier provision of accesses to business information and expression of public attitude.

The particular aspect of the development of women's business in Serbia should represent specialized medium campaigns for the provision of public support and understanding for woman's entrepreneurship and association into local business unions. A particular significance,

these campaigns should have in overcoming prejudices linking the woman's business and business associations with "feministic" ideas resp. their identification as a marginal group against males – this is very specifically reflected in a society loaded with patriarchal traditions.

One of very frequent women's problems in Serbia is the problem how to provide an external financial support for their ideas and activities. To understand the real essence of this problem, the most important is to identify the necessary type of financing. For this reason, it is necessary to make distinction between: (1) provision of basic capital, (2) provision of capital for business expansion, (3) joint venture of capital or another form of more sophisticated joint venture. When considering this problem, it is necessary to take care of the specifics of national situation. First of all and anyhow the most important is that in Serbia do not exist well established institutional bases for the hypothecary and collateral crediting of business. Only after the good institutional regulation of the problem of this external financing to the criteria and standards of an open market economy, it is possible to think on the introduction of additional regulation adapted to the specific needs of women's business.

### **Instead of conclusion**

The woman's business in Serbia belongs to the most dynamic domains of the real private sector and strongly marks the process of the privatization of economic activities. A space half-open by the institutional possibility of the privatization of development in early nineties of last century stimulated a large number of women in Serbia to take their economic fate in their own hands. Analyses demonstrate that the engagement of women in business is mainly based on self-employment and foundation of shops and micro enterprises within classic activities. However, in addition to this, the woman's business, due to its cumulate influence to the total privatization of production and employment, is one of the key factors of changes in the socio-economic system of Serbia. But, the negative effects of the privatization of inherited (communist) economic structure (like: radical diminution of production, expansion of "shadow" economy and growth of poverty) devaluate, to a large extent, these achievements because, women as a whole are the most jeopardized and their freedom for economic emancipation is largely limited under the light of this assertion, it should be necessary to define the role of woman's business in restructuring the economy and enterprises in Serbia and this is, first of all, the creation of new jobs. Their business should create incomes, in the first place for that part of population which represents the victims of the existing model of restructuring the economy and enterprises.

The distribution of political power which is, unfortunately, directly connected to the distribution of economic results and, on this basis, to the limitation of individual economic freedom, is not favorable for the development of entrepreneurship and small business. The position of women in business is additionally more difficult due to cultural and social heritage. For this reason, for woman's entrepreneurs in Serbia the creation of their own business is not a single challenge but also the foundation of organizations (business associations and networks) having as their basic functions an efficient activity in the process of making political decisions in the sphere of economy.

# **THE USE OF PRACTICES AS A TOOL TO CREATE COMPETITIVENESS**

**-A study of the relationship between the use of Best Business Practices in manufacturing SMEs and the managers experience on how their outcomes contributes to their firms competitiveness**

## **ABSTRACT**

This paper reports an analysis on the attitude of managers to how the outcomes of their use of Best Business Practices have contributed to competitiveness of their firm. The study focus on the following questions:

- Does managers' attitude to the contribution to competitiveness differ depending on their strategy and use of Best Business Practices?
- Is it a difference between managers opinion depending on the size of their firm?

Traditionally a common view on strategy has been conceptualized as a situational choice of generic strategies (e.g. Porter) assuming a type of contingency based view of the firm. During the last decade and still dominating is the focus on core competencies or distinctive capabilities assuming a resource based view of the firm (RBV). But where do the capabilities come from? It is generally acknowledged in research that these often intangible or tacit

capabilities are developed through experiential learning or learning by practicing. This is the basis of a “practice based view of the firm” (PBV), often assumed in quality theories and methodologies, as a variant or specification of RBV. It is in PBV assumed, based on research findings, that there are practices that, in combination and when effectively linked together, can be expected to consistently improve operational performance and thus provide firms who adopt them with an advantage over those that do not.

Thus good business practices, and the learning and knowledge creation developed through using them, can be thought of as the base or foundation on which distinctive capabilities and hence competitive advantage is built

## **INTRODUCTION**

Traditionally a common view on strategy has been conceptualized as a situational choice of generic strategies (e.g. Porter) assuming a type of contingency based view of the firm. During the last decade and still dominating is the focus on core competencies or distinctive capabilities assuming a resource based view of the firm (RBV). But where do the capabilities come from? It is generally acknowledged in research that these often intangible or tacit capabilities are developed through experiential learning or learning by practicing. This is the basis of a “practice based view of the firm” (PBV), often assumed in quality theories and methodologies, as a variant or specification of RBV. It is in PBV assumed, based on research findings, that practices used in combination and effectively linked together, can be expected to consistently improve operational performance and thus provide firms who adopt them with an advantage over those that do not.

Thus good business practices, and learning and knowledge creation developed through using them, can be thought of as the base or foundation on which distinctive capabilities and hence competitive advantage is built.

### **From resource based view to a practice based view of the firm**

RBV has been able to make fruitful theoretical progress in the field of strategy research, e.g. in explaining *sustained* competitive advantage as resource endowment in different respects are sticky (Barney, 2001), as well as the explanation of the existence of the firm as such as superior in coordination of resources compared to the contractual interactions and price mechanisms of the market (Teece, et.al., 1997).

At the same time at the level of action oriented research, consulting and strategic management praxis, conceptualization and approaches to strategy has during the least decades been focused on business processes and practices and the search for “best practice” in different areas. Instead of a pyramidal, functional and hierarchical organization of business, a process based, horizontally, oriented and boundary spanning organization of business activity focused on customer value and quality has been advancing. These developments has not primarily been led by theoretical ideas but by practical management concepts and approaches like Sociotechnical Systems Design, Total Quality Management, Reengineering, Lean Production, Process Improvement, Benchmarking, ABC and Balanced Scorecard accounting and controlling and more recently Six Sigma approaches. A core element in this embedded “theory of the firm” is the focus on the actual character of business practices and processes, their performance measurement, control, redesign and improvement. At the level of academically formulated theory of strategy and theory of the firm, these dominant trends in the reality of business and its strategic management does not seem to have been fully recognized and been incorporated in theories of the firm and of strategy.

In the Swedish research group for studies in 5 different regions we have focus on how a practice based view of the firm (PBV) is related to a resource based view, and in which respects it can have potentially advantages compared to that view. It should be recognized that RBV have a number of strengths as an explanatory framework as well as a guide for strategy development. It is focused on the unique features of a company in the form of heterogeneous, firm specific resources having VRIN characteristics – valuable, rare, inimitable, and no substitutable. Through this focus RBV can clarify the important differentiating aspects of strategy and how to maintain and lever them for sustainable competitive advantage.

The focus on resources, although not denying but still have a tendency to loosing in sight the fact that what a firm actual does or can do, that is, the type of practices it is performing or can perform, or the organizing of processes as systems of activity to realize certain operationally valuable goals, is the touchstone of what it can accomplish economically. The RBV defender could of course say that efficient and excellently performed practices and processes are eminent examples of resources. But the question is whether if this subsumptive conceptual strategy is explanatory helpful. We believe that it is theoretically more fruitful to recognize a practice based view of the firm and strategy (PBV) as a variant or modification of RBV.

### **From capabilities to practices<sup>i</sup>**

It is fruitful to make a distinction between capabilities and dynamic capabilities. Capabilities is what a firm can do, in other words the performance of different business practices that in different ways, and in coordination, contribute to the creation of value for customers.

Dynamic capabilities is what a firm can do in the area of innovation, e.g. product development practices, or learning processes and practices for improving on what it does (e.g. benchmarking, learning by doing), that can be seen as its different types of business practices.

Capabilities come close to organizational routines (Nelson&Winter, 1982), routines as codified and/or institutionalized ways of doing things that is a form of practices. But capabilities are in many cases at a level of abstraction from concrete business operation and including an assumed potentiality of what a firm would be able to do. To this extent it is not directly observable and recordable.

It is significant that Eisenhardt&Martin (2000: 1106) assume an organizational and empirical perspective rather than an economic and formal modeling perspective. This enable them to recognize that dynamic capabilities consist of specific business processes which often have extensive empirical research streams associated with them, and there are “best practice” in their performance. The introduction of the concept of “best practice” and its connecting to dynamic capabilities as these authors do based on empirical findings from research, also have theoretical implication that challenge some basic assumptions of RBV. Firstly, there are commonalities across effective firms in capabilities or performance of different business processes, both operative processes as well as innovative processes. Secondly, there are equifinalities of different development paths, implying that firms starting from different points of departures and moving along different tracks still are moving in similar directions in terms of “best practice” features of processes. Thirdly, firms are able to emulate elements of better practices of other firms through different kinds of learning processes. Besides research results, the whole idea of benchmarking testify to this fact (e.g. see Zairi, 1999, 1996), as well as ideas connected to industrial district and cluster approaches.

Practices is what a firm is actually doing or have done so that there is a record of performance as well as some element of continuity in behavior and its results (otherwise it hard to recognize as “a practice”, not only sporadic behavior). Best practices are business practices

that can be found in a population of firms that can show a track record of comparatively very high operational performance of the particular business practice or process in the population.

Eisenhardt&Martin (2000) is somewhat wavering in the implication for maintaining, moderating, limiting or even leaving RBV. As dynamic capabilities cannot have VRIN characteristics, one possible implication is that their connection to resources is the crucial issue; “the value for competitive advantage lies in the resource configurations that they create, not the capabilities themselves” (ibid: 1106). In other formulations dynamic capabilities attain a more important role for competitive advantage. It lies in using dynamic capabilities “sooner, more astutely, or more fortuitously than the competition”, e.g. product development practices, to create resource configurations that have that advantage (ibid: 1117). And in high velocity markets, they argue that the RBV framework breaks down, as the firm must rely on dynamic capabilities in the form of simple selection oriented routines focused on rapidly seizing opportunities for more temporary and transient advantage rather than resource building and leveraging. From a PBV point of view, these arguments indicate the importance of moving closer to best practice in performance of different business process. Furthermore, if operational performance of business practices is focused on, there is a further issue what features are most important for efficient operation. Sticky, firm specific resources are the RBV answer that research has proved to be important, but there may also be other features. There is also the further issue concerning where the capabilities come from. It is generally acknowledged in research that these often intangible or tacit capabilities are developed through experiential learning or learning by practicing, something that a practice based view can account for.

---

**Insert Table 1 about here**

---

Does this mean that RBV is to be replaced by PBV? Barney in commenting on the article tries to realign the arguments of Eisenhardt&Martin (2000) to the RBV camp. The application of dynamic capabilities “sooner, more astutely, or more fortuitously” is itself a capability or a matter of luck, something that the traditional RBV logic can account for. Also the ability to be alert to changes and change quickly and the value of these capabilities depending of market context is according to Barney is “perfectly consistent with traditional RBV logic” (Barney, 2001: 631). Although we believe Barney’s discussion too easily subsumes the arguments under the RBV hat, we will not in this context take the argument further. It should be recognized that RBV is relevant in the sense that efficient practices and processes can be acknowledged as types of resources, as well as are using resources in its performance. The theoretical and empirical issue is how far this is helpful for explaining and guiding strategic management in creating competitive advantage. In this context we will only point to some significant differences in emphasis between RBV and PBV, see Table 1, seeing it as too early to take a stand to what extent PBV should be given an independent status or seen as a variation of RBV.<sup>ii</sup>

### **Conceptualizing and modeling a practice based view**

It should be noted that PBV and its modeling creates conceptual, theoretical and measurement problems of its own.

There is a distinction between *Best practices* and *Good practices*. Best can be defined in relation to the specific business process. It was first defined pragmatically (e.g. see Rescher,

1977) in terms of operational performance of the business process where it is used. It can be a combination of common and more firm specific elements, but empirical research indicate as Eisenhardt&Martin (2000) say that there are significant common features in business practices. It is very difficult to observe best practice, so an alternative is to define levels of good practice

International research on business capability issues demonstrates that there is a link between the practices adopted and processes within businesses and their performance. Those businesses that adopt a coordinated and cooperative approach to development generally outperform firms that do not follow this approach. This coordinated and cooperative approach has often been denoted “best practice” (Knuckey et al, 1999:19)

The cooperative way is the one in which firms and their employees undertake business activities in all key processes – leadership, planning, people, customers, suppliers, community relations, production and supply of products and services, and the use of benchmarking. These practices, when effectively linked together, can be expected to lead to sustainable world class outcomes in quality, customer services, flexibility, timeliness, innovation, cost and competitiveness. (Barney, J, 1991; Australian Manufacturing Council, 1994)

The logic behind best practice is simple. Because operational outcomes are key contributors to competitiveness and business performance, and because best business practice should improve operational outcomes, good practice should lead by implication to improved competitiveness. Best practice should lead to world class performance. (Kaplan, R S, & Norton, D P, 1996; Knuckey et al ,1999:23; Kotter, J P & Heskett, J L, 1992; Prahalad, C K & Hamel, G, 1990)

However, in the past few years, the notion of “best practice” has increasingly become recognized as a moving target. What was earlier considered as best practice is not necessarily today regarded as best practice. Similarly, in attempting to manage the complex relationships between and within firms, there is no single set of “best practices” – there are too many variables. Instead, we speak of good practice, business improvement and business excellence. These are practices that jointly appear to provide firms that adopt them with an advantage over those that do not. (Lamming, 1996)

Good business practices can be regarded as the base or foundation on which the firm’s distinctive capabilities and competitive advantages are built. So to maintain these and to develop them further demands a continual reinvestment and development of processes and practices (Normann, R & Ramirez, R, 1994). The reputation of a firm, for example, is a function of its history in areas such as customer service practices, customer satisfaction and delivery performance. But reputation does not last forever - it needs to be assessed and possibly enhanced. (Senge, P M, 1990)

If we visualize a firm’s ultimate goal as international competitiveness, we can picture business practices as segments of the base of a globe. Each segment needs to be in place and effectively linked with others to provide a strong foundation. The absence of one may make the whole break down, thus threatening competitiveness and stability. Firms that are successful in achieving this leverage could be assumed to have the characteristics of learning organizations. (Knuckey et al., 2002)

## **RESEARCH QUESTION AND METHODOLOGY**

The research questions covered in this paper are:

- Does managers' attitude to their practices contribution to competitiveness differ depending on their strategy focus and use of Best Business Practices?
- Is it a difference between managers opinion depending on the size of their firm?

The approach for answering this question is to use empirical data collected by the use of a Best Business Practice Survey (BBPS) and analyze if managers of firms that hold a higher focus on strategy factors also have practices in place to support their strategy hold the attitude that these have competitive and also hold a positive attitude toward these practices contribution to their firms.

### **The business practices and performance model**

The Swedish research team chooses to use a questionnaire, adopted from the Business Practices Models used in the *Leading the Way* (1994) and *Gearing Up* (1999) studies, with some adaptations to the Swedish context. There were two reasons for this choice:

1. The models had worked well in practical surveys
2. It made comparisons possible between Swedish and New Zealand data.

The 1999 survey model comprises key modules or components:

- Structure
- Strategy
- Practices
- Outcomes
- Business results

**Structure** denotes data of size and industry. **Strategy** relates mainly to the choice of products, markets, positioning and focus. The traditional list of competitive priorities was examined: i.e. cost, quality, flexibility, delivery and innovation. Strategizing encapsulates

*Leadership & planning* activities in the firm. It examines the nature of direction setting, whether it is long-term and consultative, and whether it facilitates firm culture and values, and the relationship of the business with its community.

---

**Insert Figure 1 about here**

---

Structure, strategy, practices and outcomes are obviously inter-related. The inter-linking of these components represents the dynamic nature of business, where components rarely operate in isolation in the long run. For example, the focus of practices built up by the firm often reflects its business strategy. In this paper the element 'Business Assets and structure' will not be covered.

### **ASSESSING BUSINESS PRACTICES AND PERFORMANCE**

The study was based on a comprehensive survey questionnaire developed in New Zealand, and based on the structure of Business Practices and Performance Model. Respondents were asked questions on each element of the model. Questions on strategizing and practices required subjective responses while questions that examined operational outcomes in some cases required quantitative responses.

In analyzing the results, questions were grouped into six categories of processes: Leadership & planning, Customer focus, Quality & supplier focus, Employee practices, Information & benchmarking, and Innovation & technology.

The questions were generally based on a Likert-type (rating) scale, with the response to each question then scored on a range between zero and one with the "worst" answer given the

value of zero and the “best” answer a value of one. A similar scoring system was used for questions on operational outcomes.

---

**Insert Figure 2 about here**

---

These scores were then summed for each firm across the different practices. Each practice score was standardized to give it a value of 100. The six practice scores were then summed and standardized to provide a single score out of 100 for overall practices. The same procedure was applied for operational scores.

This scoring system resulted in two main indexes (see Figure 2):

- the strategizing/practices index provides an overall assessment of an enterprise’s efforts to achieve business improvement (should be read as strategizing AND practices index)
- the operational outcomes index provides an overall assessment of the extent to which practices have been converted into operational outcomes.

When assessing the progress of a firm, both indices are considered simultaneously.

Businesses with high scores in strategizing have made the most progress in adopting the full range of these practices. If they also have a high score on the operational outcomes index, this indicates that their practices are being converted into outcomes.

The progress of each firm towards sustainable advantage can in this model be indicated by plotting its position on a set of axes representing Business practices and Operational outcomes. The horizontal axis represents the strategizing/practices index values, and the vertical axis represents the operational outcomes index values. The closer a plant is to the top right-hand corner of the graph, the closer it is likely to be achieving sustainable high performance. The graph of the distribution of firms according to their scores is shown in Fig.

3. This shows the expected “oval” form indicating that good outcomes are associated with good practices.

### **Empirical Data**

Data for this study was gathered through five postal surveys among manufacturing business owners/managers in the middle part of Sweden.

The data was gathered in four regions and one city during the years 2001 to 2003. The actual regions were West Sweden (2001), The County of Örebro (2001), The county of Dalarna (2002), The County of Sörmland (2002/2003) and the City of Gothenburg (2003).

The Questionnaires were sent to all (2107) manufacturing sites with ten and more full time employees in these five regions. The questionnaires were addressed to the manager/owner of the sites. After one to two postal reminders, a total of 741 filled in questionnaires were returned in such a good quality that they could be used. Respondents who failed to present complete information were excluded.

So in total, responses from 741 manufacturing sites firms (460 small, 206 medium and 75 large) are discussed here, resulting in an overall response rate of 35,2 %. The size definitions are small (10-49 employees), medium sized (50 – 249 employees) and large (500+ employees).

---

**Insert Table 2 about here**

---

## **RESULTS AND DISCUSSION**

## **Distribution of the results**

The distribution of the results in relation to the indexes *Operational outcomes* and *Practice* is shown in the graph below. The regression equation is:

$$\text{Operational outcome} = 42,7 + 0,359 \text{ Practices}$$

with  $S = 9,00060$   $R\text{-Sq} = 23,9\%$   $R\text{-Sq}(\text{adj}) = 23,8\%$

---

**Insert Figure 3 about here**

---

### **Class 1 - World Class**

Thirty-nine (39) of the work sites (5,3 %) have both practices and outcomes of 75 or higher.

This group of firms is likely to be international competitive and compare to the world's best.

In this group are 46,2 % small, 25,6 % medium sized and 28,2 % large firms

### **Class 2 - Firm Foundation**

Three hundred-and-eleven (311) of the work sites (42,0 %) have practice and outcomes of 60 or more. These firms have a strong foundation of practice and performance but world class

performance is likely to require a continued focus on improvement. In this group are 47,6 % small, 34,4 % medium sized and 18 % large firms

### **Class 3 - Over Performers**

One hundred and sixty-nine (169) of the work sites (22,8 %) have strong operational outcomes (scoring 60 or more) which may not be based on best practice techniques. In the

long-term, these outcomes may not be able to be maintains without improvements to

practices. In this group are 79,9 % small, 19,5 % medium sized and only 0,6 % (1 firm) large firms

### **Class 4 – Under Performers**

Sixty-four (64) of the work sites (8,6 %) have a good foundation of practice (scoring 60 or more) but do not have operational outcomes to the same level. In time these practice should result in improved outcomes. In this group are 54,7 % small, 39,1 % medium sized and 6,3 % large firms

#### **Class 5 – Weak Foundation**

One hundred and fifty-eight (158) of the work sites (21,3 %) show both practices and outcomes below 60. These sites should look to extensively develop their capabilities to enjoy improved operational outcomes. In this group are 78,5 % small, 19,6 % medium sized and 1,9 % large firms

#### **Important Factors in Business Strategy**

The firm managers answered one question about how important different factors are for their business strategy. As can be seen in table 3 most of them claimed that the factors are very important. As many as 100 (13,5 %) mean that all five factors are very important while only 4 of them claim all five was not important at all in their business strategy.

---

**Insert Table 3 about here**

---

As further can be seen in the table was innovation the factor that have the less portion of managers that claim that the factor is very important.

Here I therefore take innovation as an example to examine if the strategy focus seems to influence how well the firms have implement the practices related to the strategy.

Figure 4 show the mean values on the sub index innovation and technology for the firms that indicated different degree of importance on innovation in their business strategy. As can be seen the ones that think innovation are very important have the highest mean value and then the mean values decrease with less and less importance. This shows that managers that hold

innovation as an important strategy factor also implement practices that support innovation and technology.

---

**Insert Figure 4 about here**

---

The next question is: Do they think that Innovation has been to a great help in their competitive positioning?

I will use the answers to question 12.2 (figure 5) to analyze that.

---

**Insert Figure 5 about here**

---

Figure 6 shows that it was only 30,9 % of all respondents that hold the opinion that innovation have been greatly helpful. That figure rank innovation as the third less helpful factor according to all respondents.

---

**Insert Figure 6 about here**

---

Analyzing the share, of firms that holds the attitude that respectively factor have been greatly helpful in improving the business's competitive position, for the two groups World Class and Weak Foundation shows that there are great differences (figure 7)

---

**Insert Figure 7 about here**

---

Measuring the distance between World Class Firms and Firms on Weak Foundation by dividing the figures for World Class with the figures for Weak Foundation shows how many times larger the portion of World Class firms are that hold the attitude that the factors have been greatly helpful in improving the business's competitive position (see figure 8).

---

**Insert Figure 8 about here**

---

As can be seen, the largest distance is on Innovation and Technology followed by Information and Benchmarking. Earlier analysis of data from one of the regions (Ahlström Söderling 2003) indicated that, accepting the assumption that market leaders have some competitive advantages, *Market leaders* more often use benchmarking and also seems to be more innovative by introducing new products as well as new processes.

The last question then is:

Do the firms, that claim that innovation has been greatly helpful, have practices in place to support innovation?

A way to analyze that is to look at the distribution on the sub index Innovation and Technology for the two groups greatly helpful vs. the rest of firms.

---

**Insert Figure 9 about here**

---

As figure 9 shows have 66,0 % of the "greatly helpful" firms' index values above 60 while the other group only have 29,8 %. This indicates that the managers that claim that innovation and

technology has been greatly helpful to the improvement of their firm's competitive position have practices in place for innovation and technology.

## **CONCLUSIONS**

The empirical data indicate that the focus on strategic factors influence the implementation of practices and that the managers impression on how the results of the practices contribute to the firms competitive position is a function of the operational outcomes of well implemented practices.

The other initial question: Is it a difference between managers opinion depending on the size of their firm have not been addressed in this paper but the data show no significant difference between managers in different firm sizes.

<sup>i</sup> This discussion is in some parts earlier published in a working paper by Ragnar Ahlström Söderling, Erik Lindhult, Jan Sundqvist, Per Magnus Wijkman presented at 17<sup>th</sup> Nordic Conference on Business Studies in Reykjavik, 14-16<sup>th</sup> of August 2003

<sup>ii</sup> Another interesting theoretical issue is the relation of PBV to a Schumpeterian, evolutionary view (Nelson&Winter, 1982) also popular today. The importance in PBV of innovation in the sense of improving operational performance of business process in line with best practice is an interesting link to such a view.

## **WOMEN ENTREPRENEURS IN JORDAN**

**Marwa Ahmed (Associate Professor)  
Philadelphia University,  
P .o .Box 1 Philadelphia University 19392  
Amman, Jordan**

### **Abstract**

This research explores some of the reasons why Jordanian women choose to develop their entrepreneurial business.

A total of 65 women were interviewed. 30.8% of them were employed before starting own Business. 53.8% were married and 35.4% had bachelor degree while 32.3% are between 25 and 30 years old.

The research revealed that the majority of Jordanian women enjoy what they do and initially ventured for personal reasons, to gain autonomy.

Jordanian women have benefited from family and/or husband support in influencing them to start a business, in managing their businesses and in coping with the demands of running the business from encouragement to assistance in finance, business advice.

Women feel there is a lack of network of businesswomen or women in similar fields of business to exchange information, discuss issues and seek advice on common topics all of which is vital for business success. In addition, due to the collectivist nature of Jordanian society, the majority includes their families, colleagues and business associates is seeking advice. Some women have suggest that relationships and knowing the right people in the right places can help women overcome some of the hurdles in the business and facilitating the processes involved, obtaining fairer deals and gaining business opportunities.

## **INTRODUCTION**

Female entrepreneurship has been rising slowly but continuously over the past 30 years, only 6 per cent of all women classify as entrepreneurs, as compared to more than 12 per cent of men. Moreover, female entrepreneurs more commonly create and retain micro enterprises, they may have had less chance than most men to accumulate the resources necessary to start up and run a successful business.

Are women entrepreneurs face specific problems in setting up a business that are different from those faced by male entrepreneurs?

When it comes to women entrepreneurs, it appears that only a small part of entrepreneurial motivations are acknowledged as gender-based. Instead, "pull" and "push" factors are now a common way of explaining different motivations for women to start a business (Brush, 1990; Buttner and Moore, 1997). Push factors are elements of necessity such as insufficient family income, dissatisfaction with a salaried job, difficulty in finding work and a need for a flexible work schedule because of family responsibilities. Pull factors relate to independence, self-fulfilment, entrepreneurial drives and desire for wealth, social status and power (Duchéneaut, 1997).

It is suggested that starting up a new venture becomes an "imaginable act" when the entrepreneur can refer to a role model who tried it before (Shaper, 1975). This factor is therefore likely to be equally applicable to both women and men.

Jordanian women live in economy, which has been largely influenced by two main factors.

First, the dearth of natural resources. Second, the political situation. (Abdel Karim, 1989).

Jordan which adopt an economic system based on free enterprise and private initiative (National Planning Council, 1981; The Jordanian National Charter, 1990), played a pioneering part through participating with the private sector in implementing large and medium –scale projects and providing incentives and an appropriate entrepreneurial climate for private investment.

This study was conducted in 2004 and its goal was to state why Jordanian women establish their own small business firms.

To understand Jordanian women entrepreneurs' motives and determination, it is useful to consider their role in society, and the effect of environmental forces that they encounter in their daily lives, the family lies at the core of society playing a major role in political, economic, social and religious spheres. Jordanian are conscious of each other's family memberships, identities and status, they links facilitate access to institutions, jobs and government services (Sabbagh, 1996, pp. 194-5). Gender differences are enshrined in the Muslim Holy Book, the Qur'an, and in the Shari'a, the Islamic Law. A woman's primary role in the family is as a wife and mother. Many employers feel that these roles will interfere with women's work productivity. Hence, there is a tendency for them to give priority to men in terms of employment and promotion, even where women have the same qualifications.

Because a major proportion of the literature on women entrepreneurs has focused on English speaking countries, it was decided to carry out this research in an area where a different language was used and which therefore identified a different Western culture in the form of a developed economy. For this reason, the research was conducted in Jordan

More specifically, the major research question for this study is what are the reasons of Jordanian women entrepreneurs to start up business?

## **REVIEW OF RELATED LITERATURE**

The research literature on women entrepreneurs from developing economies is recent, for example, Adler and Israeli (1994). Scherer et al. (1990) concluded that men had a higher rate of entrepreneurial activity than women.

The following section is an overview of prior studies that describe women entrepreneurs

Muriel Orhan; Don Scott (2001) identified a number of situations that relate to women's decisions to become entrepreneurs, namely "dynastic compliance", "no other choice", "entrepreneurship by chance", "natural succession", "forced entrepreneurship", "informed entrepreneur" and "pure entrepreneur".

Green; J David; M Dent; A Tyshkovsky (1996), Outlines the methodology and results of a study into entrepreneurship in the new Russian economy. Asks whether the Russian entrepreneur can be characterized as similar to entrepreneurs identified in research in Western economies.

Roger Henderson; Martyn Robertson (2000), suggest that generally positive images of entrepreneurship are hampered by a lack of identifiable role models, poor media presentation of individuals or small firms, and lack of encouragement from important influencers on career choice.

Roger Henderson; Martyn Robertson (2000), States that women can be differentiated by behavioral and motivational factors in their desire to start up in business in United Kingdom

Robert D Hisrich; Zhang Fan (1990), presents the business status, individual background, and social context of China's women entrepreneurs by analysing the information from a survey of 50 women entrepreneurs in China.

Jean Lee (1996) Aims to uncover the characteristics of a typical woman entrepreneur in Singapore; the motivational needs of women entrepreneurs; and the factors influencing the motivational needs of women entrepreneurs.

Jeffrey W Alstete(2002), indicate that there are several reasons why individuals considering entrepreneurship would continue with their goal of founding a business, including greater control of their destiny, increased satisfaction, more money, and creating a legacy for their family and children.

Augusta C Yrle; Sandra J Hartman; Kenneth R Walsh (2004), showed that complex technology, security, and reliability present significant challenges to the entrepreneur or small business owner about to enter the e-business arena.

Joan Winn (2004), give some insight as to the nature of the problems and perceptions faced by women as managers and entrepreneurs.

Robert D Hisrich; Sevgi Aysel Öztürk (1999), focuses on the characteristics, performance, and problems of women entrepreneurs in one developing economy - Turkey. The results indicate that while the women entrepreneurs exhibited many similarities with their counterparts in other countries they differed in other aspects such as in their reasons and motivation for starting a venture and problems encountered.

Lina Nearchou-Ellinas; Ioannis S Kountouris (2004), describes the findings of a unique nationwide research on female entrepreneurial activity in Cyprus.

Spinder Dhaliwal (2000), interview evidence gathered from both Asian women entrepreneurs in their own right and Asian women working in family enterprises, and seeks to provide a clearer picture of the roles, responsibilities and relationships of these two groups.

Gerard McElwee; Rahma Al-Riyami (2003), study presents a preliminary report of an exploratory, qualitative investigation of the role of Omani women entrepreneurs in Muscat. It establishes the factors that motivate women to become entrepreneurs.

Atsedie Woldie; Adebimpe Adersua (2004), highlights the position and role of female entrepreneurs in the economic development of Nigeria.

Gerda Siann; Alexa Clark (1992), Looks at the results of studies which concern Muslim attitudes to work possibilities for them compared with the majority races in Great Britain. Questions whether "stereotyping" is to blame for lack of opportunities in various "acceptable" careers or the attitudes of prospective employers to women generally and ethnic women in particular. Also examines ethnic family attitudes to education and choice of occupation for their daughters. Concludes that the dissemination of information in the various vernacular languages is to be recommended to aid in the community's organization for career development in further/higher education.

Ashraf R El-Ghannam (2002), Outlines important changes in the role of women in Arab societies, particularly in urban areas. Considers what factors impede or contribute to women's work in all economic sectors in an attempt to explain and determine the relationship between their activities and social, educational, economic, cultural and health factors. Suggests that findings are related to family size, fertility rates, illiteracy and population per nurse. Recommends increasing job opportunities and more labor saving technology as ways to increase opportunity for Arab women.

## **METHODOLOGY**

The information that was gained from the participants was analyzed and was then combined with information from previous research in order to develop a consolidated model of female entrepreneurial and why they start own business.

### **INSTRUMENT**

The instrument utilized for primary data collection was a questionnaire (Appendix 1), considering the purpose of the present work; the main elements of the research questionnaire deserving mention that it used before by Al-Riyami and Al-Fahal (2003) to study women entrepreneurs in Oman: some barriers to success. Questions measured on a 5-point Likert scale.

A pilot version of the questionnaire was tested in Jordan. Following the factor analysis, Cronbach's alpha reliability coefficients were calculated. The reliability for each variable was above the 0.7 level deemed acceptable by Peterson (1994).

Each questionnaire included a cover letter from the researchers stressing the importance of the study and requested prompt completion of the survey.

### **DATA COLLECTION**

A total of 77 women participated in this study. Of the 70 returned questionnaires, five questionnaires had to be withdrawn from the sample because of mistakes in filling them out and insufficient answering patterns. As a result, 65 usable questionnaires formed the effective sample size.

Data were collected by means of personal interviews. A random sample of Jordanian women in several cities was asked to fill out the questionnaire. On average, it took the respondents about 15 minutes to fill out the questionnaire. Other data collection methods such as mail and telephone were also considered, but collecting the data by means of personal interviews turned out to be the best option.

### **DESCRIPTION OF STUDY PARTICIPANTS**

A total of 65 women were interviewed. 30.8% of them were employed before starting own Business. 53.8% were married and 35.4% had bachelor degree while 32.3% are between 25 and 30 years old.

### **LIMITATION**

Respondents in this study were Jordanian women from one major kind of industry which is handicrafts and that limits the generalisability of the findings. This limitation provides an opportunity for further research.

A second limitation of this study is that the questionnaire were used to measure why Jordanian women start up own business. Using the questionnaire may have enhanced the results of the present study. This limitation also provides an opportunity for future research to improve researchers' understanding of reasons of Jordanian women to establish own business.

### **RESEARCH VARIABLES AND NULL HYPOTHESES**

On the level of the reasons of entrepreneurial Jordanian women to start own business 14 reasons are stated, with responses on a five-point Likert scale.

Ho (1): The experience of Jordanian women before starting own Business is not significantly related to the reasons of starting own business.

Ho (2): Jordanian women status is not significantly related to the reasons of starting own business.

Ho (3): Jordanian women education is not significantly related to the reasons of starting own business.

Ho (4): Jordanian women age is not significantly related to the reasons of starting own business.

### **DISCUSSION OF RESULTS**

To answer the research question: what are the reasons of Jordanian women entrepreneurs to start up business? Mean and standard deviation were calculated for all variables (reasons) [Table 2](#).

From the table we can conclude that the major reason is economic necessity (mean = 5.00) followed by family encouragement (mean =4.9077), but the least reasons are Occupy oneself and Challenge (mean = 4.1077).

This means that Jordanian women entrepreneurs have economic problems and this finding goes along with the finding of other researchers.

## **HYPOTHESES TESTING**

**Test of Hypothesis 1:** Hypothesis 1 was formulated to verify the effect of the experience before starting own Business on the reasons of starting own business.

The hypothesis measures the reasons of starting own business as indicated by 14 reasons (variables).

One Way Analysis Of Variance (ANOVA) were used to test the hypothesis and the results show that except for four reasons related to " Perceived Presence of Business ", " Corporate downsizing ", " Family encouragement " and " Ambition" the remaining variables all show a significant positive correlation between the level of the experience before starting own Business on the reasons of starting own business.

Furthermore, Tukey posttest, which used to find which level of the experience before starting own Business has higher score than the others reveal that Households feel that (Make others happy) and (Self –recognition) are some of the reasons to start own business than the women who used to be a student before starting own Business. The mean difference is significant at the .05 levels.

Thus, we cannot reject Hypothesis 1 and conclude that experience before starting own Business is related to the reasons of starting own business.

**Test of Hypothesis 2:** Hypothesis 2 was formulated to verify the effect of the women status (married or single) on the reasons of starting own business.

T-test were used to test the hypothesis and the results show that married women feel more than single women that the reasons to start up business are: " Make others happy ", "Challenge", " Social Ambition " and "Independence".

The mean difference is significant at the .05 levels.

Thus, we cannot reject Hypothesis 2 and conclude that status is related to the reasons of starting own business.

**Test of Hypothesis 3:** Hypothesis 3 was formulated to verify the effect of the women education on the reasons of starting own business.

One Way Analysis Of Variance (ANOVA) were used to test the hypothesis and the results show that except for four reasons related to " Finance", " Perceived Presence of Business ", " Challenge ", " Family encouragement " and " Occupy oneself " the remaining variables all show a significant positive correlation between the level of the education on the reasons of starting own business.

Furthermore, Tukey posttest, which used to find which level of education has higher score than the others reveal that women with Master Degree feel that "Make others happy" and " Enjoyment "are some of the reasons to start own business than the women who has Diploma or less before starting own business.

Also women with Master Degree feel that "Social Ambition" is the reason to start own business more than the women who has Bachelor Degree.

Women who have PH.D Degree feel that "Corporate downsizing ", " Independence" and "Self -recognition" are some of the reasons to start own business.

Thus, we cannot reject Hypothesis 3 and conclude that education is related to the reasons of starting own business.

The mean difference is significant at the .05 levels.

**Test of Hypothesis 4:** Hypothesis 4 was formulated to verify the effect of the women age on the reasons of starting own business.

One Way Analysis Of Variance (ANOVA) were used to test the hypothesis and the results show that all the reasons except for " Job dissatisfaction "show no significant positive correlation between the level of the age on the reasons of starting own business.

Furthermore, Tukey posttest, which used to find which level of age has higher score than the others reveal that women with 35 years old and above feel that " Job dissatisfaction "is the reasons to start own business more than the women who 30 Years -less than 35 years old and more than the women 25 years old - less than 30 years old

Thus, we cannot reject Hypothesis 4 and conclude that age is related to the reasons of starting own business.

The mean difference is significant at the .05 levels.

## **CONCLUSIONS**

The results show that except for four reasons related to " Perceived Presence of Business ", " Corporate downsizing ", " Family encouragement " and " Social Ambition", the remaining variables show a significant positive correlation between the level of the experience before starting own Business and the reasons of starting own business.

Married women feel more than single women that the reasons to start up business are: " Make others happy ", "Challenge", " Social Ambition " and "Independence".

Women with Master Degree feel that "Social Ambition" is the reason to start own business more than the women who has Batchelor Degree.

Women with 35 years old and above feel that " Job dissatisfaction "is the reasons to start own business more than the others.

The administrative system makes gender distinctions although some women feel they get more assistance than men receive and have to spend less time queuing for government services. However, there is a consensus that processes need to be simplified and fees need to be reduced. Some women feel the government concentrate on prices rather than quality and specialization in certain services. Due to a lack of the required skills and the right work attitudes locally and the difficulty of obtaining labour clearances to employ expatriates, this hampers business growth and has an adverse impact on their businesses.

## Appendix 1 Questionnaire

First Part: Personnel Information:

Experience before starting own Business:

- Employee
- Households
- Student

Status

- Married
- Single

Education

- Diploma or less
- Bachelor Degree
- Master Degree
- PH.D Degree

Second Part: Variables:

| Variable                       | Strongly Agree | Agree | Neutral | Disagree | Strongly Disagree |
|--------------------------------|----------------|-------|---------|----------|-------------------|
| Enjoyment                      |                |       |         |          |                   |
| Finance                        |                |       |         |          |                   |
| Job dissatisfaction            |                |       |         |          |                   |
| Perceived Presence of Business |                |       |         |          |                   |
| Occupy oneself                 |                |       |         |          |                   |
| Make others happy              |                |       |         |          |                   |
| Self-recognition               |                |       |         |          |                   |
| Economic necessity             |                |       |         |          |                   |
| Challenge                      |                |       |         |          |                   |
| Corporate downsizing           |                |       |         |          |                   |
| Family encouragement           |                |       |         |          |                   |

## **Abstract**

This paper presents an empirical study based on a survey of 399 small and medium size companies in Lithuania. Applying bivariate and ordered probit estimators, we investigate why some business owners intend to expand their firms based on growth expectations, while others do not. Our main findings provide evidence that the characteristics of the owners matter. Those with higher education and 'learning by doing' attributes either through previous job experience or additional entrepreneurial experience are more likely to expand their businesses. In addition, the model implications include that the intentions to expand are correlated with exporting and with size of the enterprise: medium and small size companies are more likely to grow than micro enterprises and self-employed entrepreneurs. We also analyse the link between the main perceptions of constraints to business activities and growth expectations and find that the factors, which are perceived as main business barriers, are not necessary those, which are associated with low growth expectations. In particular, perceptions of both corruption and of inadequate tax systems are main barriers to growth.

## **1. INTRODUCTION**

In this paper, we focus on the factors affecting enterprise growth in the transition country context. We use a data sample based on a survey of 399 SME owners in Lithuania. Lithuania provides an excellent example of a transition country that has successfully transformed its status from a centrally planned Soviet republic to a fast-growing, sovereign, market-oriented and democratic EU member state. We are specifically interested in the factors affecting two types of growth expectations: intention to increase the number of employees and intention to increase business turnover. Though growth expectations might be viewed as a subjective assessment, a number of authors have indicated that business growth is at least partially determined by the entrepreneur's motivations and intentions for the business (Bird, 1988; Davidsson, 1991; Kolvereid, 1992; Cooper, 1993; Herron and Robinson, 1993; Cliff, 1998; Wiklund et al., 2003). In addition, by asking entrepreneurs about their expectations regarding the future, we alleviate the problem of endogeneity, unlike the typical situation where growth indicators are explained by some contemporary characteristics of firms.

In our analysis, we incorporate a set of explanatory variables including human capital measures, firm level attributes, sectoral affiliation and export behaviour. In addition, we include perceptions of the main external barriers, i.e. taxes and corruption into account as they may have an influence on growth expectations.

Our study provides the following contributions. Firstly, our data is unusually rich in its representation of both micro enterprises and self-employed entrepreneurs. This allows us to more accurately compare the effect of firm size on growth aspirations for all SME size categories. Our results indicate that while small and medium firms expect to grow, the smallest firms i.e. micro firms do not; thus there seems to be a stagnant pool of very small enterprises. This finding contradicts a negative link between size and employment growth found in other studies (Faggio and Konings 2003; Bechetti and Trovato 2002) We argue that the discrepancy stems from the fact that the smallest firms are being typically underrepresented in other studies<sup>1</sup>. Secondly, we are able to test the effect of the two most significant business barriers on growth aspirations. Here we find that both the high level of taxes as well as corruption are identified as negatively related to growth aspirations. Thirdly, the characteristics of the owners matter. Those with higher education and 'learning by doing' attributes either through previous job experience or additional entrepreneurial experience are more likely to expand their businesses.

This paper is organised as follows. Section 2 presents relevant literature in terms of theoretical developments and empirical findings. Section 3 describes the survey and resulting sample of entrepreneurs. Section 4 presents the variables used in our estimation model and Section 5 presents our results. Section 6 concludes.

## **2. LITERATURE ON DETERMINANTS OF SME GROWTH**

We now turn to a brief literature review. First we argue that the growth of businesses and employment growth in particular are key performance indicators for SMEs. Next, we discuss findings on the determinants of growth.

## **2.1 Business performance measures**

Even though no consensus regarding the definition of small business performance exists, venture profitability and increase in employees are two ways in which business performance is typically measured (Chandler and Hanks 1993; Robinson 1999; Vesper 1996; Watkins et al. 2003). However, the profitability indicator is problematic in the context of SMEs for two reasons. Firstly, SMEs frequently rely on simplified accounting where the measures of profit are not clear-cut. Secondly, it is typical for many new firms to follow a period of losses or low profitability in the initial phase of their existence. Thus, growth and growth expectations may be a better measure of performance. As argued by Johnson *et al.* (2000): 'Employment growth is perhaps the most important measure of performance from a welfare perspective. A private sector is successful in a post-communist country only to the extent it manages to create jobs'. (p. 13). Similar conclusions are supported by other authors. For instance Klapper *et al.* (2002) stress that the SME sector is the most dynamic part of transition economies. One may also note, that the importance of employment creation by the SME sector is also crucial in high income economies, as documented by Lopez-Garcia (2002) who confirms the role of SMEs as absorbing employment released from both industry and agriculture, by creating jobs in the service sector. And finally, while we focus on employment, the issue of growth can also be captured by the investment dimension, as in Fries *et al.* (2003).

Growth can be either measured by backward looking accounting and employment data or by forward looking expectations of owners. As the data is typically generated by surveys, there is a serious risk of substantial measurement error if data for several past years is collected. Moreover, in case of new recent start-ups there is not much past history to rely on, which leads to the sample selection bias. In addition, some studies have indicated that perceptions of performance may be more insightful indicators than objective measures because perceptions draw on the insider's knowledge (Osborn et al. 1980; Watson et al. 2003) of firm's goals, strategy, structure and processes. Though it is not without controversy, there is increasing evidence indicating that attitudes such as intentions to grow a business can be used to predict behaviour (Davidsson 1991; Wiklund et al. 2003).

## **2.2 Determinants of growth**

The results of a number of studies indicate that both business and business owner characteristics can influence business growth. Existing studies have shown that human capital as measured by work experience, education and other skills that increase knowledge accumulation are not only important characteristics of entrepreneurial capacity (Sexton and Upton 1985) but have a positive influence on both firm survival, growth (Cooper et al. 1994) and entrepreneurial performance (Cooper and Gimeno-Gascon 1992; Chandler and Hanks 1998). Education seems to provide the knowledge base and analytical and problem-solving skills to more effectively deal with the demands of entrepreneurship (Watson et al. 2003). In a study of the influence of venture teams on venture performance, Watkins et al. (2003) find a significant and positive relationship between perceived venture growth and higher levels of education and work experience. They also found that younger business owners with fewer employees were significantly more likely to grow their ventures than the sample as a whole. However other studies have indicated that middle aged entrepreneurs are more likely to grow their businesses than other age groups (Burns 2001). Business sector may have an influence on these results with younger entrepreneurs growing their firms faster in IT sectors (Burns 2001). As a result, the relationship between business owner's age and business growth is still not completely understood.

Work experience can further supplement an entrepreneur's education with more practically based skills for venture performance. However perhaps even more importantly, previous entrepreneurial experience i.e. in having started up another private business may increase the likelihood for growth in the current business. This is a result of 'learning by doing' in which the entrepreneur improves their skills and chances for business success by building up their entrepreneurial experience. The different roles, which are played by the technically related work experience and by the entrepreneurial experience, may be linked to the recent empirical work based on the distinction between the two alternative views of entrepreneurship (Lazear 2004). Namely, the first view is based on belief 'that entrepreneurs are technical specialist who base their new companies on innovation' (*Ibid.*, p. 208). If this view is correct, both previous sector-relevant job experience and specialist education may be critical factors determining entrepreneurial success. An alternative view however is that entrepreneurs are 'generalist', 'jacks of all trade', as their main role is in co-ordinating a range of activities, about which they need some sufficient amount of knowledge. In our interpretation and application of Lazear's (2004) results, previous entrepreneurial experience and a more broad type of education may be more conducive to entrepreneurial success.

On a related theme, in a review of literature on the antecedents to business start-up and growth, Storey (1994) found reasonable evidence indicating a negative relationship between being unemployed before starting a business and subsequent business growth. Though unemployed individuals experience a strong push into self-employment, they may not have the skills needed to grow the business and may have lower growth aspirations.

Studies in Western countries have indicated that gender affects business development. More specifically, female businesses tend to be smaller and are less likely to grow than male-owned businesses (Cooper et al. 1994). A study by Cliff (1998) indicates that female business owners tend to have lower growth thresholds for their businesses than men, which can partially explain the tendency for women to have smaller businesses with lower turnovers. However, in a study of Norwegian entrepreneurs, Kolvereid (1992) did not find any significant differences between male and female entrepreneurs in terms of growth aspirations. Similarly, in transition countries such as Lithuania, growth aspirations of female entrepreneurs are not different from male entrepreneurs (Aidis 2003).

A study by Faggio and Konings (2003) on five transition countries shows a negative relationship between firm size and firm growth indicating that smaller firms are likely to grow faster than larger firms. However, as stressed by the authors, the small firms are heavily underrepresented in their sample. Similarly, Becchetti and Trovato (2002) found a negative link between size and growth (and positive with age of business), controlling for a wide range of factors, albeit again their sample contains firms with more than ten employees only. On the other hand, the results reported by Fries *et al.* (2003), based on a large cross-country sample from transition economies including micro firms, indicate a positive, albeit non-linear relationship between growth (as measured by both revenues and assets) and size. Similar findings are reported by Batra *et al.* (2003), using the WBES survey. Batra *et al.* show that while the difference between medium and small size companies in growth rate is not significant, it becomes significant in relation to large firms, which grow faster.

Another important determinant of growth relates to the international versus domestic orientation of sales. As confirmed by Beck *et al.* (2002), utilizing a large cross-country survey, for which 80 percent of firms are small and medium sized, exporting is a highly significant factor affecting firm growth. Similar results based on the same sample are

reported by Batra *et al.* (2003). In addition, Becchetti and Trovato (2002), found a positive, albeit marginally insignificant effect of exporting on growth for their sample of Italian firms.

Three studies, which focus directly on the link between business barriers and growth, are Johnson *et al.* (2000), Beck *et al.* (2002) and Batra *et al.* (2003). The latter two are both based on the WBES survey conducted by World Bank in 80 countries between mid 1998 and 2000. The econometric findings of the studies vary, and they are not fully compatible, as the survey instruments are different and the size distribution of firms in the samples differ. The first study (Johnson *et al.* 2000) does not cover firms with less than ten employees. Perception of barriers is captured by assessment of the extent of 'extralegal payments' in the business sector in which the company operates, and by assessment of the credibility of courts in enforcing contracts. On both measures, no significant effects on firm growth was found (Johnson *et al.* 2000).

On the other hand, Beck *et al.* (2002) relies on a more extensive range of indicators, and a larger sample with wide cross-country variation. They consider three dimensions: quality of financing, quality of the legal system, and corruption, all three based on 7-11 detailed questions with answers based on 6 point Likert scale. If a single dimension is included in the specification separately, all three turn out to have highly significant negative effect on firm growth. The effect of corruption becomes insignificant, when the three are included jointly, possibly due to multicollinearity. Another interesting finding is that the significance of these factors vary with the size of company: 'small firms report the highest financing and corruption constraints, whereas large firms report the highest legal constraints' (Beck *et al.* 2002, pp. 13-14). Similarly, using the same sample but different specifications, Batra *et al.* (2003) find that financing, high taxes and corruption are significantly and negatively associated with business sales growth.

In a related study in Lithuania, Aidis (2004) found that business barriers do not influence the business in isolation but have an inter-related effect. For instance, business owners who were affected by formal barriers such as the tax level and business legislation were found to be more likely affected by informal barriers such as governmental corruption at the national level and the implementation of business regulations. In our study, we are interested in testing if the main business barriers identified by SME owners, namely taxes and corruption would have a negative effect on growth aspirations.

### **3. SURVEY AND SAMPLE CHARACTERISTICS**

Our analysis is based on data collected by one of the authors in Lithuania. From September - December 2000, Lithuanian language questionnaires were sent out to private business owners throughout Lithuania. Due to the inability to obtain accurate lists of operating private businesses in Lithuania<sup>2</sup>, the survey was not based on a random sample and most addresses were obtained through the membership lists of various entrepreneurship organizations. This may have resulted in a bias for businesses that are older and have higher turnovers than the average private business in Lithuania. The response rate was high, at fifty percent. Of the 505 respondents, 399 were business owners<sup>3</sup>.

### 3.1 Growth

Our analysis of growth intentions is based on responses to the following question from the survey:

- In the next five years, do you think that your business will:  
(please mark all relevant responses):*
- (a) increase the number of employees*
  - (b) increase turnover*
  - (c) decrease the number of employees*
  - (d) decrease turnover*
  - (e) stay the same*
  - (f) I don't know*

The question is asked in a depersonalised, objective mode, i.e. about expectations, not intentions or strategies of the owner, to avoid possible bias. The respondents would typically assume that growth is something positive and might be inclined to present themselves in a better light, if asked about their intentions and potential. The wording applied here suggests that it is not only the entrepreneur, who is responsible for the enterprise development.

The analysis was greatly facilitated by the fact that all respondents who declared an expected increase in employment, also declared an expected increase in turnover, but not vice versa. These results lead to the following ranking, presented in Table 1.

Table 1 about here

As the number of responses in the lowest category is relatively small, combining it with the one above may be reasonable, as illustrated by an alternative categorisation (b) above. We estimated alternative models, using both specifications (see below). In particular, we applied the ordinal probit estimator, where, for a sequence of cut points:  $k_0, \dots, k_i, \dots, k_n$  (with  $k_0$  corresponding to  $-\infty$  and  $k_n$  to  $+\infty$ ), the probability of observing an outcome  $i$  is given by:

$$P(\text{outcome} = i) = P(k_{i-1} < X\gamma + u < k_i) = \Phi(k_i - X\gamma) - \Phi(k_{i-1} - X\gamma) \quad (1)$$

where  $X\gamma$  is a matrix of explanatory variables with a corresponding (column) vector of coefficients and  $\Phi(\cdot)$  refers to the standard normal cumulative distribution function.

In addition to this model, we also applied a simpler binary probit model, with the dependent variable distinguishing between the entrepreneurs predicting employment growth and all other outcomes:

$$P(\text{outcome} = 1) = \Phi(X\gamma) = \int_{-\infty}^{X\gamma} \phi(t) dt \quad (2)$$

## 4. VARIABLES DEFINED

In deriving the set of explanatory variables, we draw from the literature discussed in section 2. Our particular interest is in the link between perceptions of business barriers and growth expectations. The difference in explanatory power of barriers may not correspond to their direct ranking. To give an example, demand and financial constraints, typical for hard-budget market economy are commonly perceived as a major nuisance, as confirmed by the survey results. Yet it does not imply these have the most impeding impact on growth. Assessment of

the importance of given obstacles may indicate problems in everyday business, which the entrepreneurs may be able to overcome nevertheless. Quite a different set of factors may influence the decisions to develop and expand.

The survey generated data on a number of characteristics that are consistent with our prior expectations on a possible set of determinants of growth. Firstly, we have size, as measured by employment. The variable distribution is highly skewed to the left, with 43 observations in the self-employed category, i.e. with no employment other than the owner of the business (see Table 2). For that reason, we categorise the employment variable, using the four size categories, as recommended by the standard EU definition. The benchmark category is 'self employed' and we introduce dummy variables for micro, small and medium size enterprises correspondingly (see Table 2). Three observations with employment above 250 are eliminated from the analysis. Testing for the relationship between size and growth expectations is important, since as indicated in section 2, the link between the size and growth of enterprises remains a highly debated issue in the literature.

We are also interested in examining if human capital variables such as sector-relevant job experience, entrepreneurial experience, starting from employment or non-employment, education, age and gender are related to growth intentions. In particular, the first two may be perceived as proxies for the distinction between 'specialist' and 'generalist' human capital, as defined by Lazear (2004). We include these as well as firm level variables such as export orientation, location and sectoral affiliation in our estimations. Export orientation provides us with an indication of the influence of internationalized business operations on business growth. Capital city location is included in order to control for the effects of rapid economic growth concentrated in the capital city as compared to the rest of the country. This specific capital city development vs. underdeveloped smaller cities characterizes many transition countries. Finally controlling for sector effects is a standard for these types of estimations.

For all of the barriers included in the survey questionnaire, figure 1 below illustrates the frequency of responses identifying a given barrier as one of the three most important ones.

Figure 1 about here

Our estimation strategy was to include dummy variables for seven barriers, which were most frequently identified. It turned out that only those related to taxes and corruption were significant. In addition, there is multicollinearity between the tax dimensions, which makes the coefficients sensitive to small changes in specification and data, i.e. not robust and problematic to rely on. There is no single straightforward solution to this problem. Our response was to restrict ourselves to the two of the most important business barriers, namely 'taxes to high' and 'corruption at the national level' and exclude 'frequent changes to tax policies' and 'ambiguity of taxes'. However, interpreting the results, one should bear in mind that the retained tax indicator should not be narrowly related to the level of taxes, but interpreted as a proxy for a broader cluster of problems with tax system.

The results of three specifications are reported below. Our dependent variable relates to expected growth categorised into four ranks, as described above, where the highest rank is the expected positive growth of both employment and turnover. In the first specification, we use the dependent variable with four categories and include indicators for human capital, exporting, location, employment size categories, sectoral controls and perceptions of barriers,

as described above. In the specification two, we use three categories of expected growth (instead of four) as dependent variable and in specification three we compress the dimensions further, by using expected employment growth as a binary variable, to see if the results are robust to the modification. See Appendix 1 for a summary of the independent and dependent variables used in our estimation model.

## 5. RESULTS

All the estimation results are presented in Table 2. Unemployed prior to starting a business, age and gender are not significant as predictors of growth expectations. Age is highly insignificant, while gender is marginally significant in one specification, and insignificant in others. Interestingly, the sign of the gender coefficient is positive in all specifications, indicating that the impact of gender may be very different from that observed in high income countries; if anything women entrepreneurs have higher growth aspirations than their male counterparts. Unemployment prior to starting a business also has the expected negative sign. The other human capital measures are either significant or marginally insignificant depending on the specification. In particular, we found no evidence that the 'specialist' experience is more relevant than 'generalist' or vice versa. Both seem to matter, as documented by coefficients on experience in the same sector of activity and on entrepreneurial experience. Though 'learning by doing' through previous job experience and entrepreneurial experience does have a positive effect. In addition, we found a clear general positive effect of higher education. On the firm level, we can see a clear positive effect of exporting, and positive, albeit insignificant effect of business being located in the capital city. Sectoral affiliation is mostly insignificant, apart from some negative effect on growth expectations of 'services activities other than trade'.

Size effects are clearly important. Medium, small and micro size companies expect to grow, while the self-employed express little interest in developing their business. Moreover, the coefficients in Table 2 are neatly ordered according to size group: the larger the size category, the more likely is that the company will grow. Here, our results are consistent with those obtained from research based on samples, which include the smallest firms, as in Fries *et al.* (2003). It may also be interpreted as providing support for the arguments presented by Earle and Sakova (2001) theorizing that in transition countries, own account workers (business without employees) a more likely a form of hidden unemployment than a form of entrepreneurship. This is clearly a point of concern for policy makers.

Taxes and corruption have a negative effect on growth aspirations throughout. The result is consistent with the literature discussed above. In the case of corruption it also indicates that this barrier, while not named as very important by the majority of entrepreneurs (see Figure 1), has a detrimental effect on growth where encountered.

## 6. CONCLUSION

Our study focused on factors affecting the growth of new firms, which is arguably the key indicator of business performance and entrepreneurship as well as an important factor in overall economic development. In particular, we discover that growth expectations differ according to firm size, with small and medium size enterprises expecting growth and micro firms and self-employed less so. Arguably, we are able to detect these effects, due to a broad

coverage of size dimension by our sample. Analysis of the results in the available literature shows that the link between size and growth is sensitive to sample coverage. We also analyse the link between the perceptions of barriers by business owners and their growth expectations. Both taxation and corruption were found to be significant barriers to the growth aspirations of SMEs in our sample.

An interesting but not surprising result was the significant influence of private business experience on intention to grow in the current business. This effect may be more important in the transition context than in advanced western countries since 'entrepreneurial' skills were never taught (directly or indirectly) in the centrally planned system. Our results seem to indicate that 'learning by doing' has proved to be an important form of human capital in the transition context.

Finally, we are able to confirm two further results, consistent with the literature. Firstly, export orientation is an important factor facilitating growth of small firms. Secondly, human capital matters: higher education of entrepreneurs is correlated with higher growth expectations. Further research in this area would be useful in order to model the interactions between the characteristics of entrepreneurs, perceptions of barriers and growth expectations in more detail.

Appendix 1: Variables defined

| <b>Independent Variables</b>  | <b>Characteristic</b>   | <b>N</b> | <b>Mean</b> | <b>SD</b> |
|---|---|----------|-------------|-----------|
| <b>Human capital</b>  |   |          |             |           |
| <i>Higher education</i>   | One if the respondent has a university education, zero otherwise.   | 393      | 0.72        | 0.45      |
| <i>Job experience in same sector</i>                                      | One if the respondent has previous employment experience in the sector where they started their own business, zero otherwise.   | 389      | 0.48        | 0.50      |
| <i>Experience with other business</i>                                     | One if the respondent had started a private business besides their current business, zero otherwise.  | 395      | 0.02        | 0.14      |
| <i>Unemployed prior to starting</i>                                       | One if the respondent had not been in employment prior to starting their private business, zero otherwise.  | 395      | 0.73        | 0.26      |
| <i>Business owner's age</i>   | Continuous variable measuring business owner age.   | 390      | 42.76       | 8.77      |
| <i>Age<sup>2</sup></i>  | Age variable squared  | 390      | 1905.2      | 787.9     |
| <i>Female</i>   | One if the respondent is female, zero otherwise.  | 396      | 0.25        | 0.43      |
| <b>Firm level attributes</b>  |   |          |             |           |
| <i>Exporting</i>  | One if the business is exporting, zero otherwise.   | 396      | 0.48        | 0.50      |
| <i>Location: Vilnius</i>  | One if the business is located in Vilnius, zero otherwise.  | 394      | 0.26        | 0.44      |
| <i>Micro</i>  | One if the business has less than 9 employees, zero otherwise.  | 396      | 0.34        | 0.48      |
| <i>Small</i>  | One if the business has 10 to 49 employees, zero otherwise.   | 396      | 0.39        | 0.49      |
| <i>Medium</i>   | One if the business has 50 to 249 employees, zero otherwise.  | 396      | 0.16        | 0.37      |
| <i>Turnover*</i>  | Ordinal variable indicating annual business turnover for 1999. Five categories: (1) up to \$ 25 000 USD; (2) \$ 25 001 – 125 000 USD; (3) 125 001 – 250 000 USD; (4) \$ 250 001 – 1 250 000 USD; (5) more than \$ 1 250 000 USD.                                      | 388      | 3.00        | 1.39      |
| <b>Barriers</b>   |   |          |             |           |
| <i>Taxes</i>  | One if 'taxes are too high' is considered one of the three most important business barrier, zero otherwise.   | 368      | 0.63        | 0.48      |
| <i>Corruption</i>   | One if 'corruption at the national level' is considered one of the three most important business barrier, zero otherwise.   | 368      | 0.16        | 0.37      |
| <b>Sectors</b>  |   |          |             |           |
| <i>Retail trade</i>   | One if the business is engaged in retail trade, zero otherwise.   | 396      | 0.25        | 0.43      |
| <i>Wholesale trade</i>  | One if the business is engaged in wholesale trade, zero otherwise.  | 396      | 0.15        | 0.36      |
| <i>Busin. services.</i>   | One if the business is engaged in business services, zero otherwise.  | 396      | 0.14        | 0.35      |
| <i>Other services</i>   | One if the business is engaged in other service activities besides business services, zero otherwise.   | 396      | 0.17        | 0.38      |
| <i>Construction</i>   | One if the business is engaged in construction, zero otherwise.   | 396      | 0.04        | 0.19      |
| <b>Dependent Variables</b>  | <b>Characteristic</b>   | <b>N</b> | <b>Mean</b> | <b>SD</b> |
| <i>Growth expectations (using four ranks)</i>                             | Ordinal variable indicating the respondent's growth aspirations in the next five years. Four categories: (1) decrease turnover or employment; (2) the same or don't know; (3) increase turnover, but not employment; (4) increase employment and turnover.            | 393      | 3.08        | 0.98      |
| <i>Growth expectations (using three ranks)</i>                            | Ordinal variable indicating the respondent's growth aspirations in the next five years. Modified to three categories: (1) the same or don't know or decrease turnover or employment; (2) increase turnover, but not employment; (3) increase employment and turnover. | 393      | 2.81        | 1.32      |
| <i>Growth expectations (positive employment growth as binary outcome)</i> | One if the respondent plans to increase employment in the next five years, zero otherwise.  | 399      | 0.46        | 0.50      |

N = total number of observations; SD = standard deviation.

\* = The survey turnover was reported in the Lithuanian national currency, the Litas. The exchange rate used here is the official 1999 exchange rate: \$ 1USD = 4 Litas.

Table 1: Categorization of answers for the question on growth expectations

| <i>a. variable 'future'</i><br>(four categories) | frequency of<br>answers: | <i>b. variable 'future_3c'</i><br>(three categories)         | frequency of<br>answers: |
|--|--------------------------|--|--------------------------|
| (4) increase employment and turnover             | 182                      | (3) increase employment and turnover                         | 182                      |
| (3) increase turnover, but not employment        | 83                       | (2) increase turnover, but not employment                    | 83                       |
| (2) the same or don't know                       | 106                      | (1) the same or don't know & decrease turnover or employment | 128                      |
| (1) decrease turnover or employment              | 22                       | (missing)  | 6                        |
| (missing)  | 6                        | Total  | 399                      |
| Total  | 399                      | Total  | 399                      |

Figure 1: Percentage of entrepreneurs identifying a given dimension as one of the three most important business barriers.

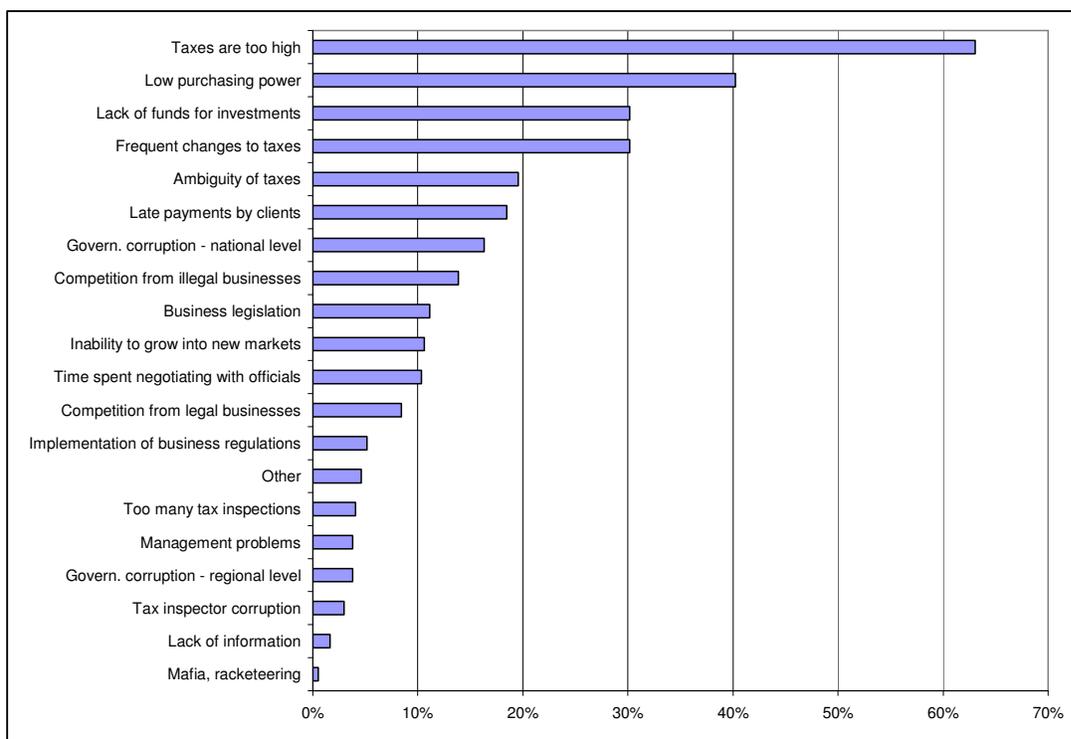

Table 2: Results

|  | (1)  | (2)   | (3)   |
|--|--|---|---|
|  | growth expectations<br>(ordered using four<br>ranks) | growth expectations<br>(ordered using three<br>ranks) | growth expectations<br>(positive employment<br>growth as binary<br>outcome) |
| <i>Human capital:</i>  |  |   |   |

## Notes

- (i) estimator: ordered probit for specifications 1- 2; binary probit for specification 3,  
(ii) three companies with employment above 250 excluded from estimation,  
(iii) standard errors in parentheses,  
(iv) significant at: †0.10 \*0.05 \*\*0.01 \*\*\*0.001,  
(v) ancillary parameters (and constant in specification 3) not reported, and available on request.

---

**Endnotes**

<sup>1</sup> See sections 3 and 4 below. Amadeus Database has been a popular source of firm level data, with the smallest firms truncated; a recent paper utilizing it for employment growth estimations is Faggio and Konings (2003). WBES World Bank survey and EBRD surveys are better in this respect, albeit the samples are still skewed; see: Beck *et al.* (2002), Batra *et al.* (2003), Fries *et al.* (2003). All those authors notice the problem.

<sup>2</sup> As in many other transition countries, an accurate list of legal enterprises in Lithuania does not exist. Previous surveys attempted using the official list of registered businesses from the Lithuanian Department of Statistics indicated that the official register was rife with non-existent businesses or inaccurate addresses. See Aidis (2003) for further discussion.

<sup>3</sup> A business owner met the following criteria: they had their own business, it was still in operation and their main business activities were not in the agriculture sector.
